Persons living 85 years and older represent one of the fastest growing age-demographics in the United States. Many of these individuals have been exposed to various life-long experiences involving personally fulfilling moments of achievement, periods of physical suffering and mental anguish, and varying exposure to traumatic stressors. However, clarification surrounding the degree to which distal, proximal, and traumatic events contribute to physical and mental health outcomes in very old age has remained limited. Of central importance is the determination of how such lifetime experiences might come to represent unique but meaningful sources of well-being in old-old age. The purpose of this symposium is to provide conceptual, methodological, and empirical insights regarding the differential effects of distal, proximal, and traumatic experiences pertaining to the well-being experiences among the oldest old. Discussion will involve presentation of quantitatively derived conceptual models and qualitative content from oral life history narratives. Implications for theoretical advancement in the area of well-being and meaning in human longevity will also be addressed. Further recommendations will be provided for use and application within geriatric clinical practices and programs that serve to improve quality-of-life among long-lived adult populations.

THE OKLAHOMA 100 YEAR LIFE PROJECT: A COLLABORATIVE EFFORT TO PRESERVE MEANINGFUL LIFE EXPERIENCES AND HISTORICAL MEMORIES ONE CENTENARIAN AT A TIME

A.J. Bishop, T. Finchum, *Human Development and Family Science, Oklahoma State University, Stillwater, Oklahoma*

The purpose of this project was to link oral life history narratives to gerontological theory. Data for this examination involved persons, 100 years of age and older, currently participating within an on-going oral history project in Oklahoma. Qualitative content of N = 25 oral history collections were reviewed for purposes of identifying common themes across oral life stories. Evidence of emotionally meaningful content emerged relative to personal narratives of life-long experiences involving marital relationships and spousal caregiving, interpersonal and family kinship ties, and individual character strengths contributing to well-being and flourishing. Findings are discussed relative to demonstration of theoretical assumptions and principles within life-span development theory, life course theory, and familial-based aging theory. Further consideration will be given toward the concept of contemplative aging with implications for constructing and advancing a gerontological theory of meaning in old-old age.

INFLUENCE OF PROXIMAL AND DISTAL LIFE EVENTS ON MENTAL STATUS IN LATER LIFE

K. Lee[1], P. Martin[1], L. Poon[2], *1. HDFS, Iowa State University, Ames, Iowa, 2. University of Georgia, Institute of Gerontology, Athens, Georgia*

Research on the relationship of life events and mental status has not explored the differential effects depending on when the events happened. The goal of this study was to explore the influences of proximal (< 2 years) and distal (> 20 years) life events on mental status in later life. Data of 208 older adults over 80 years of age from the Georgia Centenarian Study were used for the analysis. Scores of the Short Portable Mental Status Questionnaire were used for the measurement of mental status. Results of the hierarchical regression analysis indicated that along with education, personality, social support, and social provision, both distal and proximal life events were significant predictors of mental status in later life. Our result that distal events (β= .632, p < .001) had stronger effects than proximal events (β= .119, p < .05) implicates the long process involved in the change of mental status.

EARLY AND LATE LIFE EXPOSURE TO TRAUMATIC EVENTS AND BIOPSYCHOSOCIAL WELL-BEING IN EXCEPTIONAL OLD AGE

G. Randall[1], A. Bishop[2], *1. Family & Consumer Sciences, Bradley University, Peoria, Illinois, 2. Oklahoma State University, Stillwater, Oklahoma*

Traumatic life events (TLE) influence resources important to successful aging. Little is known about the distal versus proximal influence of TLE on these resources. Using data from 154 Oklahoma community-dwelling centenarians, ranging in age from 99 to 109 years (M=101; SD=1.72), the study investigated the unique influence of TLE experienced before the age of 60 compared to TLE experience after the age of 60 on outcomes of physical disability (PD), health impairments (HI), depressive symptoms (DS), and social support (SS). Regression analyses demonstrated that TLE experienced after the age of 50, compared to those experienced before 50, significantly influenced DI (β = .24, p =.004), HI (β = .15, p =.04, one-tail), DS (β = .19, p =.02), but not SS (β= .07, p =.48). For centenarians, the implications of experiencing a traumatic life event later in life, relative to earlier in life, are discussed.

EXPLORING LIFE EVENTS AND EXPERIENCES AMONG GEORGIA AND IOWA CENTENARIANS

G.D. da Rosa[1], M.S. Heinz[2], P. Martin[1], L. Poon[3], *1. Human Development and Family Studies, Iowa State University, Ames, Iowa, 2. Upper Iowa University, Fayette, Iowa, 3. University of Georgia, Athens, Georgia*

This study compared life events of 199 Georgia centenarians and 150 Iowa centenarians. Two open-ended life events questions were categorized into life event domains. Results suggest 39% of Georgia centenarians and 25% of Iowa centenarians reported marriage events as most important [$\chi^2(1, N = 331) = 7.18, p< .01$]. In addition, 33% of Georgia centenarians and 17% of Iowa centenarians mentioned child/children events [$\chi^2(1, N = 288) = 9.08, p< .05$]. Approximately 25% of women and 6% of men reported events about their child/children [$\chi^2(1, N = 330) = 10.01, p< .01$]. In addition, 36% of White centenarians and 18% of African Americans reported marriage as the most important life event [$\chi^2(1, N = 330) = 5.87, p< .05$]. Twelve percent of centenarians living in nursing homes and 5% of centenarians living independently reported social activities as the most important life experience [$\chi^2(1, N = 329) = 5.23, p< .05$].

SESSION 830 (SYMPOSIUM)

UNDERSTANDING ELDER ABUSE IN AN U.S. CHINESE AGING POPULATION: FINDINGS FROM THE POPULATION-BASED STUDY OF CHINESE ELDERLY IN CHICAGO (THE PINE STUDY)

Chair: X. Dong, *Rush University, Chicago, Illinois*

Elder abuse is an important global health issue across all socio-economic and cultural backgrounds. Despite the growing attention, we still have rudimentary knowledge on the issue of elder abuse in minority populations. In order to fill the critical void, The PINE study - Population Study of Chinese Elderly in Chicago-is a comprehensive epidemiological study that examines the health and well-being of 3,159 Chinese older adults aged 60 and over in the greater Chicago area. It is the largest cohort of U.S. Chinese older adults that systematically examines elder abuse and elder self-neglect. Our quantitative and qualitative findings show that there exists an urgent need for culturally and linguistically appropriate educational initiatives and community awareness programs that highlight this important issue among minority older adults. In this symposium, session 1 will report the prevalence and socio-demographic correlates of elder abuse among U.S. Chinese older adults. Session 2 will detail the prevalence of the sub-types of elder abuse, including physical abuse, sexual abuse, psychological abuse, caregiver neglect and financial exploitation. Session 3 will discuss the possible associations between socio-demographic characteristics and the definitions as well as severities of elder abuse. Session 4 will investigate the socio-demographic and socioeconomic characteristics associated with prevalence and severity of elder self-neglect. Session 5 will explore Chinese older adults' views regarding elder abuse interventions in order to understand barriers and facilitators of help-seeking behaviors based on the findings from qualitative focus-group interviews.

PREVALENCE AND CORRELATES OF ELDER ABUSE IN A COMMUNITY-DWELLING POPULATION OF U.S. CHINESE OLDER ADULTS

R. Chen[1], M.A. Simon[2], E. Chang[1], Y. Zhen[1], X. Dong[1], *1. Rush Institute for Healthy Aging, Rush University Medical Center, Chicago, Illinois, 2. Northwestern University Medical Center, Chicago, Illinois*

This study aimed to examine the prevalence and correlates of elder abuse among U.S. Chinese older adults. Data were drawn from the PINE study, a population-based epidemiological survey of 3,159 U.S. Chinese older adults in the greater Chicago area. Elder abuse was measured using a 10-item self-reported instrument, derived from the Hwalek-

Sengstok Elder Abuse Screening Test (H-S/EAST) and the Vulnerability to Abuse Screening Scale (VASS), with Cronbach's alpha of 0.80. Our findings suggest a prevalence of 15.0% for elder abuse among Chinese older adults. In addition, higher levels of education (r=0.16, p<0.001), fewer children (r=0.1, p<0.001), lower health status (r=0.11, p<0.001), poorer quality of life (r=0.05, p<0.01), and worsening health over the past year (r=0.08, p<0.001) were positively correlated with any elder abuse. The findings point to a pressing need for researchers, community gatekeepers, health care providers and policy makers to increase efforts on reducing elder abuse in minority populations.

SOCIO-DEMOGRAPHIC AND SOCIO-ECONOMIC CHARACTERISTICS OF ELDER SELF-NEGLECT

M.A. Simon[2], R. Chen[1], M. Zhang[1], E. Chang[1], X. Dong[1], *1. Rush Institute for Healthy Aging, Rush University Medical Center, Chicago, Illinois, 2. Northwestern University Medical Center, Chicago, Illinois*

We aimed to investigate the socio-demographic and socioeconomic characteristics associated with prevalence and severity of elder self-neglect based on the PINE study, a population-based study of U.S. Chinese older adults. Elder self-neglect was assessed with systematic observations of a participant's personal and home environment across hoarding, personal hygiene, house in need of repair, unsanitary conditions, and inadequate utility. Our findings suggest that the prevalence of elder self-neglect varied significantly by age, gender, and socioeconomic factors. Elder self-neglect was more prevalent among older adults aged 80 years or over (mild self-neglect: 34.6% 95% CI 30.9-38.4; moderate/severe: 15.6% 95% CI 12.8-18.6), men (mild: 28.6% 95% CI 26.1-31.3; moderate/severe: 13.1% 95% CI 11.2-15.1), those with 0-6 years of education (mild: 32.2% 95% CI 29.7-34.9; moderate/severe: 12.6% 95% CI 10.8-14.5), and those with an annual personal income between $5,000 - $10,000 (mild: 30.8% 95% CI 28.4-33.2; moderate/severe: 11.8% 95% CI 10.2-13.5).

PERCEIVED BARRIERS AND FACILITATORS TO IMPLEMENT ELDER ABUSE INTERVENTION FOR VICTIMS AND PERPETRATORS: VIEWS FROM U.S. CHINESE OLDER ADULTS

E. Chang[1], M.A. Simon[2], C. Li[1], Y. Li[1], X. Dong[1], *1. Rush Institute for Healthy Aging, Rush University Medical Center, Chicago, Illinois, 2. Northwestern University Medical Centerc, Chicago, Illinois*

Elder abuse is an existing public health problem in the Chinese community. This qualitative study aimed to explore Chinese older adults' views regarding elder abuse interventions in order to understand barriers and facilitators of help-seeking behaviors. Qualitative data were collected from semi-structured interviews with 37 Chinese older immigrants residing in Chicago Chinatown. Participants viewed many benefits of intervention programs. Perceived barriers were categorized under cultural, social and structural barriers. Facilitators to implement interventions included increasing education and public health awareness, integrating social support with existing community social services, as well as setting an interdisciplinary team. Perpetrators intervention strategies were also discussed. This study has wide policy and practice implications for designing and deploying interventions with respect to elder abuse outcome. Modifying barriers that affect health behavior of Chinese older adults will contribute to the salience of elder abuse interventions in this under-served community.

UNDERSTANDING SUBTYPES OF ELDER ABUSE-PSYCHOLOGICAL, PHYSICAL, SEXUAL, FINANCIAL ABUSE AND CAREGIVER NEGLECT: THE PINE STUDY

X. Dong[1], M.A. Simon[2], E. Chang[1], M. Zhang[1], *1. Rush Institute for Healthy Aging, Rush University Medical Center, Chicago, Illinois, 2. Northwestern University Medical Center, Chicago, Illinois*

This study intended to explore the scope of elder abuse including psychological, physical, sexual, financial abuse, and caregiver neglect among community-dwelling U.S. Chinese older adults in the greater Chicago area. We also aimed to examine the frequency and severities of each abuse type. Perpetrator information was also collected. Cross-sectional data from the PINE study suggests that among all subtypes of abuse, psychological and financial abuse were most prevalent; a total of 12.0% Chinese older adults reported victimized by psychological, whereas 9.2% reported experience of financial exploitation since they turned the age of sixty. The prevalence of physical, sexual, and caregiver neglect was 1.1%, 0.2% and 4.6%, respectively. Our findings also suggest spouses and adult children were most commonly identified as perpetrators; a total of 17.4% reported victimized by spouse, 11.6% by daughters, and 10.0% by sons. Correlates by each abuse type and its implications will also be discussed.

DOES ELDER ABUSE DEFINITIONS MATTER? CHARACTERISTICS ASSOCIATED WITH DIFFERENT ELDER ABUSE DEFINITIONS AND SEVERITIES

X. Dong[1], M.A. Simon[2], E. Chang[1], R. Chen[1], *1. Rush Institute for Healthy Aging, Rush University Medical Center, Chicago, Illinois, 2. Northwestern University Medical Center, Chicago, Illinois*

Previous research has documented inconsistent results on the possible association between socio-demographic characteristics and the definitions of elder abuse. This study aimed to examine if elder abuse definitions may be associated with different socio-demographic characteristics and severities among minority older adults. Data were drawn from the PINE study, a representative population-based study of community-dwelling Chinese older adults aged 60 and over in the greater Chicago area. The overall prevalence of all subtypes of elder abuse assessed by the most restrictive criteria to the least restrictive definition ranged from 25.83% to 13.91%. However, there were no statistically significant differences with respect to key socio-demographic and socio-economic characteristics in various criteria of defining elder abuse. We believe this population-based study sheds lights on some of the common methodological challenges in elder abuse research, and holds the potential to call for a paradigm shift in defining elder abuse.

SESSION 835 (SYMPOSIUM)

AGING WITH HIV/AIDS: THE MIND BODY CONNECTION

Chair: K. Porter, *UMASS Boston, Quincy, Massachusetts*
Co-Chair: M. Brennan-Ing, *ACRIA, New York, New York*
Discussant: R.J. Havlik, *ACRIA, New York, New York*

This symposium will present four scholarly papers grounded in a range of methodological approaches that explore the mind-body connection within local, national, and international populations of older adults with HIV/AIDS. The content and narrative analyses presented in the first paper explore the bodily experience of aging in both males and females with HIV in Switzerland. The paper provides insight into the complexity of physical aging changes, fears of aging, and optimism. Two papers examine the use of complementary and alternative medicine (CAM) in people aging with HIV/AIDS. In the first, almost half (46.5%) of the sample were using CAM. Hispanics, relative to non-Hispanic Whites and non-Hispanic Blacks, were more likely to use CAM. Logistic regression results found CD4 count the sole predictor of CAM use in the sample. In the second paper, 28% used CAM. In logistic regression analyses, White race, higher education and income, greater pain, and fewer depressive symptoms were related to greater odds of

CAM use. The fourth paper compares depressive symptoms in older adults (ages 50-59 and 60-74) with HIV/AIDS (PLHIV) from the International Nursing Network for HIV/AIDS Research to similarly aged adults living with other chronic conditions from the Health and Retirement Study. Results indicate greater depressive symptoms in PLHIV older adults compared to other chronically ill, but non-HIV infected peers. The discussion will consider the inter-connections between biological and physical factors and mental well-being, and the importance of taking a holistic approach in the care and treatment of adults who are aging with HIV.

DIFFERENCES IN CAM USE AMONG HIV+ OLDER ADULTS BY ETHNICITY, MODALITY AND DISEASE SEVERITY

K. Porter, *UMASS Boston, Quincy, Massachusetts*

A growing evidence base shows upward trends in complementary and alternative medicine (CAM) use among older adults, especially people living with HIV/AIDS (PLHIV). This study compares differences in CAM use in PLHIV (N=172) by CAM modality and by race/ethnicity. Almost half (46.5%) of the sample were currently using CAM. Hispanics, relative to non-Hispanic whites and non-Hispanic blacks, were more likely to use provider-administrated CAM (36% vs 27%, 25%) as well as self-administered CAM modalities (45% vs 31%, 37%). Of provider-administered modalities, acupuncture was most used (48.2%), followed by massage (42.2%) and then chiropractic (20.2%). Of self-administered CAM, meditation was most used (48.2%), followed by nutritional supplements (47.0%), medicinal teas (43.4%) and herbal medicine (28.9%). Logistic regression found immune function (i.e. CD4 count) as a predictor of CAM use; a higher CD4 count increased the odds of use. Cultural traditions and selectivity will be discussed as an explanation for these findings.

COMPLEMENTARY AND ALTERNATIVE MEDICINE (CAM) USE AMONG OLDER ADULTS LIVING WITH HIV

A.S. London, *1. Sociology, Syracuse University, Syracuse, New York, 2. Aging Studies Institute, Syracuse, New York*

We use data from the Research on Older Adults with HIV (ROAH) Study to investigate CAM use among older adults living with HIV in New York City (N=909). Overall, 28% used CAM; in multivariate logistic regression analyses, Whites, people with higher education, income, and level of pain, and fewer depressive symptoms, were more likely to use CAM. Mind/body-based CAM was used more frequently than body- or biologically-based CAM. Among CAM users, 63.2% used mind/body-based CAM. In multivariate logistic regression analyses, use of mind/body-based CAM was significantly higher than use of other types of CAM among LGBT-identified individuals, people reporting worse health, and those not taking HIV medications. Other factors significantly influenced use of body- and biologically-based CAM, respectively. These complex patterns of CAM use reflect diverse social and cultural influences, as well as use to enhance current health, or to manage pain, HIV-related symptoms, and the side effects of treatment.

QUALITATIVE RESEARCH ON THE AGING EXPERIENCE OF OLDER ADULTS LIVING WITH HIV IN SWITZERLAND

C. Rapo, *Psychology, University of Lausanne, Lausanne, Switzerland*

Since the advent of antiretroviral drugs, new issues have arisen for people aging with HIV/AIDS, including an increase of comorbidities. This paper explores HIV-positive older adults' bodily experience as they experience aging. Biographical and semi-structured interviews lasting 4 meetings were conducted with 3 females and 4 males aged over 50, living with HIV. Content and narratives analyses were performed; results suggest that aging is an ambivalent bodily experience raising both uncertainty and hope. Participants expressed fear of losing control over their health due to long-term HIV treatment side effects, as well as the aging process itself. However, they also developed coping resources including hope and optimism. This research provides insights on specific challenges related to health, body and aging, in which positive and negative emotions are amplified. Implications for the treatment and care of this aging population will be explored.

DO OLDER ADULTS LIVING WITH HIV/AIDS REPORT MORE DEPRESSIVE SYMPTOMS THAN OTHER CHRONICALLY ILL COMMUNITY-LIVING OLDER PERSONS?

M. Brown[1], K.M. Nokes[2], L.S. Eller[3], M. Brennan-Ing[4], I. for HIV/AIDS Research[5], *1. Syracuse University Aging Studies Institute, Syracuse, New York, 2. Hunter College, CUNY, New York, New York, 3. Rutgers, the State University of New Jersey, Newark, New Jersey, 4. ACRIA Center on HIV and Aging, New York, New York, 5. UCSF School of Nursing, San Francisco, California*

According to the NIMH, depression is one of the most common mental health problems in community-living older adults, negatively impacting function, health outcomes, quality of life, and health care costs. This project compares data about depressive symptoms in older adults (ages 50-59 and 60-74) living with HIV/AIDS (PLHIV) from the International Nursing Network for HIV/AIDS Research to similarly aged adults living with other chronic conditions from the Health and Retirement Study. Results indicate greater depressive symptoms in PLHIV subjects compared to other chronically ill older subjects. Depressive symptoms have been associated with specific physiologic and psychosocial factors in PLHIV. Physiologic factors include the direct impact of HIV on neurological functioning, medication side effects, and use of mind-altering drugs. Psychosocial factors include stigma, poor social support, and avoidant coping style. These findings indicate that depression is an important concern in older PLHIV compared to other chronically ill older populations.

SESSION 840 (SYMPOSIUM)

METHODOLOGICAL CONSIDERATIONS IN THE STUDY OF AGING

Chair: A.M. Freund, *Dept. of Psychology, University of Zurich, Zurich, Switzerland*

Co-Chair: D. Isaacowitz, *Northeastern University, Boston, Massachusetts*

It has long been recognized that the study of aging faces specific challenges associated with the relatively long time intervals it spans, especially compared with child development (i.e., decades rather than months or years), the impossibility of randomly assigning age to study participants, and the problems of repeated measurements of the same functions over time. The majority of publications simply acknowledge these problems in the limitation section of their discussion. This symposium will address some of the problems specific to aging research and outline potential solutions. The talks will encompass a plea for the use of experimentally simulating aging-related processes (Freund & Isaacowitz), provide an example of a Brunswikian approach to the study of social perception and aging (Isaacowitz & Vicaria), outline what daily diary methods can (and cannot) accomplish for understanding stress and aging (Alemeida & Mogle), introduce the concept of power equivalence to detect individual differences in change (Lindenberger et al.), and present an equilibrium dynamics approach to deal with multiple time scales (Boker).

BEYOND AGE COMPARISONS: A PLEA FOR THE USE OF EXPERIMENTAL DESIGNS TO INVESTIGATE DEVELOPMENTAL PROCESSES

A.M. Freund[1], D. Isaacowitz[2], *1. Dept. of Psychology, University of Zurich, Zurich, Switzerland, 2. Northeastern University, Boston, Massachusetts*

The field of adult development and aging faces particular methodological challenges stemming from the investigation of individual differences approached with age-group comparison designs. Many studies on adult development and aging use extreme-group comparisons, contrasting young and older adults, although such comparisons can lead to the overestimation of age-related effects. Moreover, age-group membership is used as a proxy variable for psychological processes leading to the observed age-related differences. The inherent correlational design of such age-group comparisons can only approximate a test of the underlying psychological processes causing the differences between the groups. We consider these problems and potential solutions to them, with a focus on pertinent practices in research in adult development and aging.

AGING AND SOCIAL PERCEPTION: THE BENEFITS (AND CHALLENGES) OF A BRUNSWIKIAN APPROACH

D. Isaacowitz, I. Vicaria, *Northeastern University, Boston, Massachusetts*

Numerous studies have investigated age differences in accuracy in perception of emotional expressions and (to a lesser extent) social judgments. These studies tend to infer underlying mechanisms simply by the observed pattern of age differences, or by considering individual difference variables (cognitive abilities, mood) that might "explain" the age differences. In this talk, we argue instead for the use of a Brunswikian approach to study age differences in social perception, though it also comes with challenges. The Brunswikian approach separately considers properties inherent in stimuli that provide accurate cues, as opposed to the particular cues that perceivers may use to make their judgments. We present one example of a study of age differences in rapport judgments that allows for the full Brunswikian analysis, illustrating a case where there are no age differences in accuracy of judgments, but utilization of cues nonetheless varies in producing equivalent judgments.

CAPTURING THE DAILY STRESS OF AGING: THE PROMISE AND PITFALLS OF DAILY DIARY DESIGNS

D. Almeida, J. Mogle, *Pennsylvania State University, Univeristy Park, Pennsylvania*

The understanding of stress and health across adulthood has benefited from the development of diary methods that obtain repeated measurements from individuals during their daily lives. Diary methods have a number of virtues including enhanced ecological validity and decreased retrospective memory distortions. Perhaps the most valuable feature of diary methods is the ability to assess within-person emotional or physical reaction to daily stressors. Our research shows that, as individuals age, they become more reactive to daily stressors. Furthermore individuals who are more reactive to daily stressors are more susceptible to physical disease and psychological problems. While promising, daily diaries bring specific challenges including subject burden and selection, lack of precision in assessing reactivity, and presence of contextual confounds. The goal of this presentation is to address both the methodological benefits and shortcomings of daily diary methods as they relate to health and aging.

EQUILIBRIUM DYNAMICS AT MULTIPLE TIME SCALES

S. Boker, *University of Virginia, Charlottesville, Virginia*

Aging presents changes in external context that constitute new challenges and opportunities. In addition, the aging body and brain present new limits on adaptations that can be made. But not all change is unidirectional: short term daily fluctuations occur in strength, cognition, and emotional states. It is important to understand how short term fluctuations are regulated and how these short term fluctuations can lead to long term change. The current talk presents an overview of one method for estimating equilibrium dynamics of within-person short term fluctuations and how these equilibria may themselves change and adapt over time. While each individual's model parameters and equilibria may have idiosyncratic trajectories determined by individual differences in external context and aging-related loss, larger nomothetic regularities may still be determined from this type of individual data-intensive analysis.

CONCEPTUALIZING AND DETECTING INDIVIDUAL DIFFERENCES IN CHANGE

U. Lindenberger[1], C. Hertzog[2], A.M. Brandmaier[1], T. von Oertzen[3], P. Ghisletta[4], *1. Max Planck Institute for Human Development, Berlin, Germany, 2. Georgia Institute of Technology, School of Psychology, Atlanta, Georgia, 3. University of Virginia, Department of Psychology, Charlottesville, Virginia, 4. Faculty of Psychology and Educational Sciences, University of Geneva, Geneva, Switzerland*

Lifespan psychology offers a broad and principled perspective on behavioral variability and change from conception to old age. We start by listing central claims of the lifespan approach and outlining key research questions, with an emphasis on cognitive aging. We then review recent methodological advances in understanding statistical power in the context of latent growth curves (LGC) for longitudinal panel data. We introduce the concept of power equivalence or isopower contours (von Oertzen, 2010; MacCallum, Lee, & Brown, 2010): different latent variable models that have equivalent power to reject a designated null hypothesis, such as zero slope variance. We present Effective Growth Curve Reliability (EGCR) as an effect-size metric for LGC slope variances and describe a statistical program for a priori statistical power analysis of tests of slope variance and other parameters by manipulating design features (e.g., number of occasions) and EGCR, thereby assisting researchers in evaluating longitudinal design quality.

SESSION 845 (SYMPOSIUM)

EPIDEMIOLOGY OF FRAILTY, DISEASE BURDEN, AND LATE-LIFE CARE: INSIGHTS FOR HEALTH CARE AND POLICY

Chair: A.L. Byers, *Psychiatry, University of California, San Francisco, San Francisco, California, San Francisco VA Medical Center, San Francisco, California*

Discussant: D.K. Miller, *Indiana University, Center for Aging Research, Indianapolis, Indiana*

By evaluating the epidemiology of frailty, disease burden, and late-life care, we will provide practical insights into health care and policy for older adults. Using epidemiological methods, we can determine which factors are most important to target, supporting strategies for prevention and intervention and promoting independent living and quality of life. Furthermore, by investigating frailty, end-of-life care, and caregiver burden, we are able to evaluate particularly prominent aspects of the late-life care continuum. During our symposium, Dr. Bandeen-Roche will present findings on the epidemiology of frailty and highlight the importance of frailty in late-life health etiology using a nationally representative study, the National Health and Aging Trends Study. Ms. Aaltonen will present data on places of death and care transitions in Finland using nationwide health and social care registers; showing us that patterns of end-of-life care varied widely across individuals. Dr. Enguidanos will then present data on the impact of Advance Directives completion timing on decisions for care preferences and treatments received, as well as site of death. Continuing with end-of-life care, Ms. Mejia will examine whether a social approach to end-of-life care (i.e., a social model care facility) is associated with fewer hospital days than community and long-term care. In the final presentation, Dr. Mittelman will describe strategies for translating evidence-based interventions for spouse/partner caregivers of individuals with dementia. The discussion will focus on the value of investigating the epidemiology of frailty, disease burden, and late-life care in supporting health care and policy for older adults.

EPIDEMIOLOGY OF FRAILTY TOGETHER WITH DISEASE, DISABILITY, AND HOSPITALIZATION IN THE NATIONAL HEATH AND AGING TRENDS STUDY

K. Bandeen-Roche[3], C.L. Seplaki[1], J. Huang[2], B. Buta[2], J. Kasper[3], *1. University of Rochester Medical Center, Rochester, New York, 2. Johns Hopkins Medical Institutions, Baltimore, Maryland, 3. Johns Hopkins Bloomberg School of Public Health, Baltimore, Maryland*

As populations worldwide age on an unprecedented scale, we must better understand the attendant burden of health impairments. Evidence regarding the epidemiology of frailty primarily has come from specialized cohort studies. Our work describes the epidemiology of frailty in the nationally representative, baseline sample of approximately 7,000 older community-dwelling Medicare enrollees in the National Health and Aging Trends Study (NHATS). Frailty was operationalized following Fried and colleagues. We found a higher prevalence of frailty in NHATS than has been typical in cohort studies, and similar demographic variation. The prevalence of adverse health outcomes was two-to-three-fold higher among frail than robust individuals, with absolute risk increases exceeding 20% for many conditions. Robust individuals only rarely exhibited disability; frail individuals frequently did; many also did not. Intriguing regional trends emerged. Our findings support the importance of frailty in late-life health etiology and identify areas and sub-groups in need on a national scale.

PATTERNS OF END-OF-LIFE CARE IN FINLAND: CARE TRANSITIONS AND PLACES OF DEATH

M.S. Aaltonen[1], L. Forma[1,2], J.M. Pulkki[1], J. Raitanen[1,3], P. Rissanen[1], M. Jylhä[1], *1. School of Health Sciences and Gerontology Research Center, University of Tampere, Tampere, Finland, 2. Institute for Advanced Social Research, University of Tampere, Tampere, Finland, 3. UKK Institute for Health Promotion Research, Tampere, Finland*

With increasing longevity, death is postponed to very old age. In Finland, most deaths now happen at the age of 85 to 89, and the older the age of death, the longer is the preceding period of frailty. We studied places of death and care transitions in last 24 months among people who died at age of 70 or older years 1998-2011 (N=428 237) by using nationwide health and social care registers that include all deaths. Even out of nonagenarians, about half lived at home 6 months before death. Hospital ward was the most common place of death, followed by ordinary home and nursing home. Of decedents, 48.6% experienced at least 2 care transitions during the last 3 months; people suffering from dementia somewhat less than others. Patterns of end-of-life care varied greatly between individuals, and there were also differences between age groups and genders.

EXPLORING THE GOLDILOCKS PHENOMENON FOR COMPLETING ADVANCE DIRECTIVES: DOES EARLY COMPLETION MATTER?

S. Enguidanos, J.A. Ailshire, *Davis School of Gerontology, University of Southern California, Los Angeles, California*

Having an advance directive (AD) has been associated with improved quality of care at end of life and lower rates of hospital death. However, recent literature suggests timing of ADs completion can influence the appropriateness of care in relation to patient preferences and goals; ADs developed too early may reflect wishes of healthy individuals and thus may include aggressive measures no longer desirable to a seriously ill person. This study describes the relationship between timing of AD completion, stated care preferences, aggressive treatment received, and site of death. We used HRS exit interviews from 2000–2010 and found significant variation in care choices depending on timing of AD completion, with those completing ADs closer to death more likely to specify aggressive care. Data suggests that choices made in the last three months of life are more aggressive in nature than those made in the last year or more of life.

A SOCIAL APPROACH TO END OF LIFE CARE IS ASSOCIATED WITH FEWER HOSPITAL DAYS IN THE FINAL MONTHS OF LIFE

S. Mejía[1], M. Odden[2], K. Hooker[1], L. Lundberg[3], *1. School of Social and Behavioral Health Sciences, Oregon State University, Corvallis, Oregon, 2. School of Biological and Population Health Sciences, Oregon State University, Corvallis, Oregon, 3. Elite Care Residential Care Communities, Portland, Oregon*

Minimizing time spent in the hospital is a preferred outcome for individuals at the end of life. We compare days spent in the hospital during the last 6 months of life among residents of a social model care facility (N = 90) with a nationally representative sample of community (N = 330) and long term care (N = 187) residing respondents from the 2008 and 2010 Health and Retirement Study using a zero-inflated negative binomial regression. Residents in the social model care facility spent fewer days in the hospital in the final six months of life than community and long term care facility residing individuals, adjusted for age, gender, number of diagnoses, and activities of daily living limitations; mean hospital days and 95% confidence interval: .60 (.20, 1.36); 6.17 (1.21, 15.21), $p < .001$; 7.37 (1.24, 16.43), $p < .001$; respectively. The mechanisms underlying these findings deserve further consideration.

TRANSLATING AN EVIDENCE-BASED INTERVENTION FOR SPOUSE/PARTNER CAREGIVERS OF PEOPLE WITH DEMENTIA TO COMMUNITY SETTINGS

M.S. Mittelman, *Psychiatry, NYU Langone School of Medicine, New York, New York*

Psychosocial interventions for people with dementia and their caregivers have demonstrated benefits in randomized controlled trials. As a result, efforts are being made to make these interventions available in community settings. One example is the NYU Caregiver Intervention (NYUCI) study which enrolled more than 400 caregivers and demonstrated short and long term positive effects. Community translations of this intervention have been conducted in multiple locations. We will illustrate the successes and barriers to translation with the NYUCI translation project in Minnesota. Training and supervision of providers, maintaining fidelity to the intervention, obtaining data to document effectiveness and creating a model for sustainability, were issues in translation. Nevertheless the perceived benefits were sufficient to convince Minnesota to include the NYUCI in the state aging services plan. We have now developed standardized training and certification available on the web to reduce the barriers to fidelity to the intervention and insure well-trained providers,

SESSION 850 (SYMPOSIUM)

MEDIATORS AND MODERATORS OF THE EFFECTS OF DAILY STRESSORS ON EMOTION AND COGNITION

Chair: S. Scott, *University of South Florida, Tampa, Florida*
Co-Chair: M. Sliwinski, *Pennsylvania State University, University Park, Pennsylvania*
Discussant: T.L. Gruenewald, *University of Southern California, Los Angeles, California*

Research indicates that experiencing relatively minor stressors predicts being in a worse mood, and more emotionally reactive individuals have worse health over the long-term. Given this descriptive base, the next step is to test theoretical explanations for why and how. This collection utilizes innovative measurements and statistical models to test theoretical depictions of daily stress process; intensive data on daily experience and functioning are drawn from smartphone-based cognitive tasks and surveys of affect, experiences, and thoughts. Sliwinski et al. uses novel mobile cognitive assessments to test a theory-based explanation for why chronic stress predicts worse outcomes. Regularly engaging in negative thoughts during everyday life mediates the relationship between higher levels of chronic role and environmental stress and cognitive performance, suggesting that recurrent negative thoughts is one of the pathways by which chronic stress affects functioning. Mogle et al. advances models the time-ordered nature of daily stressors and negative emotion. Beyond concurrent associations, Mogle et al. find evidence for lingering stress effects on negative affect that accumulate both within and across days. Attention to the order of events and responses is necessary to effectively test theories of emotion regulation and adaptation. Munoz et al. utilizes a facet-based measurement approach to identify the behavioral and cognitive characteristics that underlie the association of Neuroticism with exposure and reactivity to daily stressors. Dysphoric facets (i.e., depression, anxiety) predict exposure whereas other facets (i.e., immoderation, anger) predict emotional reactivity. Gruenewald's discussion will connect these findings to the literature on stress, aging, and long-term health outcomes.

FACETS OF NEUROTICISM DIFFERENTIALLY PREDICT EXPOSURE AND REACTIVITY TO DAILY EVENTS

E. Munoz[1], J. Mogle[1], S. Scott[2], M. Sliwinski[1], J. Smyth[1], D. Almeida[1], *1. The Pennsylvania State University, University Park, Pennsylvania, 2. University of South Florida, Tampa, Florida*

Growing evidence shows that emotional reactivity to daily stressors may be more detrimental for long-term health than mere exposure. Individual differences in neuroticism have been associated with greater exposure and reactivity, but less is known about the specific components of this trait. We examined the association between six facets of neuroticism and daily self-reported exposure and reactivity to negative events using data from 180 adults (Mage=47, SDage=10) who completed a personality questionnaire at baseline and 14 subsequent days of ecological momentary assessments. The total neuroticism scale was associated with a greater reported stress exposure (p<.001), but not associated with negative affect (NA) reactivity to events (p=.08). Immoderation and anger facets were associated with greater NA reactivity (p<.001) but not exposure. Vulnerability, depression, and anxiety facets were associated with greater exposure (p<.001), but not reactivity. Our results suggest that facets of neuroticism may be differentially related to health-related processes.

MOMENTARY UNCONSTRUCTIVE REPETITIVE THOUGHTS MEDIATE THE EFFECTS OF CHRONIC STRESS ON COGNITIVE FUNCTION ASSESSED IN DAILY LIFE

M. Sliwinski[1], J. Mogle[1], S. Scott[1], D. Almeida[1], J. Smyth[1], N. Ram[1], M.J. Katz[2], R.B. Lipton[2], *1. Center for Healthy Aging, Penn State, State College, Pennsylvania, 2. Albert Einstein College of Medicine, Bronx, New York*

Chronic stress exerts negative effects on physical and mental health, and recent research postulates that unconstructive and repetitive thoughts (URT) link stress to poor outcomes. The present study evaluates 1) whether chronic stress affects daily cognitive function and 2) whether URT mediates these effects. A racially diverse sample of 180 adults (age 25-65) completed 5 daily smartphone assessments (e.g., recent experiences, current affect and thoughts, cognitive function) for 14 days. Chronic stress (a composite of role and perceived stress surveys) and age were both negatively associated with working memory. Momentary URT mediated the effect of chronic stress on ambulatory working memory, controlling for trait level URT, and physical and mental health. A similar, but much weaker, pattern was obtained for lab-based measures of working memory. This study provides the first demonstration of how engaging in URT may be one mechanism whereby chronic stress is associated with impaired functioning.

WITHIN- AND ACROSS DAY STRESSOR ACCUMULATION: DIFFERENTIAL IMPACTS ON NEGATIVE AFFECT

J. Mogle[1], S. Scott[3], M. Sliwinski[1], M.J. Katz[2], J. Smyth[1], N. Ram[1], *1. Center for Healthy Aging, Penn State University, University Park, Pennsylvania, 2. Albert Einstein College of Medicine, Bronx, New York, 3. University of South Florida, Tampa, Florida*

Recent work has started to quantify the extent to which the emotional impact of daily stressor events accumulates across days, finding that accumulated stressor events significantly increased negative affect beyond experiencing a current event and that age moderated this effect (Schilling & Diehl, 2013). We extend this prior work by examining the effects of the accumulation of within-day stressor events and comparing it to the effects of across day accumulation. A sample of 180 adults (age 25-65) completed 5 surveys per day for 14 days. Older adults had higher within-day (p=.001) and across day (p=.001) accumulation scores compared with younger adults . After accounting for changes in negative affect due to a current event, accumulated stressors both within a day (p<.0001) as well as across days (p=.006) increase negative affect. Moderators of this effect (e.g., personality, rumination) and alternative calculations for stressor accumulation (e.g., exponential decay functions) will be explored.

SESSION 855 (SYMPOSIUM)

THE INFLUENCE OF THE COUNTRY OF ORIGIN ON VOLUNTEERING BY OLDER EUROPEANS

Chair: A. Principi, *Centre of Socio-economic Gerontological Research, National Institute of Health and Science on Aging (INRCA), Ancona, Italy*

While contextual factors of volunteering have been usually studied at the local level, this study deals with contextual differences between European countries. As Europe is characterised by different welfare regimes, the country in which older people live has a major impact in shaping their volunteering modalities. This study employs a conceptual framework according to which volunteering in older age is influenced by the interaction of the following main factors: welfare regime (i.e. cultural values and beliefs); welfare mix (i.e. how welfare-producing institutions interact with volunteering in older age); laws and policies at the macro level; motivations and predispositions at the individual level. This conceptual framework is employed to study volunteering in older age in eight European countries: Italy, Denmark, Germany, England, France, Poland, Sweden and the Netherlands. Findings show interesting insights to better understand the main challenges faced by each country to enhance volunteering among older citizens in the future.

SOCIAL CONTEXT AND VOLUNTEER PARTICIPATION: THE BELGIAN CONTEXT

S. Dury, D. Brosens, S. Van Regenmortel, D. Verté, *Vrije Universiteit Brussel, Brussels, Belgium*

There is strong evidence that social ties of older adults are correlated with volunteer participation. However, the process to which the relation between social ties and volunteering may vary remains under-explored in aging research. A mixed-method approach aims to identify social contextual factors that either promote or impede older people's volunteer participation. In the first quantitative phase, a multinomial logistic regression was applied with data of the Belgian Ageing Studies (N= 67,144; 141 municipalities) to analyze social ties characteristics determining volunteer participation. In the second, qualitative phase, six focus groups with older volunteers and nonvolunteers were conducted in each of the six case study areas (two municipalities with low, two with mediocre, and two with high rates of volunteering among the older population) in order to explain and build on the quantitative results. Research findings indicate that associational membership and residential stability are key determinants for volunteering in later life.

CAPITAL IN CONTEXT: THE ROLE OF PLACE IN UNDERSTANDING CAPITAL THEORIES OF VOLUNTEERING

M. Musick[1], R. Rose[2], *1. Univ of Texas at Austin, Austin, Texas, 2. University of Minnesota Morris, Morris, Minnesota*

Research older adult volunteering has traditionally focused on a number of factors related to theories of social or human capital, but little attention has been given to the role that residence plays these relationships. Thus, this paper intends to explore the patterns of volunteering among older adults across different types of places in the US. It also examines whether the traditional predictors of volunteering differ in their effects based on the community in which respondents reside. Using data from the Independent Sector that is nationally representative of the US population, the paper explores several hypotheses concerning the interaction of place and capital. It finds that place moderates the effect of capital on volunteering, and that the type of moderation varies by forms of capital. It concludes that future research in the area might more fully take into account the role of place in volunteering processes.

VOLUNTEERING AND PLACE IN LATER LIFE: GLOBAL PERSPECTIVES

J. Warburton[1], S. Dury[2], J. Warburton[1], *1. John Richards Initiative, La Trobe University, Wodonga, Victoria, Australia, 2. Vrije Universiteit, Brussels, Belgium*

This symposium explores empirical aspects of volunteering in later life with a particular focus on place. The intent of this forum is to gain improved understanding of volunteering by using an environmental gerontology approach. To date, research on volunteering in later life primarily addresses individual determinants of, and motives for, volunteering, with much less known how volunteer participation is influenced by the places where people live. Yet the context and environment of older people's volunteering is very important, with differences by locality, culture and region. In order to add to global understandings of volunteering in later life, we have invited scholars from different parts of the world to present on place-related connections with volunteering. Their work ranges from the micro-level of a person's social networks, to the meso-level of ethnicity and migration and finally to the macro-level of different countries. Presentations: Capital in Context: The Role of Place in Understanding Capital Theories of Volunteering Marc A. Musick, The University of Texas at Austin, and Roger Rose, University of Minnesota, Morris Social Context and Volunteer Participation: The Belgian Context Sarah Dury, Vrije Universiteit, Brussels The Influence of the Country of Origin on Volunteering by Older Europeans Andrea Principi and Giovanni Lamura, INRCA, Ancona, Italy Trust and Volunteerism in Hong Kong among Middle-aged and Older Adults: A Cultural Perspective Alice Ming Ling Chong and Susu Liu, City University of Hong Kong Volunteering during Retirement: Environmental Context in Canada Suzanne L. Cook, York University, Canada

VOLUNTEERING DURING RETIREMENT: ENVIRONMENTAL CONTEXT IN CANADA

S.L. Cook, *Department of Sociology, York University, Toronto, Ontario, Canada*

This Canadian study examined older adults' experience of volunteering during retirement using mixed methods. Interviews were conducted with 12 individuals and 214 participants completed a survey. In this paper, the interplay of environmental and individual factors that shape the life course will be explored, demonstrating the ways that the place in which one lives influences volunteer activity. As older adults remain active and engaged through volunteer work, they are a vital social capital resource for their communities when living within supportive, enabling and empowering environments.

SESSION 860 (SYMPOSIUM)

STARING AT THE SUN: NOVEL INSIGHTS FROM RESEARCH ON SELF-PERCEPTIONS OF AGING AND DYING

Chair: A. Shrira, *Bar-Ilan University, Ramat Gan, Israel*

This symposium is composed of five presentations that offer new insights on self-perceptions of aging and dying and their associations with physical functioning, cognitive status, mental state, and well-being. The presentations introduce novel findings drawn from large-scale community and diary studies of middle aged adults and older adults. The first presentation establishes the validity of self-evaluation of life expectancy by showing its strong correlations with physical, cognitive, and psychological functioning among those who are actually close to death. The second presentation shows that subjective evaluations of closeness to death interact with subjective evaluation of age in determining mental state, thereby emphasizing the importance of assessing self-perceptions of aging and dying concurrently. The third and fourth presentations demonstrate the interrelations between evaluations of subjective closeness to death and indices of well-being at both the intra-individual level (i.e., emotion) and the inter-individual level (e.g., meaning in life and will to live). The last presentation focuses on fears of aging and dying and their associations with mental state, as moderated by emotions. Together, the findings show that perceptions of one's aging or dying can help both researchers and clinicians predict late-life functioning. Participants attending the symposium will broaden their understanding of the relevance of self-perceptions of aging and dying to health outcomes. Furthermore, participants will learn of the variables that moderate the associations between self-perceptions of aging or dying and functioning outcomes through state-of-the-art statistical analyses of large datasets.

EVALUATION OF LIFE EXPECTANCY IS RELATED TO FUNCTIONING, ESPECIALLY WHEN ACTUAL DEATH IS CLOSE

G. Kavé[1], A. Shrira[2], Y. Palgi[3], E. Bodner[2], *1. The Open University, Israel, Raanana, Israel, 2. Bar Ilan University, Ramat Gan, Israel, 3. Haifa University, Haifa, Israel*

We examined whether evaluation of life expectancy is associated with physical, psychological, and cognitive status among older adults who subsequently died or survived. Data were derived from the first two waves of the Israeli component of the Survey of Health and Retirement in Europe (SHARE). Community-dwelling individuals (N=2,492, mean age=64) of whom 180 died by the second wave, provided subjective survival probability evaluations (the chance to reach to a certain target age), as well as measures of physical, psychological, and cognitive functioning. Evaluations of life expectancy were associated with functioning outcomes beyond demographic variables and beyond self-rated health, and this association was more noticeable among decedents than among survivors. These results suggest that evaluations of life expectancy predict health status when people are actually close to death. In contrast, people who are not approaching death assess their life expectancy without taking their current functioning into account.

THE INTERACTIVE EFFECT OF SUBJECTIVE CLOSENESS TO DEATH AND SUBJECTIVE AGE ON DISTRESS

Y. Palgi[1], A. Shrira[2], E. Bodner[3], *1. University of Haifa, Haifa, Israel, 2. Bar Ilan University, Ramat Gan, Israel, 3. Bar Ilan University, Ramat Gan, Israel*

Subjective age is a person's perceived age, whereas subjective closeness to death reflects how close to death one perceives oneself to be. The present study examined whether subjective age and subjective closeness to death interact in predicting psychological distress. A sample of 1,073 community-dwelling older adults (mean age=58) rated subjective age, subjective closeness to death, psychological distress, and subjective health. The combination of older subjective age and feeling closer to death was related to the highest distress. Moreover, the effect of older subjective age on psychological distress was mitigated by feeling far from death, and vice versa. This interaction was strongest for those who reported lower subjective health. The findings emphasize the importance of an integrative view of two perceptions of time perspectives, one that focuses on time since birth and another that concerns the time left until death. This integrative view is especially important under conditions of physical vulnerability.

AGE, SUBJECTIVE CLOSENESS TO DEATH, SUBJECTIVE AGE, AND EMOTIONAL COMPLEXITY

A. Shrira[1], E. Bodner[1], Y. Palgi[2], *1. Bar-Ilan University, Ramat Gan, Israel, 2. University of Haifa, Haifa, Israel*

There are mixed findings regarding the association between chronological age and emotional complexity, defined as the ability to separate and differentiate between emotions. Some studies find that emotional complexity increases with age, some find no relationship, and others find an age-related decrease in emotional complexity. The current study examined whether chronological age, subjective age and subjective closeness to death are related to emotional complexity. Ninety-six respondents (mean age=57) rated their subjective age and their subjective closeness to death, and reported their emotions on a daily basis over 14 days. While chronological age and subjective age were generally unrelated to emotional complexity, a subjective report of feeling closer to death was related to lower emotional complexity. These results suggest that self-perceptions of dying may be more relevant to emotional complexity than is chronological age. When death is perceived as close, the ability to separate and differentiate between emotions is hampered.

SUBJECTIVE CLOSENESS TO DEATH, MEANING IN LIFE, AND WILL TO LIVE: ATTACHMENT PATTERNS AS MODERATOR

Y. Bergman, A. Shrira, E. Bodner, *Interdisciplinary Dept. for Social Sciences, Bar-Ilan University, Ramat-Gan, Israel*

The current research focused on the moderating role of attachment patterns on the relationship between evaluation of subjective closeness to death and both meaning in life and will to live. A sample of 1,073 community-dwelling older adults (mean age=58) completed attachment, meaning in life, and will to live questionnaires. Perceiving oneself as far from death and low levels of attachment anxiety and avoidance predicted higher meaning in life. Additionally, a significant three-way interaction indicated that the negative correlation between subjective closeness to death and meaning in life is especially powerful among individuals high in anxiety and avoidance, but is non-significant among individuals high on avoidance alone. Similar results were obtained for will to live. Findings are in line with knowledge regarding the relationship between anxious/avoidant attachment and high/low death anxiety, respectively, enhancing the understanding of the important role of attachment as a moderator of perceptions of aging and dying.

DEATH AND AGING ANXIETY, EMOTIONAL COMPLEXITY, AND PSYCHOLOGICAL DISTRESS

E. Bodner, A. Shrira, Y. Bergman, S. Cohen-Fridel, *Bar-Ilan, Ramat-Gan, Israel*

Both death anxiety and aging anxiety are related to higher psychological distress. However, this relationship may be mitigated by personal resources, such as emotional complexity. Ninety-six respondents (mean age=57) rated their death and aging anxiety as well as their general psychological distress (i.e., general depressive and anxiety symptoms), and reported their emotions on a daily basis over 14 days. Results showed that emotional complexity moderated the relationship between death anxiety and psychological distress, and between aging anxiety and psychological distress. Those with high emotional complexity demonstrated weaker relationships between each of the two types of anxiety and psychological distress. The findings suggest that emotional complexity, as defined by the ability to separate and differentiate between emotions, buffers against psychological distress that may emanate from high fears regarding one's aging and death. Emotional complexity may thus be an important mental resource in regulating age-related fears and worries.

SESSION 865 (SYMPOSIUM)

THE SHARE INTERVENTION FOR PERSONS WITH EARLY-STAGE DEMENTIA AND THEIR FAMILY CARE PARTNERS

Chair: C.J. Whitlatch, *Benjamin Rose Institute on Aging, Cleveland, Ohio*

Persons in the early stages of dementia and their family caregivers face unique challenges that require targeted interventions to address their emotional and social needs. Yet, few interventions are designed to meet the needs of the person with early-stage dementia and the family caregiver ("care partners"). This symposium describes the development, evaluation, and future directions of the SHARE program (Support, Health, Activities, Resources, and Education) an early-stage dyadic intervention designed to: 1) educate families about dementia, 2) improve communication, 3) enhance the care partners' shared understanding of the person with dementia's care values and preferences, 4) encourage care partners to engage in healthy activities, and 5) develop a plan of care that builds a network of support to address the family's changing circumstances. The symposium begins with a brief description of the research that led to the development of SHARE and provides evidence of the program's feasibility, acceptability, and efficacy. The second paper describes the challenges of recruiting, enrolling, and retaining early-stage care partners and provides recommendations for addressing barriers to participation. Next, using case examples, SHARE is presented with an emphasis on techniques and materials designed to empower and engage early-stage care partners. The fourth paper focuses on the most recent innovations of SHARE which include an online training curriculum and iPad app to make delivery of SHARE more widely available, efficient, and user friendly. Discussion will highlight the importance of early identification and targeted intervention to meet the unique needs of early-stage families.

DEVELOPING AN EVIDENCE BASE FOR THE SHARE INTERVENTION

C.J. Whitlatch, *Margaret Blenkner Research Institute, Benjamin Rose Institute, Cleveland, Ohio*

For families facing the challenges of dementia, the time surrounding diagnosis can be very stressful. Persons with dementia sometimes voice a sense of relief when they are diagnosed ("I am relieved to know that it's a disease that's causing my mind to be so muddy"), but they also feel anxiety and fear. For family care partners, coming to understand and accept the disease that is changing their loved one can lead to feelings of loss, anger, fear, and grief. Unfortunately, few psychosocial interventions exist that target the unique needs of families in the early stages of dementia. This paper describes the program of research that led to the development of the SHARE Program (Support, Health, Activities, Resources, and Education) for persons with early-stage dementia and their family care partners. Research findings will be described that support SHARE's feasibility, acceptability, and efficacy as well as its utility in the community.

RECRUITMENT AND ENROLLMENT STRATEGIES FOR INVOLVING EARLY-STAGE DEMENTIA DYADS IN RESEARCH

S.M. Schwartz, C.J. Whitlatch, S. Orsulic-Jeras, *Research, Benjamin Rose Institute on Aging, Cleveland, Ohio*

Recruitment of persons with early-stage dementia and their family caregivers into research studies and intervention programs can present significant challenges for researchers and practitioners. Thus, appropriate recruitment, screening and enrollment strategies are needed for identifying early-stage dyads and directing them towards suitable research studies and interventions. This paper examines the organizational and participant-level barriers experienced by our research team specific to the recruitment of early-stage dementia caregiving dyads. First, we describe the unique characteristics of dementia dyads that make their recruitment, enrollment, and retention especially challenging. Next, we examine strategies we have employed to recruit dementia dyads, based on 15 years of early-stage dyad research and intervention development. We end with recommendations for successful recruitment procedures, so that researchers are able to develop interventions to meet the unique needs of families facing the long-term challenges of dementia.

AN EARLY STAGE DYADIC INTERVENTION FOR PERSONS WITH DEMENTIA AND THEIR FAMILY CAREGIVERS: TWO CASE EXAMPLES

S. Orsulic-Jeras, C.J. Whitlatch, S.M. Schwartz, *Benjamin Rose Institute, Cleveland, Ohio*

This presentation will use two case studies to demonstrate the effectiveness of SHARE, a counseling-based psychosocial intervention for individuals with early-stage dementia and their family caregivers (care partners). Each of SHARE's seven sessions builds on the previous one, guiding care partners to make care-related decisions based on a mutual understanding of each other's care values and preferences. Through the use of specialized tools, in addition to SHARE Counselor training and supervision, SHARE helps care partners build a reliable network of support. In this presentation, we will describe: 1) The content of each of SHARE's seven sessions; 2) How skills learned in SHARE help care dyads plan for current and future care needs; and 3) How assessing the care partners' readiness and reevaluating it throughout the program is integral to the application of the intervention.

NEXT STEPS FOR SHARE: DEVELOPMENT OF A TRAINING CURRICULUM AND IPAD APP FOR SHARE COUNSELORS

E. Femia[1], C.J. Whitlatch[2], *1. FIT Interactive, Falls Church, Virginia, 2. Benjamin Rose Institute on Aging, Cleveland, Ohio*

The SHARE Program is one of few evidence-based interventions that responds to the needs of families in the early stages of dementia. The program involves a pro-active strategy that offers preventive benefits and actively involves the person with dementia in discussions about future care issues. The increasing number of people living with dementia in the early stages has made SHARE appealing to service organizations who serve these individuals and their families. Consistent with the goals of translational research, the SHARE Program has taken the next steps towards broader dissemination in the "real-world" service setting. These steps include the creation of an on-line course to train new SHARE counselors and the development of new session material and tools, notably an iPad App, to help counselors more effectively facilitate SHARE sessions. The program materials and resources utilize best-learning practices and user-experience testing to ensure that the standards for treatment fidelity are maintained.

EARLY STAGE INTERVENTIONS AND THE CONTINUUM OF DEMENTIA CARE

S.H. Zarit, *Human Development & Family Studies, Penn State University, University Park, Pennsylvania*

Early stage programs need to be seen as part of a continuum of care that provides ongoing assistance as dementia worsens. Past research has shown that time-limited interventions have limited impact for a disease that evolves over a long time period. Engaging caregivers and individuals with dementia (IWD) into a care system may be the most valuable outcome on an early stage program. As the IWD's awareness declines, caregivers must learn to take a more active and unilateral role in care, particularly managing behavior problems and safety. Middle stage programs that create continuity with the insights and plans of early stage interventions while helping caregivers learn a different set of skills may lead to better outcomes for both individuals in the dyad. Evaluation of early stage interventions need to be considered in terms of value added to later stage programs for maximizing each person's quality of life.

SESSION 870 (SYMPOSIUM)

LANGUAGE AND ALZHEIMER'S DISEASE: DISCURSIVE AND INTERACTIONAL APPROACHES

Chair: R. Schrauf, *Applied Linguistics, Pennyslvania State University, University Park, Pennsylvania*
Discussant: S.R. Sabat, *Georgetown University, Washington, D.C., District of Columbia*

Recent research in clinical linguistics, applied linguistics, sociolinguistics, and pragmatics (e.g. edited collections: Davis, 2009; Davis & Guendouzi, 2013; Schrauf & Muller, 2014) has focused on specific discursive and narrative devices used by persons with Alzheimer's disease and their interlocutors to jointly construct meaning in the ongoing flow of interactive talk. These efforts represent an ongoing shift in emphasis away from a cognitivist 'defects and decrements' view of communication and cognition in the disease toward a discursivist 'preserved abilities' view (e.g. Guendouzi & Muller 2005; Hamilton, 2005; Ramanathan, 1997; Sabat 2001) In this session, we extend that research to think more deeply about extended/distributed cognition as a frame for understanding the shared cognition in such conversations (Müller), the ways in which caregivers systematically shift their "participation frames" to accommodate to the speech of their family members with dementia (Schrauf), and discourse level strategies used by individuals with dementia to maintain and foster friendships over time (Saunders). Steve Sabat, author of The Experience of Alzheimer's Disease: Life Through a Tangled Veil (Wiley-Blackwell, 2001) will serve as discussant. After attending this session, participants will be able to (a) articulate some fundamental terms and concepts used in the analysis of communicative interaction between persons with dementia and their interlocutors, and (b) apply one or the other of these notions to everyday conversation with persons who show symptoms of dementia.

THE STORIES OF FRIENDSHIP: ANALYSIS OF NARRATIVE BY PERSONS WITH DEMENTIA AND THEIR CAREGIVERS IN LONG TERM CARE

P.A. Saunders, *Neurology, GUMC, Washington, DC, District of Columbia*

The value of social relationships throughout the life course, no matter a person's abilities or limitations, is an important area of study. Friendships have been linked to psychological and emotional wellbeing and better physical functioning for older adults. Conversely, there are negative consequences (e.g., depression) associated with losing friendships and having ones' social networks decrease. Given that language and functional abilities decline as dementia progresses, it is challenging to identify markers of friendship. The Friendship Project is an ethnographic study of social interaction among persons with dementia living in a long-term care setting. The data are from transcripts and field-notes of social interactions among residents with a range of cognitive impairments over a six-month time period. Results reveal that persons with dementia employ discourse level strategies such as narrative as well as specific linguistic features such as pronominal reference to make meaning and create relationships over time. Practical implications will be discussed.

SHIFTING PARTICIPATION FRAMES TO A 'NEW NORMAL'

R. Schrauf, *Applied Linguistics, Pennyslvania State University, University Park, Pennsylvania*

Drawing on research on end-of-life caregiving trajectories (Penrod et al., 2011) and philosophical reflection on the normal and the pathological (Canguilhem, 1966 [1991]; Foucault, 1991), I analyze caregivers first-person narratives of accommodation to the changing communicative and cognitive abilities of family members who have memory loss ("deep forgetting") and possibly Alzheimer's disease. I attend in particular to the linguistic and discursive devices that narrators use to represent and accomplish changes in 'participation frames' (Goodwin & Goodwin, 2004) for the purpose of preserving meaningful and mutually satisfying conversation. I argue that shifting participation frames is a discursive rendering of successive 'new normals' in the caregiver-family member relationship, and that by examining these we may find ways of helping caregivers both prepare for and navigate these subtle transitions.

THOUGHTS ON THINKING AND REMEMBERING IN DEMENTIA

N. Müller[1], Z. Mok[2], *1. University of Linköping, Linköping, Sweden, 2. Australian Catholic University, Melbourne, Victoria, Australia*

It is (probably) quite uncontroversial that a lot of thinking, reasoning, remembering and learning does not happen in individual, unaided brains, but is distributed between multiple brains and artifacts, and situated in interactive contexts, often conversations. There is a growing body of work, chiefly in cognitive science and philosophy, that explores the notion of extended and distributed cognition as it applies to memory. This presentation is theory- rather than data-driven, in that it presents an overview of recent work in this area, and discusses how it can be relevant for research and clinical practice in dementia and dementia care. Data from conversations with an individual with dementia, collected over the course of several years, are used to illustrate the theoretical concepts discussed.

SESSION 875 (PAPER)

NEIGHBORHOOD, PLACE, AND AGING

DIABETES IN COMMUNITY DWELLING OLDER ADULTS: INDIVIDUAL AND NEIGHBORHOOD EFFECTS

R. Pruchno[2], M. Wilson Genderson[1], *1. VCU, Henrico, Virginia, 2. Rowan University, Stratford, New Jersey*

Health and well-being of older adults has been linked to the neighborhoods in which they live yet nesting of individual and neighborhood level characteristics has limited the understanding of the these associations. A random-digit-dial sample of 5,688 community-dwelling adults aged 50-74 residing in 1,644 census tracts in New Jersey provided data for multilevel structural equation models (MLM-SEM) which account which account for measurement error, structural relationships and geographical clustering. We modeled self-reported diagnosis of diabetes, age, gender, race, marital status, education and income (individual level) and neighborhood advantage (latent construct constructed using percent college educated, percent professional jobs, high household income). We found that controlling for individual level characteristics, neighborhood advantage was negatively associated with having diabetes.

THE IMPACT OF WEATHER ON MOBILITY AND INDEPENDENCE IN OLDER AMERICANS

P. Clarke, T. Yang, F. Keusch, *University of Michigan, Ann Arbor, Michigan*

Background: Increasing attention is being paid to the impact of extreme weather (e.g. heat waves, hurricanes, earthquakes) on population health. But the regular day-to-day challenges of weather have not received as much attention, particularly among older adults who may be more vulnerable because of limited mobility. Methods: Using nationally representative data from the 2013 Survey of Consumers (N=502 adults age 18-99) we examined differences in perceived weather hazards by age, and used multinomial logistic regression to understand factors associated with reported difficulty with daily activities (e.g. work, exercise, grocery shopping) under challenging summer and winter conditions. All data were weighted to be representative of the US adult population in 2013. Results: Compared to younger adults, older adults (N=337 age 65+) were more likely to say that summer heat interfered with their daily activities (20% vs 28%, respectively $p<.05$). There were no differences in reported winter conditions by age. Older adults with mobility impairment were more likely to report some difficulty (OR=4.1, 95% CI=1.61-14.37) or a great deal of difficulty (OR=10.52, 95% CI=2.52-44.06) with day-to-day activities in summer heat than those independent in mobility, controlling for gender, age, education, region and assistive device use. However, mobility impairment was not associated with more difficulty going out in winter conditions (net of controls). Conclusions: Compared to younger adults, summer heat was identified as more challenging in the day-to-day lives of older adults. Older adults with mobility impairment are particularly at risk for being house bound in summer weather.

NEIGHBORHOOD ENVIRONMENT ASSOCIATIONS WITH MOBILITY AND SOCIAL PARTICIPATION IN OLDER ADULTS

M. Levasseur[1,2], M. Généreux[4,3], J. Bruneau[3], A. Vanasse[3,6], ÉRIC. Chabot[2], L. Gosselin[5], C. Beaulac[7], M. Bédard[3], *1. School of Rehabilitation, Université de Sherbrooke, Sherbrooke, Quebec, Canada, 2. Research centre on aging - Health and Social Services Centre – University Institute of Geriatrics of Sherbrooke, Sherbrooke, Quebec, Canada, 3. Université de Sherbrooke, Sherbrooke, Quebec, Canada, 4. Health and Social Services Agency, Sherbrooke, Quebec, Canada, 5. Sherbrooke Healthy City Inc, Sherbrooke, Quebec, Canada, 6. Etienne-LeBel Clinical Research Centre, Sherbrooke, Quebec, Canada, 7. Ordre des urbanistes du Québec, Montréal, Quebec, Canada*

Rationale: As key determinants of many favorable health and quality of life outcomes, it is important to identify factors associated with mobility and social participation. Although several investigations have been carried out on mobility, social participation and neighborhood environment, there is no clear integration of these results. This study aims to provide a comprehensive understanding regarding how neighborhood environment is associated with mobility and social participation in older adults. Method: A rigorous methodological scoping study framework was used to search nine databases from different fields with fifty-one predetermined keywords. Data (neighborhood environment factors associated with mobility and social participation) were exhaustively analyzed, organized and synthesized by two research assistants following PRISMA-guidelines, and knowledge users were consulted. Results: Majority of the 53 selected articles report results of cross-sectional studies (32;60.4%), mainly conducted in US (25;47.2%) or Canada (15;28.3%). Studies mostly focused on neighborhood environment associations with mobility (40;75.5%), social participation (21; 39.6%), and occasionally both (13;24.5%). Neighborhood aspects considered mainly concerned Product and technology (44;83.0%) and Natural and human-made changes (38;71.7%), but also Support and relationships (16;30.2%) and Attitudes (21;39.6%). Mobility and social participation have been mainly associated with Available seating, Aesthetics, Resources proximity, Access to recreational facilities, Good condition of streets, Presence of cross-walks or sidewalks, Safety walking and Access to public transit. Conclusion: This comprehensive synthesis will ultimately support decisions and the development of innovative interventions for the creation of age-supportive environments. This study is funded by the Canadian Institutes of Health Research [#KAS-116 630].

NEIGHBORHOOD SOCIAL AND PHYSICAL CONTEXTS AND LEISURE-TIME PHYSICAL ACTIVITY AMONG OLDER INDIVIDUALS IN UTAH

M. Wen, Q. Nguyen, *Sociology, University of Utah, Salt Lake City, Utah*

BACKGROUND: The population over age 65 in the US is rapidly growing. Inactive older adults experience significantly greater disease burdens compared to their physically-active peers. Abundant literature has shown that neighborhood contexts matter for individual lifestyle factors but older adults are less studied in neighborhood effect on lifestyle studies. This study examined the association between neighborhood economic resources and built environment features and individual odds of no LTPA participation in Utah. METHODS: Individual-level data were from Behavioral Risk Factor Survelliance System (BRFSS) collected in 2007, 2009 and 2011 in Utah. Neighborhood-level data were from the 2007-2011 American Community Survey (ACS) and a geographic information system (GIS) park database provided by ESRI in ArcGIS collected in 2010. Zip codes were used to define neighborhoods. Multilevel regression analyses were performed to examine the research questions. RESULTS: Neighborhood income level is consistently and negatively correlated with the odds of no LTPA. When examined separately, walkability and spatial park accessibility were both significant and negative correlates net of confounding factors. When simultaneously examined, park accessibility effects remained whereas walkability effects were rendered nonsignificant. Younger-old women (age 65-80) were the most responsive to these neighborhood contexts. The oldest old group (age 80+) were not affected by neighborhood contexts. CONCLUSIONS: Both economic resources and availability of parks nearby are negatively linked to older adults' odds of reporting no LTPA participation in Utah with stronger effects found on younger-old women (age 65-80) compared to other age and gender subgroups in this sample of age 65 and over.

ASSESSING THE AGE-FRIENDLINESS OF A METROPOLITAN CITY AND BUILDING AN ACTION PLAN

A. Eisenstein, R. Johnson, L. Boyken, *Buehler Center on Aging, Health & Society, Northwestern University, Chicago, Illinois*

Introduction: Chicago, Illinois recently received the designation of an age-friendly city by the World Health Organization (WHO), with the intent to build capacity to support the health and well-being of older adults and sustain an integrated community. This paper presents the development and findings of a baseline assessment of the age-friendliness of Chicago. It was conducted to feed forward findings into an action plan for city agencies. The concept of age-friendliness has been coined by the WHO to give value to the physical, social, and environmental factors that can either promote or hinder older residents' ability to age-in-place in cities. Methods: We conducted mixed-methods analyses based on the following: (1) data from an environmental scan of current age-friendly indicators; (2) focus groups with 106 older adults across the city; and (3) interviews using a Q-sort methodology with 38 city stakeholders, who were representative of each age-friendly domain and of hard-to-reach populations. Results: Government officials, community professionals, researchers, and older Chicagoans all identified similar priorities for the city of Chicago, with the highest prioritized indicators falling within the domains of community support services, health, housing, and community and information. Stakeholders and community members identified several gaps in the content of existing age-friendly indicators, including content on pets and service animals, nutrition and food options, and accessible private transportation. Conclusions: The concept of age-friendliness has unique global and local relevance. Our findings will enable the city to build an action plan that directly targets the priority areas specific to Chicago.

SESSION 880 (PAPER)

MINORITY HEALTH AND PHYSICAL FUNCTIONING

LATE LIFE DISABILITY FOR HISPANICS IN THE UNITED STATES: A COMPARATIVE APPROACH

I.L. Martinez[1], A.N. Albatineh[2], T. Li[2], *1. Wertheim College of Medicine, Florida International University, Miami, Florida, 2. Stempel School of Public Health & Social Work, Florida International University, Miami, Florida*

Hispanics will represent 20% of all older adults in the United States by the year 2050. Most of our understanding of Latino aging comes from data on Mexican Americans in the southwest of the United States. However, 37% of Hispanics are not of Mexican origin and one-quarter live outside the southwest region. Florida has the greatest number of Hispanics outside of California and Texas. The purpose of the study is to describe the growth of the Hispanic population and present comparative disability levels for older Hispanics in Florida and the Northeast Region using data from the U.S. Census Bureau and the 2011 American Community Survey. The Hispanic population in Florida has grown five-fold since 1980, and saw nearly a 60% growth in the last decade. Meanwhile Hispanic population growth in the northeast has remained constant with the overall population growth at 3%. The majority of Hispanics in Florida are of Caribbean or South American origin. Older Hispanics in Florida report twice as much cognitive disability than Whites; it is highest among Cuban females. Mobility disability is similar among Hispanic and White males, but higher in Hispanic females, though lower than Blacks. For both self-care disability and independent-living disability, Hispanic females report higher rates than Whites, similar to Blacks. Research among Hispanics in the Southwest and Midwest has also shown heterogeneity. Recognizing the diversity of Hispanic is important for crafting policies that encourage optimal aging across diverse populations.

RACE DISPARITIES IN MOBILITY LIMITATION IN URBAN MIDDLE TO OLDER ADULTS

R. Thorpe[1], S. Szanton[2], E.M. Simonsick[3], T. LaVeist[1], A.B. Zonderman[3], M.K. Evans[3], *1. Johns Hopkins Bloomberg School of Public Health, Baltimore, Maryland, 2. Johns Hopkins School of Nursing, Baltimore, Maryland, 3. Natioanal Institute on Aging, Baltimore, Maryland*

Much of the research on disparities in mobility has focused on adults ages 65 years and older, but since African American adults experience disability at younger ages and have lower life expectancies, studies focused on these older adults likely underestimate the true extent of race differences in mobility. . In addition, many studies failed to account for the confounding of race, SES and social context. We examined the cross-sectional relationship between race differences in mobility limitation in men and women aged 50 years and older in the Healthy Aging in Neighborhoods of Diversity across the Life Span study. Mobility limitation was defined as any difficulty or inability to walk ¼ mile or climb 10 steps. Logistic regression models were used to estimate relationship between race and mobility limitation adjusting for age, education, insurance status, poverty status, body mass index, drinking and smoking status, and number of chronic conditions. Of 1618 adults, 731(45.2%) were male, 974(60.2%) were black, 630 (38.9%) were living below 125% of the federal poverty level (low SES), and 604(37.3%) reported mobility limitation. Similar proportions of Blacks reported mobility limitation (women: 44.2% Blacks vs. 40.1%; p=0.248; men: 32.4%

Blacks vs. 28.7%; p=0.288) as whites. In the fully adjusted model, black adults had similar odds of mobility limitation (women: OR=0.91; 95% CI=0.58-1.41; men: OR= 1.56, 95% CI=0.89-2.74) than white adults. These findings underscore the importance of examining differences in mobility at younger ages in cohorts at risk for disablement.

BODY PERCEPTIONS MODERATE THE ASSOCIATION BETWEEN PHYSICAL FUNCTION AND HEALTH OUTCOMES AMONG AGING AFRICAN AMERICAN WOMEN

N. Sabik[1], S. Versey[2], *1. Brandeis University, Waltham, Massachusetts, 2. Rutgers University, New Brunswick, New Jersey*

Aging adults often face a series of challenges in later life including declines in physical function and health. Although the body is the central locus for aging processes, little attention has been given to how perceptions of the body may influence functional capacities and health for older women. Race and gender specific patterns need to be considered, because African Americans experience earlier onset of death and disability compared to Whites and other ethnic-racial groups, and body perceptions may be a key factor that influences the health and well-being of older women. Using an intersectional approach, we test the main effect between physical functioning and aspects of health and emotional well-being, examining body perceptions as a moderator of this association among a community-based sample of African American women aged 65 and older. Results indicate that the importance of body functioning significantly moderated the relationship between physical functioning and pain, as well as between physical functioning and emotional well-being such that women who are functioning well and rate aspects of body function as important demonstrate the lowest levels of pain and highest levels of emotional well-being. Further, women who were low in physical functioning and were dissatisfied with their body function had the highest levels of pain. Given the scarcity of research examining race- and gender-specific outcomes in the gerontological and public health literature, this study informs future research and health care recommendations aimed at increasing physical functionality for African American women.

PHYSICAL FUNCTION, MENTAL HEALTH, AND FEAR OF CRIME AMONG OLDER ADULTS: DIFFERENCES BY RACE AND SEX

D.R. Buys[1], J.S. Cossman[2], *1. Geriatrics, University of Alabama at Birmingham, Birmingham, Alabama, 2. Mississippi State University, Starkville, Mississippi*

Background: Research has demonstrated that older adults and persons with poor self-rated health may have more fear of crime (FOC) than others. However, no work has demonstrated if other demographic factors and more objective markers of health are associated with FOC within the older adult population. Methods: Data from the UAB Study of Aging, a cohort study of 1000 community-dwelling Alabamians aged 65+, were used to assess the association between physical function (the Short Physical Performance Battery), mental health (Geriatric Depression Scale (GDS) and the Mini Mental Status Questionnaire), on FOC (self-reported limitation of activities for fear of being robbed or attacked). We conducted descriptive and multivariable logistic regression analyses with the full sample and found an interaction by race and sex. We stratified the sample by Black Females (BF), Black Males (BM), White Females (WF); White Males (WM). Results: Among the full sample, 177 (17.7%) expressed FOC. Using the full sample and adjusting for sex, living alone, age, race, poverty, and education, persons with depressive symptomology (GDS>5) had 2.6 times greater odds of FOC. In stratified models, depressive symptomology was associated with 4.0 times greater odds of FOC for BFs and 3.9 times greater odds of FOC for WFs. WF's better physical function was associated with 1.2 times greater odds of FOC. Conclusion: Physical function and depressive symptomology are differentially associated with FOC by race and sex groups in older adults. Future research should examine if participants' neighborhood characteristics interact with their individual characteristics to affect FOC.

CUMULATIVE DISADVANTAGE THEORY EXPLAINS SUBJECTIVE MEMORY/COGNITION IN BLACK OLDER ADULTS WITH CIND

N. Reed, *Sociology, Georgia State University, Atlanta, Georgia*

Objective To examine racial (black: n=51; white: n=195) differences in the effects of subjective memory on cognitive functioning. Also, to highlight how cumulative disadvantage theory drives reporting patterns and cognitive status in Blacks with CIND. Design Cross-sectional analyses participants from a nationally representative survey of community-dwelling American older adults, with CIND. Setting Four waves of data from the Aging, Demographics, and Memory Study. Participants The ADAMS participants aged 70 and older with CIND (n=246). Measurements Participants completed the Mini-Mental State Examination to measure general cognition. Subjective memory was measured by the Health and Retirement Study Self-Report of Memory Problems Questionnaire. Results African Americans were significantly less likely to report worse memory than non-Hispanic whites, however, objective measures show that African Americans are significantly more likely to suffer from low cognitive functioning than whites. Income, education, and healthcare were worse among African Americans across all waves, controlling for age. Conclusion Cumulative disadvantage explains why minorities have worse cognitive outcomes than whites. As a result of poor healthcare, income disparities, and educational disadvantages, African Americans are more likely to suffer from low cognitive functioning (worse memory reporting patterns). Prevention of severe cognitive decline can be achieved through early detection. Promotion of regular check-ups and reports of memory problems should be encouraged, especially for African Americans, as they are at greater risk of dementia diagnoses, than whites. Cognitive batteries should be included in regular check-ups for older adults over 55.

SESSION 885 (PAPER)

RETIREMENT

THE TASK OF TIME IN RETIREMENT

D. Ekerdt, C. Koss, *Univ of Kansas, Lawrence, Kansas*

Retirees almost without exception prize retirement for its "freedom" from work-related obligations and schedules. In order to learn how people use retirement time, we interviewed 30 retirees aged 65+ about their daily lives. This effort was part of a larger cross-cultural study of present and future time among elders. Despite the expressed appreciation for time freedom, time use for our respondents was not improvisational, taking each day as it comes. People create routines and obligations. Our sociological explanation for this is two-fold. First, retirees need a narrative about their time. When asked to describe "everything that you did yesterday," our retirees tended to answer in terms of what they usually do. The recitation of the idealized daily routine is evidence that people are quite practiced in talking about their daily time. Second, even without employment obligations, retirees are embedded in social structures that organize and prioritize time use. Common commitments include shared meals, household chores, care of pets, volunteer activities, newspapers and television programs that compel attention, church membership, family visits, exercise regimens, and organized social activities. The cultivation of daily routines is shaped as well by perceptions of productive/virtuous vs. nonproductive/wasteful time which mirror the time values of wider social contexts and personal life histories. For some, routines may be perceived as obligatory or limiting, even though they are generally self-imposed. Although contemporary retirement seems remote from Earnest Burgess's dark vision (1960) of a “roleless role,” how to fill time and use time remains a real task for retirees.

MIDDLE-AGED BABY BOOMERS’ PERCEPTION OF MIDDLE-AGE AND ANTICIPATION ON RETIREMENT LIFE: CASE OF KOREA

J. Ho, *Ajou University, Seoul, Republic of Korea*

Positive pre-retirement anticipation on retirement life is an important factor for successful retirement adjustment. As retirement signifies the starting point of old age, it is important for middle-aged people to have positive view towards the new phase of life. In this paper we aim to examine whether and to what extent middle-aged workers’ perception on middle age are related to positive anticipation on retirement life. We expect that people who regard their current age as still young with many opportunities to take and who are not distressed by being in their 50s would have positive anticipation on life after retirement. We rely on data from the first wave of Korea Baby Boomer Survey (2010), whose main respondents are baby boomers born between 1955 and 1963 in Korea (aged 47 – 55 in 2010). As the general retirement age in Korea is 56, baby boomers are in their high time to form retirement anticipation and plans. The study sample is 3,503 Korean men and women who are currently working and not retired. Preliminary results confirmed our expectations on link between middle-aged workers’ perception on middle-age and positive anticipation on retirement life.

WORK ROLE RESIDUALS AMONG FULLY RETIRED INDIVIDUALS

M. Damman[1], K. Henkens[1,2], *1. Netherlands Interdisciplinary Demographic Institute (NIDI), The Hague, Netherlands, 2. University of Amsterdam, Amsterdam, Netherlands*

From a role theoretical perspective it can be expected that individuals differ in the extent to which they experience aspects of the work role after they have fully retired from it. Quantitative empirical insights regarding these postretirement “work role residuals” are scarce though. This study aims at filling this gap, by (1) developing a measure capturing different aspects of work role residuals, and (2) examining these residuals in relation with the preretirement work role, alternative roles, and retirement transition characteristics. Analyses are based on panel data collected in 2001, 2006/7, and 2011 among more than 800 older individuals in the Netherlands, who were all employed at Wave 1 and fully retired after that. These fully retired individuals were asked several questions about the role of their prior work in their current lives. The results show that retirees vary considerably in that respect. For example, about 40% still likes to talk about prior work, more than 20% indicates to still keep up with the latest developments in the field, and approximately 15% is still doing work-related activities as a hobby. For understanding differences in work role residuals especially characteristics of the preretirement work role and the retirement transition appear to be important, whereas the effects of preretirement alternative roles (e.g., volunteer work, caregiving) are not statistically significant. Challenging preretirement work, a higher educational level, and involuntary retirement are all found to be associated with a higher likelihood of experiencing work role residuals after retirement.

UNRAVELING RETIREMENT

M.P. Silver, *University of Toronto, Toronto, Ontario, Canada*

Recent changes to the standard retirement age in Canada have created financial incentives to delay retirement. As retirement has unraveled from institutional schedules and age norms, what it means to be retired has become ambiguous. This study contributes to a growing body of research that is rethinking the ways in which the boundaries between work and retirement are changing. For this mixed methods study, a sample of individuals near traditional retirement age from Toronto, Canada (n=148) were asked to select from pre-specified work status categories and then to describe their work trajectories and current work status in their own words. Using conventional content analysis to examine verbal descriptions, respondents were identified as not working, working full- or part time and these three groups were compared to initial identification with working or being retired. Findings suggest that while most (74% of) respondents who identified as retired described their work status as not working, consistent with traditional definition of retirement, a sizable subset identified as retired yet were still working full- or part-time, while 10% of the total sample identified as working yet described their current work experience as being fully retired. Men in the sample where significantly more likely to adhere to a traditional definition of retirement and age played a key role in distinctions for women. Drawing from the life course perspective and integrated analyses from the qualitative and quantitative strands, a dynamic conceptual model of retirement emerged from this study.

MECHANISMS OF THE EFFECT OF INVOLUNTARY RETIREMENT ON OLDER ADULTS’ SELF-RATED HEALTH AND MENTAL HEALTH

M. Rhee[1], M. Mor Barak[1], W. Gallo[2], *1. Univ Southern California, Los Angeles, California, 2. City University of New York, New York, New York*

This study examined mechanisms of the effect of involuntary retirement on self-rated health and mental health among adults aged 50 and older, and the conceptual basis of the study was drawn from latent deprivation theory and the life course perspective. Using two waves of the Health and Retirement Study (2006 and 2010), we selected a sample of 1,280 individuals working for pay at baseline who responded to a lifestyle questionnaire in both waves. Regression-based path analyses were conducted to test the mediating effects of financial control, positive and negative family relationships, and social integration in the relationship between involuntary retirement and self-rated health and mental health. This study conducted the analyses in multiple phases to compare and contrast various dimensions of the mechanisms of retirement: mechanisms of retirement with and without specification of its voluntariness, mechanisms of involuntary and voluntary retirements both compared to no transition to retirement, and mechanisms of involuntary retirement directly compared to voluntary retirement. Approximately 37% of retirees in our sample perceived their retirement as involuntary. Transition to involuntary retirement had a significant direct effect on adverse self-rated health compared to voluntary retirement and no transition to retirement. Involuntary retirement also had a significant indirect effect on adverse mental health via financial control. No significant direct or indirect effects of retirement on self-rated health and mental health outcomes were found when retirement was not specified as voluntary or involuntary. Results of the study present the significance of recognizing the heterogeneity in the mechanisms of involuntary retirement.

SESSION 890 (PAPER)

COGNITION

AGE-RELATED DECLINES IN SPECIFIC DOMAINS OF COGNITIVE PERFORMANCE PREDICT TIME OF DEATH

S. Aichele[1], P. Ghisletta[1], P. Rabbitt[2], *1. Psychology, University of Geneva, Switzerland, Genève, Genève, Switzerland, 2. University of Oxford, Oxford, United Kingdom*

Cognitive performance declines from middle-age to late adulthood, but there have been few studies of cognitive decrements as predictive of time of death. We examined age-related changes in 20 cognitive tasks of crystallized and fluid intelligence, perceptual speed, semantic memory, and visuospatial memory in a sample of 6203 adults from Greater Manchester and Newcastle-upon-Tyne, UK. Specifically, we modeled decrements in these variables within a structural equation framework, and we then examined these decrements as predictive of time of death, controlling statistically for demographic variables such as gender, socio-economic status, locale, and cohort. Longitudinal factor analyses showed that in four of five cognitive domains, strict factorial invariance held across four occasions of measurement. Composite scores were generated from items comprising these four domains. We applied latent growth curve models to each specific task and also to the four composite scores, with trajectories spanning 56 years (i.e., age 42 to age 97). Items and composite scores related to perceptual speed, fluid intelligence, and semantic memory showed significant interindividual differences in age-related decrements. Hierarchical survival analyses showed that these same decrements contributed significant explanatory power in predicting time of death, whereas processes related to crystallized intelligence and visuospatial memory did not. These outcomes indicate that mortality prediction based on cognitive decline appears as a pervasive rather than a specific process. Additionally, our findings disconfirm the hypothesis that abilities well-preserved in old age are more affected by impending death than those that start declining at relatively younger ages.

COGNITIVE DECLINE ASSOCIATED WITH RISK AVERSION AND TEMPORAL DISCOUNTING IN NON-DEMENTED SENIORS

B.D. James, P.A. Boyle, L.D. Yu, D.A. Bennett, *Medicine, Rush Alzheimer's Disease Center, Chicago, Illinois*

Risk aversion and temporal discounting are related to sub-optimal healthcare and financial decision making in older adults. It is unknown whether age-related cognitive decline affects these decision making preferences. We studied whether cognitive decline was associated with risk aversion and temporal discounting in 455 older persons without dementia from the Rush Memory and Aging Project. All underwent repeated annual cognitive evaluations using a battery of 19 tests for up to 14.8 years (mean=5.5). Risk aversion was measured using behavioral economics questions asking participants to choose between a certain monetary payment versus a gamble in which they could gain more or nothing, with gambling gains varied. To measure temporal discounting, participants were asked to choose between an immediate, smaller payment and a delayed, larger one; two sets of questions dealt with small and large stakes based on payment amount. Regression analyses were used to test whether prior rate of cognitive decline predicted level of risk aversion and temporal discounting, controlling for age, sex, education, and starting level of cognition. More rapid cognitive decline predicted higher levels of risk aversion (p=0.002) and temporal discounting (small stakes: p=0.01, high stakes: p=0.006). In analyses restricted to persons without any cognitive impairment (no dementia or mild cognitive impairment), the relationship between cognitive decline and risk aversion persisted (p=0.08); the relationship of cognitive decline and large stakes temporal discounting persisted (p=0.026) but not for small stakes (p=0.11).These findings suggest that subtle age-related changes in cognition can affect decision making preferences to the detriment of older persons.

PERSON PERCEPTION IN FRAIL, OLDER ADULTS: CONTENT ANALYSIS OF THEIR IMPRESSIONS OF UNFAMILIAR OTHERS

A. Washburn, S.L. Williams, *National University, La Jolla, California*

A component of social cognition is person perception, including the tendency to form impressions of people we have just met. As part of a larger study of social cognition in aging and dementia, 40 nursing home residents, nearly half with GDS scores indicating mild to moderate cognitive decline, completed a test that measured their ability to infer psychological attributes of strangers. Participants viewed six brief videotapes of diverse individuals explaining what they would do with a large lottery win. After viewing each tape, participants answered the following questions: (1) "What is your impression of this person?", (2) "What kind of a person do you think he/she is?", and (3) "How would describe this person to someone who hasn't seen the tape?" Verbatim transcripts of the taped responses were coded using these categories: "Inferred, intentional," inferences about the individual's intentions, goals, and values; and "Inferred, dispositional," inferences about psychological traits or attributes, as well as interpersonal qualities. Mean number of statements coded "Inferred, intentional" and "Inferred, dispositional" across descriptions was significantly higher for residents with no or minimal cognitive impairment than for those with mild to moderate impairment. Additional, finer-grained content analyses examined how the level of detail of the descriptions, as well as specific trait information and judgments about character, varied across the six diverse, target individuals, as well as across participants. Improved understanding of the social cognitive abilities of older persons, including those with dementia, would inform the design of interventions to optimize their social functioning.

EFFECTS OF VALENCE, AROUSAL AND AGE IN INCIDENTAL ENCODING OF WORDS AND RECOGNITION MEMORY

H. Kaynak[1], D. Gokcay[2], *1. North Carolina State University, Raleigh, North Carolina, 2. Middle East Technical University, Ankara, Turkey*

Emotional words are widely accepted to be processed differently and recognized more accurately than neutral words. The effects of arousal (highly and medium arousing) and valence (positive, neutral and negative) axes of emotion on recognition memory accuracy and liberal bias were examined for emotional words. 113 volunteers participated: 60 young adults (mean age 20.77, 30 F) and 53 older adults (mean age 77.13, 33 F). In the study session, the words were presented at the center of a computer screen. The participants were instructed to count vowels under incidental encoding. After 30 min of retention interval, memory was assessed with a surprise old/new recognition task. A 2 (age: young, old) x 2 (arousal: high, medium) x 3 (valence: positive, negative, neutral nonarousing) mixed ANOVA was conducted. The results showed that young participants recognized more accurately (M=1.48) as compared to older participants (M=.92) (p=.000). Valence differences of words showed significant effect, such that positive words were recognized better in both age groups (p<.05). When response bias was taken into account, in the old-age group, there was a significant bias to respond as 'old' only to positive words (p=.000), but in the young-age group a significant liberal bias is detected for only negative words (p<.05). Older participants showed a strong liberal bias for positive words indicating that better recognition of positive words in this group is attributable to the confounding factor of bias. Spontaneously, older participants regulate their emotion in favour of maintaining well-being, while younger participants tend to carry a negative focus.

THE LINKS BETWEEN EARLY LIFE SOCIOECONOMIC STATUS AND OLD-AGE NUTRITION AND COGNITION STATUS

H. Tung, C. Li, *Asia University, Taiwan, Wufeng, Taichung, Taiwan*

The life course and Cumulative Inequality theory specify that social systems generate inequality over the life course and personal trajectories are shaped by accumulation of risk or availability of resources, which may lead to health inequalities in old age. In this study we explore the links between childhood socioeconomic status (SES), adulthood achievement, and nutrition and cognition measures among a representative sample of elders in Taiwan (N=3,511) over a 10-year follow-up period. A longitudinal survey of Taiwanese elders was launched in 1989. The elders' own level of education and their father's were used as indicators for early childhood SES. Nutrition status was evaluated by the Mini Nutritional Assessment (MNA) and Cognitive functioning was measured by using the Short Portable Mental Short Portable Mental Status Questionnaire, SPMSQ) in 1999. In order to control for sample attrition over the 10-year period, multinomial logistic regression models were used to model the odds of "death" or "having a malnutrition status" against the "stayed in normal nutritional status." The same procedure was conducted when evaluating another old-age health measure, cognitive impairment in 1999. All the analyses were separated by gender. The results show that childhood SES was associated with both of the two health outcomes. Childhood SES was still a significant predictor of cognitive decline after controlling for their adulthood SES for both gender(for male, OR=2.47 and for female OR=2.05, both p<.001). However, gender-specific association patterns were found when evaluating the nutritional status among this cohort of Taiwanese elders. For the males, childhood SES was no longer a significant predictor of old-age malnutrition status once their adulthood SES was taking into account. Nonetheless, childhood SES remained a strong predictor of old-age malnutrition status among the females, after adulthood SES has been accounted for. Our results suggest that childhood SES is directly associated with cognitive impairment in old age. For old-age nutritional status, childhood SES matters more among the elderly women in Taiwan.

SESSION 895 (SYMPOSIUM)

THE VIRGINIA GERIATRIC EDUCATION CENTER (VGEC): INTERPROFESSIONAL COLLABORATION TO DEVELOP AND IMPLEMENT TEAM PRACTICE IN GERIATRICS

Chair: E.F. Ansello, *Virginia Center on Aging, Virginia Commonwealth University, Richmond, Virginia*
Co-Chair: P.W. Slattum, *Virginia Center on Aging, Virginia Commonwealth University, Richmond, Virginia*
Discussant: N. Tumosa, *Bureau of Health Professions, Rockville, Maryland*

The VGEC, a consortium of faculty from health-related units at Virginia Commonwealth University, Eastern Virginia Medical School, and the University of Virginia, conducts and evaluates a number of brief and extensive training programs in interprofessional geriatrics care for academic faculty, community practitioners, and students in the health care professions. The Plenary, comprised of 20 faculty from the consortium institutions, oversees management of all programs, including implementing, evaluating, and refining curricula content; recruiting program participants; assessing skills and knowledge gains and their effects on interprofessional practice and patient care. This symposium addresses both its unusual administrative collaboration and three annual VGEC programs, as follows: 1) Collaboration key elements in developing and successfully managing the VGEC; 2) the 160-hour September to June Faculty Development Program (FDP); 3) the 40-hour Train-the-Trainer geriatrics program for health care preceptors and community practitioners; and 4) the 24-hour Evidence Based Practice (EBP) training program on preventing the recurrence of falls, conducted to improve both communication and patient care of older adults within interprofessional teams. The Plenary represents the best in interprofessional communication and partnership to develop, implement, and evaluate all three programs highlighted here: the FDP, TTT, and EBP-falls. Members of the Plenary have assessed changes in program participants' knowledge gains, acquisition of targeted competencies (Partnership for Health in Aging, and Interprofessional Education Collaborative Expert Panel), impact of EBP-falls training on interprofessional patient care reflected in clinical chart review, and implementation of FDP Scholars' curriculum projects to pass the torch of interprofessional geriatrics care.

THE VIRGINIA GERIATRIC EDUCATION CENTER COLLABORATION

E.F. Ansello, P.W. Slattum, C.L. Coogle, J.H. Mathews, *Virginia Center on Aging, Virginia Commonwealth University, Richmond, Virginia*

Faculty from Virginia Commonwealth University, Eastern Virginia Medical School, and the University of Virginia representing multiple healthcare disciplines and evaluation experts came together to form the VGEC focused on themes of interprofessional teamwork, medication management, and transitions of care in geriatrics. The VGEC conducts three annual interprofessional education initiatives. Core faculty and staff meet for 2.5 hours twice monthly to plan, evaluate, and revise these and other initiatives. This Plenary has evolved to function at a high level, respecting the contribution of all members to the success of the project. The Plenary effectively identifies faculty, practitioners, and teams for the programs, continuously revises and develops new curricula, and works through challenging issues, such as budget cuts and publication plans. Open communication, strong organization and commitment have been key to exceeding objectives. The forming of the VGEC team and the elements that contribute to its success over time will be discussed.

THE VIRGINIA GERIATRIC EDUCATION CENTER FACULTY DEVELOPMENT PROGRAM

P. Boling[1], L. Hackett[2], A. Conlon[1], C.L. Coogle[1], E.F. Ansello[1], *1. Virginia Commonwealth University, Richmond, Virginia, 2. Eastern Virginia Medical School, Norfolk, Virginia*

The VGEC conducts annually a 160-hour faculty development program (FDP). The VGEC, composed of faculty at three institutions, recruits as FDP Scholars 12-17 health care-related academic faculty, community practitioners, and preceptors who work with students and colleagues in classroom or clinical settings, to expand their knowledge in geriatrics, emphasizing interprofessional competencies, effective teaching methods, and teamwork. The FDP curriculum is based on the six domains of core competencies established by the Partnership for Health in Aging Workgroup, as relevant to and endorsed by all health profession disciplines. The FDP approach also models the core competencies developed by the Interprofessional Education Collaborative Expert Panel. Each FDP Scholar develops, implements and evaluates a curriculum project with content and evaluation mentoring by VGEC faculty. Scholar knowledge and attitudes are assessed, as well as outcomes of curriculum projects. Twenty-seven scholars representing six disciplines have completed the first two years of the FDP program.

THE VIRGINIA GERIATRIC EDUCATION CENTER TRAIN-THE-TRAINER PROGRAM

K. Fletcher[1], P. Parsons[2], E. Bradley[1], *1. School of Nursing, University of Virginia, Charlottesville, Virginia, 2. Virginia Commonwealth University, Richmond, Virginia*

The VGEC developed and implemented a 40-hour train-the-trainer (TTT) program for health professionals in three regions of Virginia. The TTT engages practitioners from multiple health care-related disciplines practicing in the community to increase their knowledge and competencies in geriatric care through a curriculum emphasizing interprofessional teamwork, geriatric syndromes, principles of teaching and learning with adults, transitions of care, medication management, preventing recurrence of falls, and more. Participants develop teaching projects as part of the program. The TTT uses a hybrid of live and on-line interaction among participants and faculty. Participant knowledge and attitudes, as well as outcomes of the teaching projects, are assessed. Fifteen practitioners representing six disciplines have completed the TTT during the first two years.

THE VIRGINIA GERIATRIC EDUCATION CENTER EVIDENCE-BASED PRACTICE FOR MANAGING AND PREVENTING FALLS

E. Wheeler, R. Fix, L. Waters, C.L. Coogle, M.G. Owens, *Virginia Commonwealth University, Richmond, Virginia*

The VGEC conducts an annual 24-hour evidence-based practice training on reducing falls (EBP-falls) for interprofessional provider teams. The EBP-falls program is designed for existing interdisciplinary teams working with older adults to increase their effectiveness in managing and preventing falls. The educational program focuses on improving teamwork and interprofessional communication, person-specific, environmental, treatment-related, and other intrinsic and extrinsic risk factors, evidence-based assessments, and interventions for preventing the reoccurrence of falls and instituting interprofessional care planning. Seventy team members working at Program of All-inclusive Care for the Elderly (PACE) sites have participated in the EBP program during the first three years. The VGEC has assessed participants' improvements in content knowledge and adoption of evidence-based practices (as demonstrated by review of patients' clinical charts) and documented change in practice.

SESSION 900 (SYMPOSIUM)

EAST MEETS WEST: END-OF-LIFE CARE

Chair: D. Dobbs, *University of South Florida, Tampa, Florida*
Co-Chair: Y. Suh, *Seoul National University, Gwanak, Republic of Korea*

This presentation will highlight the U.S. Hospice Medicare Benefit and the eligibility criteria for receiving the hospice Medicare benefit. Data will be provided on the population who utilizes the Medicare hospice benefit in the U.S. Comparisons between Medicare funded hospice and nonhospice palliative care will be discussed and some of the key barriers that research has identified related to access to both Medicare hospice and nonhospice palliative care such as geographic disparities between rural and urban areas, system funding mechanisms, cultural and religious values, and the lack of a social marketing strategy within our western death denying culture . The strategies developed within health care organizations and provider groups to increase the use of both of these types of end-of-life care, with a specific focus in long-term care settings (assisted living and nursing homes) will also be discussed. This section is to provide special discussion table about the End-of-Life Carein East and West. With an intensive medical care service to the elderly in East Asia more old men shouldmeet EoL phase in which they requirespecialmedical & social care systemin AD or before. Most EoLpoliciesfrom hospice and palliative care unit to deathare, however,-different from western countries because of its socio-economic & -cultural influenceincluding medical insurance system and death-culture. Although with some differences of social system and culture in Japan, Korea and China., old men had different thinking about the authority of medical doctor forpreparing their end-of-life, the role of their family for their right to knowand decide, the role of hospice and palliative care, and deathitself with postmortem process. Various legal and social problems and issues occur such as what's mean by EoL itself, role of family relation in EoL care, role of hospice unit outsidetheir home, and process of death and after.Our Korean project of "biopolitics of the elderly"deals mainly with consciousness-and institutional conflictsabout ethical, legal and social issues(ELSI) of medical interventions to aging, chronic diseases and deathincluding EoLin Korea and in East Asia. At first, our main research plan with some results is introduced by principal investigator, Dr. Yi-Jong Suh, and later legal issues and social issues are presented by Dr. KS Choi and Dr. KS Park. This discussion table will offer a collaboration research plan for a comparative study on ELSI of elderly care including end-of-life decisionmaking in East and West.

BIO-POLITICS OF END-OF-LIFE CARE IN KOREA

Y. Suh, *Seoul National University, Seoul, Republic of Korea*

Before the highest speed of development into super-aged society in Korea we meet various problems from twisted new policies on socio-cultural tradition of elderly care. Therefore our first 3 years project of bio-politics of the elderly focuses on the finding of new ethical and social way for a system-building of the elderly care including End-of-Life care from the grass-root, with empirical research of ethical consciousness in conflict at first year, of institutional systems in conflict at second year, and of alternative policies in social movements including religions at third year. EoL care means not only care in related individual systems, but also a care flow between individual systems from terminally ill patients over hospice life to death. Under universal medicare system incurable and irreversible old men stay in general hospital because of hospital's interest for getting more profit inside and outside medicare, and of family's filial duties. For old men to leave from home to care facility means to be deserted from their family, and to leave from hospital among ill patients means to abandon treatment from no familial support, although with under medical doctor's decision of incurability or irreversibility. For a push to next step care hospitals for palliative care were established, but their cost-saving policy lead to producing many small care hospitals of poor facilities with too many old men per part-time doctors. Hospice seems yet socially unclear and exotic from a culture of death in fear. and of dominant filial moral. Therefore, higher rate of elderly suicide is a symbol of such ill-equipment of EoL care in Korea. My ongoing project will draw new discussable ethical and social ideas and policies for new system of EoL care internally, for example with social & legal issues such familial care moral, Christian & Buddhist hospice activities, non-Christian and non-religious view of death.

LEGAL AND ETHICAL ISSUES ON END-OF-LIFE CARE IN KOREA

K. Choi, *Ewha Womans University, Seoul, Republic of Korea*

Korea tries to legislate withdraw or withholding life-sustaining treatment after the Korean Supreme Court decision on Grandma Kim's Case (2009). However, the Proposal for Legislation by Korean National Bioethics Committee has the following limitation. First, the Proposal requires that a patient who can decide to withdraw or withhold life-sustaining treatment be a dying patient who is about to die. A terminally ill patient is outside of the Proposal. Second, as the Supreme Court decision and the Proposal present, a Korean advance medical directive does not allow DPA and is merely an objective evidence to find patient's wishes. Thus, it may not be fully respected. Only POLST signed by competent patients themselves is effective. Third, a surrogate decision-making must be made by a legal guardian, a patient's whole family members, or hospital ethics committee. But a patient's whole family members consist of a patient's spouse, parents, and adult children only. In Korea, there is no clear legal regulation that is equivalent to Patient Self-determination Act in U.S.A. This legal situation raises lots of ethical and legal issues in end-of-life care including hospice. Can hospice appropriately work without a legal system to respect a patient's autonomy in forgoing treatments such as Patient Self-determination Act? In addition, palliative care is financially supported for cancer patients alone by the Korean national health insurance system. Thus, other terminally ill patients are likely to be reluctant to choose hospice. Further, most of end-of-life care is decided by family members, in most cases, a patient's son or daughter, rather than a patient himself/herself because of family-based Korean culture. But a patient's sons or daughters are inclined to do their best to make their parents survive as long as possible, even if treatments are futile, because they are aware of other's eyes. Unfortunately such Korean culture seems to make hospice be considered to give up any treatments for a patient.

CONTESTED KNOWLEDGE AND PRACTICES AND UNCERTAIN VALUE OF THE END OF LIFE CARE IN SOUTH KOREA

K. Park, *Seoul National University, Seoul, Republic of Korea*

Medical-social treatments for the end of life care have rapidly developed in Korea with the extension of medical industry and the increasing need of long term care for the elderly and have replaced old practices and perceptions about terminal care. Moreover, the rise of complex and diverse actors in medical-social care sites bring the knowledge, practice, and value of end of life care into confusing and political contest. Despite the general perception of the extended medical and social care as social development and individual wellbeing, the competitive extension of medical and social care particularly at terminal stage involves a critical uncertainty in terms of the dignity of life. We try to elaborate issues and meanings accrued at the competitive site of the end of life care in Korea by interpreting perceptions of diverse actors participating in end of life care, including elderly people, nursing staffs, family members, medical physicians, care related social organization, and religious groups. The analysis is based on the survey data collected in 2014 for 600cases and in depth interviews of those diverse actors in the site of terminal care. Main themes to inquire into are meanings of pains and terminal state, the uncertainty of terminal care such as prolongation and palliative treatment, ethical concerns for terminal care and meanings of death.

THE EFFECTIVENESS OF A PSYCHOEDUCATIONAL INTERVENTION PROGRAM ON FAMILY CAREGIVERS' COMPLETION ABOUT END-OF-LIFE DECISIONS FOR KOREAN IMMIGRANT ELDERLY WITH DEMENTIA

S. Han[1], E. Luckens[2], *1. NamSeoul University, Seoul, Republic of Korea, 2. Columbia University, School of Social Work, New York City, New York*

The PsychoEducation Intervention Model draws on educational and therapeutic theory to help both patient and family decrease anxiety, increase knowledge, increase confidence in managing the illness and related challenges, and enhance resiliency (Lukens & Thorning, 2010). This study aimed to examine the effectiveness of a psychoeducational intervention program (PEIP) for family caregivers' ability to make end-of-life (EOL) decisions for Korean immigrant elderly with dementia residing at a nursing home in the U.S. This study used a pre-test and post-test control group design to examine whether PEIP would enhance caregivers' ability to understand and make EOL decisions when compared to a control group in which caregivers received only routinely provided in Korean-language information. One two-hour group PEIP was designed to educate family caregivers about dementia prognosis and symptoms, life sustaining treatment choices, and process and procedures involved in making EOL decisions. A bilingual social worker met individually with caregivers from both groups to provide information and conduct a knowledge-based pre-test. Telephone interviews using semi close-ended questions were conducted at three and six-month follow-up to assess knowledge gained and the extent to which family had made an active EOL decision. Data was analyzed through Repeated Measure ANOVA (SPSS19). At both three and six-month follow-up results indicate that those in the PEIP were significantly more likely to make EOL decisions and showed significantly increased knowldege of dementia than those in the control group. Results are discussed in the context of shortcomings of the current healthcare system and the need for a focused intervention such as PEIP in order to help caregivers effectively understand and finalize EOL decision.

THE STUDY FOR MEDICAL SOCIAL WORKER'S KNOWLEDGE AND UNDERSTANDING FOR ELDERLY PATIENTS' RIGHTS ON END OF LIFE DECISION IN LONG TERM CARE FACILITIES IN SOUTH KOREA

S. Han, *NAMSEOUL UNIVERSITY, Cheonan, Republic of Korea*

This study aimed to analyze medical social workers' knowledge and understanding for elderly patients' rights on End-of-Life (EOL) decision in long-term care facilities of South Korea. The study used a quantitative research method, presenting 230 social workers at long-term care facilities with survey questionnaires. Data was analyzed through T-Test, Multiple Regression (SPSS19). Using the 5-point Likert scale for the levels of understanding for elderly patients' rights on EOL decision, results showed an average of 3.51 points (SD=0.703), with an awareness of patients' rights to receive information of advance directives, and to get help their decision for life-sustaining treatments. Social workers' religious beliefs ($p<.05$), level of license ($p<.05$), experience of engaging of EOL decision ($p<.005$) scored higher in overall understanding. The result also showed an average 2.26 points (SD=0.932) in their knowledge about Advance Directives (AD), using 5-point Likert scale. They answered that they have not enough knowledge to provide information to elderly patients and family members, as it is deemed that education and/or training is necessary. Social worker's training ($p<.001$), experience of engaging of EOL decision ($p<.005$) scored higher in the level of knowledge. From the Regression analysis, results showed the knowledge about AD ($\beta=0.514$) is highest value on the levels of understanding of the rights of elders in EOL decisions ($R(2)= 0.438$, $F=45.869$. $p=.000$). This study found that social workers were involved in EOL decision procedure, but limited support for proper education and training program in order for social workers to effectively carry out their roles in engagement for EOL decision in long-term care facilities, proposing to develop.

SESSION 905 (SYMPOSIUM)

STRENGTHENING LONG-TERM CARE THROUGH PARTNERED APPROACHES: CLOSING THE LOOP BETWEEN RESEARCH, PRACTICE, AND EDUCATION

Chair: A. Rao, *School of Nursing, University of Pennsylvania, Philadelphia, Pennsylvania*
Co-Chair: E.O. Siegel, *Betty Irene Moore School of Nursing UC Davis Health System, Sacramento, California*
Discussant: J. Reifsnyder, *Genesis HealthCare, Kennett Square, Pennsylvania*

Poor care quality in long-term care (LTC) is multifactorial; managing complexity in these environments requires collaborative problem-solving approaches. Partnerships at the institutional level are particularly important. Collaborative interactions among researchers, industry leaders, and educators result in shared processes for identifying priorities, incorporating interdisciplinary perspectives, enhancing dissemination and translation of research evidence, and developing sustainable interventions aimed at improving outcomes. Published literature describing such partnerships focuses primarily on hospital-university connections. LTC settings have long struggled with issues of recruitment and retention, workforce development, leadership stability, and poor outcomes. Addressing these complex issues requires the exchanges of information, ideas, and resources that institutional-level partnerships can facilitate. The purpose of this symposium is to discuss how partnerships in LTC settings contribute to scientific inquiry and to describe systems factors identified in these investigations that inform practice at the institutional level. Specifically, we examine (1) network characteristics and support structures that influence turnover intention among nursing home (NH) directors of nursing (DONs), (2) DONs' education, training, and experience to prepare for their positions and meet the needs of their organizations, (3) the design of interventions using systems-level data about clinical nursing practice in NHs, (4) job embeddedness as a predictor of intent to stay among NH registered nurses, and (5) a Grand Challenge approach to forming research partnerships in dementia care. A senior LTC-industry leader will serve as the discussant. This symposium will facilitate conversation between research-practice partners and highlight how partnered approaches to scientific inquiry at the systems-level can build capacity for high-quality LTC.

THE DIRECTOR OF NURSING IN NURSING HOMES: EDUCATION, TRAINING, AND EXPERIENCE

E.O. Siegel[1], S. Sikma[2], *1. Betty Irene Moore School of Nursing at UC Davis, Sacramento, California, 2. University of Washington Bothell, Bothell, Washington*

The director of nursing (DON) is critical to nursing home quality. Yet, formal opportunities to develop competencies for the DON position are not generally a component of nursing education programs. This paper describes DONs' education, training, and experience to prepare for their positions, advance in their careers, and meet the needs of their organizations. A convenience sample of current and previous DONs and nursing home administrators (n=29) across 15 states participated this exploratory, descriptive study. Data were collected from semi-structured telephone interviews. Thematic analysis was used to identify patterns and themes. DONs commonly develop their competencies through on-the-job experiences, organization-sponsored training, networking, and state trade associations. Competency gaps, consequences and recommendations were identified. In the absence of standardized education and training for the DON position, research-practice-education partnerships are essential to ensuring a DON workforce that is well-prepared to lead and manage high quality nursing home services.

RETAINING NURSING HOME DIRECTORS OF NURSING: THE IMPORTANCE OF PROFESSIONAL NETWORKS AND HIGH QUALITY PROFESSIONAL SUPPORT

A. Rao[1], L.K. Evans[1], C. Mueller[2], E. Lake[1], *1. School of Nursing, University of Pennsylvania, Philadelphia, Pennsylvania, 2. University of Minnesota, Minneapolis, Minnesota*

Turnover among nursing home (NH) directors of nursing (DONs) is a common and costly issue that adversely affects care quality. This study examined the influence of network characteristics, available support, and perceived support quality on for-profit NH DONs' intentions to stay in their positions. We partnered with a national, for-profit NH corporation to administer a web-based survey to all 302 of their DONs; 133 (44%) responded. Descriptive and logistic regression analysis revealed that DONs relied on facility team members (e.g., NH administrator, assistant DON, regional consultant, department heads, and clinical nurses) for nearly all support. DONs received considerable task support from multiple network members but little coaching from any network members. DONs' younger age (p = .023, OR= 1.06), receipt of task support from NH administrators (p = .031, OR= 1.77), and favorable perceptions of task support quality (p = 0.042, OR= 1.38) significantly predicted their intent to stay.

REGISTERED NURSES WORKING IN THE LONG TERM CARE SETTING: ROLE OF JOB EMBEDDEDNESS IN PREDICTING NURSE RETENTION

O.E. Reitz, *Mennonite College of Nursing at Illinois State University, Normal, Illinois*

The aim of this research was to determine what factors predict intent to stay employed at the current position for a sample of Registered Nurses (RNs) working in long term care (LTC) settings. A cross sectional correlational mailed survey was used to assess what factors helps predict nurse retention. The Job Embeddedness Instrument developed by Mitchell et al. (2001) was used to determine the level of embeddedness of LTC RNs. Individual demographic data and self-reported organizational data were collected. Outcome variables were self-reports of intent to stay employed at the current organization. Job embeddedness (JE) was the only variable predictive of intent to remain employed at the current job. Job embbededness could be used as a foundation to provide effective nurse retention strategies in LTC settings. This represents a shift from trying to prevent turnover to trying to increase retention, a fundamental shift in conceptualizing staffing in LTC settings.

PROVIDER-ACADEMIC PARTNERSHIPS FOR SYSTEMS-LEVEL INTERVENTIONS OF NURSING CARE IN NURSING HOMES: THE CASE OF REDUCING HOSPITALIZATIONS

K. Corazzini[1,3], B.B. Walker[5], E.S. McConnell[1,3,4], L. Day[1], M. Haske-Palomino[1], R.A. Anderson[1,3], C. Mueller[2], *1. Duke University School of Nursing, Durham, North Carolina, 2. University of Minnesota School of Nursing, Minneapolis, Minnesota, 3. Duke University Center for the Study of Aging and Human Development, Durham, North Carolina, 4. Geriatric Research, Education and Clinical Center, Durham Veterans Affairs Medical Center, Durham, North Carolina, 5. Principle Long Term Care, Inc., Kinston, North Carolina*

Hospitalizations of nursing home residents are costly and adversely affect the health of residents; annually, approximately 25% of nursing home residents are hospitalized at least once (CMS, 2013). Current, systems-level interventions to reduce avoidable hospitalizations (e.g., INTERACT-II (Ouslander et al, 2011)) do not address the fundamental nursing practice (including assessment and care planning) required for implementation, despite concerns of how practice occurs (OIG, 2013). Thus, the purpose of this paper is to describe an academic-corporate provider partnership that aims to improve nursing practice for the purpose of reducing hospitalizations in a system that uses INTERACT-II. Using a participatory research framework (Horowitz et al, 2010), feasibility and acceptability of the intervention were established through an iterative process to develop the relationship, establish shared objectives, and co-create a mechanism for intervention delivery. Results indicate that the application of participatory research to long-term care may yield rich opportunities for systems-level nursing care improvements.

A GRAND CHALLENGE APPROACH TO FORMING RESEARCH PARTNERSHIPS IN DEMENTIA CARE

E. McConnell[1,2], K. Corazzini[1], E.O. Egerton[1], L. Day[1], M. Bunn[1], A. Welch[3], *1. Duke University, Durham, North Carolina, 2. GRECC-VAMC, Durham, North Carolina, 3. Lenoir Community College, Kinston, North Carolina*

To strengthen the capacity to develop community-level, practice-relevant, research-based solutions in dementia care, we developed a Grand Challenge in Dementia Care, modeled after similar efforts in other fields (engineering and global health). Our approach to engaging communities and practice partners yielded new connections among 86 health care professionals from 3 North Carolina communities (14% minority, 52% rural) representing 7 professional categories (40% nursing, 21% rehabilitation, 18% social work or psychology) across the care spectrum. All sites showed statistically significant improvements in knowledge of dementia, confidence in managing dementia care and leading initiatives to improve systems-level outcomes. Two new research projects in long-term care, one focused on reducing avoidable hospitalization and one focused on improving oral hygiene among people with dementia have resulted. Grand Challenges are a promising approach to engaging diverse practice partners in both rural and urban communities, holding potential to enhance both discovery and implementation science research.

SESSION 910 (SYMPOSIUM)

DIETARY PATTERNS AND SOCIODEMOGRAPHIC PROFILE OF THE VERY OLD IN THE NEWCASTLE 85+ STUDY

Chair: A. Granic, *Newcastle University, Newcastle upon Tyne, United Kingdom*

Objective: To characterize dietary patterns (DP) in the very old (the fastest growing section of the population) and investigate the relationship with socio-economic status (SES). Methods: Two-step clustering was used with 32 food groups determined by 24-hr multipass recall in 791 participants in the Newcastle 85+ Study (all born in 1921). Results:

We identified four discrete DP and found significant associations between cluster membership and various SES measures. Compared with others, participants in DP1 ('High Potato & Meat Diet') were the least educated (p=0.01), occupied manual/routine jobs (p<0.001), had the fewest income sources (p=0.02), and were mostly non-community dwelling (p<0.001). Participants in DP3 ('Low Saturated Fat, High Fruit & Vegetable Diet') were the most likely to be married, to own their home, and to live in an affluent area (all p<0.001). Conclusions: As in younger populations, higher SES is associated with favorable dietary status in the very old.

FOOD INTAKE HABITS OF CENTENARIANS AND NONAGENARIANS LIVING IN PORTO ALEGRE, BRAZIL

M.S. Cabral, P. Martins, A.G. Bós, *Institute of Geriatrics and Gerontology, Pontifical Catholic University of Rio Grande do Sul, Porto Alegre, RS, Brazil*

Objective: To define food intake habits of Centenarians and Nonagenarians living in Porto Alegre, Brazil. To observe the necessity of financial assistance and participation on food acquisition. Methods: Observational, cross-sectional, descriptive and analytical study. The research was conducted from October 2011 to May 2012, using 24 hours Food Recall. We also checked socioeconomic characteristics. Results: We evaluated 44 elderly ranging from 90 to 103 years of age, 33 women and 11 men. Thirty-one (72%) did not need financial assistance to buy food, only 31% participated in the acquisition, 29.5% participated in the preparation of meals. Men had higher socioeconomic status (p = 0.0174). We observed low calcium, fruit and vegetables intake and high consumption of sweet foods and drinks. Conclusion: We observed important nutrient deficiencies among them: D and E vitamins and calcium, leading us to realize that centenarians and nonagenarians might need nutritional interventions to improved quality of life. Keywords: Nutritional assessment, oldest old, nutrition, eating habits.

NUTRITIONAL STATUS OF OLDEST-OLD LIVING IN PORTO ALEGRE, BRAZIL

C. Schirmer, A.G. Bós, *Institute of Geriatrics and Gerontology, Pontifical Catholic University of Rio Grande do Sul, Porto Alegre, RS, Brazil*

Objective: To observe the relationship between eating quality, nutritional status To observe the relationship between eating quality and body composition in the oldest old. Methods: This is a cross-sectional descriptive and analytical study, with the oldest-old (80 + years) living in Porto Alegre, Brazil. Results: Thirty-eight oldest-old, most women, uniformly distributed with and without nutritional risk, most had good and intermediate levels of diet quality. Good eating habits were associated with improved lipid and glucose serum profile. Lean mass was the largest component of body composition of oldest-old. The smallest difference between fat and lean mass was in individuals with poor diet quality and on nutritional risk. Conclusions: Weight loss was not the only nutritional problem in oldest old. It was clear the importance not only of nutritional assessment, but also the presence of a dietitian that can properly assess the health demands and priorities of care of the oldest-old. Keywords: aged, 80 and over; nutritional status; eating habits; body composition; public health

DIFFERENCES IN NUTRITION STATUS OF OLDEST-OLD BETWEEN BRAZIL AND UK

A.G. Bós[1], M.S. Cabral[1], A. Granic[2], *1. Institute of Geriatrics and Gerontology, Pontifical Catholic University of Rio Grande do Sul, Porto Alegre, RS, Brazil, 2. Newcastle University, Newcastle upon Tyne, United Kingdom*

Oldest-old, as defined to be a person 80 years and older, is the fastest growing population in both developed and developing countries. The University of Newcastle started the cohort study on 85+yo in 2006 and the Catholic University did two cohort efforts on 90+ in 2012 and 80+ in 2013. Those two groups have original reports on nutritional assessments. The present symposium aims to expose both experiences using different approaches. The Newcastle group will explore their data identifying diet patterns associating it to socioeconomic status. The group of Porto Alegre will show similar results using a diet quality tool associating this with serum tests results on 80 years and older subjects. Finally the symposium presents the results on nutritional assessment on 90 plus years old Brazilian and the association between micro-nutrients and nutrition status. This is the first time both groups are presenting their experience which will also aims to reach a joint assessment protocol for better address the nutritional needs for the oldest-old population.

SESSION 915 (SYMPOSIUM)

OCCUPATIONAL THERAPY IN DEMENTIA CARE: TESTING MODELS TO IMPROVE OUTCOMES

Chair: R.H. Fortinsky, *Center on Aging, University of Connecticut Health Center, Farmington, Connecticut*
Discussant: L.N. Gitlin, *Johns Hopkins University, Baltimore, Maryland*

Interventions using nonpharmacologic strategies to improve health-related outcomes for people with dementia and their family caregivers are growing in number and creativity. Occupational therapists (OTs) are increasingly being deployed in home and other settings where people with dementia stand to benefit from their clinical expertise. This symposium will feature presentations by investigators from four ongoing projects in which OTs are core interventionists. The Alzheimer's Disease Multiple Intervention Trial utilizes OTs in the home setting with the aim of delaying functional decline among older adults with dementia recruited from primary care practice sites; self-reported and performance-based measures of function are primary outcomes. The Skill-building through Task-Oriented Motor Practice intervention utilizes OTs in home and clinic settings with the aim of improving performance in activities of daily living in people with mild-moderate dementia. The Tailored Activity Program (TAP) for veterans with dementia uses an OT-guided assessment of preserved capabilities and deficits, as well as previous roles, habits, and interests to address veterans' neuropsychiatric symptoms with the aims of improving daily activity performance, reducing challenging behaviors, and reducing family caregiver stress. Another version of the TAP intervention is being tested on a hospital chronic care unit specializing in geriatric mental health, where OTs train unit staff on the use of nonpharmacologic strategies for behavior management in persons with dementia. The discussant will comment on the benefits of and future prospects for using OTs as key interventionists throughout the spectrum of nonpharmacologic interventions to improve dementia care and health-related outcomes.

PREVENTING FUNCTIONAL DECLINE IN OLDER ADULTS WITH ALZHEIMER'S DISEASE: IN HOME OCCUPATIONAL THERAPY COUPLED WITH BEST PRACTICES DEMENTIA CARE

C. Callahan, *1. Indiana Center for Aging Research, Indianapolis, Indiana, 2. Regenstrief Institute, Inc, Indianapolis, Indiana*

Given the lack of disease-modifying therapies, it is important to explore new models of care for older adults with dementia. In a previous clinical trial, we demonstrated that collaborative care reduces patients' neuropsychiatric symptoms as well as caregiver stress. However, these improvements were not associated with delays in subjects' functional decline. The specific aim of the ADMIT study is to conduct a two-year randomized, controlled trial to delay functional decline among older adults with AD by comparing a control group receiving best practices primary care with an intervention group receiving best practice primary care plus a home-based occupational therapy intervention. The occupational therapy sessions are delivered over 2 years and are tailored to the specific needs and goals of each patient-caregiver dyad; these needs are expected to change over time. Our primary outcome is the ADCS Activities of Daily Living Inventory; we are also assessing performance-based measures of function.

COMPARING TREATMENT ENGAGEMENT TO THE STOMP DEMENTIA INTERVENTION WHEN DELIVERED IN HOME VERSUS CLINIC ENVIRONMENTS

C. Ciro[1], J. Poole[2], L.A. Hershey[1], C. Robinson[1], T. Hamilton[1], J.E. Knoefel[2], *1. OUHSC, Oklahoma City, Oklahoma, 2. University of New Mexico, Albuquerque, New Mexico*

Purpose: Examine treatment engagement during an occupational therapy intervention for improving activities of daily living (ADL) in people with mild-moderate dementia called STOMP (Skill-building through Task-Oriented Motor Practice). Methods: Two quasi-experimental studies delivered either in home or in clinic. From daily tallies, we averaged the time spent on task and the number of repetitions completed, followed by Student's t-tests to analyze differences between groups. Results: Despite moderate dementia, participants in both groups demonstrated significant improvement in examiner- and caregiver-rated ADL which was retained at 90 days post-intervention. Mean number of repetitions were higher in the home (M=20.6 reps) vs. clinic (M=7.9 reps; p>.001). Mean time on task was higher in the home (M=38.7min) vs. clinic (M=27.4min; p>.001). Discussion: While both groups made significant improvement in ADL performance, participants treated in the home had greater treatment engagement which may hold significance for retention of ADL improvements beyond our 90-day follow-up.

TAILORED ACTIVITY PROGRAM – SUPPORTING CAREGIVERS AND ADDRESSING CHALLENGING BEHAVIORS IN VETERANS WITH DEMENTIA

S. Winter[1,2], P.B. Arthur[1,2,3], W. Mann[1,2], L.N. Gitlin[4], *1. Veterans Affairs Center of Innovation on Disability and Rehabilitation Research, Gainesville, Florida, 2. Department of Occupational Therapy, College of Public Health and Health Professions, Unv of Florida, Gainesville, Florida, 3. Rehabilitation Science Doctoral Program, College of Public Health and Health Professions, Unv of Florida, Gainesville, Florida, 4. Center for Innovative Care in Aging, Johns Hopkins Unv., Baltimore, Maryland*

The Tailored Activity Program – Veterans Affairs (TAP-VA) randomized controlled trial tests the efficacy of TAP compared to an educational intervention for Veterans with dementia and their caregivers. TAP represents an innovative theory-based dementia care approach, drawing upon occupational therapists' (OTs) unique knowledge and skills. TAP intervention aims to reduce negative dementia-related neuropsychiatric behaviors through activity engagement and implementation of environmental supports. Negative behaviors (e.g., refusing assistance, agitation) may decrease a Veteran's ability to initiate or sustain purposeful activity, and increase caregiver strain. To identify appropriate activities, OTs conduct home-based assessments of the Veterans' abilities, routines, and interests, the home environment, as well as caregiver needs, skills, and readiness. Subsequently, an activity program is introduced during 8 in-home sessions. Measurements occur at baseline, post-intervention (4 months), and long-term (8 months) to evaluate frequency and severity of neuropsychiatric behaviors, caregiver burden, and the impact of the intervention on VA health care costs.

THE ROLE OF OCCUPATIONAL THERAPISTS (OT) ON GERIATRIC MENTAL HEALTH UNITS TO MANAGE DEMENTIA-RELATED BEHAVIORS

K.A. Marx[1], L.N. Gitlin[1], K. VanHaitsma[2], D. Alonzi[3], T. Gentile[3], *1. Center for Innovative Care in Aging, Johns Hopkins University, Baltimore, Maryland, 2. Polisher Research Institute, North Wales, Pennsylvania, 3. Johns Hopkins Bayview, Baltimore, Maryland*

Hospital staff have limited training on handling challenging behaviors in dementia patients. We report a feasibility study that translated the Tailored Activity Program (TAP) for use on a chronic care mental health hospital unit. 20 dementia patients admitted for neuropsychiatric disturbances, with an average age of 77.5 years (SD=7.9) and who were mostly female (n=12, 60.0%) were enrolled. Common neuropsychiatric behaviors at admission were agitation (94.1%), dysphoria (70.6%), irritability (70.6%) and aggression (47.1%). OTs assessed participants for interests and capabilities, and trained staff on using activities to engage patients. Three case studies highlight the role of OT and activities to reduce behavioral challenges. We demonstrate that TAP can be successfully adapted for implementation in hospital settings, can be embedded in standard care and is reimbursable. Our approach represents a paradigm shift for the role of OTs, from a limited focus on physical function to their direct involvement in behavioral management.

SESSION 920 (PAPER)

ACUTE CARE I

THE CREATION OF A PATIENT-CENTERED RESEARCH AGENDA FOR THE ACUTE CARE OF OLDER PATIENTS

H.L. Wald[1], L.K. Leykum[2], M. Mattison[3], E.E. Vasilevskis[4], D. Meltzer[5], *1. Division of Health Care Policy Research, University of Colorado Health Sciences Center, Aurora, Colorado, 2. South Texas Veterans Health Care System / University of Texas Health Science Center at San Antonio, San Antonio, Texas, 3. Beth Israel Deaconess Medical Center and Harvard Medical School, Boston, Massachusetts, 4. Vanderbilt University, Nashville, Tennessee, 5. The University of Chicago, Chicago, Illinois*

Background: Medical research focused on caring for acutely ill older patients is limited. We sought to determine research priorities for the care of the acutely ill older patient with a focus on inclusion of input from patients and clinicians. Methods: We employed a systematic and inclusive process for topic generation modified from the James Lind Alliance involving the engagement of multiple stakeholders, including patients and clinicians. The approach included 5 phases: 1. Convene steering committee; 2. Consult with stakeholders to identify gaps in the scientific knowledge; 3. Collate a list of potential research questions; 4. Prioritize the most important research questions, and 5. Disseminate results. Results: A steering committee of hospital medicine and geriatrics researchers from the Society of Hospital Medicine research committee led the process. Seventeen stakeholder organizations committed to participate. Using an electronic survey, stakeholder organizations surveyed their memberships to generate 580 individual responses and 1299 unanswered questions for consideration. Two levels of review reduced the list to 75 unanswered questions. Earlier published research agendas and Cochrane reviews were reviewed to add additional relevant questions. A round of email voting by stakeholder organizations was followed by a face-to-face prioritization meeting employing nominal group technique to reach consensus. A "top 10" list of the highest priority unanswered questions for research was identified and will be presented. Conclusions: The input of diverse stakeholders is feasible and generated a balanced list of priority topics for inclusion in a patient-centered research agenda at the intersection of hospital medicine and geriatric medicine.

PERFORMANCE CHARACTERISTICS OF CAM AS SCREEN FOR DELIRIUM/ENCEPHALOPATHY IN ADULT HOSPITALIZED POPULATION - RESULTS OF HOSPITAL-WIDE SCREENING PROGRAM

R.S. DIcks, C. Waszynski, *Geriatric Program, Hartford Hospital, Hartford, Connecticut*

A hospital-wide screening program assessing all adult patients was able to track outcomes associated with CAM results in 45,000 consecutive patients. The population was comprised of med/surg patients, including patients in ICU/CCU/PACU and step-down units, age 15-104yrs. Screening consisted of CAM (Confusion Assessment Method) performed every shift. CAM results entered into the electronic medical record were labeled as "Positive", "Negative" or "Unable to Assess" according to standardized criteria (Criteria will be discussed). Patients were categorized as "CAM Positive" if they had one or more screen results that were "Positive", "CAM Unable to Assess" if they had one or more screen results that were "Unable to Assess", or "CAM Negative" if all results were "Negative". The screening program, in place for 18+ months yielded nearly 900,000 results in 45,000 patients. ICU and Step-Down populations yielded higher proportions of "CAM Positive" and "CAM Unable to assess" patients. In all settings, with or without ICU and/or Step-Down exposure, CAM results predicted clinical outcomes. Length of Stay (LOS) was >2x longer in "CAM Positive" patients (14days vs 5days), >2x longer in "CAM Unable to Assess" patients (12days vs 5days). Combining "CAM Positive" and "CAM Unable to Assess" did not further impact LOS. "CAM Positive" patients were 2x more likely to be discharged to SNF, >2x less likely to be discharged home, and > 3x more likely to die in the hospital. Combining "CAM Positive" and "CAM Unable to Assess" predicted nearly all of the inpatient deaths. Evidence-based interventions based on screening results are discussed.

PRE- AND IN-HOSPITAL DYNAMICS IN SELF CARE AND MOBILITY INDICES AND SHORT TERM FUNCTIONAL RECOVERY

O. Zaslavsky, A. Zisberg, E. Shadmi, *Department of Nursing, University of Haifa, Haifa, Israel*

Background Post-hospitalization functional change has been associated with adverse outcomes. The functional dynamics, as conceptualized by trajectories of change, have been previously examined, however functional change in self-care abilities may have differential manifestations than changes in the ability to mobilize in terms of the effects on functioning. Our aims were 1) to estimate the relationship between the type of patient's functional trajectory and likelihood of functional recovery (FR); 2) to compare how the trajectories in self-care versus mobility relate to post hospitalization FR. Methods The sample included 691 older (≥70) adults admitted to general-medical inpatient units in two hospitals in Israel, for non-disabling diagnosis. FR was defined as a restoration of functioning to levels reported 2-weeks prior to admission. Patients were classified into twelve functional trajectories depending on decline or stability in pre-hospital stage, and decline, stability or improvement between admission and discharge in ability to perform self-care or mobility activities. Results Patients who remained stable before and during hospitalization had the highest odds of remaining in their pre-morbid functional levels. Those who experienced functional improvement during hospitalization, despite previous functional loss, had a 2.4-3 times higher likelihood of FR comparing to persistent decliners. Comparing 'self-care' versus 'mobility' dynamics, the largest difference was observed in 'Stable-Decline' group, with Adjusted Odds Ratio (AOR)=2.2 (95% CI=1.1-4.5) for FR by self-care indicators, versus AOR=1.4 (95% CI=0.5-3.7) by mobility scores. Conclusion Dynamics in functioning are important correlates of subsequent FR. In-hospital changes in mobility are more deleterious than comparable changes in self care scores.

HOSPITAL ASSOCIATED FUNCTIONAL DECLINE: THE ROLE OF HOSPITALIZATION PROCESSES BEYOND INDIVIDUAL RISK FACTORS

A. Zisberg[1], O. Tonkikh[1], N. Gur-Yaish[1], G. Sinoff[2], E. Shadmi[1], *1. The Cheryl Spencer Department of Nursing, Haifa University, Haifa, Israel, 2. Department of Gerontology, University of Haifa, Haifa, Israel*

OBJECTIVES: Functional decline (FD) following hospitalization is a widely described phenomenon, yet the role of a variety of in-hospital processes that potentially increase the risk for post-hospitalization FD is poorly understood. The study aimed to test a comprehensive model accounting for individual risk factors as well as hospitalization processes that lead to FD at discharge and one-month follow-up. METHOD: Prospective cohort study performed in two Israeli medical centers from 2009 to 2011. A total of 684 participants (70 and older) admitted due to non-disabling diagnoses interviewed at admission, during hospitalization, at discharge and one-month follow-up. In-hospital mobility, continence care, sleep medication consumption, satisfaction with the hospital environment and nutrition consumption were assessed using previously tested self-report instruments to model FD from pre-morbid to discharge and from pre-morbid to one-month post-discharge. Structural Equation Modelling was used to test model. RESULTS: In-hospital mobility ($\beta=-.48$, $p<.001$) continence care ($\beta=-.12$, $p<.001$) and length of stay ($\beta=.06$, $p<.01$) were directly related to FD at discharge and, together with personal risk factors (such as basic functioning, risk of malnutrition, depression, chronic and acute illness severity), accounted for 64% of the variance. Nutrition consumption ($\beta=-.07$, $p<.01$) was significantly related to FD at one-month post discharge, explaining together with other risk factors, 32% of the variance. CONCLUSIONS In-hospital low mobility, sub-optimal continence care and low nutrition consumption account for immediate and one-month post-hospitalization FD. These are potentially modifiable hospitalization risk factors for which practice and policy should be targeted in efforts to curb the post-hospitalization FD trajectory.

HOW MUCH TIME HOSPITALIZED OLDER PATIENTS SPEND UPRIGHT?

O. Theou, M.A. Maclean, K. Rockwood, *Dalhousie University, Halifax, Nova Scotia, Canada*

Physical activity is associated with shorter stay and lower functional decline in hospitalized older adults. This study examines how long patients spend upright per day during hospitalization. Patients are recruited within 48 hours of admission to the Emergency Department or a Geriatric Assessment Unit. Currently 34 patients (of 100 planned) over the age of 70 have participated in the study (mean 85±8 years; 17 women); 28 were admitted via the Emergency Department and 6 directly to the Geriatric Assessment Unit. On average, patients remained in the hospital 16±12 days. Five patients died during hospitalization. Time spend upright (standing, walking) was objectively measured daily until discharge or for 2 week using ActivPAL accelerometers. On admission 45% were able to walk without hands on or standby assistance while at discharge/2 weeks this increased to 66%. Across all days, patients were sedentary on average 78±84 minutes per day. On the first day of admission, patients spent 61±91 minutes per day upright. Among those who remained in the hospital for at least 7 days, upright time on the 7th day increased by 6±55 minutes per day compared to the 1st day. Among those who remained in the hospital for at least 14 days, upright time on the 14th day increased by 18±71 minutes compared to the 1st day. Hospitalized patients spend very little time standing or walking even when they can walk independently.

FRAILTY & DISABILITY

CHRONIC KIDNEY DISEASE AND PHYSICAL FUNCTION: DOES THE EGFR MEASURE MATTER?

B.D. Capistrant[1], B.M. Heubner[2], S. Pederson[3], E. Amiot[3], J. Coleman[3], P.E. Drawz[4], A.M. Murray[2,3,5], *1. School of Public Health, University of Minnesota, Minneapolis, Minnesota, 2. Chronic Disease Research Group, Minnesota Medical Research Foundation, Minneapolis, Minnesota, 3. Berman Center for Clinical Research, Minnesota Medical Research Foundation, Minneapolis, Minnesota, 4. Division of Nephrology, Department of Medicine, University of Minnesota Medical School, Minneapolis, Minnesota, 5. Division of Geriatrics, Department of Medicine, Hennepin County Medical Center, Minneapolis, Minnesota*

Although chronic kidney disease (CKD) may independently contribute to physical function decline, additional evidence is necessary to establish the best renal function measure to predict physical function. We used cross-sectional data from 261 BRain In Kidney Disease Study (BRINK) participants; BRINK is a prospective cohort study of middle and older-age adults with moderate CKD (N=171) and non-CKD controls (N=90) (mean age: 69.9 (CKD), 67.3 (non-CKD). Estimated glomerular filtration rate (eGFR) was calculated from serum cystatin C, creatinine and a combination of cystatin C and creatinine using CKD-Epidemiology Consortium equations. We considered continuous, categorical (eGFR: <45, 45-59, ≥60) and dichotomous (eGFR<60) functional forms of eGFR. Short Physical Performance Battery (SPPB) scores were categorized into three groups: very high (SPPB: 12), high (SPPB: 10-11), and moderate-to-low functioning (SPPB: ≤9). Covariates included age, sex, race, smoking status, measured body mass index and glycoslyated hemoglobin. The covariate-adjusted association between each eGFR measure (cystatin C; creatinine; cystatin-creatinine) on physical function group was estimated with ordered logistic regression. Patterns were similar in nature for each eGFR measure, but continuous cystatin C eGFR provided the best model fit (C-statistic: 0.73) and was positively associated with higher physical performance categories: a 10-unit higher eGFR-cystatin was associated with a 53% greater odds of a higher functioning SPPB group (OR: 1.53, 95% CI: 1.03, 1.74). Although clinicians more commonly use creatinine in practice, cystatin C may be the better renal measure for etiologic research on physical function and CKD in older adults.

EFFECT OF AGE ON VOCAL CHOICE REACTION TIME AFTER A SUDDEN SINGLE UNDERFOOT PERTURBATION DURING GAIT

J.O. Nnodim, H. Kim, J.A. Ashton-Miller, *University of Michigan, Ann Arbor, Michigan*

The vocal choice reaction times of healthy young (22.0 ± 3.2 years; n = 32; 15 women) and old (72.0 ± 6.4 years; n = 8; 5 women) were measured while stationary as well as during perturbed and unperturbed gait. The perturbation was administered using customized shoes instrumented to lower a small flap suddenly at random under the medial or lateral forefoot during a single stance phase of 12 of 30 gait trials. The results showed that vocal choice reaction time was significantly prolonged by gait (368.9 ± 87.0 ms at standstill vs 487.4 ± 89.4 ms during unperturbed gait in healthy young adults [p=0.0018]; 332.8 ± 76.5 ms at standstill vs 529.9 ± 119.3 ms during unperturbed gait in healthy old adults [p=0.0015]). In young healthy adults, no further significant prolongation occurred with sudden simultaneous underfoot perturbation (494.7 ± 125.3 ms), in contrast with healthy older adults who showed a significant increase in vocal choice reaction time under the same circumstance (614.7 ± 80.2 ms; p = 0.016). Neither group significantly altered their step kinematics. We conclude that healthy old adults were significantly slowed in the performance of a non-gait attentional assignment by the requirement to respond to a concurrent gait challenge.

FRAILTY PREVALENCE AND KIDNEY TRANSPLANT OUTCOMES IN RECIPIENTS OF ALL AGES

M. McAdams DeMarco[1,2], A. Law[1], M. Salter[2], J. Walston[1], D. Segev[1,2], *1. Johns Hopkins University School of Medicine, Baltimore, Maryland, 2. Johns Hopkins School of Public Health, Baltimore, Maryland*

Objective: To quantify the prevalence of frailty in adult kidney transplantation (KT) recipients of all ages, and its association with adverse KT outcomes (length of stay [LOS], graft loss, and mortality). Methods: 544 KT recipients were enrolled in a prospective cohort study. Frailty was measured as per Fried scale. The risk of prolonged LOS was estimated using adjusted modified Poisson regression and the risk of death-censored graft loss and mortality was estimated using an adjusted Cox proportional hazards model. Results: At KT, 21.9% of all recipients were frail; 27.8% of older (age≥65) and 20.8% of younger (age<65) were frail, and 36.1% and 31.4% were intermediately frail, respectively. Frailty was associated with prolonged LOS (16.1% of frail patients had LOS>3 weeks, versus 12.7% intermediately frail and 8.6% nonfrail), higher death-censored graft loss (9.33 per 100,000 person-years for frail patients, versus 6.51 intermediately frail and 3.77 non-frail), and higher mortality (13.47 per 100,000 person-years for frail patients, versus 9.11 for intermediately frail and 5.03 for non-frail). In adjusted models, frailty was independently associated with 1.80-fold (95%CI:1.03-3.16, P=0.04) higher risk of LOS ≥3 weeks, 3.03-fold (95%CI:1.16-7.88, P=0.023) higher risk of death-censored graft loss, and 2.35-fold (95%CI:1.04-5.33, P=0.040) higher risk of death. The association of frailty with KT outcomes did not differ between older and younger participants (all p-values for interaction >0.05). Conclusions: KT recipients of all ages have a very high prevalence of frailty, more than 3-fold higher than community dwelling older adults. In this population, regardless of chronologic age, frailty is associated with poor KT outcomes.

A LOW COST ANDROID HEARING ASSISTIVE TECHNOLOGY APPLICATION

P. Hall, B. Tong, R. Reyes, S. Dogbevi, F.S. Baek, A. Goel, J. Mohler, *University of Arizona, Tucson, Arizona*

Objectives: Hearing loss is a prevalent condition among older adults. Hearing aids and other forms of hearing assistive technology (HAT) are expensive (~$1000 and higher) and batteries costly. Smartphones can be used as an inexpensive alternative form of HAT. The applications currently on the market are iOS-based, and do not publish their electroacoustic characteristics, and most do not comply with FDA Regulatory Requirements for Hearing Aid Devices and Personal Sound Amplification Products guidelines. Our objective was to develop an Android based HAT application that integrated safety requirements for output intensity and duration, and provided the electroacoustic properties of interest according to the ANSI S3.22 specification. Methods: Using the Android platform we tailored the aural output to patient needs by generating an audiogram to characterize the extent of hearing loss of the patient via a hearing test; an equalizer customizes the frequency response for each ear accordingly. We employed both a discrete-wavelet transform filter and spectral subtraction methods for denoising. Form factor considerations for elder use were taken into account, to allow for ease of use. Findings: Recycled cell phones can be configured for low income elders with poor hearing, alleviating the need for hearing aid and battery purchase. Conclusions: This Android application/device has far-ranging quality of life applications. Our future goal is to test the feasibility and acceptability of this device using the Client Oriented Scale of Improvement (COSI) and the Abbreviated Profile of Hearing Aid Benefit (APHAB). This application could be useful for global health applications, as well.

LONG -TERM CONSEQUENCES OF FALLS ON WELL-BEING IN OLDER WOMEN

G. Peeters[1], M. Jones[1], J.E. Byles[2], A. Dobson[1], *1. School of Human Movement Studies, The University of Queensland, Brisbane, Queensland, Australia, 2. University of Newcastle, Newcastle, New South Wales, Australia*

Background - The physical and mental health consequences of a fall may influence the individual's well-being. Well-being is an important outcome in clinical trials, but the long-term consequences of falls on well-being in an aging population are unclear. The aim was to investigate the long-term consequences of falls and injurious falls on well-being in community-dwelling older women. Methods - Data were from 10,059 participants in the Australian Longitudinal Study on Women's Health who returned the 1999 survey (then aged 73-78 years). 3960 Participants completed all 3-yearly follow-up surveys until 2011 with questions about falls and injurious falls in the past year and the Short Form-36. Scores on the SF-36 sub-scales (range 0-100) were compared between fallers and non-fallers using linear mixed modelling adjusted for survey, age, education, depression, chronic conditions and physical activity. Results - Over 12 years, 46.7% reported at least one fall, respectively. The fallers scored significantly lower than the non-fallers on all sub-scales ($p<0.001$). The differences in scores ranged from -5.8 (95% confidence interval [CI] -6.8, -4.8) for role physical to -1.5 (CI -1.9, -1.2) for mental health. The associations were somewhat weaker when only complete cases were included and somewhat stronger for injurious falls. Conclusion - In community-dwelling older women, falls and injurious falls influence all domains of well-being and these effects remain on the long-term.

SESSION 930 (SYMPOSIUM)

POLICY SERIES: THE 2015 WHITE HOUSE CONFERENCE ON AGING: GSA SECTION LEADERS REFLECT BACK AND LOOK FORWARD TO THE NEXT PHASE OF AGING POLICY ACTION

Chair: G.E. Alkema, *The SCAN Foundation, Long Beach, California*

2015 marks a historic year with the anniversaries of Medicare, Medicaid, the Older Americans Act, and the Americans with Disabilities Act. In this session, thought leaders from each of GSA's sections will describe key milestones in their field that have impacted aging policy and what they envision for the future of aging policy from their field's vantage point. Sponsored by GSA's Public Policy Committee.

SESSION 935 (SYMPOSIUM)

CULTURALLY-SENSITIVE RESEARCH ON MINORITY DEMENTIA CAREGIVERS: THE NEED FOR TAILORED ASSESSMENTS

Chair: V.E. Richardson, *College of Social Work, The Ohio State University, Columbus, Ohio*

Most studies on dementia caregivers have used white respondents from non-diverse backgrounds; however, based on a recent report from the Alzheimer's Association older minorities, in particular older Hispanics and African Americans, are proportionately more likely than older whites to have Alzheimer's disease. Research also indicates that cultural views substantially affect the stress associated with caregiving. The objective of this symposium is to present novel data on four typically insulated caregivers from South Korean, Hispanic, rural, and African American backgrounds. In this symposium, we present four papers focusing on the unique themes from each subgroup. All data were based on in-depth interviews using a culturally-sensitive research model and modified grounded theory integrating an intersectionality, critical feminist gerontology framework. Purposive sampling methods were used to recruit participants, and member checking was conducted in second interviews. In the paper on South Korean caregivers cultural isolation exacerbated by language barriers contributed to the physical and mental stresses these families encountered. Although language barriers also segregated the Hispanic caregivers, the researcher uncovered cultural values, such as anti-institutionalization, that collided with the needs of these caregivers. These issues differed from those reported in the paper about African American caregivers who more successfully used formal services and social and spiritual supports. Finally, the effects of geographic isolation among rural caregivers and their use of informal community supports were discussed in the fourth paper. All authors argued for transcendence over stereotypes and individualized assessments that practitioners could use to more effectively tailor interventions with these minority dementia caregivers.

EXPLORING THE EXPERIENCES OF KOREAN CAREGIVERS OF PERSONS WITH DEMENTIA

S. Won, *Department of Social Welfare, Daegu Cyber University, Gyeongsan Gyeongbuk, Democratic People's Republic of Korea*

In-depth interviews by a well-trained culturally competent gerontology practitioner were conducted in Los Angeles with two spousal and three daughter Korean caregivers of dementia persons. Four of the five caregivers had no substitute caregiver because few children or relatives lived in the United States. In addition, as first generation immigrants, language barriers substantially interfered with these families obtaining formal support. Participants reported feeling overwhelmed, burdened with caregiving, and that Korean values placed heavy responsibilities on them to care for their loved ones. However, they also took caregiving for granted. Spousal caregivers wished to avoid burdening their children while the daughters felt sorry for their aging Mothers who were forced to follow rigid gender roles. New information about Korean dementia caregivers along with recommendations for how service providers can better reach and serve these caregivers and engage in more culturally-competent practice are discussed.

SUPPORTING CULTURALLY-ORIENTED CHOICES AMONG AFRICAN AMERICAN CAREGIVERS OF PERSONS WITH DEMENTIA

E. Bradley, V.E. Richardson, *College of Social Work, The Ohio State University, Columbus, Ohio*

Using a modified grounded theory approach five dementia caregivers from African American backgrounds were interviewed by an experienced practitioner trained in culturally competent interviewing. Participants demonstrated resilience relying on their spirituality, carving out time for respite, and by receiving help from friends and extended family. They cared for loved ones in the home for as long as possible while not in opposition to using community-based care options. They sought to "broker" community resources coupled with their friendships and kinship networks as a means of maintaining their commitment to home-based care. Practitioners must have cultural awareness of these caregivers' historical experiences to "struggle and survive." By applying a strengths-based perspective linking kin and formal supports into a more integrated, holistic practice approach service providers will more successfully fortify these caregivers' faith and culturally-oriented preferences and help them conserve their mental and physical well-being to maintain their ongoing caregiver responsibilities.

EXPLORING THE EXPERIENCES OF RURAL-COMMUNITY CAREGIVERS OF PERSONS WITH DEMENTIA

A.K. Gibson[1], S.D. Tarrant[2], *1. College of Social Work, The Ohio State University, Columbus, Ohio, 2. Sanders-Brown Center on Aging, University of Kentucky Alzheimer's Disease Center, Lexington, Kentucky*

In-depth interviews were conducted by well-trained, rural-based gerontology practitioners with caregivers of persons with dementia residing within rural communities of Ohio and Kentucky (n=15). Participants reported lack of available support services, lack of information regarding available resources, lack of financial supports, and distance to services as major issues that impacted their role as caregivers. Despite these barriers, many rural caregivers indicated that they felt well supported through informal community members such as neighbors and church members. Faith-based organizations were a major resource for a number of these often geographically-isolated caregivers. Challenges to supporting rural community caregivers along with recommendations for how service providers can provide a better continuum of care for this population will be introduced.

I WISH I COULD DO MORE: THE EXPERIENCE OF DEMENTIA CAREGIVERS FROM LATINO BACKGROUNDS

N.L. Fields, *School of Social Work, The University of Texas at Arlington, Arlington, Texas*

Dementia among older Hispanics is growing at a faster rate than among white populations, yet there is limited research that examines the needs of family caregivers within the context of culturally-sensitive research methods. A researcher with expertise in the cultural aspects of caregiving conducted in-depth qualitative interviews with a sample of dementia caregivers from Latino backgrounds using a modified grounded theory approach (n = 5). Participants reported the frequent use of community-based services; however, a lack of Spanish speaking informal and formal care providers was perceived as a challenge to caregiving. Bilingual communication was indicated as an essential aspect of culturally competent care. However, participants also highlighted the importance of acknowledging the heterogeneity of the Latino population in terms of cultural values and traditions. Finally, a strong sense of familism was expressed by participants, particularly in their expressed desire to avoid institutionalization of their loved ones.

SESSION 940 (SYMPOSIUM)

GREEN HOUSE NURSING HOMES: IMPACT AND OUTCOMES

Chair: N. Fishman, *Robert Wood Johnson Foundation, Princeton, New Jersey*

Co-Chair: B.J. Bowers, *University of Wisconsin-Madison, Madi, Wisconsin*

Discussant: M. Downs, *University of Bradford, Bradford, West Yorkshire, United Kingdom*

Culture change models were initially designed and implemented as a means for improving quality of life for long-term care residents. More recently, interest has focused on the clinical and financial implications of culture change. This symposium addresses important questions about what might be achieved through culture change initiatives. The first presenter, a senior program officer at the Robert Wood Johnson Foundation, will present the existing knowledge related to Green House (GH) model nursing homes, and overview the Foundation's THRIVE collaborative of interrelated research projects. The remaining presentations will provide new information from the THRIVE collaborative. The first research presentation addresses the relationship between clinical outcomes and a pre-identified set of care related structures and processes in both GH and comparison nursing homes. The second research presentation focuses on GH homes achieving the highest quality clinical outcomes, exploring how these homes differ from other GH homes. The third research presentation reports on the relationship between Medicare service use and expenditures and adoption of the GH model. The final research presentation compares the quality of care in homes that adopted the GH model with homes that were similar but did not adopt the model. Two discussants will address the implications of findings for the future of the GH model and for culture change initiatives more generally, as well as the implications for research and practice development within an international context. Attendees will learn about the relationship of culture change practices to outcomes for residents and organizations.

CULTURE CHANGE MODELS: OUTCOMES, IMPACT AND PROMISING PRACTICES

N. Fishman, *Robert Wood Johnson Foundation, Princeton, New Jersey*

While a greater sense of home for residents of Green House and other culture change models has long been accepted, the evidence for broader impact, particularly in relation to financial and clinical outcomes, is lacking. Understanding what can be gained from implementing culture change is important for determining how resources should be targeted, and what should be expected in return. Equally important is a need to understand the specific culture change processes that can be expected to achieve improved outcomes. This presentation will summarize the existing knowledge related to Green House nursing homes, setting the stage for the four presentation to follow that provide new data from the THRIVE research collaborative.

RELATIONSHIP OF CARE TO OUTCOMES IN GREEN HOUSE AND OTHER NURSING HOMES

S. Hudak[2], P. Brown[3], R.J. Smout[3], S.D. Horn[3], L.W. Cohen[1], D.A. Reed[1], S. Zimmerman[1], *1. Cecil G. Sheps Center for Health Services Research, The University of North Carolina at Chapel Hill, Chapel Hill, North Carolina, 2. SLH Clinical Consulting, East Grand Rapids, Michigan, 3. ISIS, Inc, Salt Lake City, Utah*

Culture change nursing homes (NHs), including Green House NHs, intend to provide person-centered care and enhanced resident quality of life. Emerging evidence suggests that culture change may not relate to better clinical outcomes, however. This study examined relationships of structures and processes of care to resident outcomes (hospital transfer, falls, pressure ulcer development, functional status change) in a matched sample of 14 Green House homes, 4 higher culture change NHs, and 4 lower culture change NHs. Results indicate that after controlling for resident characteristics, various setting structures and clinical processes are associated with better outcomes. Some of these structures and processes are found more frequently in Green House NHs; others are equally common in higher culture change NHs; and still others are more common in higher and lower culture change NHs. Discussion will address the complex relationship between resident characteristics, structures and processes of care, and outcomes in NHs.

RELATIONSHIPS AMONG RESIDENT OUTCOMES, CLINICAL AND ORGANIZATIONAL PRACTICES IN GREEN HOUSE HOMES

B.J. Bowers[1], K. Nolet[1], T.J. Roberts[2], B.J. Ryther[1], N. Jacobson[1], *1. University of Wisconsin-Madison, Madison, Wisconsin, 2. William S. Middleton Veteran Affairs Hospital, Madison, Wisconsin*

While culture change initiatives were designed specifically to improve quality of life for long term care residents, little is known about how culture change initiatives affect resident clinical outcomes. This study was designed to explore the practices associated with high performing Green House homes and to determine the extent to which these practices are the result of or are facilitated by the Green House model. Data collection included field work and in-depth interviews at four Green House sites, representing both high and low performers on hospital transfers, pressure ulcers and falls. In-depth, onsite interviews were conducted with leadership and frontline staff in Green House homes to understand how care structures and processes related to these outcomes are designed and implemented. Study findings explore the clinical and organizational processes associated with overall level of organizational performance on hospital transfers, pressure ulcers and falls and relationship to the Green House model.

THE IMPACT OF THE GREEN HOUSE MODEL ON MEDICARE UTILIZATION AND EXPENDITURES FOR NURSING HOME RESIDENTS

D. Grabowski[1], C.C. Afendulis[1], D.J. Caudry[1], A. O'Malley[2], *1. Harvard Medical School, Boston, Massachusetts, 2. Dartmouth College, Hanover, New Hampshire*

This research represents the first large-scale longitudinal evaluation of the impact of the Green House nursing home model on Medicare spending and utilization for services such as hospitalizations, skilled nursing facility care, and hospice. We examined the implementation of the Green House Model in eighteen nursing homes over our study period and compared Medicare expenditures and utilization relative to propensity score matched comparison facilities. Thus, we relied on a differences-in-differences framework in which we compared the pre-post change in Medicare expenditures and utilization for nursing homes adopting the Green House relative to the change over this same time period in facilities not adopting the model. The results are still preliminary but the findings will provide guidance to policymakers and providers about how the Green House model impacts Medicare spending.

THE EFFECT OF THE GREEN HOUSE MODEL ON NURSING HOME QUALITY OF CARE

D. Grabowski[1], A. O'Malley[2], D.J. Caudry[1], C.C. Afendulis[1], *1. Harvard Medical School, Boston, Massachusetts, 2. Dartmouth College, Hanover, New Hampshire*

One innovation to potentially address low quality nursing home care is the Green House Project, a culture change initiative that alters the living environment and increases the level of resident and staff autonomy compared with a traditional nursing home. Although this model is thought to improve the quality-of-life for residents, less is known about the impact on clinical quality-of-care. Using a differences-in-differences framework, we examined the pre-post change in quality in eighteen nursing homes adopting the Green House model relative to propensity score matched comparison facilities. This study will provide strong evidence on whether the Green House model delivers better clinical nursing home quality.

SESSION 945 (SYMPOSIUM)

DIRECT SERVICE WORKER (DSW) TURNOVER IN LONG-TERM CARE (LTC)

Chair: A. Bukach, *Benjamin Rose Institute on Aging, Cleveland, Ohio*

DSW turnover is a critical problem in the LTC industry. This study examined differences in DSW turnover over time, as well as predictors of DSW turnover among four types of LTC agencies: nursing homes, home health, mental health and those that serve developmentally disabled populations. Stratified random sampling was used to select sites from the four types of agencies and five geographic regions across Ohio. Data were obtained from 49 agencies at two points in time. Overall, the DSW turnover rate was consistent at 31% in both years across all providers. There was a significant increase in turnover for the region type small city from 2011 (18%) to 2012 (37%). Additionally, the following organizational characteristics were predictors of lower DSW turnover: Fewer DSWs on payroll, rural location, and higher maximum hourly wages for DSWs. Recommendations include learning from the successes of organizations with little or no turnover.

THE DETERMINANTS OF DIRECT SERVICE WORKER TURNOVER IN OHIO

R.J. Gitter[1], F.K. Ejaz[2], A. Bukach[2], *1. Economics, Ohio Wesleyan University, Delaware, Ohio, 2. Benjamin Rose Institute on Aging, Cleveland, Ohio*

Turnover among direct service workers (DSWs) in the long-term care (LTC) industry is quite high as are associated replacement costs. This study examined the characteristics of DSWs to predict the probability of their leaving their employer within six months. A longitudinal study design was used to collect data from 235 DSWs from 44 employers representing four LTC industries. Using logit analysis, we found that Home Health DSWs were more likely to turnover as were women, particularly married women with children ages 6 to 18. Involving the DSW in the care plan, having permanent assignments, and planning one's schedule increased the chances of DSWs staying. Higher wages, paid family sick leave, and employer contributions to family health insurance were found to reduce turnover. These results point to the importance of addressing DSW vulnerable background characteristics, type of involvement at work and family friendly policies as methods to reduce turnover.

DIRECT SERVICE WORKERS: EMPLOYER AND EMPLOYEE PERSPECTIVES ON EXAMINING JOB SATISFACTION AND TURNOVER

F.K. Ejaz[1], R.J. Gitter[2], M. Sengupta[3], *1. Benjamin Rose Institute, Cleveland, Ohio, 2. Ohio Wesleyan University, Delaware, Ohio, 3. National Center for Health Statistics, Hyattsville, Maryland*

This symposium addresses issues related to job satisfaction and turnover among direct service workers (DSWs) in four types of long-term care (LTC) settings. Data were collected as part of a larger, longitudinal study from administrative staff as well as DSWs in various LTC settings. Stratified random sampling was used to select sites from the four provider types and five geographic regions across Ohio. Dr. Ejaz will present data 503 DSWs drawn from 82 providers. She will focus on examining predictors of job satisfaction guided by the LTC Stress and Support model. The analyses uses a mixed-model approach to include data from DSWs and providers. Findings will be discussed in the context of practice and policy implications. Ms. Bukach will focus on predictors of turnover using provider-level data on turnover in 2011 and 2012. 42 providers had complete data on turnover over time. Overall turnover rate was consistent at 31% in both years across providers although there were regional differences. Recommendations for practice will include a discussion of learning from organizations that had little or no turnover. Dr. Gitter will focus on determinants of turnover from both the employer and employee perspectives using data from 44 providers and 235 DSWs. Using logit analyses, results point to the importance of addressing DSW characteristics that place them as a vulnerable population group; and of including family friendly policies from a management perspective. Dr. Sengupta will serve as the discussant and will use her experience of conducting national LTC surveys to discuss the findings.

SESSION 950 (SYMPOSIUM)

FORGET MEMORY: RECONNECTING PEOPLE WITH DEMENTIA THROUGH PARTICIPATORY ARTS

Chair: J.M. Kinney, *Miami University, Oxford, Ohio*
Co-Chair: K. De Medeiros, *Miami University, Oxford, Ohio*
Discussant: C.J. Camp, *Center for Applied Research in Dementia, Solon, Ohio*

In her book, Anne Basting argues that imagination rather than memory should be the focus of dementia-based interventions, and that the participatory arts (performance based creative arts that are led by a professional artist) offer a unique way to achieve this. Over the past decade, arts-based interventions for people with dementia have increased dramatically. Although these interventions are conceptualized in the context of person centered care and boast short- and long-term benefits for participants, there is little consensus about what components are necessary, mechanisms at play, and the intended outcomes of these interventions (as well as how to measure them). In addition, arts-based interventions vary widely along multiple dimensions, including the level and type of training of the facilitator, the roles of the facilitator(s) and participants in the process, the type and degree of structure built into the process, and the intended product that results from the process. Our symposium reports on results from a research retreat in which three directors of national participatory arts-programmed met with social science and behavioral researchers to better understand components, mechanisms and outcomes. Discussions were recorded; transcripts were reviewed for themes. The first paper examines personhood in the context of the life course perspective of linked lives and the second paper describes specific validation techniques that facilitators use in their interventions. The final paper uses a literary studies approach to explore how poetry improves well-being for people with dementia. Taken together, these papers advance our understanding of the processes that underlie participatory arts-based interventions.

"HEALING WORDS": CRITICAL INQUIRY OF POETRY INTERVENTIONS IN DEMENTIA CARE

A. Swinnen, *Department of Literature and Art, Maastricht University, Maastricht, Netherlands*

Poetry interventions are one example of creative approaches that increasingly receive recognition as good practices in dementia care. This seems counterintuitive given that people with dementia lose their language abilities and poetry is regarded to be the most complex literary form. This paper argues that in addition to the existing research on poetry interventions from a health and social sciences' perspective, an approach from literary studies will help provide answers to the question *how* poetry works to improve the wellbeing of people with dementia. Drawing on participant observations of poetry interventions by Gary Glazner (Alzheimer's Poetry Project, USA) and Sandra Stark (Zona's Kiosk Amsterdam, NL), this paper frames poetry interventions as a specific form of oral poetry in which people with dementia are positioned as co-creators of embodied texts and directly benefit from the power of the spoken word.

TOGETHER IN ART: EXPLORING PERSONHOOD IN THE CONTEXT OF LINKED LIVES

L. Hahn, *1. Sociology & Gerontology, Miami University, Oxford, Ohio, 2. Mahidol University, Salaya, Thailand*

People living with dementia have unique thoughts and outlooks on the world, and — though communication may not look or sound like it once did — their voices deserve to be heard. This idea is at the heart of participatory, creative arts programming for individuals with neurocognitive impairment. Thomas Kitwood (1997) called it personhood, a standing or status bestowed upon one human being, by others, that implies recognition, respect, and trust. Literature about personhood and person-centered care typically positions non-impaired individuals, such as care providers, as those who grant status. In participatory arts interventions, however, status is bestowed by and among people with dementia, called co-creators, as they craft original poems, dances, or songs alongside professional artists. Using the research literature on personhood and self, this paper considers the concept of personhood within the context of linked lives, a life course principle that underscores the power of community and connection with others.

VALIDATION OPPORTUNITIES ABOUND IN PARTICIPATORY ARTS-BASED INTERVENTIONS FOR PEOPLE WITH DEMENTIA

D.B. Kaplan, *Institute for Geriatric Psychiatry, Weill Cornell Medical College, White Plains, New York*

Participatory arts-based interventions for people with dementia involve the collaborative creation and performance of poetry, story, song, and dance. These programs are designed to stimulate self-expression, social interaction, and feelings of empowerment and validation. Professional artist facilitators met with social and behavioral researchers to articulate common intervention components, mechanisms and outcomes. This paper reviews facilitators' detailed descriptions of their use of validation in the implementation of their interventions and as a cornerstone of person-centered dementia care. For example, specific verbal and non-verbal communication techniques demonstrate respect for participants. Equal opportunities for participation honor each person's potential contribution. Incorporating the artistic contributions of participants empowers group members to actively engage and interact. Encouraging the sharing of life experiences celebrates the personhood of participants. These validation techniques offer direct benefits for participants during the interventions as well as indirect benefits when modeled in the presence of formal care providers and family members.

SESSION 955 (SYMPOSIUM)

A STUDY OF GUARDIANSHIP IN PENNSYLVANIA

Chair: D.A. Menio, *CARIE, Philadelphia, Pennsylvania*
Co-Chair: J. Campbell, *Bryn Mawr College, Bryn Mawr, Pennsylvania*
Discussant: J.K. Davitt, *University of Maryland School of Social Work, Baltimore, Maryland*

In 2011, the Pennsylvania Department of Aging (PDA) contracted with the Center for Advocacy for the Rights and Interests of the Elderly (CARIE) to conduct an in-depth study of the guardianship process and practices in Pennsylvania. Specific attention was given to the interaction of the aging service system (particularly Oder Adult Protective Services) with guardianship, attorneys and the courts. This session will focus on the methods, results, and recommendations of the comprehensive study.

GUARDIANSHIP: FOCUSING ON THE ISSUES

D.A. Menio, *CARIE, Philadelphia, Pennsylvania*

Guardianship of an older adult can be life-saving, even as it may mark the end of the right to make decisions regarding how, where and with whom she or he may live. It is critical that the system by which a vulnerable older adult comes under the protection reflects best practices for preserving the rights and interests of the older adult. This research was designed to develop a deep and nuanced level of understanding of the role of the Pennsylvania AAAs in the provision of guardianship services and to make recommendations based on input from Pennsylvania stakeholders and from other states. The study examined current guardianship practices for older adults; how AAAs participate in the process; and best practices nationally to improve guardianship practices and the role of AAA's in Pennsylvania's guardianship process. Information will be presented about what has happened since the study was released in late 2013.

GUARDIANSHIP: FINDINGS FROM A COMPREHENSIVE STUDY

J. Campbell, *Social Work, Bryn Mawr College, Bryn Mawr, Pennsylvania*

Guardianship law and practice are subject to continuous analysis and evaluation due to ongoing issues: how it is initiated, how guardians are selected, how guardians are educated and overseen, and how wards are protected. This study collected information from a wide range of sources: results and recommendations from national and state studies and reports; the insight of more than 40 key informants; eight focus groups – 4 with PS workers and 4 with ombudsman; a survey of elder law attorneys (140); and a survey of all 52 PA AAA directors. The study findings are presented in chronological order beginning with a discussion of the issues related to the pre-guardianship phase, guardianship hearing phase, and finally the post-appointment phase. The study concludes with recommendations for each of these phases of guardianship including systems reforms that can be implemented through a mixture of legislation, regulation, policy, and practice action steps.

SESSION 960 (PAPER)

DEMENTIA CARE AND PERSONNEL NEEDS

DEMENTIA CARE MANAGEMENT IN AN UNDERSERVED COMMUNITY: A COMPARISON OF TWO DIFFERENT APPROACHES

J. Chodosh[1,2,3], B.A. Colaiaco[3], K.I. Connor[1], D.W. Cope[2], H.L. Liu[4], D. Ganz[1,2,3], D. Cherry[5], B.G. Vickrey[1,2,3], *1. VA Greater Los Angeles Healthcare System, Los Angeles, California, 2. UCLA, Los Angeles, California, 3. RAND Health, Santa Monica, California, 4. RAND Heatlh, Boston, Massachusetts, 5. Alzheimer's Association, Los Angeles, California*

Objectives: To compare the effectiveness and costs of a telephone-only approach to an in-person plus telephone approach for delivering an evidence-based coordinated care management program for dementia. Methods: We randomized 151 patient-caregiver dyads from an underserved predominantly Latino community to two arms sharing the same care management protocol but differing in implementation strategy: in-person visits at home and/or in the community plus telephone and mail, versus telephone and mail only. We compared between-arm follow-up differences (6 and 12 months) on primary outcomes of caregiver burden (Zarit Burden Interview) and care-recipient problem behaviors (Revised Memory and Behavior Problem Checklist). We also compared patient-caregiver dyad retention, care quality, healthcare utilization, and costs as secondary outcomes. Results: Recruitment achieved 60% of the planned sample size. Caregiver burden, care-recipient problem behaviors, retention, and healthcare utilization did not differ across arms. Retention was 61% at 6 months. Adherence to process measures of care quality improved substantially over time in both arms, and did not differ between arms: adherence to 11 out of 19 indicators more than doubled from baseline to follow-up. Average total program cost per case per month for the in-person arm intervention was $358 compared to $216 for the telephone arm, with no significant between-arm difference in healthcare utilization/costs over the follow-up period. Discussion: Dementia care quality improved regardless of how care management was delivered; large differences in effectiveness or cost offsets were not detected. It remains unclear whether greater recruitment and higher retention would reveal moderate but meaningful differences across approaches.

ANTIPSYCHOTIC QUALITY REPORTING: EFFECTS ON ANTIPSYCHOTIC AND PSYCHOACTIVE MEDICATION USE

J.A. Lucas[1,2], J.R. Bowblis[3,4], C.S. Brunt[5], *1. Seton Hall University, College of Nursing, South Orange, New Jersey, 2. Rutgers University, Institute for Health, Health Care Policy and Aging Research, New Brunswick, New Jersey, 3. Miami University, Department of Economics, Oxford, Ohio, 4. Scripps Gerontology Center, Miami University, Oxford, Ohio, 5. Georgia Southern University, Department of Finance and Economics, Statesboro, Georgia*

Background: With evidence of negative health outcomes for use of antipsychotic medications in nursing home residents with dementia, public policy initiatives have attempted to reduce the unnecessary use of these medications. Objective: This study examines how nursing homes changed their use of antipsychotic and other psychoactive medications in response to Nursing Home Compare's initiation of publicly reporting antipsychotic use in July, 2012. Research Design and Subjects: The study includes all state recertification surveys (n=40,415) for facilities six quarters prior and post the initiation of public reporting. Using a difference-in-difference framework, the change in use of antipsychotics and other psychoactive medications is compared for facilities subject to public reporting and facilities not subject to reporting. Results: The overall percentage of residents using antipsychotics, hypnotics, or any psychoactive medication is found to decline after public reporting. Facilities subject to reporting experienced an additional decline in antipsychotic use (-1.94 v. -1.40 percentage points) but did not decline as much for hypnotics (-0.60 v. -1.21 percentage points). Any psychoactive medication use did not vary with reporting status, and the use of antidepressants and anxiolytics did not change significantly over the study period. Conclusion: Public reporting of an antipsychotic quality measure can be an effective policy tool for reducing the use of antipsychotics – though the effect may only exist in the short run. While all facilities reduced the use of psychoactive medications, there is some evidence of substituting drugs that are not publicly reported but have similar sedative properties as antipsychotics.

TEAM-BASED INTERPROFESSIONAL COMPETENCY (TIC) TRAINING IN DEMENTIA SCREENING AND MANAGEMENT

Z.S. Tan[1], D. Gans[1], R. Price[1], J. Damron-Rodriguez[1], M. Cadogan[1], D. Osterweil[1], S.K. Shimomura[2], J. Chodosh[3,1], *1. University of California, Los Angeles, Los Angeles, California, 2. Western University of Health Sciences, Pomona, California, 3. VA Greater Los Angeles Health System, Los Angeles, California*

Background: According to the Alzheimer's Association, as many as 50% of people satisfying diagnostic criteria for dementia remain undiagnosed. The California Geriatric Education Center developed a team-based training program for dementia-related competencies of four professions (medicine, nursing, pharmacy and social work) whose scope of practice involves dementia care. Methods: We identified the minimum profession-specific competencies for dementia screening and management and highlighted overlaps and opportunities for interprofessional collaboration. A multidisciplinary group of 10 faculty was trained to facilitate four interactive competency stations on: 1.) Dementia screening; 2.) Differential diagnosis; 3.) Management/Team Care Planning; and 4.) Caregiver Stress. Registrants were organized into teams of five to include at least one member of each profession. The teams rotated through all stations, completing assigned tasks through interprofessional collaboration. Post program, participants were provided access to the Workshop Toolkit Essentials in order to implement the program at their own institution. Results: A total of 82 professionals (31 physicians; 18 nurses; 18 pharmacists; 11 social workers; 4 others) successfully completed the program. Change scores showed significant improvements in overall competence in dementia assessment and intervention (average change=1.24, p<0.0001), awareness of importance of dementia screening (average change=0.93, p<0.0001) and confidence in managing medication issues (average change=0.94, p<0.0001). Over 81% (n=54) of participants reported feeling "confident"/"very confident" using the dementia toolkit at their home institution. Conclusion: The TIC is an innovative team teaching model that can be used to enhance dementia screening and management competency in medical, nursing, pharmacy and social work practitioners.

PERSONAL CARE AIDE WORKFORCE DEVELOPMENT: VITAL KEY TO MEETING THE NEED FOR HOME-BASED LONG TERM SUPPORTS AND SERVICES

C. Luz[1], D.P. Ochylski[2], *1. Michigan State University, East Lansing, Michigan, 2. University of Michigan, Ann Arbor, Michigan*

The U.S. population is aging, resulting in a higher demand for in-home long-term care and a shortage of qualified workers to provide the type of care most needed, i.e. assistance with tasks of daily living such as bathing, dressing, cooking and transportation. Most paid in-home, hands-on care is provided by personal care aides (PCAs). A larger PCA workforce is needed to meet the care gap and it is critical that these workers be qualified to provide competent, safe care in a respectful manner. Yet, no federal PCA training requirements exist and many PCAs work without credentials even though they are in an excellent position to monitor client health and intervene early before costly, adverse events occur. The Personal and Home Care Aide State Training (PHCAST) demonstration, administered by the Health Resources and Services Administration, recently funded six states to develop, implement, and test PCA training programs. The Michigan model, Building Training…Building Quality, is a 77 hour, in-person training that covers basic competencies, emphasizes person-centered care, and is taught using adult learner teaching strategies. This community-based, participatory project involved multiple partners, was implemented in five regions across Michigan, and was evaluated using a quasi-experimental design, randomized control group and mixed methods of data collection and analyses. Findings indicate significant knowledge gained and improved skills, job status, and job satisfaction among the 400 participants. This session will cover key findings and lessons learned that are of value to others interested in developing a competent PCA workforce through a similar training program.

EXPLORING THE EXPERIENCES OF CARE STAFF IN DEMENTIA CARE SETTINGS: HOW RESIDENTIAL CARE AIDES' CONCEPTUALIZE GOOD CARE

H. Cooke, N.L. Chappell, K.I. Stajduhar, *Univ of Victoria, Victoria, British Columbia, Canada*

While person-centered care is increasingly viewed as synonymous with good quality dementia care, its widespread adoption and integration remains elusive. As such, greater examination of the structure of dementia care provision and the experiences of the residential care aides (RCAs), who wield enormous practical influence yet little formal power, is required. To date, however, few studies have examined how RCAs conceptualize good dementia care or construe their daily care provision. As part of a larger ethnographic study focused on the influence of the physical and organizational care environment on care provision, we explored RCAs perceptions of good dementia care. In-depth interviews were conducted with 13 care aides in two nursing homes with specialized dementia units in British Columbia, Canada. Thematic analysis of the interview transcripts revealed that RCAs equated good dementia care with tangible care outcomes – keeping residents clean, comfortable, calm and happy. Of note was the limited variation that occurred across their narratives – such tangible outcomes were almost always the RCAs first response. Also central to the RCAs notions of good care was their care approach, that is, delivering care in a gentle, kind and patient manner. Noticeably absent from their narratives was any discussion of autonomy, choice, independence, or continuity of self, themes which have emerged in studies exploring the subjective experiences of residents with dementia living in care (e.g., Clare et al., 2008). Study findings highlight the importance of messaging and modeling person-centered care, of rewarding relational care processes, and providing environmental supports that foster such care.

SESSION 965 (POSTER)

BIOMARKERS OF AGING AND AGE-ASSOCIATED DISEASE

ASSOCIATIONS BETWEEN TELOMERE LENGTH AND ALLELIC VARIATION IN TWO GROUPS OF OLDER ADULTS

C.E. Perry, D. Hedges, D.T. Ricks, B.L. Nielsen, M.J. Larson, J. Kauwe, V. Call, *Brigham Young University, Provo, Utah*

Accelerated telomere shortening has been associated with more rapid aging and increased disease risk. Particularly, shortened telomere length has been associated with major depressive disorder and cognitive impairment, both prominent disorders in aging. Genetics, stress exposure and exercise all affect in telomere length. . Given the emerging importance of telomere length on healthy aging and the lack of investigation on the effects of particular polymorphisms on telomere length in older adults, we examined the relationship between of polymorphisms associated with mood disorders, stress tolerance, and cognition and telomere length in two groups of older adults: 1) older adult participants in a competitive athletic event and 2) community-dwelling older adults. Telomere lengths in the group of older adults participating in a competitive athletic event were significantly longer than in the community-dwelling group (Z=7.349, p<0.00001). We found no associations between gene polymorphisms and telomere length in the athletic participants. In the community-dwelling older adults, however, we found that the LS genotype of the 5-HT polymorphism was negatively associated with telomere length (B=-21.456, p=0.023), the GG genotype of the GR gene was positively associated with telomere length (B=31.99, p-0.012), and the A1 allele of the DRD2 was positively associated with telomere length (B=19.09, p=0.030). These findings suggest that lifestyle or other environmental effects may modify associations between allelic variation and telomere length in older adults. This research helps elucidate the importance of genetic variation, telomere length, and exercise in aging and their effects on chronic diseases prevalent in aging.

INTERLEUKIN-6 AND C-REACTIVE PROTEIN AS PREDICTORS OF COGNITIVE DECLINE IN LATE MIDLIFE

A. Singh-Manoux, *INSERM, Paris, France*

Peripheral inflammatory markers are elevated in those with dementia. In order to assess their etiological role we examined whether interleukin-6 (IL-6) and C-reactive protein (CRP), measured in midlife predict concurrently assessed cognition and subsequent cognitive We used mean value of IL-6 and CRP, assessed on 5217 persons (27.9% women) in 1991-1993 and 1997-1999 in the Whitehall II longitudinal cohort study, categorized into tertiles to examine 10-year decline (assessments in 1997-1999, 2002-2004 and 2007-2009) in standardized scores (mean=0, standard deviation=1) of memory, reasoning, and verbal fluency using mixed models. Mini Mental State Examination (MMSE) was administered in 2002-2004 and 2007-2009, decline ≥3 points was modeled with logistic regression. Analyses were adjusted for baseline age, sex, education, and ethnicity; further analyses were also adjusted for smoking, obesity, Framingham cardiovascular risk score, and chronic diseases (cancer, coronary heart disease, stroke, diabetes, and depression). In cross-sectional analysis, reasoning was 0.08 standard deviation (95% CI: -0.14, -0.03) lower in participants with high compared to low IL-6. In longitudinal analysis, 10-year decline in reasoning was greater (ptrend=0.01) among participants with high-IL6 (-0.35; 95% CI: -0.37, -0.33) than those with low IL-6 (-0.29; 95% CI: -0.31, -0.27). In addition, participants with high IL-6 had 1.81 times greater odds ratio of decline in MMSE (95% CI: 1.20, 2.71). CRP was not associated with decline in any test. Elevated IL-6 but not CRP in midlife predicts cognitive decline; the combined cross-sectional and longitudinal effects over the 10-year observation period corresponded to an age effect of 3.9 years.

DOES HIGHER BMI INCREASE THE RISK OF DEVELOPING OSTEOPOROSIS?

T.B. Piggee, *Department of Geriatrics, Quillen College of Medicine, East Tennessee State University, Johnson City, Tennessee*

Aim Determine the relationship between weight status as determined by body mass index (BMI) and T-Score as a predictor of increased risk of osteoporosis. Method A retrospective analysis was performed on data from patients previously seen in our Osteoporosis Center. Based on densitometric diagnosis (DXA), T-Score >-1; < -1 but >-2.5; and <-2.5 were determined and patients were classified as having a normal bone mass, osteopenia or osteoporosis respectively. Body Mass Index (BMI) was calculated and patients were assigned to an appropriate weight status (underweight, normal, overweight and obese) using CDC weight classification. We then performed a cross tabulation analysis for T-Score and BMI by weight status to determine relationship and subsequent level of significance. Results We included 1,662 patients, primarily veterans: 1, 359 men and 303 women, mean age 65.4 years, 94% were age 50 and older. Body mass index for this population were underweight (2%), normal weight (23.9%), overweight (37.9% and obese (36.3%). Densitometric diagnosis revealed that in this population, 15.3% had osteoporosis, 56.8% had osteopenia and 27.9% had a normal bone density. BMI had a low significant association with DXA T-Score r = .291, p <.01. Chi-square measure of association between T-Score with BMI were significant $\chi 2$ 167.2 (6, n = 1665). Conclusion Results suggest that patients who were overweight were more likely to have osteopenia; a group which reportedly have a greater number of fractures.

HEMISPHERIC DIFFERENCES IN TIME PERCEPTION IN OLDER AND YOUNGER ADULTS

K. Chafin, *Psychology, University of West Florida, Pensacola, Florida*

Time perception is defined as our subjective experience of time. Time perception is involved in many aspects of our lives such as goal setting, driving, risk taking, interpersonal relations, and organizational behavior. This current study investigated hemispheric differences in time perception and how emotion and age affect this process. Undergraduate students (N=108) and adults over the age of 55 years (N=61) participated in a bisection task using angry, happy, and neutral faces presented to either the right or left visual field to investigate the tendency for an individual to under or overestimate durations of time. Each stimulus was presented randomly five times at each of the two standard durations (400 and 1600 ms) and at five intermediate comparison durations (600, 800, 1000, 1200, and 1400 ms). It was hypothesized that the right hemisphere would be more susceptible to the emotions of the faces and would thus overestimate the duration of the high emotionality faces compared to neutral more so than the left hemisphere would. A difference between young and old adults was expected to emerge. While the ANOVA for the angry and neutral expressions condition yielded no significant findings, there was a trend towards an age difference with old participants exhibiting a tendency to underestimate the shorter durations. The ANOVA for the happy and neutral expressions condition yielded a significant interaction between duration and age. A pairwise comparison revealed that old participants overestimated the shortest duration and underestimated longer durations.

PTX3 AS A MARKER OF ACUTE CORONARY SYNDROME RELATES TO MMP9 AND SHOWS LOW FREQUENCY OF PROMOTER METHYLATION

B. Cheng, T. Guo, K. Liu, *union hospital, Wuhan, China*

Background—The PTX3 expressed in the heart under inflammatory conditions, plays an important role in atherogenesis. But the mechanism of PTX3 involving in atherogenesis and the factors influencing PTX3 levels are not yet clear extensively. Mechanisms of epigenetic control of PTX3 gene related to coronary artery disease have not been investigated thus far. Objective—To investigate the association between PTX3 level and MMP9(biomarker of vulnerable plaque). To explore the influence of PTX3 promoter methylation on the PTX3 plasma concentration and its link with acute coronary syndrome (ACS). Methods and results —Plasma levels of PTX3 and MMP9 were measured by ELISA. PTX3 promoter methylation were evaluated by methyl-specific PCR. PTX3 plasma concentrations in ACS was 8.84±7.12 ng/mL (mean±SD), higher than the mean±SD of ACS-free groups (3.60±2.20 ng/mL). MMP9 plasma concentrations of ACS was 355.95±343.84 ng/mL, higher than the mean±SD of ACS-free groups (173.27±146.61 ng/mL).Correlation was found between the plasma levels of PTX3 and MMP9($R2 = 0.53$). Promoter methylation index of PTX3 were lower in ACS (58.91±25.00) than in those with ACS-free (71.59±13.33) . Conclusions —PTX3 as a biomarker of acute coronary syndrome may be involving in formation of vulnerable plaque. Epigenetic regulation through methylation of PTX3 promoter may be associated with the risk of ACS.

MICROVASCULAR MECHANISMS OF AGE-RELATED COGNITIVE DECLINE

Z. Ungvari[1,2], P. Toth[1,2], Z. Tucsek[1,2], S. Tarantini[1], F. Deak[1,2], A. Koller[2], W.E. Sonntag[1], A. Csiszar[1,2], *1. Geriatric Medicine, University of Oklahoma Health Sciences Center, Oklahoma City, Oklahoma, 2. Department of Pathophysiology and Gerontology, Medical School and Szentágothai Research Center, Pecs, Hungary*

Hypertension in the elderly substantially contributes to cerebromicrovascular damage and promotes the development of vascular cognitive impairment. Despite the importance of the myogenic mechanism in cerebromicrovascular protection, it is not well understood how aging affects the functional adaptation of cerebral arteries to high blood pressure. Hypertension was induced in young (3 mo) and aged (24 mo) C57/BL6 mice by chronic infusion of angiotensin II. In young hypertensive mice, the range of cerebral blood flow autoregulation was extended to higher pressure values and the pressure-induced tone of MCA was increased. In aged hypertensive mice autoregulation was markedly disrupted, and MCAs did not show adaptive increases in myogenic tone. In young mice the mechanism of adaptation to hypertension involved up-regulation of the 20-HETE/TRPC6 pathway and this mechanism was impaired in aged hypertensive mice. Downstream consequences of cerebrovascular autoregulatory dysfunction in aged angiotensin II-induced hypertensive mice include exacerbated disruption of the blood-brain barrier and neuroinflammation (microglia activation, up-regulation of pro-inflammatory cytokines and chemokines), which were associated with impaired hippocampal cognitive function. Collectively, aging impairs autoregulatory protection in the brain of mice with angiotensin II-induced hypertension, potentially exacerbating cerebromicrovascular injury and neuroinflammation.

AGING EXACERBATES OBESITY-INDUCED IMPAIRMENT OF NEUROVASCULAR COUPLING AND CEREBROMICROVASCULAR RAREFACTION: IMPLICATIONS FOR THE PATHOMECHANISM OF VASCULAR COGNITIVE IMPAIRMENT

Z. Tucsek[1], P. Toth[1], D. Sosnowska[1], A. Koller[2,3], P. Ballabh[4], W.E. Sonntag[1], Z. Ungvari[1], A. Csiszar[1], *1. ROCA, Geriatric Department, University of Oklahoma Health Sciences Center, Oklahoma City, Oklahoma, 2. Department of Pathophysiology and Gerontology and Szentagothai Research Center, University of Pecs, Pecs, Hungary, 3. Department of Physiology, New York Medical College, Valhalla, New York, 4. New York Medical College-Westchester Medical Center, Valhalla, New York*

Obesity has deleterious effects on the brain and cognitive function in the elderly, however the mechanisms through which aging and obesity interact to promote cognitive decline remain unclear. We hypothesized that aging exacerbates obesity-induced disruption of both functional and structural integrity of the cerebral microcirculation, contributing to a significant decline in higher brain function. To test our hypothesis we compared neurovascular coupling measured by CBF response above the barrel cortex to whisker stimulation, and cerebral capillary density by CD 31-labeling of cerebral vessels in young (7 mo) and aged (24 mo) high fat diet-fed obese C57BL/6 mice. High fat diet in young mice severely impaired CBF response to whisker stimulation (~50 % decrease), which was significantly exacerbated by aging. The high-fat diet-induced decrease in neurovascular coupling was significantly improved in both young and aged mice in the present of the NADPH oxidase inhibitor apocynin. Aged animals exhibited a significant decrease in cerebral capillary density, and the aging-induced rarefaction was significantly exacerbated by high-fat diet. These functional and structural pathological changes were associated with a decreased hippocampal-dependent cognitive function in aged obese mice. In conclusion, aging exacerbates high fat diet-induced decrease in neurovascular coupling via increased NADPH-oxidase derived ROS production, and significantly enhances capillary rarefaction in the brain probably contributing to cognitive decline observed in aged obese animals.

FIVE-YEAR CHANGES IN 24-HOUR HOLTER-BASED PARAMETERS AND INCIDENT DEMENTIA: THE CARDIOVASCULAR HEALTH STUDY

P.K. Stein[1], A. Magnowski[1], O.L. Lopez[2], *1. Wash U School of Medicine, Saint Louis, Missouri, 2. University of Pittsburgh, Pittsburgh, Pennsylvania*

Background: Pathophysiological changes occurring prior to cognitive impairment in dementia are not well understood. Identification of early predictors is crucial for prevention and treatment. Previous studies have suggested a link between dementia onset and sleep disturbances, with sleep disturbances suggested to predate the onset of impairment. Methods: To determine if 24-hour Holter-based parameters or changes in these parameters over 5 years differ between cognitively normal older adults with (DEM, N=78) and without (N-DEM, N=156) incident dementia over a 9-year follow up, Holter data from the Cardiovascular Health Study (CHS), a population-based longitudinal study of adults >65 years old, were analyzed using a nested case-control design. DEM participants were matched by age, gender, and diabetes status to two N-DEM controls. Holter-based parameters included: heart rate, heart rate variability, ectopy counts, apparent bed and wake times and dipping heart rate pattern at night. Results: Although most Holter-based parameters were not different between groups at baseline, DEM were less likely to have a clear dipping heart rate pattern at night (p=0.010). When changes over 5 years were compared, DEM were more likely to have an increased apparent sleep duration (p=0.023) and tended to have a larger change in sleep duration (>1 hour longer or shorter) (p=0.060). DEM were also more like to have a ≥ 5 count increase in VPCs on the second recording compared with N-DEM (p=0.022). Conclusion: Holter-based parameters may potentially help identify circadian and clinical abnormalities in older adults at risk for dementia

ANTICIPATING THE HEALTH OF AGING WOMEN: EXPLORING THE POTENTIAL FOR A SENSITIVE PERIOD AT MID-LIFE USING A BIOMARKER FOR INFLAMMATION

A. Falconi, *University of California, Berkeley, San Francisco, California*

Population aging in the United States is of economic concern, particularly with respect to its effect on rising health care costs. The health of aging women bears particular economic significance because of women's longer life expectancy and higher utilization of health services. Knowledge about the health of "near-elderly" women could facilitate efforts to predict and plan for future health service utilization and spending. Using survey data of menopausal women in the U.S., I will examine if the menopausal transition—otherwise known as perimenopause—represents a sensitive period for systemic inflammation. Fibrinogen is a sensitive indicator for inflammation, that, in relatively high concentrations, is strongly associated with cardiovascular disease, poor physical functioning, and increased risk of mortality. I will test the hypothesis that stressful life events experienced during perimenopause is associated with a greater increase in fibrinogen than stress experienced during pre- or post-menopause. Associations of fibrinogen and life stress experienced by menopausal stage will be analyzed longitudinally using a time and individual fixed effects analysis. Significant results would suggest that endocrine changes during perimenopause represent a pathway for stress to influence fibrinogen concentration. Null results would confirm earlier work on sensitive periods suggesting that windows in early development have the most profound impact on adult health outcomes. The implications of this study include greater insight into aging women's health and knowledge about whether increased risk of later-life mortality and morbidity can be linked to the interaction of endocrine changes and stress occurring at mid-life.

CROSS-DOMAIN BIOMARKER INTERACTIONS INFLUENCE COGNITIVE AGING:ALZHEIMER'S-RELATED GENES AND TYPE 2 DIABETES

G. McFall[1], S.A. Wiebe[1], D. Vergote[1], K.J. Anstey[2], R.A. Dixon[1], *1. University of Alberta, Edmonton, Alberta, Canada, 2. The Australian National University, Canberra, Australian Capital Territory, Australia*

Introduction: This gene x health study focused on exemplars of two domains of risk factors associated with Alzheimer's disease (AD). Specifically, we tested the interactive (i.e., magnifying) effects of (a) Apolipoprotein E or Clusterin (CLU; rs11136000) or PICALM (rs541548) with (b) type 2 diabetes (T2D) on (c) both executive function and memory in (d) older adults from the Victoria Longitudinal Study. Method: The present study includes three longitudinal waves (9 years) of data on n=597 (baseline) adults (age range 53 – 95, M age = 70). Initial analyses were conducted on wave 1 data, with extension to longitudinal follow-ups. Results: Results reveal several concurrent gene x health interaction effects. First, for ApoE x T2D, typical memory deficits associated with T2D are attenuated by the presence of the protective ε2 allele, whereas adults without T2D exhibit similar memory performance with or without the ε2 allele. Second, for CLU x T2D, adults without T2D show no executive function deficits across CLU risk categories, whereas adults with T2D and a CLU risk allele (C) exhibit the poorest executive function performance. Third, for PICALM x T2D, adults with T2D and a PICALM risk allele (C) exhibit relative memory deficits when compared to adults without a PICALM risk allele or T2D. Conclusion: Cross-domain AD-related biomarker interactions may reveal both vulnerability magnification and combined protective effects for concurrent cognitive performance in normal aging. In the presentation, we extend the analyses to examine effects on 9-year cognitive change as a surrogate endpoint for potential neurodegenerative decline.

TOLERANCE OF DEFICITS IN WOMEN IS GREATER THAN IN MEN, BOTH IN RELATION TO DEMENTIA AND DEATH

X. Song, A.B. Mitnitski, K. Rockwood, *Medicine, Dalhousie Unviersity, Halifax, Nova Scotia, Canada*

Introduction: Many age-related health problems have been associated with dementia, suggesting that, as with death, late-life dementia may be determined less by specific risk factors, and more by the operation of multiple health problems, which can be aggregated in a frailty index. Methods: Older adults in the Canadian Study of Health and Aging who were cognitively healthy at baseline were analyzed (men=2,902, women=4,337). Over 10 years, 44.8% men and 33.4% women died; 10.2% men and 9.1% women developed dementias. A frailty index was constructed from 42 items, including both known dementia risk factors and other deficits. Variable numbers (n=1 to 42) of randomly selected deficits were used to calculate interactions of the index, i.e. the proportion of deficits present in an individual. Results: At baseline, women had a higher mean FI than did men (0.13±0.08 vs. 0.17±0.09). The age-adjusted hazard ratios per additional deficit were 1.22 (95% CI 1.18-1.26) in men and 1.14 (1.11-1.16) in women in relation to death, and 1.18 (1.12-1.25) in men and 1.08 (1.04-1.11) in women in relation to dementia. In both sexes, the predictive value increased with the number (n) of deficits considered, regardless whether they were known dementia risks. Discussion: In both men and women, mortality and dementia risk are related to frailty. The relationship was clearest when all available health deficits were included in a frailty index. For both death and dementia, although women had accumulated more deficits than men, they tolerated them better, as evidenced by lower relative risks per deficit.

FUNCTIONAL IMPAIRMENT IN COMMUNITY-DWELLING OLDER ADULTS: THE ROLE OF HEALTH, FALLS, AND PHYSICAL ACTIVITY

F. Carnide[1], V. Moniz-Pereira[1], F. Ramalho[2], M. Machado[1], H. André[1], R. Santos-Rocha[2], A. Veloso[1], *1. Universidade de Lisboa, Faculdade de Motricidade Humana,LBMF, CIPER, Lisbon, Portugal, 2. Instituto Politécnico de Santarém. Escola Superior de Rio Maior, Rio Maior, Portugal*

This study aims to identifying determinants of functional impairment of older adults and to establish the cutoffs values that may accurately distinguish who are at risk for loss of performance in activities of daily living. Participants included 1424 community-dwelling old adults aged +65 years. Three field assessments were used: 1) Health status and falls history questionnaire; 2) YPAS Physical Activity(PA) Survey; 3) Chair-stand and 8-foot up-and-go tests from Senior Fitness Test battery and tests 4-7 from the Fullerton Advanced Balance Scale. Participants were divided into low functional fitness (LFF) and high functional fitness (HFF) groups, according to the sum of percentiles obtained in each test by each subject divided by the median of all sample. Backward logistic regression models showed that being woman, having 75+ years, poor health perception and fear of falling, being a recurrent faller in the previous year and overweighed were determinants for LFF (1.70<OR<5.89). Vigorous PA and moderate walking were protective for LFF when adjusted for other determinants (both OR=0.98). The odds estimating correctly LFF elderly was 73% indicating that models fit well the data. The area under ROC curve showed good discrimination of the participants with LFF (AUC: 0.80; 95%CI: 0.77-0.83; sensitivity:75%; specificity:80%). Cutoff-values for vigorous PA, moderate walking, and body mass index were 60min/week, 150min/week, and 27Kg/m2, respectively. Thus, moderate-and vigorous-intensity PA, motor ability, lower limbs strength and self-confidence should be included into screening routines to identify older adults with functional impairments. This study was supported by Portuguese Foundation for Science and Technology (EXPL/DTP-DES/1915/2013&PTDC/DES/72946/2006).

THE IMPACT OF VALVULAR HEART DISEASE ON MORTALITY IN THE OLDEST OLD: INSIGHTS FROM THE BELFRAIL STUDY

B. Vaes[1,2], N. Rezzoug[1], J. Degryse[1,2], G. Van Pottelbergh[2], C. Mathei[2], A.A. Pasquet[1], J. Vanoverschelde[1], *1. Institute of Health and Society, Université catholique de Louvain, Brussels, Belgium, 2. Katholieke Universiteit Leuven, Leuven, Belgium*

Aims To describe the clinical presentation of subjects aged 80 and older with valvular heart disease (VHD) and to determine the risk of VHD for all-cause and cardiovascular mortality, independent from other echocardiographic parameters and other morbidities. Methods The BELFRAIL (BFC80+) study is a prospective, observational, population-based cohort study of 567 subjects aged 80 years and older in Belgium. Echocardiograms were performed at baseline in 556 (98%) participants. Subjects were followed up for an average time of 2.9 ± 0.25 years. Cause specific mortality was registered by the participant's general practitioner. Results The prevalence of clinically relevant VHD was 11% (n = 60). Mitral stenosis was more prevalent in women and an age-dependent increase of the prevalence of severe aortic stenosis was seen. The global disease burden was higher in participants with VHD (median of 2 morbidities [IQR 1–4] vs 1 morbidity [IQR 0–3] (P=0.027)). VHD, and more specifically mitral stenosis and aortic stenosis, was found to be an independent predictor for both all-cause (HR 1.9 (95% CI 1.1–3.1)) and cardiovascular mortality (HR 2.7 (95% CI 1.3–5.3)). Left ventricular ejection fraction remained an independent risk factor for cardiovascular mortality (HR 0.95 (95% CI 0.90–1.0)). Conclusion In this large representative population-based sample of subjects aged 80 and older a high prevalence of clinically relevant VHD was found. VHD was identified as a strong risk factor for all-cause and cardiovascular mortality, independent of other structural cardiac abnormalities, systolic function and diastolic function at baseline and concomitant diseases.

FOXO3 GENOTYPE AND HUMAN LONGEVITY. WHAT IS THE CLINICAL MECHANISM?

B. Willcox[1], R. Chen[1], Q. He[1], J.S. Grove[1], K. Masaki[1], D.C. Willcox[1,2], R. Allsopp[1], T. Donlon[1], *1. Kuakini Medical Center/ University of Hawaii, Honolulu, Hawaii, 2. Okinawa International University, Ginowan, Japan*

BACKGROUND: The FOXO3 gene is among the most replicated genetic associations with human longevity. Little is known, however, about how carriers of the longevity-associated allele achieve protection against mortality. HYPOTHESIS: The longevity-associated allele of FOXO3 protects against one or more major age-related causes of death, such as coronary heart disease (CHD), cancer or stroke. METHODS: 3,584 elderly (mean age 78 years) American men of Japanese ancestry from the Kuakini Hawaii Lifespan Study, an embedded cohort of aging men within the Kuakini Honolulu Heart Program, were studied. Cause-specific mortality was assessed over a 9 year follow-up period in carriers versus non-carriers of the longevity-associated allele of the FOXO3 gene (rs2802292:G allele) using a multivariable Cox proportional hazards model. RESULTS: Over the 9 year follow-up period, carriers had 16% risk reduction (RR: 0.84; CI: 0.74-0.95; p<0.008) for all-cause mortality, 41% risk reduction (RR: 0.59:CI:0.43-0.80; p<0.001) for CHD mortality, and 28% risk reduction (RR:0.72; CI:0.58-0.88; p<0.002) for all other combined mortality (mainly infectious, inflammatory and multi-morbidity-related mortality), independent of major known risk factors. CONCLUSIONS: These data support further research to uncover molecular mechanisms for FOXO3's protection against these, mainly inflammation-linked, age-related diseases. Supported by NIA grants 2R01AG027060 and 1R01AG038707.

STEPS PER DAY AS A MARKER OF PHYSICAL FUNCTION IN COMMUNITY-DWELLING ELDERLY PEOPLE

F. Baptista[1], C. Tudor-Locke[2], E.A. Marques[3], A. Silva[1], J. Mota[3], L.B. Sardinha[1], *1. Exercise and Health Laboratory, Faculty of Human Kinetics, University of Lisbon, Lisbon, Portugal, 2. Walking Behavior Laboratory, Pennington Biomedical Research Center, Baton Rouge, Louisiana, 3. Research Centre in Physical Activity, Health and Leisure, Faculty of Sport, University of Porto, Porto, Portugal*

The purpose of this work was to evaluate the diagnostic-accuracy of habitual ambulatory activity to distinguish people with and without low physical function (LPF). Participants were 464 community-dwelling old adults (157 males). Measures of physical activity (PA) evaluated with accelerometry included time spent in low-, moderate-, vigorous-, moderate plus vigorous- intensity, total PA, steps/day, 1-minute, and 30-minute peak stepping cadence. LPF was determined through self-report using the Composite Physical Function (Rikly and Jones, 1998). Forward stepwise logistic regression analysis revealed that steps/day, gender, and age group had a significant effect on the probability of having LPF. The likelihood of having LPF increased exponentially for those accumulating <3290 steps/day; the odds ratio of having LPF decreased 10 % for every 100 steps less than this benchmark. The probability of LPF was 81% lower in men compare with similarly aged women taking the same number of steps/day. The probability was 213% lower in adults aged 65-74 yrs than in those aged 75+ yrs. The percentage of correct classifications was 90%, demonstrating the utility of the model to classify new observations. The adjusted multifactorial model (steps/day, gender, age group) showed a high sensitivity (88.7 %) and specificity (89.2 %), as well an excellent discriminant ability to identify older adults with LPF (ROC c=0.955, 95%CI: 0.936-0.973; p<0.001). Of all accelerometer-derived outputs, steps/day appears to be most useful for identifying community-dwelling elderly people with LPF and thus at risk for loss of physical independence. Funded by Portuguese Science and Technology Foundation EXPL/DTP-DES/1915/2013.

BIODEMOGRAPHY OF LONGEVITY: EFFECTS OF PARENTAL LONGEVITY, EARLY-LIFE AND MIDLIFE CONDITIONS

L. Gavrilov, N.S. Gavrilova, *NORC, University of Chicago, Chicago, Illinois*

Earlier studies found that parental characteristics as well as early-life conditions and mid-life environment play a significant role in survival to advanced ages. However, little is known about simultaneous effects of all these three factors on longevity. This ongoing study attempts to fill this gap by comparing 836 American centenarians born in 1890-1891 with their 841 shorter-lived peers born in same years and died at age 65 years. The records are taken from computerized family histories, which are then linked to 1900 and 1930 U.S. censuses with over 90% linkage success. The 1900 U.S. census provided us with information on childhood conditions when centenarians and controls were 9 to 10 years old while 1930 census described midlife characteristics. Centenarians and controls were compared using multivariate logistic regression model with sequential inclusion of different groups of variables. The study found a significant independent effect of parental longevity on survival to age 100. Some mid-life characteristics (farmer occupation for men, radio in household in 1930 for women) and early-life conditions (birth in the second half of year) also proved to be significant predictors of longevity. The results of this study suggest that both familial background, mid-life and early-life characteristics play an important role in longevity and that these effects may be gender-specific. Supported by the U.S. National Institute on Aging (R01 AG028620).

BLOOD-BRAIN BARRIER BREAKDOWN: A COMMON TRIGGER FOR CNS DISEASES

R.G. Nagele, N.K. Acharya, C. DeMarshall, A. Sarkar, E.L. Goldwaser, *Rowan University School of Osteopathic Medicine, Stratford, New Jersey*

The blood-brain barrier (BBB) prevents the influx of plasma components into the brain tissue and facilitates strict maintenance of brain homeostasis. BBB breakdown allows plasma components to enter into the brain interstitium. Some of these (e.g., amyloid peptides, autoantibodies and complement) interact with cell surfaces, disturb neuronal function and may contribute to long-term progression of CNS diseases such as Alzheimer's disease (AD). In the present study, immunohistochemistry (IHC) showed that BBB breakdown is ubiquitous in regions of AD pathology. This allows blood-borne, brain-reactive autoantibodies to bind selectively to pyramidal neurons and trigger pathological changes including intraneuronal accumulation of amyloid-beta peptides, a hallmark feature of AD, and expansion of the lysosomal compartment. Western analysis and human protein microarrays confirmed the presence of AD-specific autoantibodies in human sera. IHC revealed that brain-reactive autoantibodies bind to the same neurons that accumulate amyloid. Autoantibodies targeting neuronal surface proteins dramatically increased the rate and extent of intraneuronal amyloid deposition in the cerebral cortex and hippocampus in mouse brain slice cultures. Autoantibodies showing the most robust neuronal binding were also the most potent inducers of intraneuronal amyloid deposition. Results suggest that BBB breakdown and brain-reactive autoantibodies act together to drive CNS diseases such as AD. Further, we propose that the type of CNS disease and its severity are determined in part by the specific brain location, the type of local neurons that populate this region, the extent of BBB breakdown and the identities and titers of blood-borne brain-reactive autoantibodies. Supported by the Osteopathic Heritage Foundation.

AGE DIFFERENCES IN BIOMARKERS RELATED TO CNS PAIN MECHANISMS

Y. Cruz-Almeida, M.A. Aguirre, R.B. Fillingim, S. Wallet, J.L. Riley, *Pain Research & Intervention Center of Excellence, University of Florida, Gainesville, Florida*

Older adults experience greater clinical pain and are at a greater risk of developing chronic pain compared to younger adults. Potential contributors to this increased risk for chronic pain include the age-related deterioration of the immune and neuroendocrine systems. However, no studies have characterized immune and neuroendocrine biomarkers in response to experimental pain in healthy older adults without chronic pain. The aim of our study was to quantify the pain-evoked changes in several biomarkers in the context of experimental pain stimulation. Healthy younger and older adults (n=22) participated in 3 randomized laboratory sessions where experimental heat and cold pain and a control warm stimuli were administered over four minutes on separate days. Blood samples were collected before and after stimulation (3, 15, 30, 45, 60, 90, and 120 minutes) and were assayed using Multiplex high sensitivity kits. Older adults had significantly higher biomarker concentrations at baseline (β-endorphin, Cortisol, Substance P, TNF-α, IL-6, IL-8, IL-4, IL-10, p's<0.05). Most significantly, older adults had an earlier induction and delayed recovery of biomarkers compared to younger adults in response to pain (p's<0.05), but not warm. There were similar age-related differences in cytokines after monocyte LPS stimulation (p<0.05). Our study is the first to show that even in healthy older adults; the immune and neuroendocrine response to pain is similar to chronic pain patients. Our results also suggest that pain experiences, which are cumulative in aging, may be important contributors to the age-related imbalance in pro- and anti-inflammatory networks providing additional avenues for potential interventions.

VENULAR DENSITY BY 7TESLA MRI CORRELATES WITH COGNITIVE FUNCTION IN MOBILITY LIMITED OLDER ADULTS

C. Rosano[1], S. Studenski[1], M. Pahor[2], J. Guralnik[3], N.W. Glynn[1], A.B. Newman[1], H.J. Aizenstein[1], *1. University of Pittsburgh, Pittsburgh, Pennsylvania, 2. University of Florida, Gainesville, Florida, 3. University of Maryland, Baltimore, Maryland*

Study: Brain small vessel disease (SVD) including lower vessel density and microbleeds are emerging as pathognomonic markers of cerebral arterial angiopathy, and are related to diminished brain function in older adults without neurological disorders. Brain SVD can remain clinically silent for several years before manifesting as stroke or dementia. Although difficult to quantify on conventional neuroimaging, recent advances in ultra-high field (UHF) neuroimaging can more accurately identify SVD markers. Methods: We applied t 7Tesla to quantify SVD severity and to explore the correlations with cognition. Participants of Lifestyle Interventions and Independence for Elders received UHF at study entry (N=58, 76yo, 43 Female). Susceptibility-weighted MR Images were rated by 2 independent raters (ICC >0.8). Post-capillary venules (length 9-10mm) were traced in predetermined 10cm2 periventricular areas. Dilated perivascular spaces, microbleeds, and white matter edema were also measured. Tests of processing speed (DSST) and memory (HVLT-R) were administered. Results: Lower venular density was associated with significantly lower performance on DSST (spearman rho: -0.28, p= 0.045) and on HVLT-R (more false positive responses on recognition memory, spearman rho: -0.40, p= 0.003). Perivascular spaces and edema in the white matter were identified in more than half of the participants but were not related to cognition. Conclusion: UHF can uncover early signs of SVD that are not readily visible using low-field MRI and that are related to lower processing speed and memory. Significance: UHF can help early identification of older adults at greatest risk of SVD and may provide biomarkers to closely monitor brain vascular health.

THE ROLE OF THE APOLIPOPROTEIN E E2 ALLELE IN BIOMARKERS, GERIATRIC DISEASES, AND LIFESPAN: INSIGHTS FROM THE LONG LIFE FAMILY STUDY

A. Kulminski[1], N. Raghavachari[2], S.V. Ukraintseva[1], K.G. Arbeev[1], P. Stallard[1], D. Wu[1], A.I. Yashin[1], *1. Center for Population Health and Aging, Duke University, Durham, North Carolina, 2. National Institute on Aging, Bethesda, Maryland*

Apolipoprotein E e2 allele shows favorable effects on lipids, various geriatric diseases, and lifespan in some studies but not in the others. This inconsistency may reflect inherent complexity of mechanisms linking genes with phenotypes characteristic for post-reproductive life. We focused on Long Life Family Study whose participants were selected for their chances to live long lives and were comprised of long-living parents, their offspring, and spouses of parents and offspring (N=4,659). We used the Cox and mixed effects regression models to examine associations of e2 (contrasted by e3/3 genotype) with diseases of heart (HD), stroke, pneumonia, asthma, macular degeneration, bronchitis, lifespan, and the levels of lipids and creatinine. No associations of e2 with macular degeneration, asthma, and bronchitis were detected. Marginally significant protective associations were seen for lifespan, pneumonia, stroke, and creatinine levels in some family groups. Strong protective effects were seen for low density lipoprotein cholesterol (LDL-C) and HD. The association with LDL-C was not family-group specific (beta=-0.063, p=6.0E-31) whereas that with HD was observed in long-living parents and offspring (RR=0.74, p=4.2E-3) but not in spouses (RR=1.28, p=0.28). We found that the associations of e2 with HD and lifespan were strongly modulated by LDL-C that substantially improved the effects for HD, RR=0.60, p=3.1E-6. P-value for lifespan was improved by one-order of magnitude; the effect was limited to women with longer lifespan (RR>93years=0.60, p=1.6E-3). Unlike LDL-C, HD did not affect this association. Our results suggest that e2 allele may show favorable effects on biomarkers, diseases, and lifespan through different mechanisms.

PERINATAL COMPLICATIONS PREDICT SUBJECTIVE AND OBJECTIVE AGING INDICATORS BY MIDLIFE

I. Shalev[1], A. Caspi[2], T.E. Moffitt[2], *1. Pennsylvania State University, University Park, Pennsylvania, 2. Duke University, Durham, North Carolina*

Background: The model of the developmental origins of health and disease suggests that impaired growth in utero may permanently change the body's function and metabolism, leading to accelerated aging. Evidence of perinatal programming of adult mortality raises the question of what mechanisms embed this long-term effect. We tested the hypothesis that perinatal complications are associated with biomarkers of accelerated aging already at midlife, before onset of aging-related diseases. Methods: In the first prospective-longitudinal study we tested the association between perinatal complications (assessed at birth) and two aging indicators assessed at age 38 years— objectively by leukocyte telomere length and subjectively by perceived facial age — in the representative Dunedin birth cohort (N=1037). Results: Perinatal complications predicted both leukocyte telomere length (β= -.101, p=.004) and perceived age (β= .097, p=.005) by midlife. We repeated analyses with controls for measures of genetic and social risk that could predispose to perinatal complications and accelerated aging, and for measures of poor health taken in between birth and age-38 follow-up. These covariates attenuated, but did not fully explain, the associations observed between perinatal complications and aging indicators. Conclusions: Our findings provide support for early-life developmental programming by linking newborns' perinatal complications to accelerated aging at midlife. We observed indications of accelerated aging 'inside', as measured by leukocyte telomere length— an indicator of cellular aging— and 'outside', as measured by perceived age— an indicator of declining integrity of tissues. A better understanding of mechanisms underlying perinatal programming of adult aging is needed.

EFFECTS OF DEPRESSIVE SYMPTOMS ON NON-LESION AND ISCHEMIC LESION BRAIN VOLUMES IN ELDERLY WOMEN: WHIMS-MRI2 STUDY

J.S. Goveas[1], D.P. Beavers[2], R. Casanova[3], M.A. Espeland[4], P. Hogan[5], N.F. Woods[6], C. Davatzikos[7], S. Resnick[8], *1. Medical College of Wisconsin, Milwaukee, Wisconsin, 2. Wake Forest, Winston-Salem, North Carolina, 3. Wake Forest, Winston-Salem, North Carolina, 4. Wake Forest, Winston-Salem, North Carolina, 5. Wake Forest, winston-Salem, North Carolina, 6. University of Washington, Seattle, Washington, 7. University of Pennsylvania, Philadelphia, Pennsylvania, 8. National Institute on Aging, Baltimore, Maryland*

Background. The cross sectional and longitudinal associations of subclinical depressive symptoms (DS) (Aim 1) and DS severity scores (Aim 2) with non-lesion and ischemic lesion brain volumes in elderly women were examined. Methods. DS (measured by the 15-item Yesavage Geriatric Depression Scale [GDS]) that were measured within one year prior to the first WHIMS-MRI scan were available for a total of 765 women free of mild cognitive impairment and probable dementia. 397(51.8%) women whose GDS were available were rescanned an average of 4.7 years after the initial MRI. MRI outcomes of interest included non-lesion and ischemic lesion volumes in the total brain, gray matter (GM), white matter, and frontal, parietal, temporal and occipital lobes. General linear models were used to determine cross-sectional differences and mean rates of longitudinal changes in MRI measures, after adjusting for relevant covariates. Results. 62 (8%) women at baseline and 26 (7%) at second MRI met DS cut-off. After covariate adjustment, depressed women had lower non-lesion volumes for total brain, frontal and parietal lobe (p<0.05); and higher mean lesion burden for total brain, GM and parietal lobes (p<0.05). Longitudinally, only greater GM and frontal lobe ischemic lesion load increases were associated with DS. Greater DS severity was associated with lower GM and frontal lobe non-lesion volumes, and higher GM and parietal lobe lesion load (p<0.05). Conclusion. These findings of volume loss and higher ischemic lesion burden in the fronto-parietal areas may provide novel insights into the disrupted executive control neural circuitry in subclinically depressed older women.

THE RELATIONSHIP BETWEEN PEAK ALPHA FREQUENCY AND COGNITIVE ABILITY IN NORMAL ADULTS

J. Fleck, J. Kuti, J. Brown, R. Alden, C. Gayda-Chelder, *Psychology, The Richard Stockton College, Galloway, New Jersey*

Reductions in peak alpha frequency have been observed in individuals with AD and MCI, when compared to older adults experiencing healthy aging. This slowing of electrical activity has been linked to neurodegeneration in the brain (e.g. reduced hippocampal volume). We compared peak alpha frequency in normal adults with no prior diagnosis of dementia or MCI. Eyes-closed resting-state EEGs were recorded from 74 participants, between the ages of 50 and 85 years (M = 67.31). Participants also completed neuropsychological assessments of memory (Digit Span, CVLT-II), executive function (Trails A and B, Letter and Category Fluency), and global cognition (MMSE-II). Participants were divided into high and low cognitive ability groups using a composite of neuropsychological assessment scores. Because peak alpha levels decline with age, age was used as a covariate in all analyses. Participants in the high cognitive ability group exhibited higher peak alpha frequencies than did participants in the low cognitive ability group. Mean peak alpha values, calculated across the 19 electrodes in the International 10-20 Electrode System, were positively correlated with Digit Span scores, and negatively correlated with completion times on Trails A and B. In sum, these findings reveal a slowing of brain electrical rhythms in normal adults and link the reduction in peak alpha frequency to weaker performance on measures of cognitive ability. We discuss EEG as an important tool in the early detection of cognitive decline.

IDENTIFICATION OF INHERITED AND ACQUIRED MITOCHONDRIAL DNA MUTATIONS LEADING TO AGE-RELATED COGNITIVE AND SENSORY DECLINE

G.J. Tranah[1,3], T. Harris[2], K. Yaffe[3], S.R. Cummings[1], *1. Research Institute, California Pacific Medical Center, San Francisco, California, 2. National Institute on Aging, Bethesda, Maryland, 3. University of California, San Francisco, San Francisco, California*

Mitochondrial dysfunction is an especially important characteristic of most late-onset neurodegenerative diseases. Early alterations to mitochondria may present more desirable therapeutic targets than the reversal of the individual pathologies that occur later in the neurodegenerative process. We assessed the influence of inherited and acquired (heteroplasmy) mtDNA sequence variation on cognitive function, vision and hearing in 1,000 European- and African-Americans from the population-based Health, Aging, and Body Composition Study. The entire 16.5kb of mtDNA was sequenced using array based and next generation sequencing technologies and we examined the role of individual and aggregated mtDNA sequence variants for associations. Heteroplasmy, a mixture of normal and mutant mtDNA molecules, was also measured and analyzed for associations. Individual and aggregate inherited mtDNA mutations were significantly associated with cognitive function, vision and hearing. Higher heteroplasmy levels detected at specific mtDNA mutations previously linked to mitochondrial diseases was significantly associated with decreased cognitive function, contrast sensitivity, and high frequency hearing. Identifying inherited and acquired mitochondrial genetic variants that influence cognitive and sensory decline might lead to the development of interventions or new clinical strategies for improving mitochondrial function and delaying the onset of neurodegeneration. Circulating mtDNA heteroplasmy may represent a useful peripheral bio-marker for identifying those at risk of developing cognitive and sensory impairment and for monitoring persons who are receiving pharmacologic and behavioral treatments that target the mitochondria.

SESSION 970 (POSTER)

SOCIAL ISOLATION, NETWORKS AND SUPPORT

RELIABILITY & VALIDITY OF SELF-EFFICACY SCALE FOR PREVENTING SOCIAL ISOLATION OF ELDERS IN RESIDENTS

A. Kono[1], Y. Kanaya[1], E. Tadaka[2], Y. Dai[2], W. Itoi[3], Y. Imamatsu[2], *1. School of Nursing. Osaka City University, Osaka, Japan, 2. School of Medicine, Yokohama City University, Yokohama, Japan, 3. School of Medical Science, Teikyo University of Scinence, Tokyo, Japan*

We have previously tested the Self-Efficacy Scale for Preventing and Alleviating Social isolation among community-dwelling elderly people (SES-PAS) in a dataset of community volunteers. The aim of the present study was to test the SES-PAS in a dataset drawn from general residents and demonstrate the internal consistency and concurrent validity of the SES-PAS. The SES-PAS, based on 12 items and a 4-point Likert-type scale, was developed using self-reported questionnaires administered to 3,484 randomly sampled general residents (age: ≥ 55years) living in urban areas in Japan. Data were collected using the subscale "offering" of the revised Generative Concern Scale (GCS-R; Marushima, et al. 2007) and the Community Commitment Scale (CCS; Kono, et al. 2012) to assess concurrent validity. Item analysis and factor analysis identified 8 items, which were classified under the domains "community networking" and "neighborhood watching", for the residents (cumulative contribution 0.52). The Cronbach's alpha index of the SES-PAS was 0.90, that of the subscale for "community networking" was 0.88, and that of the subscale for "neighborhood watching" was 0.84. The correlation coefficients were 0.54 ($p<0.001$) for the scores of the SES-BRCE and "offering" of the GCS-R and 0.52 ($p<0.001$) for those of the SES-PAS and CCS. These results demonstrated that there was sufficient internal consistency and acceptable concurrent validity for the SES-PAS with respect to general residents. Thus, it would appear that the SES-PAS could be utilized in general residents aged 55 years or older living in urban areas.

SOCIAL EXCHANGE OF COMMUNITY-DWELLING OLDER MEN THROUGH PARTICIPATION IN COOKING CLASSES FOR MEN

J. Karashima[1], Y. Nakagawa[1], H. Osada[2], *1. Jissen Women's University, Tokyo, Japan, 2. J. F. Oberlin University Graduate School, Tokyo, Japan*

This study examined the effect of encouraging social exchanges in older men by participating in cooking classes for men. Cooking classes that targeted community-dwelling men were held six times, from June 2012 to November 2013, in Hino City, Tokyo, Japan. The cooking consisted of collaboration in groups, and participants ate all the dishes they made for lunch. A questionnaire survey was administered to the participants after the end of each class, to examine the effects of encouraging social exchange, the questionnaire asked about the age of the participants, the number of times they participated, and whether this was their class. Participants of all six cooking classes were 66 men (mean age = 71.4, SD = 14.4). The majority were elderly adults, but there was also a middle-aged man. Repeat participants and first-time participants were mixed in each class. The classes were an opportunity to increase participation in social activities and promote the ongoing expansion of social exchanges in the region for the older -men. In addition, 80.6% of the first-time participants had an opportunity to be introduced to the neighborhood association, a percentage that was higher than that of the repeat participants. Cooking provides the opportunity for an exchange of conversation, which inevitably occurs in a group activity. Expansion of the group through new participants is required to support the continuation of participant invites. By increasing the independence of older men, this cooking-based intervention can be expected to further promote exchanges.

BABY BOOMERS' VOLUNTEERING INTENTION AND RESOURCES

H. Lee, *Joongbu University, Suwon, Gyeonggi-do, Republic of Korea*

Objective: There have been, in North America, much debates on how many baby boomers will engage in volunteerism in their retirement years, compared to their older generations. The underlying assumption is that baby boomers are huge in size so that they are valuable resources for communities and countries. An aim of this investigation is to explore future volunteering participation for Korean baby boomers(1955 to 1963 birth cohorts), in which the paper uses future volunteering intention as a proxy measure of civic engagement in retirement years. Method: The data come from 2009 Korean Social Survey by Statistics Korea which is nationally representative and executed biannually. The volunteering intention is measured by a 3 point Likert scale. An ordered multinomial logistic regression is performed to estimate parameters of regression coefficients for 19 resource variables, controlling for other 10 variables(N=6,903). Findings: All variables in equation appeared to be statistically significant($p<.001$). A high education increased the volunteering intention(B=.103), but long work hours reduced the volunteering intention(B=-.001). Many numbers of associations registered increased the intention(B=.297), but having spouses reduced the intention, as opposite to our expectations(B=-.019). Having religion increased the intention(B=.306) and many frequencies of enjoying exhibits and culture performances increased the volunteering intention, too. In sum, the findings give some supports to resource approaches to volunteer intention studies. Implications: Selective resource enhancement strategies may be true in order for Korean baby boomers to engage in volunteering, even though intention and participation behaviors are not necessarily in agreement. Also, adequate incentive systems need to be complemented.

CONTINUITY AND CHANGES IN SOCIAL CONVOYS : A CASE OF BEREAVED OLDER ADULTS IN RURAL JAPAN

H. Kodama[1], R. Hirayama[2,1], *1. Tokyo Metropolitan Institute of Gerontology, Tokyo, Japan, 2. Japan Society for the Promotion of Science, Tokyo, Japan*

Guided by social convoy theory, our aim in this study was to examine whether and how the social relationships of Japanese rural older adults were reconstructed after the death of their family members they had cared for. The theory posits that one's personal network (i.e., social convoy) can be reorganized accompanying changes in the role this person assumes. We thus sought to identify whether and how loss of caregiver role might influence the structure and functions of these older adults' social convoys. We used semistructured interview data from 13 rural older adults (77% women; mean age = 67.3). They spent, on average, 26 months after they lost their care recipients. We qualitatively analyzed these data with particular attention to participants' accounts of their support sources. Our analysis revealed both continuity and changes in the social convoys of bereaved older adults. There was little difference in the composition of their convoys before and after the death of their care recipients. Changes were found in how convoy members helped these older adults. Participants maintained contacts with those who had helped them with their caregiving (e.g., care service staff members), from whom they then received assistance in adjusting to their post-caregiving lives. For example, some participants found a paid job with help from staff members of day care facilities that their family members had used when alive. These findings suggest that social ties built in the process of caregiving may promote former caregivers' adjustment to bereavement.

FEASIBILITY OF AN ANALYTIC FRAMEWORK TO EXAMINE PERSON-CENTERED INTERACTION AND BEHAVIORAL SYMPTOMS

A.L. Gilmore-Bykovskyi[1,2], E. Lipton[1,3], E. Brucks[1,3], L. Nakad[1], T.J. Roberts[4,1], B.J. Bowers[1], R.L. Brown[1], *1. University of Wisconsin-Madison School of Nursing, Madison, Wisconsin, 2. University of Wisconsin-Madison School of Medicine & Public Health, Department of Medicine Geriatric Division, Madison, Wisconsin, 3. University of Wisconsin-Madison Department of Communication Sciences and Disorders, Madison, Wisconsin, 4. William S. Middleton Memorial Veterans Hospital Geriatrics Research Education and Clinical Center (GRECC), Madison, West Virginia*

Dementia-related behavioral symptoms pose a major challenge during mealtimes, compromising nursing home (NH) residents' nutritional status, which is central to maintaining function and quality of life. Research suggests that the quality of interactions during meals may influence nutritional intake, but little is known about what types of interactions most effectively reduce common mealtime difficulties such as behavioral symptoms. Person-centered interactions have been found to be effective at reducing behavioral symptoms during other care processes, such as bathing. Past research on person-centered interactions and mealtime care among NH residents has relied heavily on static observational methods, limiting our ability to quantify sequences of temporality between various person-centered interactions and behaviors. No research has examined the time-sensitive relationship between person-centered mealtime interactions and behavioral symptoms. The purpose of this video-recorded observational study was to examine the feasibility and clinical utility of a computer-assisted analytic framework for documenting patterns of person-centered mealtime interaction and behavioral symptoms. Twenty-five video-observations of provider-resident mealtime interactions in 2 memory care units in Wisconsin (N=9 residents, N=6 providers) were conducted. Interactions were coded using the Person-Centered Behavior Inventory and Pittsburgh Agitation Scale which were adapted for use with the Noldus Observer® XT. The framework proved to be feasible and effective in capturing clinically-relevant interaction-related antecedents to mealtime behavioral symptoms. The framework yielded acceptable inter-coder agreement ratings (94 percent agreement, κ= .78). Feasibility issues related to training of coders, challenges with addressing reciprocation of person-centered provider actions and clustering strategies for non-dyadic interactions will be presented.

RELATIONSHIP OF LONELINESS, SOCIAL ISOLATION, AND MORTALITY OF JAPANESE OLDER ADULTS

E. Takagi[1], Y. Saito[2], *1. Towson University, Towson, Maryland, 2. Nihon University, Tokyo, Japan*

We investigated how Japanese older adults' feeling of loneliness and social isolation are related to mortality respectively. Our analyses used five waves of data in the Nihon University Longitudinal Study of Aging (NUJLSOA) collected from the nationally representative Japanese older adults of 65 years and older (n=4997) between the years of 1999 and 2009. For this study, we pooled two or three-year interval observations and conducted analyses of logistic regression with older respondent's death at the end of the interval as outcome. The results indicated that most of the variables related to social isolation, such as living alone, living with a child, and frequencies of contact with children were not directly related to mortality. On the other hand, one variable that reported older adults' affiliations with community groups and organizations was associated with a lower level of mortality. We also identified a moderate association between older adults' feeling of loneliness and a higher level of mortality. This seems to confirm results of past studies in other national contexts that indicated significant associations between loneliness and negative physical health problems. Our results suggest that feeling of loneliness has potentially a significant impact on physical well-being of older adults in Japan; and that its relationship with health, social isolation, family support, and ties with surrounding communities need to be carefully examined.

IS BEING MARRIED ASSOCIATED TO THE FUNCTIONAL STATUS OF OLDER ADULTS? A LONGITUDINAL STUDY IN A MIDDLE INCOME COUNTRY

A. Fuentes-García[1], C. Albala[2], H. Sanchez[2], L. Lera[2], *1. School of Public Health, Faculty of Medicine, Universidad de Chile, Santiago, Chile, 2. Institute of Nutrition and Food Technology, Universidad de Chile, Santiago, Chile*

Introduction: One of the most important sources of emotional support during old age is the presence of partner/spouse. Few studies have used longitudinal data in Latin American to associate functionality with emotional support. Methods: The data source is a 5-years longitudinal study (2000-2005) of the SABE cohort, a probabilistic and representative sample of 1019 adults aged 60+y (75.6% women;72.2±8,2) living in Santiago-Chile. Functional limitation was defined from a combination of 6 ADL, 7 IADL, and 7 mobility activities (non-limited; and limited). Marital status (married vs. not married) was used as a proxy for emotional support. Aim: To estimate the prognostic role of emotional support to functional status of elderly in a middle-income country. Results: The initial prevalence of functional limitation was 47.3%(95%CI:44.2;50.4), and after 5 years 17% died and 8% was lost to follow up. 71.5% of men (95%CI:66.4;76.1) and 31.3% of women are married (95%CI:27.7;34.9). The logistic regression model of functional limitation after 5year follow up, adjusted for age, functional limitation in baseline, schooling, and number of morbidities (none, 1 or >=2), show interaction between emotional support and gender. Compared with non-married men, being married in the baseline was a protective factor of functional limitation for men (OR:0.45; 95%CI:0.2-0.99) but not for women (OR:0.9; 95%CI:0.39-2.13). Conclusion: There is a differential effect of emotional support on functionality by gender. Marriage protection for health seems to be related to gender traditional roles in this cohort. These findings indicate gender differences in the process of ageing, and the importance of the social context of disablement.

GENDER, CONFIDANT RELATIONSHIPS, AND DEPRESSIVE SYMPTOMS IN LATE LIFE

J. Bookwala, *Psychology, Lafayette College, Easton, Pennsylvania*

Data from 4,923 older adults (mean age=64.3; 55% female) who participated in the Wisconsin Longitudinal Study were used to test gender differences in the prevalence of family and friend confidants and the role of such relationships in emotional well-being. Participants indicated whether or not they had available two types of confidant relationships (with a family member and a friend) and completed the CES-D to measured depressed affect. Having a family member as confidant was common for both women and men (90% vs. 87%) but a friend as confidant was more common among women than men (83% vs. 62%). 2-way ANCOVAs showed those who had a family member as confidant reported significantly lower depressive symptoms than those did (F[1,4913]=120.94, p<.001; Ms= 12.64 vs. 17.35, respectively) and women reported more depressive symptoms than men obtained (F[1,4913]=8.51, p<.05; Ms= 14.72 vs. 16.22, respectively); however, no significant gender x family confidant interaction was obtained. In comparison, a significant gender x friend confidant interaction was seen (F[1,4913]=7.21, p<.01) in addition to the main effects seen with having a family member as confidant. Simple effects analyses showed that, although the unavailability of a friend as confidant was linked to more depressive symptoms for both women and men, this negative effect was substantially stronger for women. These results show that friend confidants are especially important for women's emotional well-being. Interventions that can promote the development and maintenance of confiding friendships may be especially effective in promoting emotional well-being in late life.

LINKING RESOURCES AND SOCIAL SUPPORT AT 65+: FINDINGS FROM THE KOREAN LONGITUDINAL STUDY OF AGEING

J. Shim[1], M. Martin[1,2,3], C. Röcke[2,3], *1. Department of Psychology, University of Zurich, Zurich, Switzerland, 2. University Research Priority Program "Dynamics of Healthy Aging", University of Zurich, Zurich, Switzerland, 3. International Normal Aging and Plasticity Imaging Center / INAPIC, University of Zurich, Zurich, Switzerland*

There is strong evidence that social support is an important resource to boost psychological wellbeing and physical health conditions. However, relatively little attention has been paid to the exchange of social support within the generation of older adults (intragenerational support potential), especially in Asia. Social support resources include both emotional and/or instrumental assistance. We measured social support potential/resources on two measurement occasions of the Korean Longitudinal Study of Ageing (KLoSA; N = 3,384 adults aged 65+ years), assessed two years apart. In the first step, we examined a variety of resources as proxies for social support potential, including aid (physical ability; K-IADL) and affect (emotional ability; K-CES-D10). The results indicated a mean-level decrease in everyday competence as well as a mean-level increase in depressive symptoms. They also showed individual cases with stable or improved (decreased) levels of competence (depression) over time. In the next step, we examined the relationship between available resources and change therein and actual social support behavior over time (a) to examine if social support behavior depends on the level of functioning, especially with regards to individuals who show high or very low functioning and thus potential for support over time, and (b) to investigate the moderating effect of objective and subjective social network characteristics on the actual social support behavior. The findings provide an interesting glance into aging in Asia. In addition, the results suggest effective ways of promoting the intragenerational exchange of social support in future studies.

ASSOCIATION BETWEEN FAMILY STRUCTURE AND FUNCTIONING AMONG THE OLDEST OLD

Y. Zhang[1], P. Martin[1], L. Poon[2], *1. Human Development and Family Studies, Iowa State University, Ames, Iowa, 2. University of Georgia, Athens, Georgia*

This study explored the effect of family structure on functioning among oldest old adults. Based on the Georgia Centenarians Study, this research consisted of 82 octogenarians and 239 centenarians. Family structure was assessed by number of children, living brothers or sisters, number of living brothers or sisters, number of deceased siblings, and number of living children. Functioning was assessed by the following four dimensions: cognition, mental health (i.e., depression and loneliness), activities of daily living (ADL), and subjective physical health. Results indicated that family structure had an effect on all four aspects of functioning in extreme late life. The more children the oldest old had, the lower their cognitive level and the lower their level of loneliness. The more living children the centenarians had, the lower they rated their physical health. Having living siblings was associated with better daily functioning for octogenarians. The more deceased siblings octogenarians had, the less likely they were to feel depressed. Future research needs to address social comparison aspects of these findings and explain some of the disparate findings about beneficial and detrimental aspects of family support.

SOCIAL ENGAGEMENT OF THE OLDEST-OLD: FINDINGS FROM THE 2010 HEALTH AND RETIREMENT STUDY

C. Somerville, C. Lee, I. Livingstone, D.R. Kafle, L. Quach, E. Dugan, *Gerontology, University of Massachusetts Boston, Boston, Massachusetts*

Social engagement is an integral component of healthy aging. In this cross-sectional study, we describe and compare social activity of the very old(VO) and centenarians(CE) and explore factors associated with involvement. Data from participants 85 and older (N=2321) from the 2010 wave of the HRS were analyzed. Demographic characteristics: mean age was 89.71 years (85-109 range) and 63% were female (84% for CE), 80.6% were non-Hispanic Whites (72.7% for CE), and the mean number of years of education was 11.55 (10.93 for CE). About 28% of VO were married and 64% were widowed, whereas for the 11 CE respondents, all were widowed. Nearly 42% of VO attend religious services frequently, but only 18.18% attend frequently. About 18% of VO report volunteerism and 19% report helping others; no CE responded positively for volunteering or helping others. The VO rarely use email for communication (11.3%); few met with friends daily (17%) or weekly (33.83%). No CE reported using email or the Internet for communication but 3 respondents met daily with friends or family and 2 met weekly with others. A small number of VO still participate in paid work (2%) and no CE reported paid work. In a logistic regression analysis for a combined group of oldest-old (VO and CE; N=1097), those who identified religion as very important (OR=4.74; p-val≤.01), who are cognitively stable (OR=1.05; p-val≤.05), those who still drive (OR=1.92; p-val≤.01), and those who live near friends (OR=4.02; p-val≤.01) are more likely to participate in one or more social activity.

THE EFFECT OF SHORTENED FUTURE-TIME PERSPECTIVE ON SOCIAL RELATIONSHIPS AND EMOTION REGULATION

N.G. Regier[1], P.A. Parmelee[2], *1. VA Boston Healthcare System, Boston, Massachusetts, 2. University of Alabama, Tuscaloosa, Alabama*

Carstensen's well-known theory of Socioemotional Selectivity Theory (SST) holds that, when time is perceived as constrained, both younger and older persons focus more on the emotional aspects of situations, favor emotion-focused coping strategies over problem-focused ones, and prioritize emotionally rewarding relationships over novel social ones. In addition, SST posits that persons with a shortened future-time perspective become more adept at emotion regulation in general, as this becomes a higher priority than knowledge acquisition. The majority of research on SST concepts has been conducted in the field of cognitive psychology, whereas the present study directly and explicitly examined the effects of changing future-time perspective on relationship or social network shifts and emotion regulation in older adults using data from the Aging, Status, and Sense of Control (ASOC) survey (Mirowsky & Ross, 1995; 1998; 2001). Only those participants who provided data for all of the aforementioned relevant variables at both baseline and the 2001 follow-up were included in the analyses (n = 592). Ordinary least-squares regression analyses found that a) marital happiness increased as perceived percentage of life left decreased, b) less constrained future-time resulted in an increase in socialization, and c) emotion regulation increased as perceived future-time decreased. The present study provides one of the first direct assessments of the implications of future-time perspective on relationships and emotion regulation, and several findings provide empirical support for socio-emotional selectivity theory.

SINGLE AND SEARCHING: HOW OLDER AND YOUNGER ADULTS SEEK ROMANTIC PARTNERS ONLINE

E.M. Davis, L.A. Neff, K. Fingerman, *Human Development and Family Sciences, The University of Texas at Austin, Austin, Texas*

Despite a growing population of single older adults, past research and theory on romantic partnership has primarily focused on younger adults. Online dating has become an increasingly prevalent context for both older and younger adults to form romantic relationships. Nonetheless, adults of different ages may have different motivations for seeking dating partners. Older adults are likely to present a communal orientation in their dating profiles, emphasizing connections with others and a desire for companionship. Conversely, younger adults are likely to present an agentic orientation, emphasizing their own attributes and achievements. The current study sampled 4,000 profiles from two popular online dating websites. Themes in these profiles were identified using Linguistic Inquiry and Word Count (LIWC; Pennebaker, Booth & Francis, 2007). Regression analyses revealed significant associations between age and word use. Older adults were more likely to use words associated with positive emotion ($\beta = .15$) and friends ($\beta = .04$) as well as first person plural pronouns (e.g. we, us, our), reflecting a focus on connectedness ($\beta = .13$). Younger adults were more likely to use words associated with work and achievement ($\beta = -.03$ and $\beta = -.08$) and were more likely to emphasize the self ($\beta = -.27$), using more first person singular pronouns (e.g. I, me, my). Results suggest younger adults focus on enhancing the "self" when seeking romantic partnership. Consistent with theories of adult development, older adults view romantic partners as an addition to an existing network of friends and family.

FACTORS PREDICTING RELATIONAL CLOSENESS IN LONG-TERM CARE RELATIONSHIPS

C.K. Coleman[1], K.N. Williams[2], *1. Center for Community Support and Research, Wichita State University, Wichita, Kansas, 2. University of Iowa, College of Nursing, Iowa City, Iowa*

Relationships between staff and residents have increasingly been recognized as an important component of person-centered care and residents' quality of life. (White et al., 2008, Schenk et al., 2013). The Mutuality Scale, taken from the family caregiving literature, shows promise for measuring the closeness of relationships in long-term care (LTC) (Archbold et al., 1990, Heliker, 2010, Coleman & Medvene, 2013). This study examines factors related to mutuality in LTC in order to understand how these relationships differ from family caregiving relationships. As part of a larger intervention study aimed at increasing communication skills in LTC caregivers, staff participants (N=94) paired with residents with which they regularly work were surveyed. Caregiver's age, confidence level, and mutuality score were collected as well as the resident's Functional Assessment Staging Test (FAST), Modified Cumulative Illness Rating Scale (MCIS), and level of ADL support. A standard multiple regression analyses was significant, $R = .58$, adjusted $R2 = .34$, $F(4, 54) = 6.95$, $p < .001$, indicating that a third of the variability in mutuality is predicted by the caregiver's confidence (β=.49), caregiver age (β=.26), required level of ADL assistance (β=-.23), and comorbidities (β=-.14). Feelings of closeness to the resident increased with caregiver confidence and age. Mutuality decreased with greater levels of functional disability and illness. The FAST score did not contribute to the equation indicting that level of dementia did not impact mutuality. These findings are similar to the findings in the family caregiving literature.

SUBJECTIVE VS. STRUCTURAL ASPECTS OF SOCIAL CAPITAL AND MENTAL HEALTH: DOES AGE MATTER?

H. Litwin, K.J. Stoeckel, *IGDC, Hebrew University, Jerusalem, Israel*

Although social capital is associated with mental health in late life, there is little agreement as to what accounts for this association. An underexplored area is the relative contribution of structural and subjective aspects of social capital. Specifically, is it the structure of the social network or one's subjective interpretation of these ties which matters most? Moreover, do the relative contributions of social capital measures vary by age? The current study examined these questions among respondents aged 65+ from the 4th wave of the Survey of Health, Ageing and Retirement in Europe (SHARE), using data retrieved by a name generating social network inventory (N=26,784). Structural capital features included network size and percent of the network: a) in close proximity, b) in frequent contact, and c) with close emotional attachment. Subjective social capital adequacy was measured by satisfaction with the network (0-10). The mental health outcome, depressive symptoms (EURO-D), was regressed on the social capital variables controlling for background demographics (age, gender, country, education, marital status, number of children) and health (physical symptoms, ADL limitations, mobility limitations, cognition). Age interaction terms were employed for each of the social capital variables. The results revealed that among those aged 65-79, greater satisfaction with ties was associated with fewer depressive symptoms, as were, to a lesser degree, network size and greater emotional attachment. In contrast, only network size was negatively related to depressive symptoms for those aged 80+, while close proximity was positively related.

CRITERION-RELATED VALIDITY OF A COMMUNITY COMMITMENT SCALE AMONG OLDER PEOPLE

A. Kono[1], Y. Kanaya[1], E. Tadaka[3], Y. Dai[3], W. Itoi[2], Y. Imamatsu[3], *1. School of Nursing. Osaka City University, Osaka, Japan, 2. Faculty of Medical Science, Teikyo University of Science, Tokyo, Japan, 3. School of Medicine, Yokohama City University, Yokohama, Japan*

We developed the Community Commitment Scale (CCS) to measure the psychological sense of belonging and socialization in the community among older people and verified that it has sufficient internal consistency and concurrent validity. We hypothesized that local volunteers who help elderly neighbors would have a high level of community commitment. The purpose of the present study was to compare the community commitment of local volunteers to that of general residents, and to confirm the criteria-related validity of the CCS among older adults. Based on a self-report questionnaire survey administered to 859 local volunteers and to 3484 randomly sampled general residents, we formulated a matching dataset stratified by gender and age and selected subjects aged from 60 to 80 years. The subject population consisted of 614 local volunteers and 614 general residents. According to bivariate analysis, the CCS scores for local volunteers were significantly higher than those for general residents ($p<0.0001$). A multiple stepwise regression model showed that there was a strong correlation between community commitment and being local volunteers (beta=3.2, $p<0.0001$, partial $R2=0.16$), adjusted for variables for which there was a significant correlation by bivariate analysis, including owing a house (beta=0.9, $p<0.0001$, partial $R2=0.01$), living in the area for 30 years or longer (beta=1.0, $p<0.01$, partial $R2=0.01$), and living in a family of three generation (beta=0.9, $p<0.01$, partial $R2=0.01$). The results demonstrate that local volunteers were more likely to commit to their community than general residents, and the criterion-related validity of the CCS was confirmed.

LEVERAGING SOCIAL NETWORKS TO PROMOTE CANCER SCREENING AMONG MIDDLE AGED AND OLDER ADULTS: PERSPECTIVES FROM KEY PLAYERS

N.E. Schoenberg[1], C. Snell-Rood[1], A. Jonas[1], K. Eddens[1], M. Katz[2], *1. Behavioral Science, University of KY, Lexington, Kentucky, 2. Ohio State University, Columbus, Ohio*

Abstract: Social networks (SN) influence health behavior and health status. “Key players” or individuals identified as influential by multiple people within the SN often serve as opinion leaders, having taken the pulse of the community and possessing novel and relevant insights. To better understand cancer screening patterns within SN of a health disparities population (rural Appalachia), we first conducted a SN analysis of sixteen egos and 125 alters. Within the SN, we identified individuals according to their centrality and interviewed these ten key players (KP) to determine the nature of their role in their SN, their cancer screening patterns compared with those in their SN, and how KP might be leveraged to increase cancer screening. In this presentation, we first present our SN maps and explain how we identified the KP. Our findings suggest that KP have the following attributes: (1) they occupy highly relevant positions in the community (health care professional, community helper); (2) they maintain positive personal characteristics (helpful, but not coercive; knowledgeable about health issues; good communicators); and (3) they tend to maintain positive health behaviors, including current cancer screening status. KP may be leveraged to promote cancer screening through (1) their insights into what constitutes barriers and facilitators of cancer screening uptake; (2) their awareness of what comprises appropriate and needed informational support to non-screened members of their SN; and (3) their creative ideas on improving navigation of the health care environment in medical underserved rural communities.

SOCIAL SUPPORT BUFFERS THE NEGATIVE EFFECTS OF MULTIPLE LOSSES IN LATE LIFE IN DEPRESSION

A. Choi, J. Seok, D. Hyun, I. Nam, *Hallym University, Chuncheon, Republic of Korea*

Social Support Buffers the Negative Effects of Multiple Losses in Late Life in Depression Ilsung Nam Background: A grieving individual in late life can confront multiple losses simultaneously or in rapid succession. Depressed mood is a common response to this seemingly relentless progression, especially for older adults who are themselves in failing health or who suffer from social isolation. Understanding the level of distress post-death of those with multiple losses and their coping resources with a loss will advance knowledge, which can inform practice. Method: Data from the Changing Lives of Older Couples (CLOC) project provide a unique opportunity to further understanding of the pattern of depressive symptoms over time. Participating caregivers completed the Center for Epidemiologic Studies Depression inventory, measures related positive social support from others. Of the 210 participants in baseline, 92 individuals followed over a period of 48 month were analyzed for bereaved caregivers [Spousal loss only ($n = 61$), Additional losses ($n = 38$)]. Result: A 4 x 2 x 2 repeated-measures analysis of variance was performed on depressive symtomatology as a function of loss status (spousal, spouse and additional) and social support (high, low). There was a marginally significant difference on the depressive symptomatology between single and multiple losses, $F(1, 85) = 2.99$, $p = .08$, $\eta p2 = .03$. There was a significant time and time X social support effect, [$F(2.64, 152.76) = 6.21$, $p = .01$, $\eta p2 = .07$; $F(2.64, 152.76) = 2.80$, $p = .03$, $\eta p2 = .004$]. Depression of the bereaved decreased over time and there was a different pattern of the decrease in depression over time by the social support level. At the high level of social support, both spousal loss and multiple losses groups showed a similar decreasing pattern, whereas multiple losses group at the low level social support repeated decrease and increase over time as opposed to continuing decreasing pattern of spousal loss group with high level of social support. Conclusion: The current study revealed a significant buffering effect of social support on depressive symptomatology. This analysis provides an insight into the ways that individuals experienced multiple losses and received low social support at baseline are a high risk population for chronic depressive symptomatology. These findings can advance practice knowledge by helping better understand the importance of pre widowhood contextual factors such as preloss availability of support to those with multiple losses in late life.

EVIDENCE-BASED PSYCHOSOCIAL TREATMENTS FOR PAIN IN OLDER ADULTS

A. Shah[1], P. Tsui[3], A.K. Hughes[2], *1. University of Alabama, Tuscaloosa, Alabama, 2. Michigan State University, East Lansing, Michigan, 3. Stony Brook, Long Island, New York*

Pain is a common concern for older adults, resulting in a poorer quality of life. Outside of pharmacological pain treatments, clinicians have little guidance as to the efficacy of psychosocial pain management approaches. Criteria suggested by Weisz and Hawley (2001) was used to identify evidence based treatments. To be considered evidence-based, there needed to be two controlled studies in which the treatment was shown to be significantly better than a control condition. Articles were included if the mean age of the participants was 50. Two reviewers conducted searches in Psychinfo, PubMed, and CINAHL databases using the search terms chronic pain, pain, older adults, geriatric, elderly, aged, psychotherapy, pain management, nonpharmocological pain management, and intervention. Initially, abstracts and titles were examined. Articles whose abstracts seemed to fit search criteria were reviewed in greater detail. In addition, we reviewed other pain review articles. The studies that met our stringent criteria evaluated the following types of psychotherapies; guided imagery, relaxation training, cognitive behavioral therapy, self-management, mindfulness meditation, pain coping skills training, problem focused therapy, emotion focused therapy, educational training, and spouse assisted training. Cognitive behavioral therapy, pain self-management interventions, pain coping skills training, and guided Imagery seemed to have the most support for use in older adults.

WHY DON’T OLDER PEOPLE TALK ABOUT LONELINESS?

C. Victor, *Brunel University, Uxbridge, United Kingdom*

We have an extensive body of evidence documenting the prevalence of loneliness in later and identifying the key risk factors. For example in Britain approximately 10% of those aged 65+ report that they are often/always lonely and this prevalence rate has remained stable over the last 6 decades. In addition one third of those aged 65 and over perceive loneliness as a part of ‘normal’ ageing and half expect to become lonelier as they grow older. However it remains the case that we have limited intervention with proven effectiveness and we remain uncertain as to how best to support those vulnerable to loneliness in later life. One dimension lacking from our evidence base are the voices of older people themselves about who they talk to about loneliness, what factors, if any, stop them talking about loneliness to their family and what interventions they think would help combat loneliness. We examine these questions using a telephone survey of 1126 British people aged 55+ undertaken in

October 2013 commissioned by the SilverLine helpline for older people to mark their launch. Overall 15% reported that they very/quite often lonely, of whom 60% have not discussed their feelings of loneliness with their family. Almost a half of this group, 47%, report that this was because they did not want to be a burden to their family. Chats over a meal and/or over the phone were reported as being helpful activities to combat loneliness.

LATE MIDLIFE PURPOSE IN LIFE: DISTINCT PATTERNS OF TRAJECTORIES AND PSYCHOSOCIAL PREDICTORS

H. Ko, K. Hooker, G. Geldhof, *School of Social and Behavioral Health Sciences, Oregon State University, Corvallis, Oregon*

Research has indicated a significant age difference in purpose in life in which older adults showed lower scores than young and middle-aged adults (Ryff & Singer, 2008), but patterns of purpose in life trajectories during late midlife are unknown. Knowledge of such patterns could enhance understanding of purposeful development in later life. We examined purpose in life trajectories over five years and the significance of baseline psychosocial characteristics in predicting such trajectories. Data were from the Foley Longitudinal Study of Adulthood, a longitudinal study of personality and life stories in late midlife among White and African American middle-class adults. There were 151 participants aged 55-58 at baseline. Purpose in life was assessed each year with the PIL subscale of the Psychological Well-Being scale from 2008 to 2013. Growth mixture modeling results indicated two classes of PIL trajectories (LRT = 111.06, p=.003; BLRT= 113.07, p< .001; Entropy= .873. The majority (75%) started higher and then showed a decreasing PIL trajectory (intercept= 4.29; slope= -.10, p=.04); the other class (25%) started lower and remained stable (intercept= 2.98; slope= -.02, p= .85). The odds ratio of being in the higher-decreasing versus low-stable class is 1.439 (p=.04) for one-unit increase in conscientiousness, adjusting for gender, race, neuroticism, extraversion, and generativity. However, contrary to the theoretical importance of generativity in midlife (Erikson, 1963; McAdams & de St. Aubin, 1992), generativity and related personality traits did not significantly predict class membership. The importance of conscientiousness in contributing to the higher-decreasing pattern of PIL trajectory will be discussed.

AN EXPLORATORY DISCRETE-TIME MULTILEVEL ANALYSIS OF THE EFFECT OF SOCIAL SUPPORT ON THE SURVIVAL OF ELDERLY PEOPLE IN CHINA

Z. Feng, *Centre for Research on Ageing, University of Southampton, Southampton, United Kingdom*

This study undertakes a survival analysis of elderly individuals in China using the Chinese Longitudinal Healthy Longevity Survey 2002-2008. Employing discrete-time multilevel models, we explore the effect of social support on the survival of elderly persons in China. The study finds that living arrangements, perceived and received social support, family income, health status and the level of the province's economic development are associated with older people's survival after controlling for their demographic characteristics and social-economic status. Being more specific, elderly individuals who are younger, female, living with spouse, perceiving care support from family, social service and live-in care givers, covering for finance and medical expenses themselves, with higher family income and good health status have higher odds of survival. When the analysis is conducted separately for elderly persons in urban and rural areas, the results are broadly similar. There is a larger difference between those perceiving care support from family or social service and not perceiving care support in urban areas comparing to those in rural areas. Those who cannot pay medical expenses are the least likely to survive. The higher level of economic development in province has no significant effect on the survival of elderly persons for the whole sample model and for the model including only elderly persons in urban areas; however, there is a negative influence on the survival of elderly people in rural areas.

CONTINUING CARE RESIDENTS' CONNECTIONS TO SOCIAL SUPPORT AND NETWORKS BEFORE AND AFTER FACILITY LIFE

C.M. Burger, *University of Evansville, Evansville, Indiana*

As successive birth cohorts reach older adulthood, the number of individuals seeking residential continuing care will grow accordingly. As a result, the resources offered by continuing care facilities will need to grow and develop accordingly. Furthermore, because residential care by its nature creates an encapsulated living system with the propensity to seclude its residents from life outside of the facility, the social needs of residents will require specific attention. How people relate to society and to their social networks is key to the human condition and to successful aging. Unfortunately, the existing literature regarding continuing care residents' connections to social networks is lacking. This study aims to provide a qualitative assessment of continuing care residents' attitudes toward and perceptions of their connections to social networks, and of how those connections have changed since they have moved into a facility setting. Fifteen women were interviewed in order to measure their attitudes about social connections and residential life. Residents overall reported that, while their connections may have diminished overall, the manner in which they define and experience these connections has changed as well.

POSITIVE AND NEGATIVE SOCIAL INFLUENCES OF FRIENDS ON THE PHYSICAL ACTIVITY LEVELS OF MIDDLE-AGED AND OLDER ADULTS

B.J. Ayotte[1], J. Margrett[2], *1. Psychology, University of Massachusetts Dartmouth, North Dartmouth, Massachusetts, 2. Iowa State University, Ames, Iowa*

Support from family members is an important predictor of physical activity among middle-aged and older adults. However, less is known about how support from friends is related to physical activity levels. The current study examined the association of physical activity with positive and negative social influence from friends. Data on physical health, positive and negative social influence from family members, positive and negative social influence from friends, and physical activity were collected from 232 middle-aged and older adults (Mage = 58.86, SD = 7.10). A hierarchical linear regression controlling for age, physical health, education, and self-reported positive/negative influence from family members found that positive support from friends was related to higher levels of physical activity. Negative social influence from friends, on the other hand, was not related to physical activity levels. Further analyses examined the potential moderating role of sex. Results indicated that positive support from friends was related to increased physical activity for both males and females. Negative social influence was related to lower levels of physical activity among males and females, but this relationship was stronger among females. Overall, this model accounted for 45% of the variance in physical activity levels. Findings are discussed in terms of the need for physical activity interventions to account for social influences from multiple sources.

IS IT BETTER TO GIVE OR TO RECEIVE? AFFECTIVE WELL-BEING CORRELATES OF SOCIAL SUPPORT

D. Wang, T.L. Gruenewald, *University of Southern California, Los Angeles, California*

Research on the connections between social support and health has primarily focused on the psychological and physical well-being benefits of receiving social support. However, emerging evidence suggests that giving support to others may also benefit health. This study investigates the links between giving and receiving support and affective well-being. We examined a subset of adults 25-74 (n=5,999) from the first wave of the National Survey of Midlife Development in the United States (MIDUS). Provision of emotional and instrumental social support was measured in hours per month. Positive and negative affect was measured with a brief version of the Positive and Negative Affect Scale (PANAS).

OLS regression analyses, adjusting for sex, race, and education, indicated that both giving instrumental and emotional support to others were negatively associated with positive affect (β=-.05, p=.028; β=-.08, p=.001) while both receiving instrumental and emotional support from others were positively associated with positive affect (β=.103, p=.000; β=.050, p=.020). Those who gave more instrumental support to others had more negative affect (β=.098, p=.000) while those who received more instrumental support had less negative affect (β=-.069, p=.001). Additional analyses of the ratio of support given to received indicated that those who gave more than they received had more negative and less positive affect. Consistent with previous research, findings suggest affective well-being benefits of receiving support. However, greater levels of support provision are associated with poorer affective well-being. Further analyses will explore the factors that may underlie less favorable well-being in those who give more than they receive.

SESSION 975 (POSTER)

TRANSPORTATION AND AGING

THE INFLUENCE OF INTERPERSONAL PARTNERS ON SELF-REGULATORY DRIVING BEHAVIORS BY OLDER ADULT DRIVERS WITH A VISUAL IMPAIRMENT

E. Schryer[1], S.E. Mock[1], K. Boerner[2], J. Reinhardt[2], A. Horowitz[3], *1. Recreation and Leisure Studies, University of Waterloo, Waterloo, Ontario, Canada, 2. Jewish Home Lifecare, New York, New York, 3. Fordham University, New York, New York*

The goal of the current research is to examine the role played by close interpersonal partners on older adults' decisions to regulate their driving behavior in response to age-related changes in visual functioning. As part of a larger longitudinal study, a sample of 381 drivers aged 55 to 95 with a diagnosed visual impairment, together with a close interpersonal contact (i.e. spouse, friend, adult child) were interviewed about the older adults' driving behaviors both at baseline and again after 12 months. Contacts' level of stress positively predicted changes in the driver's use of self-regulatory driving strategies (e.g. not driving at night). Contacts' perceptions of the negative consequences of driving cessation (for themselves), in contrast, negatively predicted drivers' use of self-regulation strategies over the time period. These results suggest that drivers are sensitive to and adjust their self-regulatory strategies over time in response to the emotional reactions and instrumental well-being of close relationship partners.

A COMPARISON OF BRAKE REACTION TIMES ACROSS THE LIFESPAN

A. Dickerson, S. Burhans, K. Apple, *Occupational Therapy, East Carolina University, Greenville, North Carolina*

When an individual recovers from medical condition, there should always be a discussion about fitness to drive. Although the individual may have impairment, it should not be assumed that, with recover, the individual can return to driving or should cease driving. In many cases, evaluation or intervention is needed. Although simple brake reaction timers (SBRT) have not shown to be related to driving outcomes and should never be used as a single tool for determining fitness to drive, SBRT do have good face validity with older adults. Thus, it may be appropriate to use as a screening tool and/or one method of obtaining a functional evaluation of cognitive impairment (e.g., following instructions, generalization of the task). SBRT also have the advantage of being relatively inexpensive and portable. This poster will illustrate the results of a study on SBRT with data from over 800 healthy drivers across the life span. Results demonstrated significant differences in reaction times between age groups (F=9.31, p<.001). Reaction times for those over 70 yrs of age were significantly different from all other age groups, except for those 19 yrs and younger. The young group only demonstrated differences with the 70-79 yrs; those over 80 yrs of age were significantly different from all groups. The results confirm the slowing of reaction speed with age. However, even in the oldest group, the mean (Mean=.64) demonstrates reaction speed well within an appropriate range, reinforcing fitness to drive is related to function, not age.

INVESTIGATION OF THE CARS INSTRUMENT AS A BRIEF DRIVING SAFETY SCREENING TOOL

A.L. Curl, *University of Missouri, School of Social Work, Columbia, Missouri*

Driving is critical to mobility, autonomy, freedom of choice, and engagement for older adults, but it is normative to eventually stop driving. Poor health often eventually leads to driving cessation, yet some drivers do not realize that their driving is impaired while others continue driving despite recognized impairments. Health professionals (e.g., physicians, social workers, occupational therapists) tend to interact frequently with older adults and are able to promote optimal aging and public health by helping older adults preserve driving skills and easing the transition of driving cessation when necessary. This role necessitates driving assessments to ascertain whether individuals are at greater risk of crashes. However, questions about driving status and ability are rarely addressed with older adults unless the issue is raised by others (e.g., family members, law enforcement). There is a need for a brief self-report measure about driving safety that could be used as a screening tool by health professionals during assessments and routine appointments. Therefore, a 4-item screening tool was developed using the acronym of "CARS" (to increase memorability): confusion while driving, accidents, refusal of others to accept rides, and encouragement to stop driving. This instrument was pilot tested with a sample of health professionals and experts in driving cessation. Respondents (N=8) were asked to review the instrument for length, errors, clarity of instructions, recommended cut-off level, item weighting, length of time asked about, and utility as a screening tool. Results suggest that "CARS" is a useful, brief, self-report measure, warranting further psychometric validation and investigation.

ASSESSING THE ASSOCIATIONS BETWEEN SIMULATED DRIVING AND THE USEFUL FIELD OF VIEW AND THE ATTENTION NETWORK TEST

C. Lindeman[1], H. Maxwell[1], B. Weaver[1,2], S. Gagnon[3], M. Bedard[1,2,4], *1. Centre for Research on Safe Driving, Lakehead University, Thunder Bay, Ontario, Canada, 2. Northern Ontario School of Medicine, Thunder Bay, Ontario, Canada, 3. Department of Psychology, University of Ottawa, Ottawa, Ontario, Canada, 4. St. Joseph's Care Group, Thunder Bay, Ontario, Canada*

We examined associations between two measures of cognition (the Useful Field Of View [UFOV] and the Attention Network Test [ANT]) and results from three distinct driving tasks on a driving simulator. Sixty-seven participants between the ages of 18 and 92 completed the UFOV and the Centre for Research on Safe Driving version of the ANT (CRSD-ANT), followed by three driving simulator tasks (driving through a construction zone, turning left at an intersection with oncoming vehicles, and merging on a highway). We calculated correlations between performance measures from the simulator and the cognitive tests. For both tests, lower values indicate better performance – hence correlations should be in the same direction. For the construction zone task, we expected negative correlations, and observed correlations ranging from -.294 to -.159 for the UFOV and from -.421 to -.331 for the CRSD-ANT. For the left turn task, we expected positive correlations, and correlations ranged from -.118 to .047 for the UFOV and .077 to .539 for the CRSD-ANT. Positive correlations were also expected for the merging task, and the correlations ranged from .225 to .037 and .016 to .243 for the UFOV and CRSD-ANT respectively. Neither test of cognition was strongly correlated with measures of performance in our simulated driving environment. However, some of the correlations obtained with the CRSD-ANT suggest it may have potential as a tool to study driving performance. On the basis of these findings further examination of the CRSD-ANT and its sub-components is warranted.

DRIVING REHABILITATION PROGRAMS FOR OLDER DRIVERS IN THE UNITED STATES

M.E. Betz[1], A. Dickerson[2], T. Coolman[1], E. Schold Davis[3], J. Jones[4], R. Schwartz[5], *1. Emergency Medicine, University of Colorado School of Medicine, Aurora, Colorado, 2. East Carolina University, Department of Occupational Therapy, Greenville, North Carolina, 3. American Occupational Therapy Association, Bethesda, Maryland, 4. University of Colorado College of Nursing, Aurora, Colorado, 5. University of Colorado School of Medicine, Division of Geriatric Medicine, Aurora, Colorado*

OBJECTIVE. Comprehensive evaluations at driving rehabilitation programs (DRPs) are the most accurate assessment of driving ability but may be underutilized by older drivers. To enhance older driver safety and mobility, it is critical to understand current DRP practices and identify barriers to use. We sought to describe older driver DRPs in terms of services offered, referral and reporting practices, and barriers to utilization. DESIGN & METHODS. DRPs providing older driver evaluations were identified from the combined databases of two national associations; one staff member from each DRP completed a confidential online survey. RESULTS. 204 DRPs participated (62% response rate). DRP program availability varies across the United States; each DRP serves a median of 64,151 older adults (range: 1,006 to 676,981). The median cost for a 2-3 hour complete evaluation was $400 (interquartile range: $298-$478), and 36% of programs reported not receiving any third-party reimbursement. Physicians were the most common source of referrals, and 59% of programs could schedule an appointment within 2 weeks. Participants thought barriers to program use include cost/reimbursement, lack of awareness of program services, and issues with evaluator training CONCLUSION. DRP program availability varies. A major barrier appears to be inadequate reimbursed through third-party payers, as fees commensurate with DRP evaluator training may be too high for many older adults to pay themselves. Increased awareness of program benefits by healthcare providers and older drivers, as well as models for program sustainability and reimbursement, could enhance utilization.

RISK FACTORS FOR DRIVING CESSATION IN OLDER BLACK AMERICANS: FINDINGS FROM THE HEALTH AND RETIREMENT STUDY

E. Dugan, C. Lee, *Gerontology Dept, University of Massachusetts Boston, Boston, Massachusetts*

The population of senior drivers is older and more diverse than in previous cohorts and this trend is expected to continue. Most older adults live in areas under-served by alternative transportation options so reliance on driving is high. Our previous research found an association between minority race and ethnicity and driving cessation. In this research we seek to better understand factors related to driving cessation in older Black Americans. Data from six waves of the HRS (1998-2008) were pooled. The analytic sample included Black adults age 65 or older with complete data on variables of interest (N=2,350). The mean age was 74.38 years (65-108 range), and 64% reported being current drivers. 39% of the sample was male, 41% were married, and the average number of years of education was 10.49 (SD 3.66). 35% reported having fair or poor vision, 30% had diabetes, 74% had hypertension, and 69% had arthritis. Logistic regression analyses identified demographic, functional, and psychological risks for cessation. Specifically: age (OR 0.96), gender (OR 6.31), education (OR 1.09), marital status (OR 0.55), income (OR 3.43), cognition (OR 1.05), ADL (OR 0.83) and IADL (OR 0.58) limits, and poor vision (OR 0.64), cancer (OR 0.65), and stroke (OR 0.04), pseudo R sq=0.32. This study of older Black adults highlights the social determinants (e.g., gender, age, education, income) of driving status in addition to expected biomedical factors (e.g., vision, cognition). Better understanding of the strengths and challenges related to senior mobility is needed. Such study will inform intervention development.

RISK FACTORS FOR DRIVING CESSATION IN OLDER HISPANICS: FINDINGS FROM THE HEALTH AND RETIREMENT STUDY

C. Lee, E. Dugan, *Gerontology, Univ Mass Boston, Boston, Massachusetts*

Driving is a preferred means of mobility for many older adults. Our previous research detected an association between driving status and race/ethnicity. Only a few senior transportation studies have considered cultural factors related to mobility despite the potential impact of traditions, values, and opportunities associated with culture. In this cross-sectional study we explore the risk factors for driving cessation in older Hispanic adults. Data from six waves of the HRS (1998-2008) were pooled. The analytic sample (N=1,341) included adults age 65 or older reporting Hispanic ethnicity with complete data on variables of interest. The mean age was 74.26 years (65-107 range), and 57% reported being current drivers. 43% of the sample was male, 56% were married, and the average number of years of education was 7.75. 40% reported having fair or poor vision, 31% had diabetes, 62% had hypertension, and 63% had arthritis. Logistic regression analyses identified demographic, functional, and psychological risks for cessation. Specifically, driving cessation was associated with: age (OR 0.93), gender (OR 8.69), education (OR 1.13), marital status (OR 0.30), income (OR 2.45), cognitive scores (OR 1.06), functional status (ADL, OR 0.82; IADL, OR 0.65), and vision (or 0.67), pseudo R sq=0.37. The impact of gender on risk for driving cessation is large and may reflect culturally determined gender roles. Further study is warranted, especially if older Hispanic women are prematurely stopping driving. This study of older Hispanics provides a glimpse of factors contributing or detracting from mobility in a rapidly growing and important ethnic group.

CAN WE SCREEN MEDICALLY AT RISK OLDER ADULTS FOR DRIVING FITNESS USING BRAKE REACTION IN A FUNCTIONAL ACTIVITY?

A. Dickerson, K. Apple, S. Burhans, *Occupational Therapy, East Carolina University, Greenville, North Carolina*

When an individual recovers from medical condition, there should always be a discussion about fitness to drive. Upon recover, it should not be assumed the individual can return to driving or should cease driving. In many cases, evaluation and/or intervention is needed. This study compared three age groups (young 18-40 yrs, n=16; middle 41-64 yrs., n=13; old 65-78, n=31) using three different brake reaction timers. Results indicated no significant difference between a foot model and hand model (simple) brake reaction timers. However, using a "choice" model (using a yellow/caution light with directions to make a choice), there was a significant difference in reaction times. The "choice" model had longer reaction times for all participants. Between groups, there was no difference between ages on either of the two simple brake reaction timers, supporting the fact age does not make a difference with simple reaction. However, when reaction time required processing time to make a choice, there was a significant difference between the groups (F=3.93, p<.03). Post hoc results indicated the differences were between the young and old groups and the middle and old groups; demonstrating slower processing with increased age. This presentation will discuss the results and implications of this study. In examining functional processing time with a brake reaction timer that has a mechanism to add complexity over a simple device of red and green lights (an added yellow caution light), it may be useful as a functional screening tool or intervention strategy that has face validity for older adults.

SESSION 980 (POSTER)

HEALTH BEHAVIORS

PATHWAY TO COMMUNITY SELF-MANAGEMENT OF DIABETES FOR LOW-INCOME OLDER FILIPINO AMERICANS

S.E. Dilkes, M. McBride, *Community Wellness Center, FASGI, Los Angeles, California*

Background: The Community Health Worker (CHW) model was adapted for health improvement of older Filipino American (OFA) residents in/around the Los Angeles Historic FilipinoTown. A 2006 community health screening found 47% of 127 low-income immigrant OFAs had elevated blood glucose levels; none reported diabetes. Purpose: The Filipino American Service Group, Inc. (FASGI), a non-profit organization provided an 8-week holistic health promotion (HP) program, infused with Filipino cultural values/practices for volunteer OFAs to create a cadre of CHWs. Method: OFA volunteers, age 60+ with diabetes or under pre-diabetes care were recruited from Filipino organizations. The Open Health Diabetes (OHD) project involved: learning health content, changing behaviors, performing kali- martials arts exercises, monitoring health indicators (BP, HR, WT, BMI, WC) and skill building to disseminate HP information to community-living OFAs. These senior peer educators (SPEs) received guidance in sharing information and empowered to use English, Tagalog, other Pilipino languages, or Tagalog-English hybrid (Tag-Lish). Evaluations included pre/post knowledge tests, focus group, weekly health indicator measurements, and observations of dissemination sessions. Results: Twenty three OFAs (pre-diabetic and diabetic), age 61-87 years, 74% well-educated, received training. Outcomes were: 18% increased knowledge, 32% improved self-confidence, 21% improved food selection/intake and exercise frequency. Mean health measures indicated: 2.6% and 2.5% decrease in systolic and diastolic pressures, respectively; 1.2% decrease body weight; and 5.1% decreased girth. SPEs Information-sharing reached 206 unduplicated OFAs. Conclusions: Overall positive effects of a holistic HP curriculum on knowledge, self-concept, skills, and health status empowered OFAs to function as SPEs/CHWs and improve personal health.

FRUIT AND VEGETABLE CONSUMPTION AMONG ADULTS IN NORTH CAROLINA: RACIAL AND AGE DIFFERENCES IN TRENDS

O.T. BABATUNDE[1], S. Imai[2], *1. NUTRITION SCIENCE, EAST CAROLINA UNIVERSITY, GREENVILLE, North Carolina, 2. EAST CAROLINA UNIVERSITY, Greenville, North Carolina*

Introduction: Research evidence establishes the importance of fruits and vegetables consumption in the reduction of risks for the development of several chronic diseases. This is especially crucial for the aging population. Objective(s): The objective of this study was to determine the trend in daily fruit and vegetable (F&V) intake among adults in North Carolina (NC) and if this differs by age and race/ethnicity. Method: Cross sectional study using 2002-2009 NC Behavioral Risk Factors Surveillance System (BRFSS) data. Participants were a total of 38,081 adults. Trends and difference in daily consumption of F&V by age category and ethnicity were established using descriptive statistics and confidence intervals (CI). Results: Trend shows percent of NC adults consuming ≥3 servings of F&V daily decreased in the general adult population over time. Consumption decreased from 69% (95% CI=65.44-71.93) in 2002 to 62% (95% CI=59.97-63.97) in 2009 in older adults ≥60 years, and for adults < 60 years from 59% (95% CI=56.32-60.72) to 56% (95% CI=54.28-58.24) respectively. When stratified by race, intake (≥3 daily servings of F&V) in adults < 60 years increased in all ethnic/racial groups except for non-Hispanic White, while for adults' ≥60 years' consumption decreased over time regardless of race/ethnicity. Non-Hispanic Black had the lowest intake (52%) compared to 58% in Hispanic and 64% in non-Hispanic White. Conclusion: F&V consumption is essential for healthy aging. These findings support the need for nutrition education efforts to improve F&V intake for the reduction of risks, and management of chronic diseases among older adults, particularly minorities.

THE DYNAMICS OF HEALTH AND ITS DETERMINANTS AMONGOLDER ADULTS

Y. Kim, *Eastern Michigan University, Ypsilanti, Michigan*

This paper examines the determinants of chronic health conditions and explains their persistence, using a panel data set from the Indonesian Family Life Survey (IFLS). I incorporate dynamics into a health demand function, finding strong correlations between lagged and current health measures when nothing else is controlled. This could represent the influence of lagged health or fixed unobserved factors such as genetic endowments and childhood health. To disentangle these, I estimate the influence of lagged health by using first-difference two-step generalized method of moments (FD-GMM), where the first-differencing removes fixed unobserved factors and keeps only lagged health. I found that it is this fixed effect, representing both genetic endowments and childhood health, that is most important in explaining later life chronic conditions. The impact of past health conditioning on the fixed effect, captured by the coefficients on lagged health measures, is weak, with estimated coefficients relatively close to zero. These results are robust to potential measurement errors in health and to sample attrition. Socio-economic status also has very little influence on current health, again conditioning on the fixed effect and on the influence of lagged health. In order to investigate if past health has different impacts across demographic or economic groups, I disaggregate the sample across age, household per capita expenditure level (PCE), and years of education. The results show that those with less education tend to show more persistence, compared to those with higher education.

PREDICTORS OF SLEEP SYMPTOMS AND QUALITY OF LIFE AMONG RURAL OLDER ADULTS

M.A. LaRocca[1], F. Scogin[1], K.L. Lichstein[1], H.R. Dillon[2], S.J. Thomas[1], E.A. DiNapoli[1], J.A. Woosley[1], A.C. McFadden[1], *1. Clinical Psychology, University of Alabama, Tuscaloosa, Alabama, 2. Central Alabama Veterans Health Care System, Montgomery, Alabama*

It is well established that older adults often suffer from poor sleep and low overall quality of life, and rural older adults often lack health-care access to remedy these issues. The current study examined the role of depression symptoms and self-rated health in predicting quality of life and sleep difficulties among rural older adults ($n = 54$). Depression was measured using the Hamilton Rating Scale for Depression (HAM-D; Hamilton, 1980), and self-rated health consisted of a simple rating of overall health (1 = poor; 6 = excellent). Quality of life was measured using the Quality of Life Inventory (QoLI; Frisch, 1994), consisting of 16 domains measuring overall quality of life, and sleep difficulty was measured using the Insomnia Severity Index (ISI; Morin, 1993). Analysis consisted of hierarchical multiple regression controlling for age, race, and sex. Greater self-rated health and lower depressive symptoms significantly predicted quality of life ($p < .01$; $p < .001$, respectively), and greater depressive symptoms also predicted sleep difficulty ($p < .001$). Moreover, in a separate analysis, self-rated health moderated the role of depression in predicting sleep symptoms ($p < .01$). Specifically, depressive symptoms were most predictive of sleep difficulty among those with lowest self-rated health. These results suggest that attention to health and mood symptoms among rural older adults will benefit their sleep and overall quality of life.

PERCEIVED BARRIERS TO EXERCISE IN PERSONS WITH PARKINSON'S DISEASE

L. Girling, L. Morgan, *University of Maryland, Baltimore County, Baltimore, Maryland*

With the increasing number of older adults in the US population, the prevalence of Parkinson's disease (PD) is expected to increase. Accordingly, the search for interventions that may delay or obstruct the progression of PD has intensified. There is increasing empirical evidence indicating that exercise can decrease disability and improve quality of life among persons with Parkinson's disease (PwP). Despite the vast benefits exercise has been shown to offer, many PwP do not engage in regular exercise. Few studies have examined barriers to exercise in PwP, and very little is known about these barriers from a qualitative standpoint. In order to gain a deep and more nuanced understanding of barriers to exercise, in-depth interviews were conducted with PwP. Inductive content analysis of preliminary data (N=8) revealed several barrier themes including: (a) apathy's role in decreased motivation, (b) safety concerns, (c) time constraints, and (d) transportation problems. Findings from this pilot study can inform future PD research, improve exercise intervention designs, and contributes rich narrative detail on how PwP conceptualize impediments to exercise.

THE MODERATING EFFECT OF SLEEP QUALITY ON THE ASSOCIATION BETWEEN PSYCHOLOGICAL DISTRESS AND SELF-RATED HEALTH

H. Yoon[1], S. Kim[2], K. Kim[3], *1. University of Texas at Austin, School of Social Work, Austin, Texas, 2. Columbia University, School of Social Work, New York City, New York, 3. University of Maryland at Baltimore, School of Social Work, Baltimore, Maryland*

Purpose: Given the importance of an individual's subjective assessment of personal health status in health research and practice, the study examined predictors of self-rated health (SRH) in older adults by considering the direct and interactive effects of physical/mental health indicators and sleep quality. Methods: The data were drawn from the National Health and Aging Trends Study (NHATS) Round 1. Older adults aged 65 and older (n=8245) were included in the analyses. Linear regression models of SRH were estimated using the sets of predictors: (a) demographic information (age, gender, marital status, and education), (b) physical/mental health indicators (chronic conditions, physical pain, and psychological distress), (c) sleep quality, and (d) interactions between each health indicator and sleep quality. Results: Health indicators and sleep quality were found to make a significant contribution to the predictive model even after controlling for demographic information. Multivariate analyses only identified a significant interaction between psychological distress and sleep quality on SRH. Further analysis indicated that older adults having low levels of sleep quality were more likely to have negative rating of SRH when they had great levels of psychological distress compared to their counterparts having high levels of sleep quality. The entry of each block made a significant contribution, and the total amount of the variance explained was 34% (F[9, 5153]=294.1, p < .001). Implications: Findings highlight the importance of considering sleep quality in the assessment of SRH. Findings recommend that sleep quality among older adults with psychological distress should be closely monitored by healthcare providers.

SOCIAL FACTORS OF PROBLEMATIC DRINKING AMONG KOREAN MIDDLE-AGED AND OLDER MEN: FINDINGS FROM THE BASELINE SURVEY OF THE KOREAN LONGITUDINAL STUDY ON AGING

G. Jeon[1], S. Park[2], S. Cho[1], S. Park[3], *1. Department of Nursing, Mokpo National University, Muan-gun, Jeon-nam, Republic of Korea, 2. Silver School of Social Work, New York University, New York, New York, 3. Department of Social Work, Kyonggi University, Soowon, Kyonggi-do, Republic of Korea*

This study examined the social factors of problematic drinking by comparing such drinking among middle-aged and older men in South Korea. The data were generated from the 2006 baseline survey of the Korean Longitudinal Study on Aging, and the sample consisted of 3,631 men between 45 and 64 years of age and 1,173 men aged 65 or older. This study employed variables identifying various socioeconomic features, social ties, and health-related factors. Logistic regressions were used to compare the factors related to problematic drinking among middle-aged men and older men. Frequent contact with close persons was related to problematic drinking for both groups. Lower education, unemployment, frequent contact with others, poor health, smoking, and depression were associated with problematic drinking with middle-aged men but not with older men. Frequent contact with friends was the only predictor of problematic drinking among older men. Our findings suggest that further research is required to investigate the various social processes that occur in different age groups to prevent problematic drinking.

THE RELATION BETWEEN RACE/ETHNICITY, REGION OF RESIDENCE, AND ALCOHOL CONSUMPTION AMONG OLDER ADULTS

A.N. Bryant[1], G. Kim[1,2], *1. The University of Alabama, Tuscaloosa, Alabama, 2. The Center for Mental Health and Aging, Tuscaloosa, Alabama*

Given the reported role of race/ethnicity and geographic location in alcohol use, this study examined the influence of race/ethnicity, region, and the interaction of these two variables on average monthly alcohol consumption among older adults. Data were obtained from the 2010 Behavioral Risk Factor Surveillance System (BRFSS). A two-way ANCOVA was conducted to examine both the main effects and the interaction of the variables of interest. A significant main effect of race/ethnicity was found [F(3,185170)=206.06, p<.001]. More specifically, post hoc testing relying on a Bonferroni adjustment revealed that Whites had significantly higher average monthly alcohol consumption than other racial/ethnic groups. A significant main effect was also found for region [F(3,185170)=16.32, p<.001]. Post hoc testing relying on a Bonferroni adjustment revealed the following significant pairwise comparisons: average monthly alcohol consumption was significantly higher in the Northeast than the South. Additionally, average monthly alcohol consumption was significantly higher in the West than the Midwest and the South. Lastly, there was a significant race/ethnicity by region interaction [F(12,185170)=16.32, p<.001], indicating that racial/ethnic alcohol consumption patterns vary by region of residence among older adults. For instance, among both the Black and White sample past month alcohol consumption was significantly greater in the West as compared to the Midwest and South. Having a better understanding of how and where alcohol is used is an important first step for identifying potential alcohol related problems and benefits on both an individual and community wide level.

VOLUNTEER ACTIVITY AND SELF-RATED HEALTH OF OLDER ADULTS: THE MORE THE BETTER?

B. Kim, F.W. Porell, J.A. Burr, E. Dugan, *UMass Boston, Boston, Massachusetts*

While past research has examined the health benefits of volunteering, the debate about whether the amount of time spent volunteering moderates the benefits is resolved. The purpose of this study was to understand if the relationship between volunteering and self-rated health varies with annual volunteering hours. A sample of 17,058 respondents age 50 and over was drawn from 2010 Health and Retirement Study (HRS) data. The majority of the sample was female (58%), and the mean age was 66 years old. More than one third of people volunteered (36%), and among volunteers, 40% volunteered less than 50 hours. Logistic regression was used to estimate the effects of volunteer hours, while controlling for demographic variables, psychological factors, physical limitations, and employment status. A non-linear, inverted U-shaped relationship was found between the annual number of hours of volunteering and self-rated health (R-squared=0.30). Compared to non-volunteers, all volunteers had significantly better self-rated health. Respondents who volunteered between 100 to199 hours a year benefited the most (OR=0.67) in terms of self-rated health when compared to those who volunteered 1-49, 50-99, 100-199, or 200 or more hours a year. Results showed that volunteering had a protective effect on subjective health. However, the benefits varied by number of hours. Volunteering excessively seems to be a burden on health for some older adults and have a less protective effect. These findings may provide both volunteering organizations and volunteers with information that will help them best maximize the beneficial effects of time spent volunteering.

NUTRITION, EXERCISE AND OSTEOPOROSIS IN CHINESE IMMIGRANTS

B. Qi, *College of Nursing, Villanova University, Villanova, Pennsylvania*

Background: Recent Chinese Immigrants With Low Educational And Income Levels And Older At The Time Of Immigration, Have Been Found To Have Low Bone Mineral Density And A High Risk For Osteoporosis. The Benefits Of Lifestyle Modifications Are Not Widely Recognized By Them Due To Barriers Including Language And Limited Access To Care. Interventions Targeting Chinese Immigrants And Tailored To Chinese Culture, Language, And Specific Needs That May Increase Adherence To Osteoporosis Prevention Behaviors Are Critically Needed To Effectively Reduce Racial, Ethnic, And Socioeconomic Health Disparities Related To Osteoporosis And Fracture. Purpose: Test The Efficacy Of A Social Ecological Model Based Osteoporosis Behavior Change Intervention Aimed At Increasing Adoption And Adherence To Exercise, Calcium-Rich Diet And Osteoporosis Medication Use At 3-, 6-, And 12-Month After The Intervention Started. Design: A Quasi-Experimental Design With A Repeated Measure Pre-And Post-Test, Experimental Vs. Attention Control Group With Randomization Of Treatment Sites. Method: Participants Were Eligible If They Were 55 Years Old Or Older; Foreign-Born Chinese, Without Reading, Hearing, Communication, Or Comprehension Problems, Who Understand Mandarin Or Cantonese; Had A Mini Mental State Exam Score Of 26 Or Greater; Had No Medical Problems. Both Groups Met Twice A Week For 14 Weeks And Once A Month For 3-6 Month. The Experimental Group Received The SEOPE-NEW Intervention Including Supervised Exercise, Food Record Review And On-Going Education On Every Meeting. The Control Group Received Education Classes That Focus On General Information About Different Diseases. This Is An Ongoing Study. Data Were Being Collected; Interventions Were Being Conducted; And Results Will Be Reported.

IT'S NEVER TOO LATE TO LOSE WEIGHT: FACILITATING A WEIGHT MANAGEMENT PROGRAM FOR SKILLED NURSING HOME RESIDENTS

M. Florsheim, S. Walker, A. Woods, *Department of Veterans Affairs Medical Center, Palo Alto, California*

Recent research indicates that the prevalence of obesity among nursing home residents is increasing. Obese nursing home residents suffer health consequences, and for staff they pose care management difficulties and increased risk of injury. Little research exists with nursing home populations; most research in this area has been conducted with community-dwelling elders. The present poster describes our experience over the past eight years facilitating a weight management program at a skilled nursing facility at the VA Palo Alto Health Care System. These include efforts to heighten staff awareness of the health concerns and care management problems associated with excess weight, and the development of a weight management group for nursing home residents. We describe development of the weight management group, its structure and process, and its goals as they relate to the nursing home setting. We discuss successes and challenges with increasing staff awareness of problems associated with excess weight, and describe future plans for staff training and for the weight management group. Case examples are presented that illustrate approaches used to support weight management with disabled institutionalized elders.

BENEFITS OF FORMAL VOLUNTEERING IN OLD AGE: DOES GENDER MAKE A DIFFERENCE?

P. Lu[1], S. Chao[2], *1. Graduate Institute of Social Work, National Chengchi University, Taipei, Taiwan, 2. Taiwan University, Taipei, Taiwan*

Objectives: This study aims to examine the associations between volunteering practices and volunteering benefits, and furthermore to examine if there are differences in benefits by gender Background: In the existent literature, volunteering has a positive impact on older adults. The association between volunteering behaviors (e.g., time spent on volunteering, types of volunteering tasks), organization features, and volunteering benefits, however, has not been well investigated. Methods: This study collected data from a mailed-in questionnaire. A total of 772 volunteers, involved in 75 organizations and groups, completed the questionnaire. A hierarchical regression model was applied to analyze the data and a scale was developed to measure the benefits gained from volunteering. Findings: 1. One's health condition is positively related to the benefits of volunteering; the great access to either psychological or social resources through volunteer work is also positively related to the benefits. Furthermore, the better volunteer management practices in an organization, the greater the benefits. 2. Bivariate analysis shows that women report greater benefits of volunteering than men. After controlling for effects of socio-demographic variables, volunteering practices, psychological and social resources, and organizational features, gender difference diminished. 3. The effect of access to psychological resources on benefits is significant for women sample; whereas it is not significantly for men sample. Put differently, access to social resources through volunteer work has a mediate effect on gender differences. Conclusions and Implications: The results suggest that good practice in the management of volunteers will increase volunteers' benefits; volunteer administrators should take this into consideration.

THE ASSOCIATION BETWEEN EDUCATION AND MORTALITY IN A SAMPLE OF 3,060 CATHOLIC MONKS FROM GERMANY

M. Luy[1,2], C. Wegner-Siegmundt[1,2], P. Di Giulio[1,2], *1. Vienna Institute of Demography, Austrian Academy of Sciences, Vienna, Austria, 2. Wittgenstein Centre (IIASA, VID/OEAW, WU), Vienna, Austria*

Education is the central element of a complex network that links many factors related to socioeconomic status (SES) with health and mortality. We contribute to the still unanswered question whether and to what extent education per se has a direct effect on longevity and old-age mortality by analysing the association between education and mortality in 3,060 Catholic monks from western Germany who were born between 1840 and 1959. This natural experiment allows us to isolate the effect of education from most other characteristics of SES. To better assess the obtained results we compare the monks with a sample of 3,221 men of the German general population. Analyses are based on Kaplan-Meier product limit estimation and Cox proportional hazard regression modelling. We find that among male order members education does not have a significant impact on mortality and that the survival of low as well as high educated monks is almost identical to that of worldly men with high education. Health behaviours and occupation-related risk factors are discussed as most likely causes for the differences in education-specific mortality between the monastic and the general population. The presentation will provide two central messages of general interest: (i) education appears to have no direct effect on mortality and thus functions rather as proxy for other characteristics of SES; (ii) the well-known education gradient in longevity is predominantly due to the high mortality of low educated individuals and not to the low mortality of persons with high education.

EFFECTS OF HEALTH ON ADVANCE CARE PLANNING IN OLDER ADULTS IN THE WISCONSIN LONGITUDINAL STUDY

E.K. Chen, *Human Development, Cornell University, Ithaca, New York*

Advance care planning (ACP) is associated with better end-of-life care and improved outcomes for survivors, yet approximately 20% of older adults have not completed formal (legal) or informal (discussions) ACP. Research on ACP has focused on demographic variations in ACP, as well as the effect of recent experiences, such as hospitalizations or the death of a loved one, on the likelihood of planning. However, the effect of an individual's health and changes in health on likelihood of ACP is largely unknown. Based on Leventhal's Commonsense Model of Illness, I hypothesize that four measures of health (self-rated health, functional status, major health events, and chronic conditions) and changes in these measures over time will predict ACP. I use logistic regression to estimate the associations of health measures with the likelihood of having formal or informal ACP in the 2004 wave of the Wisconsin Longitudinal Study (WLS; M=64 yr). In addition, I test how baseline health and health changes between the 2004 and 2011 waves predict ACP in 2011 for respondents with no ACP in 2004. At Time 1, ACP was associated with more major health events, more chronic conditions (informal only), and better self-rated health. For respondents without ACP at Time 1, baseline functional status predicted Time 2 formal ACP, whereas chronic conditions and declines in self-rated health predicted Time 2 informal ACP. Diverse measures of health have different associations with formal and informal ACP. Future research should include more focused, objective measures of health to understand the triggers of ACP.

ENHANCED COGNITION, SOCIAL SUPPORT AND SPONTANEOUS BRAIN ACTIVITY: EFFECTS OF A MULTIMODAL INTERVENTION FOR HEALTHY OLDER ADULTS

J. Li, X. Zhu, S. Yin, R. Li, *Institute of Psychology, Chinese Academy of Sciences, Beijing, China*

Objectives This study examined the effects of a multimodal intervention on cognitive functions and well-being, and whether the intervention modifies spontaneous neural activity in healthy older adults. Methods The intervention group (n = 17, mean age = 68.59 ± 5.65) was engaged in a six-week intervention that consisted of cognitive training, TaiChi exercise, and group counseling. The control group (n = 17, mean age = 71.65 ± 4.00) attended health knowledge lectures. Results The intervention group showed enhanced memory and social support compared to the control group. The amplitude of low frequency fluctuations (ALFF) in the middle frontal gyrus, superior frontal gyrus, and anterior cerebellum lobe was higher for the intervention group, while the control group showed reduced ALFF in these three regions. Additionally, changes in social support, and subjective well-being were correlated with intervention-induced changes in ALFF. Conclusions These findings suggest that a multimodal intervention is effective in improving older adults' cognitive functions and well-being, and can induce functional changes in the aging brain.

MENTAL HEALTH IN OLDER WOMEN BEFORE, DURING AND AFTER BEREAVEMENT

D. McLaughlin, R. Hockey, J.E. Byles, *School of Population Health, The University of Queensland, Herston, Brisbane, Queensland, Australia*

The death of a spouse is regarded as one of the most distressing life-course experiences and it becomes increasingly common with advancing age. While late life spousal bereavement is the most common form of spousal loss, very few studies involve the use of prospective data in community based samples. Following mental health trajectories before and after bereavement helps to contextualise grief reactions. That is, to determine whether the poor mental health associated with spousal illness and loss is a continuation of pre-loss functioning or a time limited response to a distressing event. Adjustment to widowhood may also be facilitated by appropriate social support. Participants were 2,241women from the 1921-1926 birth cohort of the Australian Longitudinal Study on Women's Health. Psychological distress among the women was measured by the SF-36 Mental Health Index (MHI), and the Duke Social Support Index (DSSI) measured social support. Mental health showed a clear decline from >4 years preceding widowhood, with the most marked effect occurring at the time of widowhood and 12 months post bereavement. By >4 years after spousal loss, the women's mental health had returned to pre-loss levels. Social support increased in the 12 months leading to bereavement and was maintained at this level for more than four years. These results clearly illustrate the effect of spousal loss on women's mental health, and the response of their social networks as the women transition to widowhood.

EMOTIONAL COMPLEXITY OR EMOTIONAL STABILITY: WHICH BRINGS MORE BENEFITS FOR HEALTH AGING?

F. Zhang, H. Fung, *Department of Psychology, The Chinese University of Hong Kong, Hong Kong, Hong Kong*

Emerging evidence has suggested salutary effects of emotional stability and emotional complexity on health outcomes, especially for older adults, who prioritize emotionally meaningful goals and display enhanced emotional functioning (Ersner-Hershfield, Scheibe, Sims, & Carstensen, 2013; Terracciano, Lockenhoff, Zonderman, Ferrucci, & Costa, 2008; Scheibe, & Carstensen, 2010). However, no study has investigated emotional stability and complexity integratedly across lifespan. By using experience sampling over 7 days,113 Hong Kong participants aged from 17 to 83 years reported on 9 types of affects for 5 times each day (negative affect: Angry, Anxious, Bored, Sad; Positive affect: Happy, Enthusiastic, Calm; and neural affect: Activated, Quiet). In the analysis, mixed emotions (the co-occurrence of positive affect and negative affect) was calculated as an index of emotional complexity, and fluctuations of daily affective states served as an index of emotional stability. Surprisingly, regression analysis found that mixed emotions, similar to negative emotions, declined with age and predicted more physical symptoms and lower subjective well-being. Meanwhile, the benefit of emotional stability was evidenced: lower fluctuations of emotions across 7 days, regardless of the valence, predicted fewer physical symptoms for different age groups. Our findings underscore the importance of emotional stability in aging health, compared with emotional complexity, less variation of emotional states may bring more benefits across lifespan.

A QUALITATIVE STUDY OF ALCOHOL CONSUMPTION IN MID TO LATER LIFE: IMPLICATIONS FOR SERVICE PROVISION

C. Haighton[1], G. Wilson[3], J. Ling[2], K. McCabe[2], A. Crosland[2], E. Kaner[1], *1. Institute of Health & Society, Newcastle University, Newcastle upon Tyne, United Kingdom, 2. Sunderland University - Department of Pharmacy, Health and Well-being, Sunderland, United Kingdom, 3. University of Edinburgh - Reid School of Music, Edinburgh, United Kingdom*

Surveys show a steady increase in the amount of alcohol consumed by middle and older age groups. Physiological changes and an increased likelihood of health problems and medication use make older people more likely than younger age groups to suffer negative consequences of alcohol consumption, and at lower levels. However, health services targeting excessive drinking tend to be aimed at younger age groups. This study, based in the North East of England, assessed the views of people aged over 50 in relation to alcohol health services. Qualitative interviews and focus groups with a purposive sample (18 male, 33 female, ages 50-95) who consumed alcohol or had been dependent revealed that most interviewees had reduced their drinking, with or without specialist help. Barriers to seeking help included functioning at a high level, concern about losing positive aspects of drinking, perceiving stigma, service orientation to younger people, and fatalistic attitudes to help-seeking. Facilitators included concern about risk of fatal illness or pressure from significant people. Older people tended to look first to their General Practitioner for help with alcohol. Detoxification courses had been found effective for dependence but in the short term; rehabilitation facilities were appreciated but seen as difficult to access. Activities, informal groups and drop-in centres were endorsed as less demanding, comforting and supportive environments offering distraction from drinking. It was seen as difficult to secure treatment for alcohol and mental health problems together. There is a need for specific services tailored to older people's health in relation to alcohol.

HEALTH EDUCATION, THEMATIC GAMES AND OLDER ADULTS: MOTIVATION INTERVENTION

R. Cotrofe, N. Almeida, M. Freire, D. Bonfim, S. Gonçalves, J. Pereira, J. Da Silva, *Federal University of Rio de Janeiro, Rio de Janeiro, Rio de Janeiro, Brazil*

Classic and innovative motivational interventions have been subject of investigation in the Motivation Program. This qualitative study is strategies to motivate older adults to sustain self-care practices that are difficult, especially when involving long diet, exercise and extensive medication regimens over time. Objectives: (i) analyze two thematic health games used in health education to help older patients with a diabetes and chronic heart conditions to sustain self-care practices; and (ii) describe preliminary data analysis on thematic games and self-care outcomes. Method: At phase one a pre-intervention questionnaire on health demands was applied to thirty older adults at an ambulatory unit. At phase two, games the Life Board Game and the Health Bingo, were played in small groups of older adults with cardiovascular and metabolic health issues with an on-going, recorded discussion. At phase three, a post-intervention interview and questionnaire, were applied to learn participants experiences, game preferences and content learning. Results: Participants accounts reported The Life Board Game was described as the game that helped the most with the discussing and solving health doubts. Conclusion: health thematic games can become cost-effective, culturally sensitive teaching-learning tools to enhance patient knowledge, which is one of the enablers towards motivation to sustain self-care practices.

AGING BABY BOOMER VETERANS: THE ROLE OF MILITARY SERVICE ON THE PHYSICAL HEALTH OF VIETNAM VETERANS

M.S. Marsala, L. Erickson, *Sociology, Brigham Young University, Provo, Utah*

Relatively little is known about the long-term impacts of serving in the Vietnam War on the health of baby boomers. About 10 percent of baby boomer males served in Vietnam so its effects could have substantial implications for the kinds of policies needed to address baby boomers as they transition into retirement. Studies show that veterans of previous conflicts, particularly World War II and the Korean War, experienced better physical health than their non-veteran counterparts during their older years. It may be, then, that baby boom veterans who fought in Vietnam are also healthier than non-veteran baby boomers. On the other hand, there was less public support for the Vietnam War compared to these previous wars, including substantial anti-war sentiment and less public support for veterans returning from Vietnam. Using male respondents from the Life and Family Legacies study, a representative sample of Washington state high school juniors and seniors which began in 1966 with follow-up surveys in 1980 and 2010, we compare self-reported physical health of veterans and non-veterans. As part of this study we will examine variables such as activities of daily, physical activity, and chronic illness living. We hypothesize that these baby boom veterans will have worse health outcomes than non-veterans. Considering the size of the baby boom cohort, the need and cost of health care for veterans could be substantial if the health outcomes prove to be lower.

BRAIN FITNESS PROGRAMS: MOTIVATORS FOR LIFESTYLE CHANGES FOR OLDER ADULTS?

R. Nicholson[1,2], C.J. O'Brien[2], *1. Comparative Human Development, University of Chicago, Evanston, Illinois, 2. Mather Lifeways Institute on Aging, Evanston, Illinois*

Brain fitness is a rapidly growing field aimed at addressing concerns about cognitive decline and decreasing risk of dementia. Due to the increasing popularity of brain fitness and neuroscience as well as fears about dementia, brain-based educational programs may prove to be particularly effective motivators of lifestyle changes. Although many brain fitness programs focus primarily on intellectual stimulation or "brain games", research from neuroscience, cognitive psychology and longitudinal studies has revealed a number of lifestyle factors that contribute to cognitive health and decreased risk of Alzheimer's disease or dementia. This research inspired the development of the multimodal Spencer Powell Brain Fitness program. This program covers how lifestyle factors related to intellectual activity, physical activity and emotions can impact cognitive function and risk of developing dementia. Additionally, this program provides guidance for developing new habits, and provides strategies for improving memory. To evaluate the effectiveness of this program a staggered-entry, waitlist controlled intervention study was conducted. Our preliminary analysis of the first wave of data compared an intervention group with waitlisted controls at 5 senior living communities, with a total of 116 participants. At the conclusion of the brain fitness course, the intervention group reported greater behavior change than the control group in intellectual activity and in the frequency, intensity and amount of physical activity. They also reported a greater understanding of how exercise, stress and lifestyle affect their risk of dementia, and indicated an intent to make more lifestyle changes in the coming months to decrease their risk of dementia

SOCIAL SUPPORT AND SCREENING DECISIONS FOR BREAST CANCER AND CHRONIC CARE: COMPARING PERSPECTIVES OF OLDER SURVIVORS, FAMILY AND PHYSICIANS

M. Rosenthal[1], S. Hudson[2], L. Murphy[1], *1. Institute for Hlth, Hlth Care Pol, Aging Rsch, New Brunswick, New Jersey, 2. Rutgers RWJ Med Sch - Dept. Fam. Med., Somerset, New Jersey*

Many of the 6.5 million breast cancer (BC) survivors over age 65 must manage additional chronic conditions. Because social support influences adherence to preventive care, shared beliefs about chronic conditions may affect the support survivors receive for screening decisions. We collected data from older BC survivors (N=48) with hypertension (HTN), matched pairs of survivors and family members (N=20) and physicians (N = 13) in five primary practices. We compared responses about health beliefs, support and advice on decisions about BC and HTN screenings. Survivors reported receiving enough support and advice. However, more family members reported giving support (70%) for screenings than advice for HTN screenings (55%) or BC screenings (40%). We suggest that survivors may view family as supportive, but look to doctors for advice. While physicians reported giving both support and advice (84%) for screening decisions, survivors may view their doctors' support as advice-giving. In comparison, on healthy behaviors, all the physicians reported giving advice for HTN, but only 45% gave advice for preventing a recurrence of BC. While 95% of survivors and family members shared a belief that HTN is controllable, only 50% shared a belief that recurrence of BC can be controlled. Survivors' and family members' differing beliefs about controllability of BC and other chronic conditions, such as HTN, may affect family support for screenings and preventive care; physicians' advice may also shape some of these differences. Understanding the composition, influence, and health beliefs of survivors' support networks provides insight into survivors' preventive screening decisions.

SESSION 985 (POSTER)

EPIDEMIOLOGY OF AGING

STROKE AND ACTIVE LIFE EXPECTANCY: MODELING STROKE INCIDENCE THROUGHOUT OLDER LIFE

J.N. Laditka, S.B. Laditka, *Public Health Sciences, University of North Carolina at Charlotte, Charlotte, North Carolina*

Stroke reduces active life expectancy, both years lived and their proportion without disability. Research has offered little information about active life expectancy following stroke for African Americans. It has also focused on stroke at a baseline such as age 65, not the much greater number of strokes in later life. We studied stroke and active life expectancy for African American and White women and men using data from the Panel Study of Income Dynamics, 1999-2009 (n=1,862, 15,859 person-years). We estimated monthly probabilities of death and disability in activities of daily living with multinomial logistic Markov models adjusted for age, sex, ethnicity, recent stroke (≤2 years), previous stroke (>2 years), and education. A random effect accounted for repeated measures. Microsimulation created large populations with stroke incidence at age-specific national rates throughout older life, identifying active life expectancy. Bootstrapping provided confidence intervals. We matched individuals with strokes with randomly selected persons without strokes by first stroke age, sex, ethnicity, and previous disability. About two-thirds of life after stroke for women was disabled, 61.5% for African American men, 37.3% for White men. Compared to matched participants, stroke reduced remaining life 33.0% (95% confidence interval 30.9%-34.7%) and increased the proportion with disability 31.6% (14.4%-55.6%). People with strokes nonetheless lived a substantial average proportion of life without disability; this finding may be due in part to stroke diagnosis without functional impairment through imaging. Stroke substantially reduces active life expectancy, especially for women and African Americans, underscoring the importance of stroke treatment and prevention.

INDEPENDENT AND COMBINED ASSOCIATIONS OF MULTIPLE MORBIDITIES WITH ACTIVE LIFE EXPECTANCY

S.B. Laditka, J.N. Laditka, *Public Health Sciences, University of North Carolina at Charlotte, Charlotte, North Carolina*

Increasing prevalence of chronic diseases in the United States may reduce active life expectancy (ALE), both years lived and their proportion without disability. Related research has adjusted for comorbidities using disease counts, an approach assuming all comorbidities are equal that does not provide ALE estimates specific to each combination of diseases. We identified individual and joint associations of six diseases with ALE: arthritis, diabetes, heart disease, hypertension, lung disease, and depression. Data representing African American and White women and men ages 55+ were from the Panel Study of Income Dynamics (1999-2011, n=1,862, 15,859 person-years). We estimated monthly probabilities of death and disability in activities of daily living with multinomial logistic Markov models adjusted for age, sex, ethnicity, education, and the six diseases. A random effect accounted for repeated measures. Bootstrapping provided standard errors. Microsimulation created large populations to identify outcomes. White women illustrate results: life expectancy from age 55 without any diseases was 92.4 years (95% confidence interval 90.2-94.6), 4.7 (4.5-4.9) fewer years adding hypertension, 10.8 (10.2-11.4) fewer adding diabetes, 13.6 (12.6-14.5) adding heart disease, 25.2 (23.2-27.2) with all diseases. The percentage of remaining life with disability was 14.8% (13.7-15.8) with no diseases, 16.6% (15.3-17.9) adding hypertension, 25.1% (22.8-27.4) adding diabetes, 26.4% (23.8-29.0) adding heart disease, 27.2% (24.2-30.2) with all diseases. Average ages of first disability for the same combinations were: 77.6, 74, 70.5, 70.2, and 63.2. Other groups had similar patterns. Findings identify opportunities to focus public health on diseases with the greatest toll on mortality and disability.

THE MEDIATING ROLE OF SELF-RATED HEALTH ON THE RELATIONSHIP BETWEEN SOCIOECONOMIC STATUS AND ONLINE HEALTH INFORMATION SEEKING AMONG MIDDLE-AGED AND ELDERLY US ADULTS

Y. Cho[1], Y. Oh[1], K. Han[2], *1. MSASS, Case Western Reserve University, Cleveland, Ohio, 2. Seoul National University, Seoul, Republic of Korea*

Online health information seeking (OHIS) is socially patterned with health disparities. Drawing upon the Conservation of Resource Theory (Hobfoll, 1988), this study investigated the relationship between social resources [i.e., Socioeconomic Status (SES)] and OHIS, and whether the relationship was mediated by self-rated health (SRH). Data came from 492 middle-aged and elderly people (age ≥ 50 years) who reported ever going online for health information in U.S. Health Tracking Survey (2012) by the Pew Internet and American Life Project. OHIS was measured by whether respondents use the Internet to seek information about 11 health topics (yes/no, possible range 0-11). Three focal predictors were investigated: income (continuous), education [< high school, high school, some college, and college and above (reference)], employment [employed versus unemployed (reference)]. The mediator was SRH rated as excellent, good, fair, or poor. Control variables included: age, gender, race, marital status, chronic disease, smartphone use and area of residence. Multiple regression analysis was used to examine the relationships among predictors, mediator, and outcome. Mediation effects of SRH on the relationship between SES and OHIS was estimated. Multiple regression analysis showed that income (b = .088) and employment (b = .148) were significantly predictive of SRH. Also, SRH (b = -.476) and income (b = .137) significantly predicted OHIS. A Sobel test confirmed that the relationship between income and OHIS was partially mediated by SRH (z = -2.56). These findings suggest that SRH may serve as an important mechanism through which income impacts OHIS among middle-aged and elderly people.

DISTRIBUTION OF THE MMSE-J SCORES IN AN ELDERLY JAPANESE POPULATION IN TOKYO: MACHIDA HEALTH SURVEY

N. Sakuma[1], C. Ura[1], F. Miyamae[1,2], H. Inagaki[1], K. Ito[1,3], H. Niikawa[1,4], S. Awata[1], *1. Tokyo Metropolitan Institute of Gerontology, Tokyo, Japan, 2. Yokohama National University, Yokohama, Japan, 3. Tokyo Medical and Dental University, Tokyo, Japan, 4. University of Tokyo, Tokyo, Japan*

BACKGROUND: The Mini-Mental State Examination (MMSE) is widely used as a cognitive screening test for older people. Cognitive performance can be affected by age, education, and sample-selection bias. We examined the distribution of scores on the published Japanese version of the MMSE (MMSE-J) in an urban population-based sample. METHODS: The subjects were all residents aged 65 years and older living in an urban residential district in Tokyo (N=7,682). First, a questionnaire survey was conducted for all subjects to examine socio-demographic and health-related variables. Second, 3,000 residents were randomly selected from this population and visited by trained nurses to examine cognitive function (the MMSE-J) and physical and mental health status including blood pressure, prescribed medicines, and daily functions. RESULTS: A total of 1,341 residents (47%) were administered MMSE-J, whose median scores were 28 (6-30). The MMSE-J scores of 1,273 participants, aged 65-97 years (mean = 74.3 years) with formal education ranged 2 to 24 years (mean = 12.6 years), were analysed by three age cohorts (65-74, 75-84, 85-97) and by three education level (2-9, 10-12, 13-24 years). Younger age and higher education were associated with better performance, with greater variations among the oldest age and the lowest education groups. A total of 132 participants obtained lower scores below the traditional 23/24 cutoff point (10.4%). CONCLUSION: The distribution of MMSE-J scores in these participants can serve as an urban community-based norm for older people, and be useful to clinicians and researchers assessing older adults in both in and out of clinical settings.

CULTURAL COMPARISONS OF SUBJECTIVE LIFE EXPECTANCY RESPONSE PATTERNS: THE ROLE OF TIME PERSPECTIVE

S. Lee, J. Smith, *Institute for Social Research, University of Michigan, Ann Arbor, Michigan*

With an unprecedented population aging pattern, the subjective life expectancy (SLE) question has emerged as an important predictor of mortality. SLE asks respondents to estimate the probability that they will live up to a certain age. In spite of its predictive power for the general population, its comparability across diverse population groups has been questioned. An implicit yet important premise of SLE is that respondents cognitively organize their personal experiences relevant for future events, known as future-oriented time perspective. Time perspective is an unconscious yet fundamental cognitive process that provides a framework for organizing personal experiences in temporal categories of past, present and future. On SLE, future-oriented respondents are less likely to experience difficulty and say, “I don’t know,” than the counterparts, leading to lower item nonresponse rates. As culture plays a central role in shaping individuals’ time perspective, SLE item nonresponse rates may vary across cultural groups. Drawing on the time perspective theory, this study examines culture-specific patterns of SLE item nonresponse using the Health and Retirement Study, the English Longitudinal Study of Ageing, the Survey of Health, Ageing and Retirement in Europe, and the China Health and Retirement Longitudinal Study. The results show a large variation in item response rates on SLE and confirm our hypothesis: SLE item nonresponse rates vary significantly in the way that future-oriented cultures and individuals are less likely to report, “I don’t know,” than past- or present-oriented cultures and individuals. Moreover, SLE item nonresponse itself is associated with higher subsequent mortality rates.

STUDY ON GLOBAL AGEING AND ADULT HEALTH (SAGE): LINKS BETWEEN SOCIOECONOMIC STATUS AND OBESITY

M.A. Liebert[1], T. Gildner[1], P. Kowal[2,3], S. Chatterji[2], J. Snodgrass[1], *1. University of Oregon, Eugene, Oregon, 2. World Health Organization, Geneva, Switzerland, 3. University of Newcastle Research Centre for Gender, Health and Ageing, Newcastle, New South Wales, Australia*

Recent studies have documented complex relationships between socioeconomic status (SES) and obesity, with level of economic development and sex structuring the directionality and strength of associations. Evidence suggests that SES and obesity are positively associated in lower-income countries but negatively associated in higher-income countries; however, few studies have systematically evaluated these links among older adults in low- and middle-income countries. Here, we use Study on global AGEing and adult health (SAGE) data with nationally-representative samples of older adults (≥50 years old) in China, Ghana, India, Mexico, Russian Federation, and South Africa to examine the relationship between SES and obesity. Height, weight (for body mass index [BMI]), and waist circumference (WC) were measured to assess obesity. SES was quantified by income and education. Linear regressions estimated the association between income and education, BMI and WC while controlling for age, physical activity, smoking, drinking, marital status, and residence. Analyses were conducted separately by country and sex. Among men, BMI and WC were positively associated with income in all countries except Russia, while BMI and WC were positively associated with education in India, Ghana, and China ($p<0.05$). BMI and income were positively associated among Russian women ($p<0.05$). Results suggest that high SES may increase obesity risks for older men in middle-income countries. The findings in women may imply a shift in the relationship between SES and obesity due to societal and nutritional changes associated with globalization. This study highlights the importance of the socioeconomic context of obesity among aging populations from middle-income countries. Support: NIH NIA Interagency Agreement YA1323-08-CN-0020 with the World Health Organization; NIH R01-AG034479; University of Oregon

CROSS-CULTURAL DIFFERENCES IN COGNITIVE AND HEALTH INDICATORS IN COMMUNITY OLDER ADULTS

A.J. Revell, *University of Massachusetts Dartmouth, North Dartmouth, Massachusetts*

Little is known for how to assess and detect cognitive impairment levels in ethnically-diverse populations. Portuguese immigration has been dwindling over the last several years, which has led to a significant aging of the Portuguese-American population. Preliminary analyses from a pilot study composed of Portuguese-American (30.9%) and other non-Portuguese community (69.1%) middle-aged and older adults (Mean age = 69.16; SD age = 8.92; range 52-89; 78% female) from Southeastern Massachusetts were administered language-specific neuropsychological batteries to establish a baseline of cognitive ability. Measures to assess vascular health such as resting pulse pressure were also evaluated since risk of cognitive impairment has been associated with elevated pulse pressure (e.g., Yasur et al., 2011). Initial mean level differences by cultural group in the community-dwelling indicate significant differences with Portuguese-Americans scoring lower on global cognitive ability ($p = .002$), higher on depression ($p=.003$), and lower on verbal fluency ($p=.042$), yet only near significant differences were present on memory recognition and executive functioning measures. Near significance was also found for lower, that is more healthy, pulse pressure among the Portuguese-Americans ($p =.086$). Observed differences in cognitive domains may be due to differences in education, as non-Portuguese-Americans had significantly higher education (Mean=14.63, SD=2.52) levels as compared to the Portuguese-Americans group (Mean=9.71, SD=4.75; t(53)=5.03, p <.001). Known cut scores comparing normal aging to cognitive impairment were applied in secondary analyses, though few met the criteria. Replicating these findings in a larger, longitudinal study will be necessary in order to develop sufficient screening tools for this population.

DO VERBAL AND VISUOSPATIAL ACTIVITIES MODERATE THE RELATIONSHIP BETWEEN EDUCATION AND DEMENTIA? BASED ON THE AGING, DEMOGRAPHICS, AND MEMORY STUDY (ADAMS)

Y. Lee, *University of Southern California, Los Angeles, California*

Background: Cognitive reserve theory has been widely adapted in dementia studies and existing studies have often focused on the main or mediating effect of education, occupation and later-life cognitive activities on the risk of dementia. Only paucity of study explored the moderating effect; thus, this study aims to investigate the interaction effect of verbal and visuospatial activities on the relationship between education and the risk of dementia. Method: 702 older Americans were included in the final multinomial logistic regression analysis from the ADAMS. The outcome variable was cognitive diagnosis categorized into normal, cognitively impaired not demented (CIND), and demented. Principal component factor analysis was conducted to draw two factors (verbal and visuospatial) from cognitive leisure activities. CIND was treated as the reference group to compare 1) normal vs. CIND and 2) CIND vs. demented. Results: The findings show that older adult with longer education years (OR=1.08, CI=1.01-1.17) and frequent engagement in verbal (OR=1.20, CI=1.10-1.30) and visuospatial (OR=1.23, CI=1.11-1.38) activities were more likely to have normal cognition than CIND. Only verbal (OR=0.68, CI=0.63-0.75) and visuospatial (OR=0.79, CI=0.70-0.90) activities showed significant main effect on the risk of dementia compared to that of CIND but not for education years. There was interaction effect for education x verbal activities (OR=0.98, CI=0.96-0.99) on the risk of dementia (vs. CIND). Conclusion: Unlike previous studies, the study found moderating effect of verbal activities on education and dementia. This suggests that for those with same educational years may have lower risk dementia by more engaging in verbal activities.

MEMORY TRAJECTORIES IN A DIVERSE URBAN SAMPLE OF OLDER ADULTS

L.B. Zahodne, M. Wall, J.J. Manly, *Columbia University, New York, New York*

Objective. Most longitudinal studies of cognitive aging describe only average changes, but several recent reports support the presence of subgroups of older adults exhibiting different trajectories of change. The present study identified and characterized subgroups based on memory trajectories in the largest and most racially, ethnically and educationally diverse cohort used for this purpose to date. Method. The 3404 initially non-demented older adults in this study participated in the Washington Heights-Inwood Columbia Aging Project, a community-based longitudinal study of aging in Northern Manhattan. Latent class growth analysis identified subgroups based on trajectories of episodic memory performance over a period of up to 18 years. Immediate recall, delayed recall, and recognition scores from the Selective Reminding Test were combined into a composite score reflecting episodic memory at each of four visits. Results. Four subgroups were identified: high performers with stable decline (16.4%), high-average performers with minimal decline (44.7%), low-average performers with accelerating decline (31.3%), and low performers with accelerating decline (7.5%). These subgroups could be differentiated by initial age, APOE genotype, sex, race, ethnicity, education, language and depressive symptoms, but not by chronic disease burden (including cardiovascular conditions) or body mass index. Groups also differed in incident dementia rates. Conclusions. Results confirm prior work that the majority of older adults exhibit minimal cognitive decline with age. This sample revealed a greater number of distinct subgroups than has been previously reported, suggesting that diverse longitudinal cohorts are important for understanding heterogeneity in late-life cognitive trajectories in the aging population.

UNDERSTANDING DEPRESSIVE SYMPTOMS AMONG COMMUNITY-DWELLING CHINESE OLDER ADULTS IN THE GREATER CHICAGO AREA

R. Chen[1], M. Zhang[1], E. Chang[1], J. Ruan[1], C. Li[1], M.A. Simon[2], X. Dong[1], *1. Rush Institute for Healthy Aging, Chicago, Illinois, 2. Northwestern University, Chicago, Illinois*

Background: Older adults are disproportionately affected by depressive symptoms. The presence of depressive symptoms may lead to declined quality of life, worsened physical and cognitive function, as well as increased use of health care services. This study aimed to examine the prevalence of depressive symptoms among U.S. Chinese older adults. Methods: Data were from a population-based survey of community-dwelling U.S. Chinese older adults aged 60 years and above in the greater Chicago area. We assessed depressive symptoms by face-to-face interviews through using the Patient Health Questionnaire (PHQ-9) (Cronbach's alpha = 0.82). Results: Of the 3,159 participants, 58.9% were female and the mean age was 72.8 (SD = 8.3). In total, 1,717 (54.4%) participants reported having any depressive symptoms in the last two weeks. Older age (r=0.09), being female (r=0.10), lower income (r=0.09), not being married (r=0.07), having fewer years in the U.S. (r=0.05), lower overall health status (r=0.32), poorer quality of life (r=0.14), and worsening health over the past year (r=0.24) were significantly and positively correlated with any depressive symptoms. Conclusion: Depressive symptoms were common among U.S. Chinese older adults in the greater Chicago area. Future studies should improve our understanding of risk factors and outcomes associated with depressive symptoms among U.S. Chinese older adults. Community organizations should promote prevention and intervention programs to improve mental health care for Chinese older adults. Special attention should be given to the oldest old, women, low income older adults, and those with poor health status and quality of life.

THE PERCEPTION OF SOCIAL SUPPORT AMONG COMMUNITY-DWELLING U.S. CHINESE OLDER ADULTS IN THE GREATER CHICAGO AREA

R. Chen[1], M. Zhang[1], E. Chang[1], I. Lin[1], K. Lam[1], M.A. Simon[2], X. Dong[1], *1. Rush Institute for Healthy Aging, Chicago, Illinois, 2. Northwestern University, Chicago, Illinois*

Background: Social support is important for maintaining health and successful aging. This study examined perceptions and correlates of both positive and negative social support among U.S. Chinese older adults. Methods: In total, 3,159 community-dwelling Chinese older adults aged 60 years and above in the greater Chicago area were interviewed in person from 2011-2013. We assessed participants' levels of social support through asking the frequency of receipt of positive and negative support from spouse, family members and friends. Results: Of the 3,159 participants, 58.9% were female and the mean age was 72.8 (SD = 8.3). U.S. Chinese older adults were more likely to perceive positive and negative spouse and family support than friend support. Younger age (r=0.07), being female (r=0.04), higher levels of education (r=0.09), being married (r=0.08), living with a larger number of people (r=0.09), higher health status (r=0.15), better quality of life (r=0.21), and improved health over the past year (r=0.05) were positively associated with positive social support. On the other hand, younger age (r=0.06), being male (r=0.13), higher levels of education (r=0.19), being married (r=0.18), having fewer children (r=0.13) and grandchildren (r=0.15), living with more people (r=0.09), lower health status (r=0.04), and poorer quality of life (r=0.04) were positively correlated with negative social support. Conclusion: The findings point to the importance of integrating family and spousal supports into policy and program developments. In addition to enhancing family and spousal support, increasing efforts should be put into preventing and intervening potential negative interactions such as abuse and conflicts.

SENSE OF COMMUNITY AMONG CHINESE OLDER ADULTS IN THE GREATER CHICAGO AREA: FINDINGS FROM THE PINE STUDY

M. Zhang[1], R. Chen[1], E. Chang[1], J. Ruan[1], Y. Li[1], M.A. Simon[2], X. Dong[1], *1. Rush Institute of Healthy Aging, Chciago, Illinois, 2. Northwestern University, chicago, Illinois*

Background: Sense of community is a concept that has significant implications in public health practice. However, little is known about the sense of community from Chinese older adults' perspective. This study aimed to explore the perception of the sense of community among community-dwelling U.S. Chinese older adults. Methods: Data were from the PINE study, a population-based survey of U.S. Chinese older adults aged 60 years and above in the greater Chicago area. We administered the Sense of Community Index to measure the levels of sense of community. Data were collected through interpersonal interviews. Results: Of the 3,159 participants, 58.9 % were women and the mean age was 72.8 (SD = 8.3). In total, 86.7 % of the participants reported satisfaction with the current neighborhood, and 78.4% expressed their desire to continue living in the community as long as possible. Older age (r=0.11), being female (r=0.08), having higher levels of income (r=0.08), being unmarried (r=-0.06), living with fewer people (r=-0.22), having more children (r= 0.11), having been in the U.S. for more years (r=0.12), longer residency in the community (r=0.15), higher overall health status(r=0.18), better quality of life (r=0.23), and improved health status in the past year (r=0.11) were significantly correlated with the higher levels of the sense of the community. Conclusions: The study investigation provided the basis for generating empirical knowledge to understand the mechanisms underlying sense of community. Future research is needed to explore the health outcomes associated with the sense of community among Chinese aging population.

SELF-MASTERY AMONG CHINESE OLDER ADULTS IN THE GREATER CHICAGO AREA

M. Zhang[1], E. Chang[1], Y. Li[1], K. Lam[1], M.A. Simon[2], X. Dong[1], R. Chen[1], *1. Rush Institute of Healthy Aging, Chciago, Illinois, 2. Northwestern University, Chciago, Illinois*

Background: Self-mastery is an important psychological resource to cope with stressful situations. However, we have limited understanding of self-mastery among minority aging populations. This study aims to examine the presence and levels of self-mastery among U.S. Chinese older adults. Methods: Data were drawn from the PINE study, a population-based survey of U.S. Chinese older adults aged 60 and above in the greater Chicago area. We assessed self-mastery through face-to-face interview using the Chinese Self-Mastery Scale (Cronbach's alpha=0.80), which was derived from Pearlin's Mastery Scale. Results: Of the 3,159 participants,58.9 % were women and the mean age was 72.8 (SD = 8.3). In total, one third of the participants (N = 1,007) reported any self-mastery in their lives. Stronger self-mastery beliefs were reported for specific scenarios: 87.5 % of our participants disagreed with being pushed around in life. Older adults with zero years of education and the oldest-old aged 85 and over had the lowest level of self-mastery in our study. A higher mastery level was associated with an younger age, being female, higher educational level, higher income, being married, having fewer children, better self-reported health status, better quality of life, and positive health changes. Conclusions: Although self-mastery is commonly experienced among the Chinese aging population in the greater Chicago area, specific subgroups are still vulnerable. Future longitudinal studies are needed to improve the understanding of risk factors and outcomes associated with self-mastery among Chinese older adults.

SOCIAL ENGAGEMENT AMONG GREATER CHICAGO AREA CHINESE OLDER ADULTS

M. Zhang[1], M.A. Simon[2], I. Lin[1], E. Chang[1], R. Chen[1], J. Ruan[1], X. Dong[1], *1. Rush Institute of Healthy Aging, Chciago, Illinois, 2. Northwestern University, chicago, Illinois*

Background: Social engagement is one key indicator for the older adults' quality of life and well-beings. However, social engagement patterns of Chinese older adults in the U.S. have not yet been thoroughly studied. This study aimed to understand the social engagement pattern among U.S. Chinese older adults. Methods: Data were collected by the PINE project, a cross-sectional population-based study of 3,159 U.S. Chinese older adults aged 60 and older in the greater Chicago area. Face-to-face interviews were conducted. Social engagement patterns were examined through Social Engagement Scale, containing 16 social engagement activity related questions. ANOVA procedure, Pearson or Spearman correlation coefficients were used to examine the correlation between socio-demographics and social engagement. Results:Of the 3,159 participants,58.9% were female and the mean age was 72.8 (SD = 8.3).Watching TV (80%)and reading (65 %) are the most common social engagement activities.Younger age(r=0.1, p<0.001). higher education levels(r = 0.54, p < 0.001),,better health status(r = 0.16, p< 0.001), and better quality of life(r = 0.17, p < 0.001) were correlated with higher levels of social engagement. Conclusion:Future studies should explore the role of community centers in the lives of Chinese older adults. Further longitudinal studies are needed to understand the factors and outcomes associated with social engagement among U.S Chinese older adults.

THE EXPECTATION AND PERCEIVED RECEIPT OF FILIAL PIETY AMONG CHINESE OLDER ADULTS IN GREATER CHICAGO AREA

M. Zhang[1], R. Chen[1], E. Chang[1], Y. Zhen[1], J. Ruan[1], M.A. Simon[2], X. Dong[1], *1. Rush Institute of Healthy Aging, Chciago, Illinois, 2. Northwestern University, chicago, Illinois*

Objectives:Filial piety is a key cultural value that determines children's caregiving obligation to older adults. Current research called for a better understanding of the evolving conceptualization of filial piety for U.S. Chinese older adults. This study aimed to evaluate the expectations and receipt of filial piety from the perspectives of Chinese older adults with the respect to their length of staying in the U.S.Methods:Data were drawn from the PINE study, a population-based study of U.S. Chinese older adults aged 60 and older in the greater Chicago area. Filial care were examined in six domains, including care, respect greeting, happiness, obedience, and financial support through face-to-face interviews. Socio-demographic correlates with expectations and receipts of filial piety were examined.Results:Of the 3,159 participants, 58.9% were female and the mean age was 72.8 (SD = 8.3).More than half of the Chinese older adults reported a higher than average level of filial piety expectations and receipt on respect, care, greet, happiness, and obedience. Highest expectation and perceived receipt were placed on the domain of respect (4.1 to 4.3) while the least expectation and perceived receipt were placed on financial support (2.5 to 3.0). The receipt of filial piety differed by years in the U.S(p < 0.001).The expectations and perceived receipt of filial piety were correlated with sex, education, marital status, overall health, quality of life, years in the U.S., and the number of daughters and grand children. Discussion: This study provides insights on the extent in which U.S. Chinese older adults perceive filial care and has implications for the provision of culturally appropriate health care services.

AGE AND GEOGRAPHIC DIFFERENCES IN THE USE OF PERSONAL HEALTH RECORDS

T.M. Luger[1,2], L.M. Richardson[2], H. Feng[2,3], K.L. Harvey[2,3], T.K. Houston[1,2,3], *1. Center for Health Outcomes and Implementation Research, Bedford, Massachusetts, 2. eHealth Quality Enhancement Research Initiative, Bedford, Massachusetts, 3. University of Massachusetts Medical School, Worcester, Massachusetts*

The Veteran's Health Administration online personal health record, MyHealth*e*Vet, seeks to engage Veterans with the healthcare system by connecting Veterans to their personal health information, health resources, and physicians[1]. Few studies have examined MyHealth*e*Vet use among older adults, in spite of the fact that 43% of Veterans are over the age of 65 years[2]. We examined variations in use of MyHealth*e*Vet features across the lifespan in order to better understand the reach of health information technology. Data was drawn from a national repository of Veteran data and MyHealth*e*Vet activity logs and included 174,321 Veterans ages 18-100 years. Variables of interest were age, rurality, and the demographic covariates of race, marital status, economic need, and comorbid conditions. Binary logistic models showed significant main effects and interactions between age and rurality for MyHealth*e*Vet registration (*B*age = -0.43, *SE* = 0.01; *B*rural = -0.21, *SE* = 0.02; *B*age*rural = -0.09, *SE* = 0.02), sending a secure E-mail message to a physician (*B*age=-0.41, *SE* =0.02; *B*rural = -0.24, *SE* = 0.03; *B*age*rural = -0.09, *SE* = 0.03), downloading personal health information (*B*age =-0.34, *SE* =0.02; *B*rural = -0.21, *SE* = 0.03; *B*age*rural = -0.10, *SE* = 0.04), and requesting a prescription refill (*B*age =-0.43, *SE* =0.01; *B*rural = -0.15, *SE* = 0.02; *B*age*rural = -0.08, *SE* = 0.05) with older, rural Veterans being less likely to use the features. To reduce disparities in reach, providers and community leaders may want to focus efforts on educating and encouraging health technology use for rural, older adults.

SESSION 990 (POSTER)

CULTURE, PLACE, AND MEMORIES

LIFE REVIEW OF AMERICAN VETERANS OF THE SECOND WORLD WAR: REMEMBERING AND REFLECTING ON "THE GOOD WAR"

H.K. Ulatowska, D. Garst Walsh, T.O. Santos, B. Reyes, *University of Texas at Dallas, Richardson, Texas*

The investigation deals with testimonies of American veterans of World War II. Testimonies of twenty veterans aged 88-97 of the European & Pacific theatres are included. The study examines veterans' evaluation of war experiences, motivations of joining the service, selection of especially meaningful events of combat and the impact war had on their later lives. This type of analysis was motivated by the great need to understand the war from the perception of the last living witnesses and their contributions to build it into collective memory for future generations. This study is also relevant to life review literature for the cohort who experienced the most important historical event of their times and expressing perceptions based on life experience. It also sheds some light on what types of experiences can outlive the damaging effects of memory deterioration. This is illustrated by a compelling statement of a veteran which was lacking specific facts of his war experience but contained a highly abstract evaluation: "You don't run marathons to win, you run'em just to finish," This study is a continuation of investigations of testimonies of survivors of Auschwitz concentration camp as a meaningful tribute to those who were involved in the war.

MAKE A BUCKET LIST: AGE DIFFERENCE IN LIFE GOAL PRIORITIZATION UNDER A LIMITED TIME PERSPECTIVE

Q. Chu, D. Grühn, *Psychology, North Carolina State University, Raleigh, North Carolina*

Lifespan developmental theories suggest that goal prioritization varies by age and by the perception of remaining time. However, less is known about the meaningful life goals that people pursue when lifetime is limited. The current study investigated age differences in bucket lists, containing goals to be attained before the end of life. We asked 248 adults (18-87 years, 57.2% females) to imagine they had only six months to live, and to list at least ten things they wanted to do before the end of life. For each generated item, participants also indicated how important the "thing" was to them and how likely they would do the "thing". Using the socioemotional selectivity theory as a framework, three raters coded the generated items into three goals: (a) information acquisition, (b) emotional well-being and (c) development and maintenance of self-concept. Findings revealed significant age difference in the structure and prioritization of life goals: First, younger adults indicated a higher proportion of information acquisition goals and a lower proportion of emotional well-being goals than older adults. Second, older adults regarded the goals of pursuing emotional well-being and self-concept as more meaningful than younger adults. Finally, the self-concept development goals were rated as more likely to be attained by older adults than younger adults. The findings support the notion that younger and older adults differ in goal prioritization - even under a controlled limited-time perspective. Thus, bucket lists differ between age groups, which may provide reference for practice and research in terminal care.

THE OLDER MEN MASCULINITY IDEOLOGY SCALE: FACTOR STRUCTURE, RELIABILITY, AND CONSTRUCT VALIDITY

E.H. Thompson[1], K. Barnes[2], A. Futterman[1], *1. Sociology & Anthropology, College of the Holy Cross, Worcester, Massachusetts, 2. Case Western Reserve University, Cleveland, Ohio*

Measures of masculinity ideologies developed 20 to 30 years ago operationalized the conventional (or "traditional") cultural guidelines for being a (younger) man in Western society. These hegemonic ideologies are heteronormative and ageist. On the face of the continuing absence of distinct guidelines for being an older man (Spector-Mersel 2006), the question begs to be asked, what masculinity standards likely influence how older men go about their lives? The current study reports the development of the 18-item Older Men Masculinity Ideology Scale. Exploratory factor analysis of responses from 349 men aged 65 and older supports a four-factor structure, satisfies good fit principles (CFI = .947; TLI = .913, RMSEA = 0.046, SRMR = 0.033), and mimics the four tenets Brannon (1976) theorized as core principles of masculinity in American culture. The total scale shows very good internal consistency ($\alpha = .86$), and the reliabilities for the respect, toughness, avoiding femininity, and hardiness subscales are lower, but acceptable. Mean scores importantly show that older men do not support all "traditional" masculinity principles. On average, they moderately endorsed norms specifying that men must continue to earn respect, yet they disagreed with the cultural emphasis on toughness, no sissy stuff, and the sturdy oak qualities of doggedness and self-reliance. Further research is needed to fully understand which cultural guidelines are most important and differentially influence older men's health decisions and behavior, retirement experiences, risk-taking in care work, or bereavement.

ON BEING FEMALE, MIDDLE-AGED, AND BACK IN SCHOOL: PART 2

I. Johnson[1,3], K. Humber[2,3], *1. Towson University, Towson, Maryland, 2. UMUC, Adelphi, Maryland, 3. UMBC, Baltimore, Maryland*

The nontraditional doctoral student is increasingly female, over 30, enrolled in part-time study, married with children and/or dependent parents, and self-funded. Returning to school as a middle-aged women is a life course transition, co-occurring with other transitions in family and career. This study will present survey data reflecting the experiences of middle-aged women who have returned to school to pursue doctoral degrees. Content of the survey was formulated after the authors completed a prior qualitative study to identify factors that were significant for middle-aged women pursuing doctorates in gerontology. Results of that study identified 4 core concepts: 1) returning to school as a push or pull, 2) balancing responsibilities / role strain, 3) managing as a nontraditional student, and 4) living through age-related life transitions. Additional participants were recruited from gerontology and other disciplines. Participants completed an online survey. Using a life course perspective, we examine how life course trajectories play a role in women's decisions to return to school, and we discuss the life course factors that women identified as being influential in either helping them succeed or in creating barriers. Having a better understanding of these factors may be beneficial in developing appropriate supports to encourage successful completion.

HEALTHY AND SUCCESSFUL AGING POPULATION OVER 40 YEARS-OLD IN THE AMERICAS: A REVIEW

B.A. Corona-Figueroa[1], E. ArIas-Merino[1], N.M. Mendoza-Ruvalcaba[1], M.E. Flores-Villavicencio[1], A.E. Morales-Sánchez[1], A. DiazInfante-Villalpando[2], *1. Universidad de Guadalajara, Guadalajara, Jalisco, Mexico, 2. Universidad Autónoma de Guadalajara, Guadalajara, Jalisco, Mexico*

INTRODUCTION: Interest in the study of aging has grown due to factors like epidemiological transition and population aging. The positive approach to aging models includes: active aging, successful aging and healthy aging. OBJECTIVES: Determine prevalence and relationship between active, healthy and successful aging in North and Latin Americans aged >40 years. METHODOLOGY: A literature review was performed which included the topics active, healthy and successful aging published between 1980 and 2013. 180 articles were reviewed to determine prevalence and associated factors in successful aging based on the Rowe and Khan model(1997. The program "Ten Keys to Healthy Aging" proposed by Pittsburgh University was taken to distinguish preventable disease for a healthy aging. RESULTS: Prevalence of successful aging was 12.8% and 11.5% in Mexico and U.S. Factors associated with successful aging were male gender, higher education, exercise and not smoking. Preventable diseases for healthy aging included hypertension, diabetes, tabaquism, osteoporosis, hypercholesterolemia, cancer and depression. Behaviors such as social isolation, sedentarism and lack of immunization were also preventable. Prevalence of these diseases in countries like Argentina, Brazil, Colombia, Costa Rica and Ecuador, among others, was between 8% and 59 %. CONCLUSIONS: The review observed medium successful aging compared with international rates. Although prevalence of diseases differed between countries they are all among the leading causes of mortality. Knowing the prevalence of risk factors at an early age allows us to have a proper intervention for successful and health aging.

BABY BOOMERS' HOUSING PREFERENCES FOR LATER LIFE

H. Kwon[1], J.O. Beamish[2], H. Lee[3], *1. Purdue University, West Lafayette, Indiana, 2. Virginia Tech, Blacksburg, Virginia, 3. Chungbuk National University, CheongJu, Republic of Korea*

Boomers, people born between 1946 and 1964, comprised about 30% of the total U.S. population (U.S. Census Bureau, 2012). As Boomers approach retirement age and become empty nesters, this significant number of housing consumers may consider their future housing plan for later life. Residents' lifestyle has one of the most important impacts on housing choice these days (Beamish, Goss, & Emmel, 2006). The purpose of this study is to examine how Boomers' lifestyle is related to their housing preferences for later life. The authors developed a self-administered questionnaire. Data were collected by an on-line market research survey company in April, 2011. Factor analyses were used to identify the U.S. Boomers' lifestyles and housing preferences for later life. Structural equation model was employed to analyze their relationships (N=403). Four Boomers' lifestyle factors (the beautiful home, the eco-friendly, the engaged, and the family centric) and four housing preferences for later life factors (the supportive housing, the apartment rental, the city townhouse, and the country house) were identified. Boomers with the beautiful home lifestyle were more likely to choose the country house. People with the eco-friendly lifestyle prefer the supportive housing and the city townhouse. Respondents with the engaged lifestyle have a preference for the supportive housing, the apartment rental, and the city townhouse. Boomers with the family centric lifestyle liked the country house for their later life. This research shows that lifestyle factors can be an important underlying explanation to better understand Boomers' housing preferences for their later life.

WAITING FOR HOUSING ASSISTANCE: EXPERIENCES OF LOW-INCOME OLDER PERSONS

P. Carder, J. Kohon, E. Becker, *Institute on Aging, Portland State University, Portland, Oregon*

Gerontological discussions of housing options for older persons typically frame housing in terms of choice, decision making, options, and aging in place, but for low-income older adults, these topics have limited or altered meanings. Rental assistance and low-income housing provide an important resource to nearly 2 million older persons. The limited availability of affordable units results in average waits of two years for a HUD Section 202 unit and 11 older persons queued for each unit in an urban area. Yet, the status of persons who apply for and become waitlisted have been overlooked by gerontologists. This mixed methods study describes the characteristics and lived experience of low-income older adults who applied for rental assistance through a public housing authority, but were still waiting. Data were collected through mailed surveys (n=267) and in-depth, qualitative interviews with a purposive sample of 30 persons, age 56—98. Survey results indicated that 56% had fair/poor self-rated health, 47% used the ED, and 42% were food insecure. Thematic analyses revealed topics including personal cost-benefit analyses, daily realities of the 2008 recession, coping strategies, and frustration with the system. Dimensions that affect these themes include health status, homelessness and housing instability, and access to services and supports. The choices, decisions, and options faced by older persons experiencing poverty provide new insights into decision making theories and to the meaning of aging in place. In addition, this study offers suggestions for how housing authorities and advocates might respond to older persons who need housing assistance.

CHALLENGES AT AGE 100: FINDINGS FROM THE FORDHAM CENTENARIAN STUDY

D.S. Jopp, S.A. Hicks, S. Jeswani, E.M. Kennedy, K. Long, A. Soyeju, A. Cavanagh, M. Knapp, *Fordham University, Bronx, New York*

What are the challenges that individuals face when having reached age 100? Despite considerable interest in what contributes to exceptional longevity, only limited information is available on how centenarians experience their lives, including everyday difficulties. The present study addressed this gap in the literature by investigating the challenges reported by near-centenarians and centenarians. The Fordham Centenarian Study is a population-based study of 95 to 107 year old individuals living in New York City (N = 119; 78.2% females). The majority was White (79.8%) and 19.3% were African American. Seventy-seven participants answered open-ended questions about current challenges. Relative to the total sample, individuals who shared information on challenges had a slightly higher cognitive status. Other differences (e.g., physical health) were not found. The qualitative answers were coded using a coding schema developed for the study. Specifically, recurring topics were categorized using so-called clustering or open coding (Glaser & Strauss, 1967; Miles & Huberman, 1994). Participants mentioned functional challenges most often (71%), followed by psychological challenges (39%) and social challenges (16%). Within the health category, mobility challenges were reported most often, followed by physical limitations, visual impairment and functional disability. Within the psychological challenges category, acceptance of health issues were mentioned most often, followed by issues related to dependency, emotions and death/dying. Findings indicate that despite the fact that very old individuals seem to adapt quite successfully to age-associated loss, they still experience these losses as challenging.

EVALUATION OF THE HEALTHY AGING AND INDEPENDENT LIVING INITIATIVE OF UNITED WAY OF TARRANT COUNTY IN TEXAS

J. Cho[1,2], J. Thorud[1], M.G. Ory[2], A.B. Stevens[1], *1. Scott & White Healthcare, Temple, Texas, 2. TAMHSC School of Rural Public Health, College Station, Texas*

In response to the United Way of Tarrant County's 2020 Bold Goal, the Healthy Aging and Independent Living initiative delineated specific strategies to address known health risks in Tarrant County, Texas. The United Way has partnered with six community-based organizations to provide health interventions and health promotion activities to improve health and lower healthcare costs to individuals at risk of poor health. The nine health intervention programs include, A Matter of Balance, Better Choice Better Health, HomeMeds, Patient Activation, Diabetes-Salud!, REACH II, Respite Care, Diabtetes/Nutrition Counseling, and Health Literacy. These programs target the areas of falls prevention, chronic disease self-management, medication management, community health navigation, diabetes screening and education, and health literacy, respectively. This presentation addresses output and outcome achievements as a result of program implementation by each organization, from July 2012 through June 2013. A total of 9,224 clients were served through the initiative. Improvements were seen in major outcomes of interest (e.g., healthcare utilization, and self-rated health). The percentage of client's self-rated health of good/very good/excellent increased from 59.4% at the initial assessment to 62.1% at the six month assessment. The percentage of clients with hospitalization reduced from 22.2% at the initial assessment to 12.4% at the six month assessment. Additional improvements were seen in program specific outcomes (e.g., falls efficacy scale, medication adherence score, and diabetes knowledge assessment). This work highlights the value of evaluation and a community-based health intervention programs' success in improving health and reducing healthcare costs among older adults in community settings.

OLDER ADULTS, AGING IN PLACE, AND HOUSING CHALLENGES IN NEW YORK CITY

A.W. Costley, *York College-CUNY, Queens, New York*

Background: With New York City ranking in the top five US cities for highest cost-of-living, housing costs greatly contribute to this index. Without substantial policy efforts to create more meaningful housing options, older adults in New York City are facing an inevitable "housing crisis." Methods: This exploratory project examines a variety of secondary data sources to assess the current status of "housing security" and access to affordable housing for older adults in New York City. Comparative and descriptive data are used to illustrate trends in: homeownership, median income, median rents, and the percent of income spent on rent. Results: With a much lower homeownership rate compared to the rest of the country, NYC housing stock is skewed by high rates of renters. City-wide increases in rental rates are even higher in selected boroughs. The percent of annual income spent on housing rose approximately 10% city wide, with almost 50% of "older renters" spending at least 35% of income on rent and 75% of "low-income" renters spending up to 50% on rent. As median income city-wide fell by 5% from 2005 to 2011, median rents city wide rose by 10% or more. Conclusions: Substantial policy efforts are needed to create meaningful "affordable" housing options not indexed to "market-rate" options to allow older-adult tenants to age in place in many neighborhoods. Possible interventions include: changes to tax-incentive policies for real-estate development, increased funding for federally-subsidized housing (e.g. section 202) and changes in eligibility requirements for age-based rent protections (e.g. SCRIE).

WHERE DO CENTENARIANS LIVE IN THEIR LAST YEAR OF LIFE?

J.D. Gass, S.L. Andersen, L. Feldman, T.M. Neary, T.T. Perls, *Boston University Medical Center, Boston, Massachusetts*

Studies report compression of disability among people who live to 100 years and for those who live to even older ages, such as 105+ years, there is an observed compression of morbidity. We hypothesize that this delay allows centenarians to live independently for longer. We analyzed the proportion of NECS centenarians, by sex, in each of four living situations: alone, alone with care, assisted living, and skilled nursing facility (SNF) at their last annual follow up. Sample: 824 NECS centenarians, 615 females, mean age at death 105; 209 males, mean age 102 years. At time of death, average time since enrollment was 2.14 years for women (SD=1.92) and 2.61 years for men (SD=2.09). Of the female participants, 8% reported living alone, 25% alone with care, 19% in assisted living, and 48% in a SNF. Among men, 21% lived alone, 36% lived alone with care, 22% resided in assisted living, and the other 21% lived in SNF. More centenarians lived in independent settings than in SNF within one year of their deaths. A larger proportion of men had independent or semi-independent living arrangements than women. This sex-based difference is consistent with reports indicating that though far fewer, male centenarians are functionally better off than female centenarians. These findings suggest centenarians are able to live independently into extreme old age, near the end of life, consistent with their compression of disability. It is worth investigating whether there may be a reciprocal relationship between living independently and surviving to an exceptionally old age.

MATURE GAZE: DIS-EMPOWERMENT OF YOUTH CULTURE ON AGING FEMALE'S IDENTITY

J. Manning Dantis, *Miami University, Oxford, Ohio*

The purpose of this theoretical paper is to offer Mature Gaze (Forthcoming Manning-Dantis) perspective as a way of critically looking at the power of new forms of media in the development of social identities for older women. Mature Gaze as a construct critically views the illusion of perfection as a way of gaining or losing power. Mature Gaze looks at self-objectification and the link with individuals' misidentifying with youth culture. For individuals who covet youthful images and disengage from positive feelings towards aging, this may increase the likelihood of a loss of power by going past the line of looking to obsessing. Once an individual disengages from an aging identity and begin to identifying with youth culture, power is potentially shifted to reinforcing the idea that youth is more beautiful. Once individuals give power to the idea that youth equates to beauty, they are also taking power from themselves. Through new networks found on the internet, an individual who creates a persona that is younger or provides information that is from years past reinforces the disengagement they have with their aging self. Through digital medium, the pursuit of perfection can be obtained by photo shopping away any trace of a flaw. Self-objectification creates a need to change what individuals can, or medically remove what they cannot. The concept of Mature Gaze is drawn from independent research in the field of gerontology.

GERONTOLOGY, ART, AND NURSING: CONNECTING DIVERGENT DISCIPLINES FROM A STUDENT PERSPECTIVE

M.B. Ligon, K.E. Grogan, *Behavioral Sciences, York College of PA, York, Pennsylvania*

Liberal arts education encompasses “critical thinking, communication, problem solving and developing an understanding of historical, economic, scientific, cultural and global contexts where we live and work” (Sandeen, 2012. p.81). With more than three fourths of the United States older population having two or more chronic illnesses, the connection between the topics of nursing and gerontology are established (Salive, 2012). Photography lends a visual expression of our most precious commodity, our elders. By embracing the liberal arts perspective, we can see the person as a whole. As a nontraditional nursing student, the connection was made for me between gerontology, chronic illness and photography one semester when I was enrolled in these three classes. I was able to connect topics by combing assignments in each of the courses: 1) through my photography assignment, shooting a series of older adults, 2) through completing an oral history project with an older adult in a gerontology course, and 3) through an interview assignment with an older adult with a chronic illness in a nursing class. Through connecting divergent topics of chronic illness, social aspects of aging and photography, I was able to see the subject as a whole person and understand that elders have a story to tell if we just take the time to look into their faces. Thus, this project helped me accomplish the intent of a liberal arts education. Through a culminating project the connection was formulized, and the proposed presentation reflects this work.

RECONNECTING CREATIVITY AND AGING: NEW EXPLORATIONS

D.J. Sheets[1], F. Segal-Gidan[2], P. Liebig[2], *1. University of Victoria, Victoria, British Columbia, Canada, 2. University of Southern California, Los Angeles, California*

New insights across disciplines (e.g., neuroscience, philosophy, literature, psychology) on creativity as both process and outputs provide opportunities to re-examine how we define that concept and its relationship to aging. Cohen’s (2006) pioneering work constituted a major sea change in how we think about creativity and understand its impact on aging. To further explore the concept of creativity and its relationship to age and aging, data were collected from academics in aging studies, gerontology or related disciplines using an online survey. Respondents (n=54) were asked to describe creativity in their own words and to assess its relevance to age or aging. The mean age of respondents was 57.9 years (range 30 to 82 yrs.); 72.2% were women. The majority (77.4 %) held PhDs. Responses were primarily from the United States and Canada (68%), but one-third (32%) of responses came from European countries. Three-fourths (76.9%) report the subject of creativity and aging is “very important” to them. When asked to define creativity, themes included: new solutions to problems, generativity, “outside the box” thinking, spontaneity and a series of processes. In general, definitions were largely focused on the arts. In assessing creativity’s relation to age or aging, responses fell into two camps. Some respondents viewed creativity as a lifelong developmental process. Others viewed creativity with a more ageist lens, suggesting it diminished with age/aging. Given these responses, it is clear that a larger survey of this kind needs to be conducted to address this topic.

DIGITALLY LITERATE: PSYCHOMETRIC VALIDATION OF ELECTRONIC HEALTH LITERACY SCALE (EHLS)

G. Seckin, *Sociology, University of North Texas, Denton, Texas*

Objective: The purpose of this paper is to describe the development of an instrument that can be used to measure self-reported ability to evaluate quality and credibility of health information from electronic sources. Methods: The study included a nationally representative sample of 710 community-dwelling adults (381 women and 329 men) ranging in age from 18 to 93 years (M = 48.82, SD = 16.43). Exploratory factor analyses (EFA) with Principal Components Analysis and Varimax rotation was first conducted to assess the factor structure of the EHLS. EFA was validated using age stratified subsamples. A confirmatory factor analysis with AMOS graphics was used to determine the final factorial structure of the scale. Results: EFA revealed three factors with Eigen values greater than 1.0 accounting for 65% of the variance of the data. This three-factor model fit the data well for the full sample: Chi-Square (710) = 901.919, p = .000, CFI = .914, NFI = .901, RMSEA = .090. For the older subsample (age≥ 60), the estimates are as follows: Chi-Square (194) =384.383, p = .000, CFI = .907, NFI = .867, RMSEA =.098. The alpha value for the whole sample is .93. Reestimation of factor structure and internal consistency reliability estimates using the older subsample produced an alpha value of .943. Conclusion: The study findings offer an initial examination of digital health literacy proficiency that moves beyond print resources. As information technologies evolve, health practitioners must assess the ability of their patients to evaluate information gained from the electronic sources.

ELDERS AT AN LGBT SENIOR CENTER REFLECT ON THEIR LIVES AND NEEDS

M. Ye[1], B. Kahana[2], E. Kahana[1], S. Shick[1], J. Siegel[1], *1. Sociology, Case Western Reserve University, Cleveland, Ohio, 2. Cleveland State University, Cleveland, Ohio*

Limited research offers insights into the life- worlds of LGBT seniors. We obtained data from 83 elders who attended a unique Community Center dedicated to needs of LGBT seniors.The center attracts elders willing to drive long distances to participate. The anonymous survey was administered at a coffee hour .Most of the participants were gay men.There were 9 lesbian women in attendance, who sat separately and mingled little with the men.For this generation of elders coming to terms with their LGBT identity poses a challenging task. About ½ of respondents came out of the closet in their youth (teens, 20s and 30s), but many participants did not come out until later life (50s and 60s) and a substantial group have “not yet “ come out.The latter group emphasized that coming out can be a difficult life- long struggle. Almost 1/3 of respondents(both men and women) reported a heterosexual marriage and many faced rejection by adult children . Attendees were educated, articulate and were in relatively good health. Many reported living with a partner in a committed relationship or bereaved after loss of a long term partner. Major needs identified included social programs to combat loneliness, legal protections for partners, and gay rights advocacy. Health related concerns were not with HIV/ AIDS, but with care for chronic illnesses that are not unique to LGBT populations.

MOTHERS' AND DAUGHTERS' DOMINANCE ACROSS THE LIFESPAN: LONGITUDINAL FINDINGS FROM THE INTERGENERATIONAL STUDIES

C. Jones, *psychology, california state university, fresno, Fresno, California*

The Intergenerational Studies, begun in 1929, are rare multi-generational longitudinal investigations of normal human development. Original participant women (N=180) and daughters of original participants (N=190) are studied here, with respect to score on the California Psychological Inventory's (CPI; Gough & Bradley, 1996) Dominance (DO) scale. Data were collected from the older cohort five times, at approximately ages 30, 40, 50, 60, and 70, and from the younger cohort three times, at approximately ages 20, 30, and 40. Previous analyses of these women's lifespan change in CPI Femininity (FM), via three-level hierarchical linear modeling (HLM; Bryk & Raudenbush, 1992), found a significant linear lifespan decrease for both cohorts (Jones, 2013). To more broadly capture aspects of the femininity-masculinity dimension, DO, an indicator of positive aspects of masculinity (Twenge, 2001) is now explored. Both developmental and sociocultural theorists (e.g., Gutmann, 1994; Stewart & Healy, 1989) predict women acquire positive cross-gender characteristics with age, particularly those born after the Women's Movement. Obtained results support theory: on average, while the older and younger cohorts are equivalent with respect to level of DO in early adulthood, the two cohorts show a statistically significant difference in lifespan increase, with the younger cohort increasing .16 points per year; the older .03 points per year. Results are robust because family-level dependencies in score are systematically modeled, the age range examined is extensive, repeated measurements are available, and a standardized measure of dominance is used. Results illustrate both cohort and individual developmental movement toward more dominance in women.

GENERATIVITY IN JAPANESE OLD AGE: THE DIFFERENCE OF AGE, AREA AND GENDER

M. Tabuchi[1], Y. Gondo[2], T. Nakagawa[2], Y. Masui[3], K. Kamide[2], K. Ikebe[2], T. Ishizaki[3], R. Takahashi[3], *1. Kwansei Gakuin University, Nishinomiya, Japan, 2. Osaka University, Suita, Japan, 3. Tokyo Metropolitan Institute of Gerontology, Tokyo, Japan*

Objectives: The purpose of this study was to reveal the age, area and gender differences in the development of 'generativity' in old age using the large sample in Japan. Generativity, suggested by E. H. Erikson as a developmental task in middle-age, is now an important life goal not only for middle-aged but also for older adults. According to previous studies, higher level of generativity leads to higher level of psychological well-being. Methods: The participants were community-dwelling elderly aged 69–72 years (n=1000), 79–82 years (n=973), and 89–92 years (n=272). The two locations, urban and rural area, were set in the western and eastern regions in Japan. The Japanese Generativity Scale (Tabuchi, Nakagawa, Gondo, & Komori, 2012), which is the translated Loyola Generativity Scale, was used. The survey was approved by the ethical committee of human behavior in the Human Sciences, Medicine, and Dentistry Department of Osaka University, Tokyo Metropolitan Institute of Gerontology, and the School of Medicine, Keio University. Results: We analyzed generativity using an age group × gender × area ANCOVA. We controlled the personality as a covariate. As a result, a gender × area interaction was significant ($F(1, 2138) = 4.76$, $p < .05$), and in female, the score of generativity did not differ significantly by area, whereas in male, generativity was significantly higher in rural than in urban area. Conclusion: This result posed the problem of psychological development and well-being in elderly men living in urban area because of their lower score of generativity.

IS WORKFORCE DIVERSITY VIEWED AS A GOOD, ETHICAL, OR WORTHLESS PRACTICE?: EXPLORING NURSING HOME LEADERS' REACTIONS TO DIVERSITY

K. Condeelis[1,2], L.D. Vinson[1,2], M.R. Crowther[1], A. Snow[1,2], *1. The University of Alabama, Tusclaoosa, Alabama, 2. The Center for Mental Health & Aging, Tuscaloosa, Alabama*

The Reaction to Diversity (R-T-D) is a quantitative measure of an individual's positive and negative attitudes and perceptions towards workforce diversity (WD). Using data from a survey designed to explore WD management perceptions and practices among nursing home leaders in the Deep South, the current study examines how nursing home leaders' understand and characterize diversity. The predominately Caucasian (90.1%) sample had a mean age of 51 and was 58% female. Individuals reporting positive/optimist perceptions of diversity represented 46.6% of the sample, whereas neutral/realist and negative/pessimist views accounted for 52.7% and 0.7%, respectively. There was a significant positive correlation between R-T-D scores and diversity management (r=.40, n=136, p=.01), with leaders endorsing more optimistic/positive attitudes toward diversity also reporting more diversity management practices and policies. There was no significant difference in R-T-D scores based on race, age, state, or gender. These results are consistent with previous research using the R-T-D in college and industry samples. Future research should investigate the R-T-D with a more heterogeneous sample, in order to determine whether leaders' race and gender influences their responses on the R-T-D. Our study suggests that nursing home leaders often select negative items related to diversity. As a result, future research should also examine reasons that nursing home leaders regularly choose negative items and determine methods to promote more positive perceptions and attitudes toward diversity. Furthermore, the R-T-D might be a useful measure to identify common aspects of WD that could benefit from improvement within nursing homes.

CULTURAL BELIEFS OF AGING WELL AND INTERGENERATIONAL RELATIONSHIPS AMONG JAPANESE OLDER ADULTS

K. Hoshino, *The Pennsylvania State University, University Park, Pennsylvania*

PURPOSES: The goal of this study was to examine cultural beliefs of aging well and intergenerational relationships among Japanese older adults by using the Sentence Completion test for Gerotranscendence (SCTG), which was developed from the Gerotranscendence Scale Type 2. METHODS: In Japan, 235 older adults (the mean age=69.17 years old, SD=4.72) answered the SCTG, which consisted of 10 items: physical perception; attitudes toward aging, life, and death; perspectives of society, history, and the universe; social relationships and marital relationships; meditation. Two researchers independently evaluated the items on a three-point scale, rated as: 0. Negative; 1. Neutral or Ambivalent; and 2. Positive, and conducted a content analysis. RESULTS: One-third of the participants had positive attitudes toward aging and death based on their intergenerational relationships, while one-third of the participants had neutral attitudes because they regarded aging and death as natural processes in their lifespan development. Most of the participants had positive perspectives of society, history, and the universe and indicated intergenerational ties beyond each individual live. DISCUSSION: This study revealed that positive attitudes toward aging and death based on their intergenerational relationships were distinctive among Japanese older adults. They were familiar with transcendent perspectives of society, history, and the universe in terms of their historical ties and generational successions. Thus, these cultural beliefs may represent culturally specific aging well in Japan and should contribute to develop culturally appropriate intergenerational educational programs.

COPING WITH HOUSING INADEQUACIES, PERSPECTIVES OF OLDER PEOPLE IN BRUSSELS

A. Smetcoren[1], N. De Witte[1,2], E. Verté[1], T. Kardol[1], D. Verté[1], *1. Faculty of Psychology and Educational Sciences, Vrije Universiteit Brussel, Brussel, Belgium, 2. University College Ghent, Ghent, Belgium*

Concepts such as 'place-attachment' and 'aging in place' have received considerable amount of attention in recent years. In particular, it has been stressed that aging is often associated with an intensification of feelings of place. Conversely, research has pointed out that many seniors live in inadequate housing due to increasing care needs. While local policies and elderly themselves generally promote aging in place, little attention has being paid to strategies older people develop to cope with housing inadequacies. Drawing on qualitative research this study explores how older people handle events and challenges within their current housing situation. Data is emanating from an extensive qualitative study on aging in place, housing and care in Brussels (Belgium) organized in 2011-2012. The project comprised focusgroups with a wide range of participants; third & fourth age (8), vulnerable older people (3) and older migrants (7). Many of the respondents indicated a gap between their actual and their desired situation, due to several restraints (e.g. lack of information, feelings of distrust, little social support, etc.). Subsequently, instead of making the dwelling more adapted to their needs, most respondents adapt themselves to the limitations of their dwelling (e.g. avoid using upper floors). And although most of them recognized the need for planning their future housing, only few changed their words into actions. Hence, the paper calls for research and policy approaches in which older people are being informed and stimulated to anticipate on their future needs so they can remain in control when problems occur.

ALTERNATIVE HOUSING, A SOLUTION FOR THE FUTURE? EXPLORING OLDER PEOPLE'S PERCEPTIONS

A. Smetcoren, L. De Donder, S. Dury, S. Van Regenmortel, T. Kardol, D. Verté, *Faculty of Psychology and Educational Sciences, Vrije Universiteit Brussel, Brussel, Belgium*

This contribution explores perspectives on different alternative housing possibilities among different groups of older people in Brussels. As defined by Lawton (1981) alternative forms of housing is whatever form that can not be placed within the traditional group of residences. A common element among them is the relatively small scale and the fact that they are more custom-built for people whose needs or resources do not fit into the mold of traditional housing types. In a large extensive qualitative study on aging in place, housing and care in Brussels, organized in 2011- 2012, there was a specific attention for alternative forms of housing. The research project comprised 18 focus groups with a wide range of participants: third & fourth age (8), vulnerable older people (3), and older migrants (7). Different forms such as Abbeyfield housing, cohousing and granny flats are being discussed as well as their strengths and deficits. Results suggest that a large part of the respondents are open to these new ideas. Autonomy, affordability, not being alone when something would happen and the possibility of staying in the familiar neighborhood are seen as advantages by the different groups. Overall, findings suggest that alternative forms of housing are not a generalized solution, however, we can conclude that they are important additions to the range of housing choices available for older people. More information could support the visibility of existing forms towards older people. Results suggest that more research is necessary for future developments.

SESSION 995 (POSTER)

PSYCHOLOGICAL AND PHYSICAL HEALTH

IS SARCOPENIA A RISK FACTOR FOR PHYSICAL AND COGNITIVE FUNCTIONAL IMPAIRMENT?

M. Tolea, J. Galvin, *New York University, New York, New York*

Goal: To investigate whether sarcopenia increases the risk of simultaneously having impairment in both the cognitive and physical aspects of functionality. Methods: 214 community-dwelling adults aged 40-100y (mean 68.1±10.6; 65% female, 40% Hispanic, 40% non-Hispanic Caucasian, and 20% non-Hispanic African-American) were recruited and assessed on functionality, anthropometry, and cognition. Participants in the lowest quartile of lean muscle mass (measured by impedance) but not the lowest quartile of upper extremity muscle strength (measured with a hand-held dynamometer) were categorized as pre-sarcopenic; those in the lowest quartile on both measures as sarcopenic; those in higher quartiles on mass and strength or low strength but high mass were considered non-sarcopenic controls. Groups were compared on likelihood of having cognitive impairment (Montreal Cognitive Assessment (MoCA) score<26; AD8>2), physical functional impairment (Mini Physical Performance Test score<12), both, or neither by ordinal logistic regression adjusted for age, gender, race, BMI, and depression. Results: Compared to controls, sarcopenic participants had a 6-fold risk of combined cognitive and functional impairment. The fully adjusted model showed a 3-fold increased risk of combined cognitive and functional impairment. The results were consistent across different measures of global cognition (OR=5.92, 95%CI: 2.51-13.96 for MoCA; OR=6.38, 95%CI: 2.89-14.52 for AD8). Those in the pre-sarcopenia stage were not significantly different from controls. Conclusions: Individuals with sarcopenia are at increased risk for simultaneously having cognitive and physical functional impairment. Interventions designed to prevent sarcopenia, increase lean muscle mass and improve strength may help reduce the burden of cognitive and physical impairments in community-dwelling older adults.

EXPOSURE TO HURRICANE SANDY, NEIGHBORHOOD SOCIAL CAPITAL AND DEPRESSIVE SYMPTOMS IN OLDER ADULTS

F. Cartwright[1], M. Wilson-Genderson[2], R. Pruchno[1], *1. New Jersey Institute for Successful Aging, Rowan University School of Osteopathic Medicine, Stratford, New Jersey, 2. Virginia Commonwealth University-School of Medicine, Richmond, Virginia*

We examined aspects of neighborhood social capital that promote resilience of older adults exposed to natural disaster. We hypothesized that higher levels of neighborhood social capital reduces depressive symptoms among older people exposed to Hurricane Sandy. A random-digit-dial sample of community-dwelling adults aged 50-74 residing in New Jersey was interviewed approximately 8 months after the storm. Participants reported the extent to which they were in immediate physical danger from the storm, felt distressed during the storm, and experienced damage to home. Neighborhood characteristics and depressive symptoms were also collected via self-report. MANOVA revealed higher levels of depressive symptoms in people who experienced physical danger (28%; 6.7 v. 7.7, $p < .02$) and emotional distress (52%; 5.6 v. 8.25, $p < .0004$) but not those who sustained home damage (26%; 7.1 v. 7.5, $p > .20$). Lower ratings for neighborhood quality (shared values, $p < .04$; watchfulness over children, $p < .05$; wanting to move away, $p < .03$) were associated with higher levels of depressive symptoms.

FINDING CONTINUITY IN CHAOS: A QUALITATIVE STUDY OF OLDER ADULTS IN DETROIT

W.D. Bartlo, *Anthropology, Wayne State University, Detroit, Michigan*

National media portray Detroit neighborhoods as spaces fraught with chaos, instability, and abandonment, a portrait extended by association to the lives of city residents. This research questions how public images of disruption enter into individual management and experiences of expectable later life continuities, change, and meaningful connections. Using in-depth interviews conducted in Detroit, Michigan with older current and former residents, I analyzed interview transcripts to identify key topics, themes, and patterns. Images of Detroit as chaotic and unstable did not characterize the experiences of these older adults. Multiple links to specific locales or social networks were self-identified as sources of stability and continuity. These pilot findings support plans for a larger project to evaluate competing approaches to conjoin macro-level public images of a city space with micro-level individual experiences.

GENE X PHYSICAL ACTIVITY INTERACTIONS AFFECT EXECUTIVE FUNCTIONING IN AGING: CROSS-DOMAIN LONGITUDINAL ANALYSES

S.D. Thibeau, G. McFall, S.A. Wiebe, R.A. Dixon, *Psychology, University of Alberta, Edmonton, Alberta, Canada*

Introduction: Although physical activity (PA) is an important modifiable contributor to age- related variability in executive functioning, its role may be moderated by non-modifiable genetic polymorphisms. We examine two factors (genetic risk and PA) associated with performance and change in executive function (EF). Specifically, we tested independent and moderating effects of Brain-Derived Neurotrophic Factor (BDNF; rs6265) and Insulin Degrading Enzyme (IDE; rs6583817) on EF and PA-EF relationships. Method: The sample was genotyped older adults ($N=579$, M age$=70.47$) over three waves (9 years) of the Victoria Longitudinal Study. Analyses included (a) confirmatory factor analysis establishing a single latent EF factor from four standard EF tasks, (b) latent growth modeling (Mplus 7.0) over a 40-year band of aging (ages 53-95), and (c) path analyses to investigate the independent and interactive effects of BDNF, IDE and PA. Results: First, higher levels of PA were associated with better EF performance at the centering age (75 years) and less EF decline. Second, IDE G+ (protective) carriers exhibited better EF performance at age 75 than their G- peers. Third, within the IDE G+ carrier group, those with higher PA exhibited better EF performance and more gradual change over time than those with lower PA. Fourth, within the lower performing BDNF homozygote Val group, unlike the better performing BDNF comparison group (Val/Met; Met/Met), higher PA was associated with better EF performance and more gradual EF change. Conclusion: The effect of modifiable health factors on executive functioning is differentially moderated by polymorphisms bridging health and cognition in aging.

GENDER AND RESIDENTIAL DIFFERENCES IN THE REPORTED HEALTH AND WELL-BEING OF CENTENARIANS

A.J. Bishop, J. Taylor, *Human Development and Family Science, Oklahoma State University, Stillwater, Oklahoma*

This study involved examination of gender and residential differences in health and well-being among centenarians. Participants included $N=154$ centenarian ($M = 101$; $SD = 1.71$) residing in private-homes and care facilities in Oklahoma. IBM/SPSS was used to compute univariate analyses of variance on reported health and subjective well-being scores. Significant gender differences emerged relative to lifetime trauma, $F(1, 153) = 7.58$, $p < .05$, functional health, $F(1, 153) = 5.29$, $p < .05$, and Neuroticism, $F(1, 148) = 5.76$, $p < .05$. Compared to centenarian women, centenarian men reported higher mean scores on lifetime trauma ($M = 2.60$ vs. $M = 1.91$), functional health ($M = 32.60$ vs. $M = 30.96$) but lower reported mean scores on Neuroticism ($M = 22.03$ vs. $M = 25.02$). Significant residential differences were also evident relative to perceived health, $F(1, 153) = 5.09$, $p < .05$, health conditions $F(1, 153) = 6.04$, $p < .05$, and functional health, $F(1, 153) = 21.02$, $p < .01$. Comparatively, centenarians residing in care facilities reported a lower average number of health conditions ($M = 2.62$ vs. $M = 3.41$) than centenarians residing in private homes. Yet, centenarians residing in care facilities had lower average scores of perceived health ($M = 3.81$ vs. $M = 4.33$) and functional health ($M = 30.14$ vs. $M = 33.41$). Results have implications toward improving quality-of-life for centenarian men and women who reside independently at home as well as within care facilities.

ACTIVE LIFE EXPECTANCY FOR AMERICANS WITH DIABETES: RISKS OF HEART DISEASE, OBESITY, AND INACTIVITY

S.B. Laditka, J.N. Laditka, *Public Health Sciences, University of North Carolina at Charlotte, Charlotte, North Carolina*

Active life expectancy research examining associations among diabetes, disability, and death has often not accounted for health factors that are common among people with diabetes. Thus, it is not known if diabetes itself is a principal cause of disability and death, or if health factors that are frequently associated with diabetes may be the causes. Our study identified associations of diabetes with life expectancy (LE) and the proportion of life with disability (DLE), accounting for heart disease, and earlier-life obesity and physical inactivity. Data were from the Panel Study of Income Dynamics (1999-2011, and 1986, $n=1,862$, 15,859 person-years), representing African American and White women and men ages 55+. Disability was assessed by activities of daily living. We estimated monthly disability status probabilities with multinomial logistic Markov models adjusted for age, sex, ethnicity, education, and the four health factors. A random effect accounted for repeated measures. Bootstrapping provided standard errors. Microsimulation created large populations to identify the outcome measures. African American women exemplify results: LE was 2.5 years less with diabetes than without (95% confidence interval 1.7-3.3), 9.5 less (8.2-10.8) with heart disease added, 18.1 less with all factors (12.1-24.1). DLE was 22.5% (20.3-24.7) with no risk factors, 27.0% (25.2-28.8) with diabetes alone, 38.3% (36.5-40.1) with heart disease added, 54.4% (41.8-67.2) with all factors. Other groups had similar patterns. Much of the disability and mortality associated with diabetes was due to heart disease and earlier-life obesity and inactivity, risks that can be modified by preventive health care and healthy behaviors.

QUESTIONNAIRE DEVELOPMENT AND MEASUREMENT OF KNEE OSTEOARTHRITIS KNOWLEDGE, COPING PATTERNS AND SELF-MANAGEMENT EFFICACY FOR RURAL COMMUNITY-DWELLING OLDER ADULTS

S.Y. Chen, *Department of Adult and Continuing Education & Graduate Institute of Elder Education, National Chung Cheng University, Chia-Yi, Taiwan*

The decline of physical and mental function will affect the survey results which is been measured by the premise of cognitive ability. Currently very few studies explore the tools development for older adults, especially with low literacy. The purpose of this study is to develop questionnaires suitably to community-dwelling older adults to explore their knowledge, coping patterns and self-management efficacy of knee OA. Objects include older adults over 65 years old who came from 91 community senior centers or active senior learning centers in Chiayi County, at Taiwan south rural area. Over 90% older adults' education level are under primary school and there were pain symptoms on knee in the last year. Research tools include knee OA knowledge scale, coping scale and self-management efficacy scale for the older adult. It collects data by group interview at the community senior centers and use pictures to help older adults understand the measurement methods.

The developing procedures include referring to empirical researches and the latest treatment guidelines and then sent to 10 professionals to test the reliability, after the pre-test to analyze the internal consistency and modify the scales. The results show that knee OA coping scale and knee OA self-management efficacy scale have good internal consistency. The subscale's validity, including the knowledge of disease causes, symptoms and course is over 0.7, but the subscale's validity of diagnosis and treatment is not satisfactory. Finally, this study provides recommendations for survey the older adults with low literacy.

KNOWN AND UNKNOWN: PROSTATE CANCER KNOWLEDGE AMONG RURAL AFRICAN AMERICAN MEN AND THEIR ADVOCATES

L. Mieskowski[1], M.K. Eichorst[1], R.S. Allen[1], J.S. Oliver[2], *1. Dept. of Psychology, University of Alabama, Tuscaloosa, Alabama, 2. University of Alabama - Capstone College of Nursing, Tuscaloosa, Alabama*

The existence of racial/ethnic health disparities has been firmly established in the scientific literature. Prostate cancer (PC), which is differentially and adversely experienced by African American (AA) men, is of particular interest considering the recent change to the USPSTF screening recommendations. In order to create effective interventions, obtaining a better understanding of actual PC knowledge will be necessary to affirm known facts and dispel misunderstandings. Furthermore, in populations where PC knowledge is low, certainty about what is known and unknown may have greater effect on the decision-making process of AA men and their "health care advocates" consideration of the risks and benefits of PC screening. Our study interviewed a sample of 33 AA men (Mage = 54.61, SD = 8.30, range = 40-71) and their self-selected advocates (Mage = 54.52, SD = 10.42, range = 31-79) from three southern, rural counties. Knowledge was generally low among participants. PC knowledge in men was stable across time, ($F(2, 91) = 0.37$, $p > .05$), suggesting that distribution of PC information is insufficient in increasing PC knowledge within this sample. Correct PKI responses varied across time among participants; therefore, additional analyses evaluating item stability were conducted to reveal stability in responses. Implications of the present study include the importance of tailored, engaging approaches to increasing PC knowledge, and the importance of assessing baseline knowledge for each patient.

PREDICTORS OF PERCEIVED HEALTH AMONG OLDER ADULTS

E.E. MaloneBeach, M. Hakoyama, *Human Development and Family Studies, Central Michigan University, Mount Pleasant, Michigan*

Extended longevity has provided more options for older adults to enjoy late life. However, age-related health problems deprive older adults of independence and decrease quality of life. The current study, based on an IRB approved survey administered to older adults (N = 109; M age = 73.66 years), used path analysis to examine demographic, behavioral, and familial predictors of perceived health and the extent to which it predicts older adults' management of daily tasks and their perceived stress level. Surveys were distributed to undergraduate human development and gerontology students who conducted interviews with community-dwelling older adults. Path analysis revealed that three variables (economic status, exercise frequency, and family relationship quality) were significant predictors ($p < .05$) of perceived health. Neither age nor education predicted health; age may have become irrelevant because of restriction of range. Consistent with expectations, health predicted the participants' sense of managing daily tasks and management of daily tasks predicted lower levels of perceived stress. Although existing research has found stress to be deleterious to health, the direction of effects in this study were in the opposite direction, operating indirectly through daily task management. For older adults, poorer health and the inability to perform daily tasks may be particularly stressful if independence seems in jeopardy. Inconsistencies with earlier research may lie in our measurement of perceived stress rather than more targeted stresses. In addition, these findings indicate the importance of testing relationships for direction of effects even when they are counter to existing research.

THE INFLUENCE OF DEMENTIA AND STROKE ON THE CHANGES OF CONDITION OF THE FRAIL ELDERLY LIVE AT HOME

R. Hata[1], S. Masakazu[2], K. Masuda[3], Y. Takasuna[4], Y. Takase[5], S. Yoshie[6], *1. Hokusei Gakuen University, Sapporo, Japan, 2. J.F.Oberlin University, Tokyo, Japan, 3. Waseda Univrsity, Tokorozawa, Japan, 4. Minami-ku Home Based Care Support Center, Yokohama, Japan, 5. Home Care Medicine TAKASE CLINIC, Tokyo, Japan, 6. Institute of Gerontology The University of Tokyo, Tokyo, Jamaica*

Dementia and stroke make it difficult for the frail elderly to live at home. The aim of the present study was to explore the influence of dementia and stroke on the changes of condition of frail elderly who live at home. Three surveys on understanding the condition of elderly patients were conducted 6, 18, and 30 months from the beginning of support (November, 2010, November, 2011, and November, 2012). The time series data of the 121 cases with replies for all three times were analyzed. As for the measurement of the frail elderly' condition, seven items were set, eating, bathing, toileting, motivation in life, communication, social participation and care burden of the family. In order to identify the influence of dementia and stroke on the changes of clients' condition, a two-way repeated measure ANOVA was conducted with each of the seven indexes as the dependent variables, the time as the independent variable and with/without dementia or stroke as the between-subject factor. As a result of the analysis, time was shown to have a significant correlation with all condition items. Dementia showed significant correlation with only care burden of the family ($p<0.05$), identifying the negative pattern of changes among the clients with dementia. On the other hand, stroke showed significant correlation with bathing ($p<0.05$), communication ($p<0.05$) and social participation ($p<0.05$), identifying the negative pattern of changes among the clients with stroke. According to these results, it is important to support family care giver and the social aspects of the frail elderly.

AGE-RELATED CHANGES OF PREDICTORS OF SELF-RATED HEALTH: THE ROLE OF EDUCATION

S.M. Spuling[1], O. Huxhold[1], M. Wiest[1], S. Wurm[2], *1. German Centre of Gerontology, Berlin, Germany, 2. Friedrich-Alexander University, Erlangen-Nuremberg, Germany*

Previous studies have shown that the importance of different indicators for self-rated health (SRH) varies with age. In this context, social comparisons with the peer group play a crucial role. However, it is also known that the own peer group is normally rather education homogeneous. Given the existence of education-related health disparities, the assumption is reasonable that individuals of the same age compare themselves to rather healthy individuals, if oneself is higher educated or to less healthy individuals, if oneself is lower educated. Therefore, the present study investigated whether education influences age-related changes regarding predictors of SRH. Longitudinal data of community-dwelling adults aged 40 years and older from four measurement occasions of the German Ageing Survey was used (N=2,658). A cross-lagged panel regression model over seven age groups was employed to analyze age-related changes regarding the importance of various health and psychological predictors on SRH according to education. The age-related decline regarding the importance of physical and functional health for SRH emerged in both the lower and the higher educated. However, strong educational differences in psychological predictors were present: while positive affect and depressive symptoms gained in importance in the higher educated group both psychological factors showed a stable importance for SRH in the lower educated group.

Together these findings suggest that predictors of SRH not only vary according to age but additionally to education – especially regarding psychological predictors. We discuss possible underlying mechanisms, for instance how higher education is related to psychosocial resources and a healthier lifestyle.

IMPACT OF EMPLOYMENT ON TRAJECTORY OF DEPRESSION AMONG KOREAN OLDER ADULTS: ACTOR AND PARTNER EFFECTS

H. Jun[1], K. Cho[1], E. Lee[1], M. Kim[2], *1. Yonsei University, Seoul, Republic of Korea, 2. Director, senior or welfare divison, Seoul Metro politan Government, Seoul, Republic of Korea*

The purpose of this study was to examine depression trajectories of older adults and assess the effects of employment on these trajectories. Dyadic data, converted from three waves of the Korean Longitudinal Study of Aging (KLoSA) were used for the analysis, and the Latent Growth Model (LGM) was applied for the statistics. The final sample was 3,144 older adults aged 55 to 74 who remained married throughout the three waves of data; 1,693 husbands and 1,451 wives. The depression trajectories of both husbands and wives were analyzed using two unconditional models. The associations between husband/wife employment and depression trajectories of oneself and one's spouse were examined through four models to examine actor effects (husband employment-husband depression trajectories, wife employment-wife depression trajectories) and partner effects (husband employment-wife depression trajectories, wife employment-husband depression trajectories). The results show that depression trajectories for both husband and wives increase with time, and for husbands we found both actor and partner effects of employment. When husbands were employed their depression initial value was lower and the depression levels increased more slowly as time passed compared to their unemployed counterparts. This was consistent for their spouses as well. However, we found no evidence that wives' employment affected their own or their spouse's depression trajectories. This study contributes to current literature in that it analyzes the association between employment and depression trajectories focusing on both spouses and the interacting effects. The gender differences in actor and partner effects of employment on the trajectories of depressive symptoms and related policies are further discussed.

WHAT INFLUENCES SATISFACTION WITH LIFE? A STRUCTURAL MODEL FOR OLDER ADULTS

S. von Humboldt, I. Leal, *ISPA-Instituto Universitário, Lisbon, Portugal*

Aims: This study aims at exploring a structural model of satisfaction with life's (SWL) predictors in a cross-national sample of older adults. Methods: A community-dwelling sample of 1,234 older adults was assessed regarding SWL, sense of coherence (SOC) and socio-demographic, lifestyle and health-related characteristics. Structural equation modeling was used to investigate a structural model of the self-reported SWL, comprising SOC, socio-demographic characteristics (age, sex, education, marital and professional status, household, adult children, income, living setting and religion), lifestyle and health-related characteristics (physical activity, recent disease and medication). Results: Significant predictors are SOC ($\beta = .733$; $p < .001$), religion ($\beta = .725$; $p < .001$), income ($\beta = .551$; $p < .001$), adult children ($\beta = .546$; $p < .001$), education ($\beta = -.403$; $p < .001$), living setting ($\beta = -.292$; $p < .001$) and medication ($\beta = -. 197$; $p < .001$). The variables accounted for 24.8% of the variability of SWL. Moreover, differences between the four nationality groups ($F(3, 671) = 3.671$, $p = .066$) were not found concerning SWL. Conclusions: Sense of coherence is the strongest predictor of self-reported SWL. Other predictors are religion, income, adult children, education, living setting and medication. The four nationalities did not present significant differences, concerning SWL. This study highlights the factors that influence older adults' SWL, namely, SOC, religion and income, as promoters of aging well, within a salutogenic model of health for older populations. Keywords: Satisfaction with life; predictors; structural equation modeling; older adults; sense of coherence.

THE IMPACT OF SENSE OF COHERENCE, SUBJECTIVE WELL-BEING AND SOCIO-DEMOGRAPHIC, LIFESTYLE AND HEALTH-RELATED FACTORS IN OLDER ADULTS' ADJUSTMENT TO AGING

S. von Humboldt, I. Leal, *ISPA-Instituto Universitário, Lisbon, Portugal*

Objective: The aim of this study was to build a structural model to explore the predictors of adjustment to aging (AtA) in a community-dwelling older population. Methods: A community-dwelling sample of 1270 older adults aged between 75 and 102 years answered a questionnaire to determine socio-demographic (sex, age, professional and marital status, education, household, adult children, family's annual income, living setting and self-reported spirituality), lifestyle and health-related characteristics (perceived health, recent disease, medication and leisure). Several instruments were used to assert psychological variables, namely AtA, sense of coherence and subjective well-being. Structural equation modeling was used to explore a structural model of the self-reported AtA, encompassing all variables. Results: Significant predictors are self-reported spirituality ($\beta = .816$; $p < .001$), perceived health ($\beta = .455$; $p < .001$), leisure ($\beta = .322$; $p < .001$), professional status ($\beta = .283$; $p < .001$), income ($\beta = .230$; $p = .035$), household ($\beta = -.208$; $p = .007$), sense of coherence ($\beta = -.202$; $p = .004$) and adult children ($\beta = .164$; $p = .011$). The variables explain respectively 60.6% of the variability of AtA. Conclusions: Self-reported spirituality is the strongest predictor of AtA. This study emphasizes the need for deepening the variables that influence older adults' AtA, in particular perceived health and further lifestyle-related characteristics, as being relevant for promoting aging well in later life, within a salutogenic context for health care. Keywords: Adjustment to aging; older adults; predictors; subjective well-being; sense of coherence; structural equation modeling.

THE DIVERSE PERSPECTIVES ON ADJUSTMENT TO AGING AMONG THE OLD AND THE OLDEST OLD

S. von Humboldt, I. Leal, *ISPA-Instituto Universitário, Lisbon, Portugal*

Objectives: Older adults experience varying challenges that occur from late adulthood to extreme old age. This study aims at exploring the indicators of adjustment to aging (AtA) reported by old and oldest old adults and at examining the potential explanatory mechanisms of a model for AtA for these two age groups. Methods: This qualitative study comprised demographics and semi-structured interviews. Complete information on 152 older adults aged between 76-102 years ($M=83.76$; $SD = 6.458$) Data was subjected to content analysis. The correlational structure and latent constructs of indicators of AtA were analyzed by a Multiple Correspondence Analysis (MCA). Results: 'Occupation and achievement' was the most mentioned indicator of AtA by the old participants (17.7%), whilst, 'existential meaning and spirituality' was the most verbalized indicator of AtA for the oldest old participants (16.9%). AtA was explained by a three-factor model for each age group. For the old participants, the largest factor 'occupational and social focus' accounted for 33.6% of total variance, whereas for the oldest old participants, 'spirituality and health focus' represented 33.5% of total variance. 'Environmental drive' was the least representative factor for old participants (24.8% of total variance) and 'environment and leisure focus' for the oldest old participants (24.6% of total variance). Conclusions: The outcomes presented in this paper stressed the varied perspectives concerning AtA, contoured in two different models, for the old and the oldest old. Key Words: Adjustment to Aging; Multiple Correspondence Analysis; Old; Oldest Old.

MULTIAXIAL PREDICTORS AFFECTING MUSCLE STRENGTH AMONG COMMUNITY DWELLING OLDER ADULTS WITH MILD COGNITIVE DECLINE

Y. Lim[1], K. Park[2], J. Kim[3], S. Moon[4], *1. Yonsei University Wonju College of Medicine, Wonju, Gangwon-do, Republic of Korea, 2. Yonsei University Wonju College of Medicine, Wonju, Gangwon-do, Republic of Korea, 3. Yonsei University Wonju College of Medicine, Wonju, Gangwon-do, Republic of Korea, 4. Yonsei University Wonju College of Medicine, Wonju, Gangwon-do, Republic of Korea*

Although there are many studies on the falling among older adults with dementia, few studies have identified the multiaxial factors of the muscle strength associated with falling in community dwelling older adults considering the stage of cognitive impairment. The purpose of the study was to determine multiaxial factors affecting muscle strength among community dwelling older adults with mild cognitive decline. This study used secondary data that was obtained from '2013 Korean Nationwide Project for Early Detection of Dementia'. The total sample in this study was 230 elders rated by Clinical Dementia Rating (CDR) 0.5 (mild cognitive impairment) and CDR 1 (mild dementia) over 60 years old in one rural area in Gangwon province. Factors included (1) demographic factors (age and gender); (2) neuropsychological factors (word list recall scores and constructional praxis recall scores); (3) clinical factors (GDS scores and falling experience); and (4) stage of cognitive impairment. Multiple regression analysis was done to identify predictors associated with muscle strength. Demographic and clinical factors were major predictors to identify the muscle strength. Older women with mild cognitive decline is strongly associated with low muscle strength ($\beta=-.463$, $p < .01$). The more depression older adults have, the more they have low muscle strength ($\beta=-.302$, $p < .01$). In addition, age ($\beta=-.222$, $p < .01$), stage of cognitive impairment ($\beta=-.125$, $p < .05$), word list recall ($\beta=-.104$, $p < .05$), and constructional praxis recall ($\beta=-.118$, $p < .05$) had an influence on the muscle strength of older adults with mild cognitive decline. Unexpectedly, falling experience didn't have an influence on the muscle strength. Both depression and neuropsychological characteristics should be considered in developing strategies for prevention of the loss of muscle strength among older adults with mild cognitive decline.

EFFECTS OF ENHANCED CAREGIVER TRAINING PROGRAM ON CANCER CAREGIVER'S SELF-EFFICACY, PREPAREDNESS, AND PSYCHOLOGICAL WELL-BEING

C.C. Hendrix[1,2], D. Bailey[1], K. Steinhauser[3,4], M. Olsen[5], J. Tulsky[3,4], *1. Duke University School of Nursing, Durham, North Carolina, 2. Durham VAMC GRECC, Durham, North Carolina, 3. Duke Palliative Care, Duke University Health System, Durham, North Carolina, 4. Department of Medicine, Duke University School of Medicine, Durham, North Carolina, 5. Center of Excellence for Health Services Research in Primary Care, Durham Veterans Affairs Medical Center,, Durham, North Carolina*

Background: Living with cancer generates distress for patients and their caregivers. The days following a hospital discharge are particularly stressful for caregivers. This study examined the effects of an enhanced caregiver training (ECT) discharge protocol that teaches knowledge and skills for managing patient symptoms, and also provides strategies for managing their own psychological distress. Methods: RCT that compared the effects of ECT to a comparison education (CE) on caregiver self-efficacy for caregiving, preparedness in caregiving, and psychological well-being (depression, anxiety, burden). Caregiver data were collected at baseline, immediately after the training, and at 2 and 4 weeks post-discharge. Results: The mean ages of caregivers and patients were 55 and 57 respectively (N = 138 dyads). ECT caregivers had a greater increase in self-efficacy (6.1, 95% CI: 3.0-9.3, $p<0.001$), certainty to cope with own stress (4.8, 95% CI: 0.5-9.1, $p=0.03$), and preparation for caregiving (0.2, 95% CI: 0.1-0.4, $p=0.01$) at the post-training assessment as compared to the CE group. These differences were not sustained at the follow-up post-discharge. Caregivers' depressive symptoms and anxiety improved from the baseline to two-week follow-up. However, there was no evidence of intervention group differences in these improvements (all $p > 0.05$). There was little change over time in caregiver burden for the ECT and CE groups. Conclusions: No long-term effect was noted on the ECT intervention. Additional dose of intervention maybe needed after discharge as caregiving needs may have changed. Psychological well-being of caregivers is difficult to intervene upon because of its multifactorial in nature.

LOWER PREVALENCE OF PSYCHIATRIC CONDITIONS WHEN NEGATIVE AGE EXPECTATIONS ARE RESISTED

B.R. Levy, C. Pilver, R. Pietrzak, *Yale University, New Haven, Connecticut*

Background: Older veterans in the United States are at greater risk for experiencing psychiatric conditions than same-aged non-veterans. However, little is known about factors that may protect older veterans from developing psychiatric conditions. The current study is the first to evaluate the association between the potentially stress-reducing factor of resistance to negative age expectations and lower prevalence of three psychiatric conditions: suicidal ideation; generalized anxiety disorder, and posttraumatic stress disorder (PTSD). Methods: Participants were comprised of 2,031 community-dwelling individuals, aged 55 or older, who were drawn from the National Health and Resilience in Veterans Study, a nationally representative survey of American veterans. The aging-expectations predictor was assessed with the Expectations Regarding Aging Survey and the psychiatric outcomes were assessed with validated psychiatric screening instruments. Results: The prevalence of each psychiatric condition was significantly lower among participants who fully resisted negative age expectations, compared to those who fully accepted these expectations: suicidal ideation, 5.0% vs. 30.1%; anxiety, 3.6% vs. 34.9%; and PTSD, 2.0% vs. 18.5%. These findings persisted above and beyond key covariates of potential relevance to the population, including combat exposure, physical health, age, resilience, and personality factors. Conclusion: These findings suggest the importance of examining how negative perceptions of aging may contribute to psychiatric conditions in later life.

PSYCHOPATHOLOGY AND HIV DIAGNOSIS AMONG OLDER ADULTS IN THE US

M.J. Brown[1], S.A. Cohen[1], J.P. DeShazo[2], *1. Virginia Commonwealth University School of Medicine, Richmond, Virginia, 2. Virginia Commonwealth University, Richmond, Virginia*

Background: Approximately one in three adults living with HIV/AIDS in the US is over 50 years of age. Adults aging with HIV/AIDS may have stressors that may increase their vulnerability to depression. Many studies have examined depression among adults living with HIV. However, research examining the association between other psychiatric disorders, such as general anxiety disorder (GAD) and post-traumatic stress disorder (PTSD), and HIV diagnosis among older adults is scant. Objective: To determine the association between GAD, PTSD, substance use disorder (SUD) and depression, and HIV diagnosis among adults age 50 and older. Methods: We used HealthFacts data from Cerner Corp., which are de-identified longitudinal electronic health record data from 470 hospitals and outpatient clinics nationwide (N=38,168,846). Multivariable logistic regression models, adjusting for age, sex, marital status, and race/ethnicity, were used to determine the adjusted odds ratios and 95% confidence intervals (CIs) for the associations between GAD, PTSD, SUD and depression, and HIV diagnosis. Results: After adjusting for age, sex, marital status and race/ethnicity, patients who had GAD, PTSD, SUD, and depression were 8.79 times (95% CI: 7.64 – 10.1), 3.32 times (95% CI: 2.86 – 3.86), 2.24 times (95% CI: 2.17 – 2.31), and 3.56 times (95% CI:3.56 – 3.74) more likely to be diagnosed with HIV, respectively, compared to patients without these disorders. Discussion: HIV programs for older adults should consider a psychosocial approach and address, not only depression and SUD, but GAD and PTSD as key focal points for these intervention and prevention programs.

SELF-REPORT MEASURES OF COGNITION AS PREDICTORS OF PERFORMANCE ON NEUROPSYCHOLOGICAL ASSESSMENTS

C.A. Gayda-Chelder, J.R. Mahon, J.M. Ceresini, K.L. Margeotes, J. Fleck, *Psychology, The Richard Stockton College of New Jersey, Galloway, New Jersey*

Recent studies have been investigating the relationship between self-reports of mood, well-being, and neurocognitive functioning with performances on neuropsychological measures. Seventy-four community dwelling adults with an average age of 67.31 years (range 50 to 85) completed the following self-report measures: Behavior Rating Inventory of Executive Function-Adult Version (BRIEF-A), Everyday Memory Questionnaire, Life Satisfaction Assessment, and the Geriatric Depression Scale. Participants were also administered a variety of neuropsychological measures, including the California Verbal Learning Test-Second Edition, Trail Making A & B, Digit Span, and Verbal Fluency tasks. Findings revealed that individuals reporting greater deficits on the BRIEF-A demonstrated decreased performances on measures of executive functioning, particularly on categorical verbal fluency tasks. In addition, self-perception of reduced neuropsychological functioning as assessed on the BRIEF-A and Everyday Memory Questionnaire was correlated with higher levels of depression and poorer quality of life. The results support the need for continued investigation into the utility of self-report instruments and their value in the assessment of cognitive decline within the context of comprehensive neuropsychological evaluations. Further exploration into the use of both cognitive remediation strategies and psychotherapeutic techniques to improve mood, quality of life, and neurocognitive functioning is suggested. In addition, longitudinal studies will be essential to determine the extent to which perceived neurocognitive decline does indeed predict the development of many subtypes of dementia.

DENTAL HEALTH INEQUALITIES OVER THE LIFE COURSE: MONITORING THE SIZE OF THE GAP LONGITUDINALLY

J. Fritzell[1,2], R.K. Celeste[1], *1. Aging Research Center, Karolinska Instiiutet/Stockholm University, Stockholm, Sweden, 2. Centre for Health Equity Studies, Stockholm University&Karolinska Institutet, Stockholm, Sweden*

Usually the prevalence or accumulated incidence of many diseases is studied and it has been consistently associated with socioeconomic conditions. For almost all diseases, the well-off have better health. Although increasing health inequalities have been reported in many countries, lesser is known about the evolution of health inequalities over the life course. Therefore, the first aim of this study is to report the prevalence and incidence of one cumulative outcome (dental health) at different periods of life for two economically defined groups (poor vs. non-poor). We used combined data from two sources: the Swedish Panel Study of Living Conditions of the Oldest Old (SWEOLD), a nationally representative study of older people (aged 77+) originally drawn from the longitudinal Swedish Level of Living Survey (LNU) a representative sample of the Swedish population, aged 15-75. The first wave of LNU was conducted already in 1968, the latest SWEOLD data was conducted in 2011 and we use four data waves in between. Our overall aim is to compare the changes in the socioeconomic gap in dental health in five different birth cohorts (1906-15, 1925-34, 1944-53, 1957-66 and 1970-1979). We present results comparing a complete case and an all-case analysis from closed cohort. Our results indicate that socioeconomic differentials prevail across the life course also among the oldest old, and across birth cohorts, also among the youngest birth cohort. Moreover, our findings show a prevailing effect from childhood economic poverty.

DETERMINANTS FOR CANCER SCREENING AMONG OLDER WOMEN (NATIONAL HEALTH INTERVIEW SURVEY, 2010)

Y. Gorina, L.A. Pratt, D.T. Huang, N. Elgaddal, *National Center for Health Statistics, Hyattsville, Maryland*

Getting screening tests regularly may find breast, cervical, and colorectal (colon) cancers early. Lack of evidence for screening effectiveness and harms for older adults may complicate a decision among cancer screening in older adults. However, a limited data exist on cancer screening rates among older persons. We used 2010 National Health Interview Survey to assess screening rates and associated factors. Among women aged 65 and over, the screening rates were 61.7% for colorectal cancer, 64.2% for breast cancer, and 46.8% for cervical cancer, with 53.7% for women without history of hysterectomy. A logistic regression analysis found that regardless of age higher level of education, higher income, seeing a health professional in the past two weeks, and receiving a flu immunization in the past year were independent factors associated with higher rates of CRC screening. Additional factors for breast cancer screening were being married, a non-smoker, and participating in physical activity. The results for cervical cancer screening showed that independent factors for cervical cancer screening were no history of hysterectomy, higher level of education, being a non-smoker, and receiving a flu vaccine. Screening rates for all three types of cancer did not differ by race/ethnicity, while higher socio-economic characteristics and receiving a flu shot were common factors associated with higher rates of screening. The differences in associations between CRC screening and selected characteristics by sex will be presented. The U.S. Preventive Services Task Force guidelines and Medicare coverage for screening procedures for each of three cancer types will be discussed.

DOES ALZHEIMER'S DISEASE KNOWLEDGE PREDICT BETTER HEALTH STATUS AMONG HIGH-RISK INDIVIDUALS?

N. Solorzano, *Center for Aging, Tulane University, New Orleans, Louisiana*

Alzheimer's disease (AD) caregivers are a high-risk group for the disease due to shared genetics, similar environmental/lifestyle risk factors as care recipients, and poorer health resulting from prolonged chronic stress as caregivers. AD is preventable by controlling for associated cardiovascular risk factors and by engaging in preventive health behaviors over the life span. The general public, does not understand the link between cardiovascular health and AD. This study's aims are: 1) Determine whether AD caregivers understand the association between AD and cardiovascular health. 2) Determine the relation between disease knowledge and health status. 3) Determine whether high-risk female caregivers are aware of their increased risk as caregivers for someone with the disease and in context of their menopausal health. This correlational study will investigate the relation between disease knowledge and health status and how the relation is mediated by perceived risk and demographics. Data collection methods are: 1) A short medical examination to obtain information on objective health (health biomarkers, chronic conditions, and healthcare utilization). 2) A self-administered survey to obtain information on subjective health (subjective emotion/physical well being, physical activity, and depressive symptomology), disease knowledge, and perceived risk. Fifty-seven participants will be recruited from 3 health care systems in the New Orleans area for a total of 171. Descriptive statistics will compare disease knowledge, objective and subjective health status, and perceived risk across the health care systems. ANOVA analysis, calculation of different correlation coefficients, and multiple regression analysis will discern the relation between disease knowledge and health status.

SESSION 1000 (POSTER)

DISABILITY AND FALLS

RELATIONSHIPS BETWEEN COGNITION AND SENSORIMOTOR ABILITIES IN THE ACTIVE STUDY

J.E. Maye, M. Marsiske, *University of Florida, Gainesville, Florida*

Sensorimotor variables have been shown to be related to a variety of cognitive measures in older adults. The current study was a secondary analysis of a ten-year study of older adults who were participants in the ACTIVE cognitive intervention study. Analyses addressed two aims: (1) description of ten-year change in sensorimotor (vision, balance) and cognitive (memory, reasoning, perceptual speed, visual attention) function; (2) examination of whether participants who experienced the most sensorimotor loss also experienced the most cognitive loss. The ACTIVE sample consisted of 2,802 adults aged 65-104 (76% female; 26% African American). Participants were assessed for up to ten years. In participants who remained enrolled (n=1,220) at the ten-year follow-up, normative age-related decline was observed in all sensorimotor and cognitive domains over time, with roughly uniform slopes of change. Sensorimotor functioning accounted for approximately half of the age-related individual differences in each cognitive composite, and accounted for between 40% and 80% of the variance in ten-year cognitive change. Thus, common clinical assessments of vision and balance functioned as potentially useful sentinels of age-related cognitive change in this study. Future research should evaluate the clinical utility of using sensorimotor measures as easily administered preliminary screening tools to identify those who might benefit from more thorough screening for cognitive decline.

RESILIENCE AS A BUFFER TO THE DELETERIOUS IMPACT OF CHRONIC ILLNESS ON DISABILITY IN LATER LIFE

L.K. Manning[3], D. Carr[2], B.L. Kail[1], *1. Georgia State University, Atlanta, Georgia, 2. Stanford, Stanford, California, 3. Concordia University Chicago, Chicago, Illinois*

Objectives: In Examining the Ability of Individual Resilience to Buffer the Impact of Chronic Disease Onset on Disability in Later Life, the Authors Tested Two Hypotheses: (1) People with Greater Levels of Resilience will have Lower Levels of Disability; and (2) Resilience will Moderate the Association Between the Onset of a New Chronic Condition and Subsequent Disability. Methods: This Study used a Sample of 10,753 Americans between the Ages of 51 and 98, Derived from Three waves of the HRS Study (2006 to 2010). Ordinary Least Squares Regression was used to Estimate the Impact of Resilience on Changes in ADL and IADL Limitations (i.e., Disability) over a Two-Year Period. Results: Resilience Protects against Increases in ADL and IADL Limitations Associated with the Natural Progression of Aging. Resilience Mitigates a Considerable Amount of the Deleterious Consequences Related to the Onset of Chronic Illness and Subsequent Disability. Discussion: Our Results Support our Hypotheses, and are Consistent with Claims that High Levels of Resilience can Protect Against the Negative Impact of Disability in Later Life.

CONTINUING THE CONVERSATION ON THE EFFECTS OF N'BALANCE ON SOCIAL SUPPORT AND PERCEPTIONS OF LEISURE ON FEAR OF FALLING FOR COMMUNITY-DWELLING OLDER ADULTS, 6-MONTH FOLLOW-UP

C.M. Headley, *Exercise & Sport Science, Judson University, Elgin, Illinois*

This 6-month follow-up to the replication study examined the effects of a community-based program reducing the risk of falls, exploring fear of falling and social support and perceptions of leisure in older adults. The program (N'Balance©) focused on challenging the sensory systems through multi-factorial, multi-dimensional classes using multiple sites. The 6-month follow-up may provide evidence that N'Balance© reduces fear of falling. Measures in the study include the 30-second chair stand, 8-foot Up-and-Go, 50- foot Gait Analysis, M-CTSIB, Fullerton Advanced Balance Scale, postural analysis, and a questionnaire. Results of the initial study indicated that N'Balance© participation was associated with improved balance (.00), the fear of falling (.04), and approached significance with leisure self-efficacy (.06) with the longitudinal replication study currently being evaluated. The 6-month follow-up to the replication study augments the previous study that N'Balance may improve social support, perceptions of leisure, reduces the risk of falls, and reduces fear of falling, in community-dwelling older adults.

EFFECTS OF MARRIAGE ON THE ONSET OF DISABILITY IN OLDER MEN AND WOMEN: A SEVEN-YEAR FOLLOW-UP

T. Saito-Kokusho[1], C. Murata[1], J. Aida[2], S. Jeong[1], K. Kondo[3], *1. National Institute of Geriatrics and Gerontology, Obu, Aichi, Japan, 2. Tohoku University, Sendai, Miyagi, Japan, 3. Nihon Fukushi University, Nagoya, Aichi, Japan*

The importance of marriage in the health of older adults is still unclear in Asian countries, where adult children are traditionally expected to act as caregivers to their aging parents. Using a prospective survey, we examined the direct and moderating effects of marriage on disability in older Japanese people. The sample consisted of 3378 men and 3712 women aged 65+ from the Aichi Gerontological Evaluation Study in 2003, who had no limitation in basic activities of daily living (BADL) and who had provided information on study variables. Respondents who experienced at least one difficulty in BADL between one and seven years after the baseline were considered disabled. A gender-wise logistic regression model was used to examine the effects of marital status on the onset of BADL difficulties, controlling for instrumental ADL (IADL), self-rated cognitive function (SRC), and other variables assessed at the baseline. The interaction effects of the significant factors with marital status on the dependent variable were also examined. During the seven-year study period, BADL difficulties occurred in 11.6% and 11.0% of the men and women, respectively. A multivariate analysis showed that marital status was negatively related to the onset of BADL difficulties only in men. The interaction effects of marital status and IADL or SRC were significant in men, indicating that IADL and SRC limitations were more strongly related to the onset of BADL difficulties in non-married men. Marriage had a beneficial effect on BADL independence in men, even if the husbands already showed risk factors.

ARE LIVING ARRANGEMENTS ASSOCIATED WITH FALL-INJURIES AMONG OLDER ADULTS?

D.R. Kafle, L. Quach, E. Dugan, K. Kittle, S. Thapa, *Gerontology Department, University of Massachusetts Boston, Boston, Massachusetts*

Falls are a critical issue among older adults. This study aims to: 1) investigate the association between fall-injuries and living arrangements, and 2) explore if associations vary by race. This cross-sectional study utilized data from the Health and Retirement Study (HRS) 2010 wave. Fall-injury is self-reported about if a participant had a fall in the past 2 years severe enough to cause an injury. Living arrangements was a count of number of people in the household. Co-variates include demographic, education, depression, cognition, vision, heights, alcohol, motor skills, physical activities, and chronic conditions. Logistic regression was used to perform the analysis using SPSS. The analytic sample (N= 4,189) ranged age from 64 to 109 years with mean age 77.3 years. There were 61% female, 78% non-Hispanic White, 12% non-Hispanic Black, 9% Hispanic, and 1% were non-Hispanic other race. In outcome variable fall-injury, 32% of respondent reported that they fell and injured in last two years. The odds of fall-injury was .81

times lower (OR: 95%CI: .65-1, p-value=.05) with 1% point increment of number of people in the household adjusting for other co-variates. Similarly, the odds of fall-injury was 0.74 times lower (OR: 95%CI: .56-.98, p-value=.04) of people who live with three to four members in the household than the people who live with two persons in the household. Next, the odds of fall-injury was 0.72 times lower (OR: 95%CI: .54-.96, p=.02) of non-Hispanic Black than for non-Hispanic White. These findings suggest the lower fall-injury in larger size of household.

RACIAL/ETHNIC DIFFERENCES IN PHYSICAL ACTIVITY AMONG OLDER ADULTS WITHOUT DISABILITY: BRFSS, 2011

C.A. Mingo[1], D.X. Marquez[2], C. Greene[1], *1. Gerontology Institute, Georgia State University, Atlanta, Georgia, 2. University of Illinois at Chicago, Chicago, Illinois*

Racial/ethnic minorities fare worse than Whites on most conditions (e.g., hypertension, diabetes, cardiovascular disease, obesity) despite efforts being made to address health disparities in the US. Engaging in sufficient physical activity (PA) has been shown to reduce the risk and minimize the negative impact of the aforementioned chronic conditions. Therefore, the purpose of this study is to estimate the prevalence of older adults engaging in sufficient PA, and to determine if estimates significantly vary by race/ethnicity. Data from the 2011 Behavioral Risk Factor Surveillance System, a random-digit dialed telephone health survey administered annually by state health departments to adults ≥18, was analyzed to examine the prevalence of older adults (i.e., age ≥50) meeting current PA recommendations (e.g., 150 minutes a week of moderate-intensity aerobic activity) set forth by the Department of Health and Human Services. Prevalence estimates for PA recommendations were stratified by race/ethnicity (i.e., Whites [n=152,138], Blacks [n=12,453], Hispanics [n=7,628], Other [n=9,778]) and age (i.e., 50-64, ≥65) for older adults without disability. A significant relationship was found between race/ethnicity and meeting PA recommendations in older adults age 50-64 (p < .001) and 65+ (p<.001). In each age group (i.e., 50-64, ≥65) a significantly higher portion of Non-Hispanic Blacks (47%, 51%; respectively) and Latinos/Hispanics (41%, 44%; respectively) did not meet the minimum standards for PA for both aerobic and muscle-strengthening activity. Findings suggest that it may be useful to design interventions focused on meeting PA recommendations as a way to address racial/ethnic chronic disease health disparities among older adults.

OPTIMISTIC ELDERS WITH FUNCTIONAL IMPAIRMENTS SUFFER FEWER DEPRESSIVE SYMPTOMS

K. Barnes[1], J. Lee[1], B. Kahana[2], E. Kahana[1], *1. Case Western Reserve University, Cleveland, Ohio, 2. Cleveland State University, Cleveland, Ohio*

Depressive symptoms are common among the elderly and many studies have demonstrated its strong association with functional impairment. Although dispositional optimism has been viewed as an important resource for the aging population, relatively little is known about the effects of optimism and difficulties engaging in instrumental activities of daily living (IADL) on psychological well-being in older adults. Based on the broaden-and-build hypothesis (Fredrickson, 2001), our study examines this understudied linkage between optimism, IADL, and depressive symptoms by following 591 community dwelling elders over a 10 year period. Using multilevel modeling, we examined the fixed effect of optimism and IADL in predicting depressive symptoms. Our results revealed that overall level of optimism was significantly related to fewer depressive symptoms. Additionally, individuals with higher levels of optimism reported less fluctuation in their depressive symptoms. In the model including IADL and optimism, the moderating role of optimism with IADL was also supported. In particular, elders with higher levels of IADL reported fewer depressive symptoms when their optimism scores are high (β= - .06990, p< .0001). Furthermore, elders with higher intra-individual IADL also reported fewer depressive symptoms when their optimism scores are high (β= -.07164, p< .001). These findings highlight that optimism plays a significant moderating role in linking IADL and depressive symptoms at the inter-individual and intra-individual levels. Our study lends support to the literature that individual traits, such as optimism, are important psychological resources for individuals that can buffer the impact of limited activities on psychological well-being in later life.

SESSION 1005 (POSTER)

AGING AND SOCIAL DISRUPTION

UNRAVELING TRAUMA AND STRESS, COPING RESOURCES, AND MENTAL WELL-BEING AMONG OLDER ADULTS IN PRISON: EMPIRICAL EVIDENCE LINKING THEORY AND PRACTICE

T.M. Maschi[1], D. Viola[2], K. Morgen[3], *1. Graduate School of Social Service, Fordham University, New York, New Jersey, 2. New York Medical College, Valhalla, New York, 3. Centenary College, Hackettstown, New Jersey*

A theoretical integration of the life course perspective, cumulative advantage, inequality, and stress processing theories provide an important integrated lens to study the relationship between accumulated interpersonal, social-structural, and historical trauma and stressful experiences on mental well-being mental well-being in later life. The life course perspective, cumulative inequality, and stress processing theories provide an important integrated lens to study the relationship between accumulated interpersonal, social-structural, and historical trauma and stressful experiences on mental well-being mental well-being in later life. This study builds upon the extant literature by examining the mediating role of coping resources on the relationship between trauma and stressful life experiences, post traumatic stress symptoms, and mental well-being among a sample of 677 adults aged 50 and older in prison. The majority (70%) reported experiencing one or more traumatic or stressful life experiences during their life span. Participants also reported on average 11 occurrences of multilevel trauma and stressful life events and lingering subjective distress related to these events. Results of a structural equation model revealed that internal and external coping resources had a significant and inverse effect on the relationship between trauma and stressful life experiences and mental well-being. As prisons are forced to deal with an aging population, research in this area can take the preliminary steps to enhance understanding of risk and resilience among older adults in prison. This understanding will aid in the development and improvement of integrated theory-based interventions seeking to increase human rights, health, and well-being among older adults in prison.

WOMEN'S TRANSFORMED LIVES AS A RESULT OF NEGATIVE EXPERIENCES WITH FACIAL INJECTIONS: A FEMINIST PHENOMENOLOGICAL ANALYSIS

ÁINE. Humble, S. Berwick, *Family Studies and Gerontology, Mount Saint Vincent University, Halifax, Nova Scotia, Canada*

Non-cosmetic procedures to the face (e.g., Botox and other injectable fillers) have been widely popularized in the media for how they reduce signs of aging in the face, yet significantly misunderstood with respect to their impact on women, particularly those who have negative experiences. To fill this research gap, seven American and Canadian women (43 to 64 years old) who had negative or mixed emotions about having had Botox or other facial injectables were interviewed. They had received between 1 to 9 facial injections 2 to 8 years prior to being interviewed. Four women had serious physical and psychological side effects (e.g., heightened sensitivity to noise, anxiety, problems sleeping, and depression), and others had impacts ranging from minor and unwanted physical skin changes to fear of potential, future side effects (e.g., addiction). Data were analyzed using feminist moral theory and a hermeneutic phenomenological method that focused on corporeal (bodily), temporal (time), and communality (relational) existential modes of being. Themes are the: (a) commodified body, (b) fractured body, (c) abandoned body, (d) reflective body, and (e) transformed body. Participants acknowledged influences of sexism and ageism. Questionable ethical practices were evident in the medical profession. These women's lives were transformed in terms of their relationships to their bodies and themselves (e.g., guilt over having had the procedure done yet a more positive outlook on aging), to others, to society (e.g.,. loss of trust in the medical profession), and to the future (e.g., uncertainty about the progression of their side effects).

A LIFE COURSE PATTERN OF PHYSICAL ABUSE IN WISCONSIN: DOES PAST ABUSE PREDICT ABUSE IN LATER LIFE?

Y. Yon, Z.D. Gassoumis, K. Wilber, *University of Southern California, Los Angeles, California*

Despite decades of research, fundamental issues concerning the etiology of elder abuse remain. There is currently no research examining whether earlier patterns of physical abuse predict abuse in later age. This poster discerns the patterns of abuse and their associations to late-life intimate partner violence (IPV), to inform elder abuse detection and intervention. This research examined life course patterns of physical abuse with data from the Wisconsin Longitudinal Study. Among 175 subjects who experienced abuse after the 1992 wave (average age 53 ±0.7 years), 56.7% had experienced prior abuse (4.2% child abuse, 25.3% early-life IPV, 42.8% mid-life IPV). Predictors of late-life IPV were examined using logistic regression. Included in the predictive models were demographic, socioeconomic and health variables as well as history of past abuse. Being female and married were initially significant predictors of abuse; however, when prior history of abuse was added into the final model both gender and marital status became non-significant. In the final regression model, early-life IPV (OR=13.8, p<.001) and mid-life IPV (OR=21.3, p<.001) independently predicted physical abuse. The interaction between early- and mid-life IPV also predicted late-life IPV (OR=12.5, p<.001). This study provides the first evidence of links between earlier patterns of IPV and late-life abuse. Past histories of abuse were more predictive than any known risk factors, informing the ongoing discussion of whether elder abuse is a distinct type of abuse or a continuation of past abuse. These findings point to the importance of understanding elder abuse within the larger context of domestic violence.

CONCEPTUALIZING HISTORICAL TRAUMA WITHIN THE CONTEXT OF INADEQUATE DIABETES SELF-MANAGEMENT AMONG AFRICAN AMERICAN OLDER ADULTS

K. Skrine Jeffers, L.R. Phillips, *UCLA, Los Angeles, California*

A growing body of research contends that historical trauma—i.e., massive group trauma that has occurred across generations due to cumulative emotional and psychological wounding—has behavioral consequences that include disengaging in health-promoting behaviors. Today's cohort of African American older adults (AAOAs) has been surrounded by historical trauma throughout their life courses. They were born within a few generations from slavery; were proximally situated during the Jim Crow era and mass migration period; have endured redlining practices and mass incarcerations; and, have faced barriers to employment, quality schools, health care, goods, services, and day-to-day exposures to microaggressions and microinsults. This cohort has experienced a lifetime of emotional and psychological assaults. This paper raises the question of how these historical traumas might impact AAOAs' health behaviors, specifically, their diabetes self-management behaviors. A plethora of literature has noted the effects of SES, education, health literacy, dietary preferences, and physical inactivity as barriers to diabetes self-management within this group; however, much of the literature understates the context within which these factors continually arise. This conceptual examination of historical trauma within the context of inadequate diabetes self-management behaviors of AAOAs lays the groundwork for future research aimed to better understand this phenomenon among today's cohort of African American seniors.

RACIAL DIFFERENCES IN REPORTED EARLY LIFE TRAUMA BETWEEN AFRICAN AMERICAN AND WHITE URBAN OLDER ADULTS

T. Goler, B. Kahana, T. Bhatta, E. Kahana, *Case Western Reserve University, Cleveland Hts, Ohio*

We focus on differences in exposure to early life trauma among urban African American and White older adults. We expand our prior research on successful aging among retirement community dwelling, racially homogeneous older adults (Kahana et al., 2012) to a racially diverse urban sample. Understanding etiological processes across ethnicities may provide better understanding of how early risk exposure predicts differences in mental health and in resiliency in later life. We utilized the Antonovsky Life Crisis Inventory to consider reporting of traumatic early life events by different racial groups. Our findings based on 409 older adults (mean age= 79 years, SD=5.74) revealed that African Americans reported greater incidence of parental divorce and death of a family member through violent means (accident, homicide, suicide) during their childhood years compared to White respondents. There were no significant race differences in the death of a mother or father before the child reached age 15. Despite these differences in life experiences, we observe lower depressive symptoms (CESD Depression Scale) and greater life satisfaction (Diener Life Satisfaction Index) among African Americans compared to their White counterparts. A potential source of resilience among African American elders is their propensity to appraise negative events as less problematic than did White elders. These finding suggest a paradox of successful aging among urban African-American older adults. They appear to have acquired significant 'Survival Skills' through the necessity to navigate socio-cultural adversities linked to discrimination, poverty and racism.

EVIDENCE OF DIFFERENTIAL MORTALITY BETWEEN ELDER ABUSE TYPES

J. Burnett[1,2,4], A.R. Aschenbrenner[2], P.M. Diamond[3,2], J. Booker[5,2,1], C. Dyer[1,2,4], *1. UT Health, Houston Internal Medicine, Houston, Texas, 2. Texas Elder Abuse and Mistreatment Institute (TEAM), Houston, Texas, 3. UTHealth, Houston School of Public Health, Houston, Texas, 4. Harris Health System, Houston, Texas, 5. Texas Department of Family and Protective Services, Houston, Texas*

Background: Elder abuse independently predicts survival; beyond other medical, social, physical and mental factors. This study assesses 4-year differential all-cause mortality associated with types of elder abuse. Methods: A secondary data analysis of N= 1732 cases of elder abuse (i.e. age >64) substantiated by Texas Adult Protective Services (APS), between the dates of January 1, 2004 and December 31, 2008 and data from the Texas Vital Statistics was conducted. Datasets were matched using probabilistic and deterministic algorithms. Age adjusted 4-year survival analyses were conducted to assess for differential all-cause mortality. Results: Differential mortality was assessed by comparing emotional/verbal abuse (HR = 1.14, 95% CI: [0.67, 1.93], p = 0.611), exploitation (HR = 1.72, 95% CI: [1.01, 2.95], p = 0.0479), and caregiver neglect (HR = 2.21, 95% CI: [1.37, 3.56], p = 0.00108) to physical abuse (4-year survival rate: 78.5%, 95% CI: [72.1%, 85.9%]). Significant differences in mortality were also found in comparing exploitation (HR = 1.50, 95% CI: [1.03, 2.18], p = 0.0313) and caregiver neglect (HR = 1.93, 95% CI: [1.47, 2.53], p < 0.001) to emotional/verbal abuse (4-year survival rate: 75.5%, 95% CI: [71.1%, 80.2%]), but there was no difference between exploitation and caregiver neglect (p = 0.1). Conclusion: This study provides evidence for differential mortality between elder abuse types. Caregiver neglect and financial exploitation impose the greatest 4-year mortality risks among vulnerable elder abuse victims. These data have important implications for the case management and triage of APS substantiated elder abuse victims.

RESIDENT-TO-RESIDENT ELDER ABUSE: THE CANADIAN LANDSCAPE

L. McDonald[1], S. Hitzig[1], C. Sheppard[2], T. Spalter[1], *1. University of Toronto, Toronto, Ontario, Canada, 2. University of Waterloo, Waterloo, Ontario, Canada*

Introduction: There is a lack of research on resident-to-resident elder abuse (RREA) in institutional settings. Given the knowledge gap on this issue, a scoping review was conducted to gain a better understanding of what characterizes and contributes to RREA, and to develop recommendations for research, clinical practice and policy in Canada. Method: Peer-reviewed and grey literature databases (Medline, PsycINFO, AgeLine, CINAHL, ISI Social Sciences Citation Index; ISI Conference Proceedings Citation Index- Social Science & Humanities; Dissertations & Theses: Full Text, Canadian Institute for Health Information and National Institute of Health) were searched (1985 – April 2013) for relevant records. In addition, a redacted data set on RREA in Canadian institutions from 2011 was analyzed. Results: After applying inclusion and exclusion criteria, only 32 articles were included for the review. Six studies were classified as grey literature and the remaining 26 studies were peer-reviewed. Most research took place in the United States (n=29), followed by Canada (n=2) and the United Kingdom (n=1). The most common study designs were cross-sectional surveys or interviews (n=14), retrospective case analyses (n=10), and literature reviews (n=3). Only one intervention study was identified (n=1). With regard the secondary data analysis, the total number of incidents of all types of alleged/reported abuse in long-term care facilities was 23,472, with 28% being RREA. Conclusion: There is a glaring lack of data on RREA in Canada. Barriers to characterizing the extent of RREA includes under reporting and heterogeneous reporting policies and practices in nursing facilities across Canada.

EFFECT OF CHILDHOOD ABUSE ON TRAJECTORIES OF INTERGENERATIONAL SOLIDARITY IN LATER LIFE

J. Kong, *Boston College, Brighton, Massachusetts*

This study aims to examine changes in intergenerational solidarity over time among adult children with histories of childhood abuse in comparison to those without histories of childhood abuse. Incorporating Intergenerational Solidarity theory, data analyses focused on (a) charting the trajectories of emotional closeness and frequency of contact between aging parents and their adult children, and (b) examining the effect of childhood abuse on the trajectories. Data were taken from the Wisconsin Longitudinal Study (WLS), a random sample survey of 10,317 men and women who graduated from Wisconsin high schools in 1957. This study used multiple waves of the WLS, including the 1993-1994, 2004-2005, and 2010-2011 datasets. The final study sample was comprised of 2,961 graduates and their siblings whose parent was alive at the 1993-1994 wave. To take advantage of the three-wave longitudinal data, three-level (time-individual-family) growth curve modeling techniques were employed. Results showed that there was a significant decrease in emotional closeness over time between adult children with histories of childhood abuse and their formerly abusive parent. Also, frequency of contact between adult children and their formerly abusive parent significantly declined with age. This was contrasted for adult children without any histories of childhood abuse who showed a significant increase in contact with their aging parent(s). Yet, there was no significant change in regards to emotional closeness and frequency of contact between adult children and their non-abusive parent. These results indicate worsening intergenerational solidarity over time between adult children with histories of childhood abuse and their aging parent(s).

SESSION 1010 (POSTER)

RETIREMENT AND LABOR FORCE TRANSITIONS AND TRAJECTORIES

RETIREMENT PLAN PROFILES AND RETIREMENT OUTCOMES: EVIDENCE FROM 10 WAVES OF THE HEALTH AND RETIREMENT SURVEY

J. Deichert, S.P. DeViney, *Gerontology, University of Nebraska at Omaha, Omaha, Nebraska*

David Ekerdt and colleagues, using the first wave of the Health and Retirement Survey created a five category profile of retirement plans. This profile of plans categorized persons future expectations into “Stop working all together”, “Never stop working”, “Reduce the hours worked”, “Change Careers”, or “No plans for retirement”. Our goal in this study was to investigate the relationship between those expectations and self-definition of work status in later waves of HRS. The self-definitions were “not retired”, “retired completely”, and “partly retired”. We found that over time the majority of all categories of respondents reported themselves to be completely retired. Yet there were significant differences in outcome responses by retirement plans in all waves of the data. Those who planned to stop working completely were more likely to state they were retired; those who stated that they intended to never retire were more likely to state that they are not retired; those with no plans were also more likely to state that they are not retired; and those who stated they intended to reduce the hours worked were more likely to report themselves as partly retired. We found no clear pattern for those who intended to change careers. Our analysis shows that the profiled plans do have a linkage to later self-definitions of work status in this cohort.

CHALLENGES IN RETIREMENT: EXPLORING THE EFFECTS ON MEN’S PERSONAL RELATIONSHIPS AND IDENTITY

L.K. Soulsby, C. O’Brien, J. Kuhlke, *University of Liverpool, Liverpool, Merseyside, United Kingdom*

Working life plays a central role in the life of most adults. The concept and process of retirement are changing and, as state pension age increases in the UK, a clearer understanding of the experience of retirement is important. This study uses data from face-to-face, semi-structured qualitative interviews with 16 retired British men to explore the psychosocial impact of retirement. Interview questions focused on the participants’ working life; decisions around, and the adjustment to, retirement; personal relationships and support; and identity. Interviews were transcribed verbatim and the data was analysed using a grounded theory method. The interviews provide an insight into the way men view and adjust to retirement and highlight the variability of the retirement experience. Moving out of paid work was viewed as a largely positive experience, providing new opportunities to maintain relationships and pursue leisure activities. However, almost all of the men also discussed retirement as a loss, characterized by disruption to their personal relationships, their sense of self and their daily activities. Several participants continued to work in unpaid or part time roles with a view to minimizing the losses associated with the transition out of full time paid work. The findings enhance the understanding of the experience of retirement for men and have implications for the provision of support to both soon to retire and retired men.

ARE WORKING HOURS AND INCOME ASSOCIATED WITH HAPPINESS AMONG PRE-RETIREMENT AGE EAST ASIAN WORKERS?

T. Yamashita[1], A.R. Bardo[2], D. Liu[1], *1. University of Nevada, Las Vegas, Las Vegas, Nevada, 2. Miami University, Oxford, Ohio*

As the baby boomers have recently begun to retire in the economically developed nations, subjective well-being (happiness in this study) among pre-retirement workers has received growing attention. Working hours and income are widely recognized predictors of happiness among workers. Importantly, these happiness predictors are influenced by sociocultural contexts. For example, due to the "busy ethic," Americans believe that longer working hours lead to greater income, and in turn, to greater happiness whereas Europeans prefer shorter working hours. Yet, significantly less is known about pre-retirement age workers in East Asia, despite their leading roles in the global economy and rapid population aging. The current study utilized the 2010 East Asian Social Survey, an internationally representative dataset of adults in China, Japan, South Korea and Taiwan. Partial proportional ordinal logistic regression was used to model happiness as a function of working hours, income and other covariates among the pre-retirement workers [i.e., late middle age (45-64)]. Working hours was negatively associated with happiness only in China ($OR = 0.98$, $p < 0.05$). However, relative income ($OR = 1.56\text{-}3.88$, $p < 0.05$) was consistently positively associated with happiness in all four nations. The Chinese workers might have adjusted for their suddenly increased working hours and/or overtime in the context of their nation's rapid economic development. Also, greater income in East Asian societies might be an indicator of perceived financial security that contributes to greater perceived levels of happiness since the majority of East Asian workers were concerned about possible financial dependence in their retirement.

TRIGGERS AND HINDRANCES: CONTEXTUALIZING THE RETIREMENT PLANNING TRAJECTORY FOR MARRIED INDIVIDUALS

E.A. Fenster, *Social Science, Valley City State University, Valley City, North Dakota*

Retirement research has largely focused on actual retirement or the post-retirement transition, but less on pre-retirement planning. Further, there is a lack of research on how being married may influence retirement planning. This study addresses these limitations by focusing on how pre-retirement married individuals ages 42 or over describe their retirement planning experiences. Data were collected from a sample of 14 married individuals via demographic questionnaires and qualitative in-depth interviews. Analysis utilized a grounded theory approach. The life course perspective was used to help understand the impacts of personal biography and explore the implications of linked lives, which suggests an individual's and their spouse's life circumstances are interconnected (Elder, 1994; Macmillan & Copher, 2005). Emergent themes addressed how life transitions may trigger or constrain retirement planning. Individuals mentioned certain "firsts" as life events that initiated their planning, such as a first "real" job, getting married, and becoming a parent. Participants also mentioned hindrances in the following areas: family and relationships, employment circumstances, uncertainty and feelings towards the future, and financial decisions or behaviors. These themes resulted in the creation of a timeline to visualize events and behaviors occurring throughout participants' lives that trigger retirement planning, which has not yet been attempted in life course and retirement research. For some, experiences in childhood and young adulthood began to shape their thoughts on planning and motivations for the future, highlighting that retirement planning may begin early. Based on these findings, implications for individuals, employers, and possibilities for future research will be discussed.

RETIREMENT PROCESS AND THE QUALITY OF LIFE AMONG KOREAN BABY BOOMERS : A FOCUS ON GENDER DIFFERENCES

G. Han[1], J. Son[2], *1. Research Institute of Human Ecology, Seoul National University, Seoul, Republic of Korea, 2. Institute on Aging, Seoul National University, Seoul, Republic of Korea*

Though career changes and transition into retirement are very closely related to the quality of life, understanding about this process is very limited in Korea. This study examines how various aspects of retirement process is associated with the quality of life focusing on gender differences of Korean baby boomers. The data were collected from 3275 adults (1496 men and 1779 women) at the age of 50 to 58. In this survey, quality of life was evaluated in four dimensions: marital satisfaction, financial satisfaction, leisure satisfaction, and self rated health. And retirement process consisted of four types: working at the career job, working at the bridge job, not working after retiring from the main job, and full retirement. The major findings are as follows. First, male and female baby boomers who are currently working at the career job are more satisfied with their financial situation and show higher self rated health than those who working at the bridge job or are fully retired. Second, male baby boomers who working at the career job are more satisfied with their marital relationship and leisure time than those who have retired fully. On the other hand, female baby boomers who retired fully are more satisfied with their marital relationship and leisure time than those who working at the career or bridge job. The result of this study suggests that it is important to recognize both gender differences and gender similarities in order to integrate theory and research into a coherent picture of "gendered" reality. Implications of these findings are discussed further.

COMPETING DEMANDS: FINANCIAL NEEDS OF CHILDREN AND PARENTAL RETIREMENT TIMING

J. Kling, *1. University of Maryland, College Park, Maryland, 2. Maryland Population Research Center, College Park, Maryland*

Decreasing income security, lower pension wealth, and other wealth reductions have all contributed to the recent increases in the retirement age in the U.S. However, there is also growing recognition that diverse and often disrupted family experiences (e.g., divorce, dependent children) may disadvantage older adults as they approach retirement. In this study, I examine the connection between family demands and retirement behaviors of older adults. I ask whether the presence of financially dependent children affects parents' retirement timing. Observing parents in their 50s using the Health and Retirement Study (HRS), I first examine the cross-sectional relationship between financially dependent children and parents' employment status in the 1998. Then, incorporating subsequent waves of the HRS, I use event history analysis to model differences in the timing of transitioning out of the labor market between parents with and without financially dependent children. I model the transition to fewer hours in the same job or another job and fully exiting the labor market. I consider three categories of financial dependents: dependent-aged children under the age of 22 (the earliest age one could expect to graduate from college); adult co-resident children; and adult non-coresident children who receive a certain amount of financial help from their parents. I expect parental wealth will mediate the relationship between financially dependent children and parental retirement. Therefore, in addition to demographic factors, I control for parents' personal savings and expected retirement income from Social Security and pension wealth.

PRE-RETIREMENT FAMILY RELATIONSHIP AND POST-RETIREMENT ADAPTATION: THEIR TRAJECTORIES AND LINKAGE

S. Joo, H. Jun, H. Chai, *child and family studies, Yonsei University, Seoul, Republic of Korea*

From a life course perspective, retirement is an event as well as a transition from work to family. Also, it is thought that better family relationships promote better adaptation to retirement. However, few studies examined the trajectories of pre-retirement family relationship and post-retirement adjustment as well as the linkage between the two as a longitudinal process of transition into retirement. Thus, the purpose of this study was to investigate the longitudinal trajectories of family relationship during pre-retirement period and their effects on the trajectories of post retirement adjustment measured by life satisfaction. Data from the ten waves of Korean Labor & Income Panel Study (1997 to

2007) was used and middle and elderly individuals retired in 2001 and 2002 (N=198, mean age=57.31) were analyzed with Structural Equation Modeling. Results indicated that trajectories of both family relationship before retirement and life satisfaction after retirement were stable. In addition, overall pre-retirement family relationship had positive effect on overall post-retirement life satisfaction. These results imply that programs designed to help retirees' adaptation to retirement need to be implemented during the pre-retirement period because adaptation to retirement is influenced by the context set before retirement. However, interventions that promote pre-retirement family relationship may not be so effective. Even though family relationship have an effect on post-retirement adaptation, we need to consider that patterns of family relationship is established far before transition into retirement and that family relationship examined in this study remained stable throughout the 5-year pre-retirement period.

EXPOSURE VERSUS CUMULATIVE EFFECT OF SOCIAL PARTICIPATION DURING POST-RETIREMENT ADJUSTMENT STAGES

H. Chai, H. Jun, S. Joo, *Yonsei University, Seoul, Republic of Korea*

Active participation in diverse social groups plays an important role in retirees' post-retirement adjustment because it compensates their loss of the work roles. However, whether social participation per se or the number of participating social groups matters more for adjustment remains unclear. Not only this, despite the progression of retirement adjustment in long-term stages, previous studies on retirement transition mainly focused on short-term adjustment. Therefore, using data from the respondents who made transition into retirement between the first (2006) and second (2008) waves of the Korean Longitudinal Studies of Aging (*N*=263), this study examined exposure and cumulative effects of social group participation on retirees' life satisfaction shortly after retirement (2008) and two years after retirement (2010). The results showed that in the short term, retirees' social participation has a positive cumulative effect on life satisfaction (β=.23, p<.05). This means that for recently retired individuals, participating in more diverse social groups leads to higher life satisfaction rather than the participation itself. However, at two years after retirement, social participation did not have any significant influence. This indicates that the effect of social groups only lasts during the early phase of retirement adjustment, when retirees reorganize their life styles and enjoy their free time. When adjustment to retirement is stabilized after a few years, social participation loses its significance in adjustment. Such results are noteworthy in that they highlight the importance of participating in diverse social groups after retirement and the need to consider long-term adjustment stages in studying transition into retirement.

CATCH A GLIMPSE OF ME: DEVELOPMENT OF PERSON-CENTERED CARE/ LEGACY VIDEOS THROUGH COLLABORATION OF RESIDENT, FAMILY MEMBER, AND STAFF MEMBER FOCUS GROUPS

T. Gendron, L. King, *Virginia Commonwealth University, Richmond, Virginia*

Older age tends to be a time for evaluating ones life, and one of the major tasks is to work through a life review- a purposeful, constructive effort to review one's life and put it into perspective (Saxon et. al, 2010). This project was initiated to develop an evidence-based mechanism to help older adults initiate a life review and to share what is important to them with both staff members who may be taking care of them and loved ones. Healthcare professionals have been increasingly moving toward a holistic model of care that emphasizes residents' perspectives and their individually defined experiences and needs. The model, most often defined as "person-centered care" (Epp, 2003) moves away from traditional task-oriented and professional driven models of healthcare. The Catch a Glimpse of Me project used focus groups with residents, family members and staff at a continuing care retirement community, to design and develop person-centered care/legacy videos of older adults. The primary goal of this project was to create a model video that is both meaningful to residents, family members, and staff members currently providing care for them. This poster will present a summary of the data analysis from the focus groups and discuss the topics for inclusion in the video.

HOW DO VIEWS OF AGING INFLUENCE RETIREMENT PLANNING?

A. Barrett, A. Raphael, *Florida State University, Tallahassee, Florida*

Better views of aging improve health, including health-related behaviors like exercise. Less is known about their effects on other behaviors, such as retirement planning. We address this issue by examining the relationship between views of aging and having a retirement plan, using data from the National Survey of Midlife Development in the United States (1995-1996, 2004-2006). We examine three measures of views of aging: age identity, conceptions of the end of middle age, and attitudes about later life. Having a retirement plan is operationalized as having an employer- or union-offered pension or retirement plan, an IRA or Keogh plan, or some other retirement plan. Analyses control for factors shown in prior studies to predict likelihood of having retirement plans, including sociodemographics (e.g., SES, race, gender), job characteristics (e.g., hours, occupational prestige), and psychological orientations (e.g., mastery). Results of logistic regression models indicate that individuals with positive attitudes about later life have higher greater odds of having a retirement plan, compared with their peers with less favorable views of this life stage. Odds of having a retirement plan are associated with neither age identity nor conceptions of the timing of middle age. Our study contributes to the literature in two ways — by identifying another predictor of retirement planning and documenting further consequences of aging attitudes.

SOCIAL DETERMINANTS OF ACTIVE LIFE ENGAGEMENT AMONG FRENCH RETIREES

E.L. Sabbath[1], A. Leclerc[2], M. Goldberg[2], L.F. Berkman[1], *1. Center for Population and Development Studies, Harvard University, Cambridge, Massachusetts, 2. INSERM U1018, Villejuif, France*

Background: Active life engagement is a key component of successful aging. However, little is known about daily activities that comprise such engagement among older adults in France. We aimed to understand social determinants of productive time use among French retirees. Methods: We used data from GAZEL, a cohort of now-retired French utility workers. For each half-hour of the day prior to completing the survey, participants reported primary and secondary activities (choosing from 41 items). We examined five types of active engagement: paid work, volunteering, caregiving, community involvement, informal social interaction. We modeled concurrent predictors (gender, education, pre-retirement occupation, marital status, age, self-rated health) of any participation in each activity. Among activity participants, we modeled adjusted marginal means for time spent by different sociodemographic groups. Results: 11,178 individuals completed the time use instrument. Single/divorced participants were most likely to work for pay after retirement. Men were more likely than women to participate in volunteering and community activities; conversely, women were more likely to engage in informal activities (caregiving and social interaction). Non-married participants sought social connections outside the home. Time spent on both paid work and informal engagement declined linearly with both age and health status, though relationships between other activities and age/health status were more complex. Conclusions: Participants exhibited high levels of active life engagement, with clear gender and socioeconomic differences in type and intensity of activities performed. Participation did not uniformly decline with age or health status. These findings provide insight on the lives of successfully aging French adults.

THE ACCESS TO BRIDGE EMPLOYMENT: THE CASE OF DUTCH RETIREES

E. Dingemans[1], K. Henkens[1,2], H. Van Solinge[1], *1. Netherlands Interdisciplinary Demographic Institute, The Hague, Netherlands, 2. University of Amsterdam, Amsterdam, Netherlands*

Bridge employment is often defined as the paid work pattern among those who receive a pension income. Empirical studies on the predictors of bridge employment often focus on the actual behavior, thereby neglecting the fact that some retirees may be unsuccessful at finding a bridge job. This study aims to improve the understanding of the social forces that selectively determine the participation in bridge employment. Following the life course perspective, we focus on social circumstances as well as psychosocial factors to explain why some people fully retired after career exit, some participated in bridge jobs and others unsuccessfully searched for a bridge job. Using panel data of Dutch retirees (N = 1225), we estimate multinomial logit models to explain the participation in and attainability of bridge employment. The preliminary results show that about one in four retirees participated in bridge jobs after retirement and seven percent unsuccessfully searched for a bridge job. The multivariate models indicate that the psychosocial factors, work disengagement and perceived labor market opportunities, seem to determine the participation in bridge employment, but not whether people eventually succeed in finding a bridge job. In addition, we found that unhealthy people and those who experienced involuntary career exit have a higher likelihood to be unsuccessful at finding a bridge job, which suggests a cumulative disadvantage in the work domain in later life.

PARENTAL AND SOCIAL INFLUENCES ON THE UNDERSTANDING OF FINANCIAL PLANNING FOR RETIREMENT

J.L. Koposko, D.A. Hershey, *Psychology, Oklahoma State University, Stillwater, Oklahoma*

Numerous factors structure individuals' perceptions of financial planning for retirement, but few studies have examined the role of positive, early learning experiences in relation to financial planning. Consistent with the conference theme, this investigation focused on the transfer of financial knowledge from parents to children and the extent to which that knowledge is predictive of future retirement planning tendencies. A psychomotivational model was tested on an important yet understudied group—college students—to assess the dimensions that underlie expectations of future retirement planning practices. Early learning experiences were assessed using two newly developed measures: (a) a scale that taps parental influences on saving, and (b) a measure of non-family early influences on saving. The model was constructed on the basis of empirical findings that are central to the life-course perspective. Participants were 722 undergraduate college students (260 men; 462 women) between the ages of 17-52. Respondents completed a battery of retirement and financial planning measures, which were analyzed using a path analysis approach that was designed to predict expectations of future planning and retirement quality of life. Findings revealed that the two early learning measures were important indirect determinants of expectations of planning and future quality of life, accounting for more than 30% of the variance in the two dependent variables. Implications are discussed in terms of how: (a) early learning experiences can shape the motivational basis of the retirement planning process, and (b) intervention approaches could make young adults better future retirement planners and savers.

WHO WORKS AFTER RETIREMENT? : FACTORS OF BRIDGE EMPLOYMENT IN OLDER ADULTS

J.A. Cho, B.L. Needham, J. Liang, M. Elliot, S. Robert, C. Mendes de Leon, *University of Michigan, Ann Arbor, ANN ARBOR, Michigan*

With widespread implementation of pro-work policies and the notion of retirement as a gradual process rather than one-time transition, bridge employment rate in the US has continuously increased for last few decades. However, causal factors for bridge employment are not fully understood. In addition, there is little systematic information on gender difference in the precursors of bridge employment despite substantially different occupational experiences in men and women. This study explores different factors of bridge employment in men and women. Discrete time survival analysis was conducted using 10 waves of Health and Retirement Studies (n=2021, aged 65 or older). Separate analyses were conducted by gender to help deeper understanding of how different career paths and gender role expectations for men and women influence engaging in bridge employment. Lower financial means was associated with higher likelihood of bridge employment in both men and women. Having more extended family relationships was associated with a lower likelihood of bridge employment in women. Higher education and having skilled, high-paying occupations is associated with higher likelihood of bridge employment in men. Marital status was found to be an effect modifier of the association. Factors of bridge employment were different among men women due to different social roles and career trajectories. This work will contribute to policy development for pre- and post-retirement welfare and well-being among older adults

WHAT FACTORS FACILITATE COGNITIVE PERFORMANCE MAINTENANCE FOLLOWING RETIREMENT?

D.C. Carr[1], R.J. Willis[2], L.L. Carstensen[1], *1. Stanford University, Stanford, California, 2. University of Michigan, Ann Arbor, Michigan*

Recent research shows a causal relationship between retirement and decline in cognitive performance. This study examines whether personal characteristics, engagement behaviors, and occupational differences mediate cognitive performance decline during the retirement transition (from four years prior to retirement to four years following retirement). Drawn from the Health and Retirement Study, our sample includes individuals 51 or older who retire for the first time between 2000 and 2008 and have normal cognitive performance in the four years leading up to retirement (n=1,830). Cognitive performance is measured according to a 27-point test assessing episodic and working memory and mental processing speed. We use propensity score matching (Gaussian kernel) to adjust for baseline differences in circumstances surrounding retirement and all other environmental, demographic, and personal characteristics. Compared to the four years prior to retirement, our study shows two key factors are independently correlated with maintenance of cognitive performance through the retirement transition: (1) having an occupation requiring the greatest cognitively complex tasks (based on the ONET classification) and (2) engaging in paid work after retirement. Bridge jobs offer greater benefit to those with the high occupational complexity relative to those with low cognitively complex occupations. In this session, we will discuss the implications of these findings for development of potential interventions that could diminish the negative effect of retirement on cognitive performance.

TIME SPENT ON HEALTH PROMOTING ACTIVITIES FOR OLDER AMERICANS: EVIDENCE FROM THE HEALTH AND RETIREMENT STUDY

Y. Zhang, J.A. Ailshire, *Davis School of Gerontology, University of Southern California, Los Angeles, California*

There is an increase interest in understanding time use patterns, particularly among older adults. Given the differences in time use indicate how employment affects people's life, it is important to understand how employed and unemployed older adults differentially spend their time. Based on the data from the 2001 Consumption and Activities Mail Survey and the 2000 Health and Retirement Study (N=3507), this study aims to examine how time spent varies on health promoting activities, including sleeping, exercising, social engagement as well as treating and managing medical conditions, among older adults. We hypothesize that the employed elderly will spend less time on health promoting activities compared to the unemployed elderly, since the opportunity cost of spending time on health promoting activities is higher for the employed elderly. After controlling for the effects from demographic differences, self-reported health status, functioning problems and health conditions, the results from negative binomial regression models suggest that full employed older adults spend less time on the health promoting activities we examined. On average, full employed older adults spend 1.29 hours less on sleeping per week ($p<0.001$), 4.43 hours less on social engagement per month ($p=0.08$), and 5.04 hours less on treating and managing medical conditions per month ($p<0.001$) compared to retirees. Overall the employed elderly may not allocate as much time for health promoting activities, which could benefit their later life. In moving forward, it may be important to examine the effects from activities of other family members and the changes in time use over time.

WHO IS LIKELY TO COMMIT TO A CAREER WORKING WITH OLDER ADULTS?

T. Gendron, E. Welleford, B.J. Myers, *Virginia Commonwealth University, Richmond, Virginia*

Gerontology, as an academic discipline, provides professionals with the conceptual knowledge and the skills necessary to address the complexities of working with a diverse aging population. We know little about what attracts professionals to the aging field and what maintains commitment to these careers. The aim of this study was to investigate the roles of career motivation, job satisfaction, anxiety about aging, and professional identity in relation to career commitment among those working with older adults. Participants ($N = 756$) were recruited through linkservs and links distributed by organizations and institutions serving older adults and responded to an online survey. Participants' motivation for working with older adults, level of job satisfaction, and exposure to formal gerontological education significantly predicted career commitment. In addition, aging anxiety mediated the relationship between job satisfaction and career commitment. This study sheds lights on perspectives of professionals working with older adults and highlights areas for future research and training with this population.

MEASURING WORK ABILITY BEYOND HEALTH: DEVELOPMENT & CONSTRUCT VALIDITY OF THE WORK ABILITY SURVEY REVISED GERMAN

J. Voltmer[1], J. Deller[1,2], *1. Institute for Strategic Human Resource Management Research and Development, Leuphana University, Lueneburg, Germany, 2. Silver Workers Research Institute, SRH Hochschule, Berlin, Germany*

The development of the German version of the Work Ability Survey revised (WAS-R) is presented. The WAS-R is improving psychometric problems of the Work Ability Index (WAI), i.e. a ceiling effect. Additionally, it is integrating factors of work place and social environment into the measurement of work ability. Few studies have been using the WAS-R, and no validation study has been published, yet. We translated the 54-item version of the WAS-R in a translation-backtranslation process. A sample of 1,052 senior managers of the German chemical industry was used for construct validation. Participants completed an online-survey of the WAS-R, the WAI, measures of job attitude and questions concerning retirement age. Factorial structure was tested using confirmatory factor analysis. Internal consistency of the subscales of the WAS-R ranged from .58 to .94. The WAS-R total score was correlated significantly with the WAI ($r = .56$, $p < .001$), job satisfaction ($r = .73$, $p < .001$), desired retirement age ($r = .16$, $p = <.001$), and willingness to return to one's organization, if asked ($r =.32$, $p < .001$). Lower skew and kurtosis indicated a better distribution of the WAS-R than of the WAI. We compared results from our sample with a subsample of the Australian WAS-R study. The German version of the WAS-R extends our understanding of work ability by integrating characteristics of work place and social environment. Its psychometric properties allow parametric statistical analysis. Interventions aiming at the improvement of work ability can be derived from its detailed subscales.

SESSION 1015 (POSTER)

NUTRITION & OBESITY

IMPACT OF OBESITY ON HEALTH CARE COSTS IN ADULTS OVER 65 YEARS OF AGE

F.G. Bottone[1], S. Musich[1], S. Wang[1], C.S. Yeh[2], K. Hawkins[1], *1. Analytics and Data Management, OptumInsight, Ann Arbor, Michigan, 2. AARP Services, Inc., Washington, District of Columbia*

Abstract (249 of 250 words) Objective: Obesity is a risk factor for a variety of chronic conditions and is a significant contributor to preventable medical expenses. The objective of this study was to evaluate the impact of weight, as a function of body mass index (BMI), on total health care costs. Design: 53,286 adults with an AARP® Medicare Supplement Insurance Plan insured by UnitedHealthcare Insurance Company (for New York residents, UnitedHealthcare Insurance Company of New York) in 10 states were surveyed for satisfaction and experience with care. Methods: Following adjustments for survey non-response bias and insurance status, we estimated health care utilization (inpatient and emergency room admissions) of 9,484 eligible respondents using multivariate logistic regression models. Subsequently, an exponential conditional mean (ECM) regression model was used to estimate the impact of BMI on medical and pharmaceutical expenditures relative to the normal weight category. The models adjusted for available demographics, socioeconomics and insurance status. Results: 23% of eligible respondents were obese. Relative to the normal weight category, annualized total health care costs were $1495 greater for those in the obese weight category ($p=0.03$). The majority of these costs were explained by chronic conditions likely associated with obesity. Most of these costs were attributable to the pharmaceutical management of these conditions. Conclusions: Obese older adults cost 8.6% more compared to their normal weight counterparts. These largely preventable costs are primarily associated with the management of chronic conditions. With 23% of this population self-reporting obesity, this equates to an additional $1.8 billion annually, mostly attributable to Medicare.

ASSOCIATION BETWEEN SUN EXPOSURE AND PLASMA LEVELS OF VITAMIN D IN CHILEAN OLDER PEOPLE

H. Sanchez, C. Albala, L. Lera, B. Angel, C. Marquez, *Institute of Nutrition and Techonology foods, Santiago, RM, Chile*

Introduction: The Influence of sun exposure on plasma levels of vitamin D (25OH-D) is well known. However the decreased ability of skin to synthetize 25OH-D in older people suggests that its role is not important in the elderly. The aim of this study was to evaluate the effect of latitude on plasma levels of 25OH-D in older people. Methods: Cross-sectional study corresponding to the baseline of a RCT aimed to determine optimal levels of fortification with 25OH-D and vitB12 of a milk drink provided to Chilean Ministry of Health`s beneficiaries ≥70y. Participants were enrolled in primary care centers from 3 cities located in the North (NL) (Latitude: 20°13'03"S), Center (CL) (Latitude: 33°28'10"S) and South (SL) (Latitude:53°09'18"S) of the country. Mobility, functional status and medical history were registered. Anthropometry and 25OH-D were measured. Crude and adjusted regression models were developed for analyzing the association between latitude and 25OH-D deficiency (<50nmol/L). Results: 815 elderly, 188 from NL, 309 from CL and 300 from SL were recruited. The three groups had similar age and gender proportion. Mean 25OH-D was 89.2 nmol/L(SD:32.2) in NL, 64.0 nmol/L(SD:32.9) in CL and 44.2 nmol/L(DS:33.6) in SL (p<0.05). 25OH-D deficit was 8.4%(95%CI:4.3-14.5) in NL; 37.5%(95%CI:27.8-48.0) in CL and 66%(95%CI: 60-72) in SL (p<0.05). Considering NL as reference, the age, sex and BMI adjusted OR of having 25OH-D deficit was 8.4(95%CI:3.5-20.6) in CL and 24.9(95%CI:10.9-57.0)in SL. Conclusions: The results demonstrate the importance of sun exposure on plasma levels of vitamin D in older people. Project funded by FONDEF D10I1091

KNEE-HEIGHT AS ALTERNATIVE MEASURE IN NUTRITIONAL EVALUATION OF FREE-LIVING ELDERLY

V.E. Closs[1], L.S. Rosemberg[1], B.G. Ettrich[2], I. Filho[1], C.H. Schwanke[1], *1. PUCRS, Porto Alegre, RS, Brazil, 2. UFRGS, PORTO ALEGRE, RS, Brazil*

Background: one simple way to evaluate nutritional status is to use anthropometric measurements, and many indices utilized are dependent upon stature. Elderly people are affected by mobility and skeletal muscle changes, therefore, several equations to predict stature have been developed for these populations. The objectives of this study were to evaluate the homogeneity between height and body mass index (BMI) measured, and estimated through the knee-height (KH) measure, and the agreement between the nutritional evaluations based on two BMIs, a measured and another estimated. Methods: cross-sectional study with a random sample of 583 free-living elderly. The variables investigated were weight (W), stature (S1), KH and estimated stature (S2) (obtained through Chumlea equations). BMI was calculated with S1 (BMI1) and S2 (BMI2) and classified according to Lipschitz. The statistic analysis was performed by the Intraclass Correlation Coefficient (ICC) and the weighted Kappa with Quadratic Weights (kw2). Results: the majority of the sample was female (63.6%) and mean age 68.5±7.1 (60-103) years. The correlation was statistically significant (P<0.001) both for stature (ICC=0.91) and BMI (ICC=0.90). Most of elderly were overweight, BMI1=57.4% and BMI2=55.6%. The Kappa index between nutritional assessments of BMI1 and BMI2 was 0.77. Conclusions: the results showed an excellent homogeneity between measured and estimated data and a good agreement between the two nutritional evaluations, suggesting the desirability of additional studies with a large population, for increase the validity of the use of knee-height as a useful tool to evaluate nutritional status of free-living elderly.

ASSOCIATION BETWEEN DIETARY VARIETY AND BODY COMPOSITION AND PHYSICAL FUNCTION IN COMMUNITY-DWELLING OLDER JAPANESE

Y. Yokoyama[1,2], M. Nishi[1], H. Murayama[1], H. Amano[1], Y. Taniguchi[1], M. Narita[1], Y. Kawano[2], S. Shinkai[1], *1. Research Team for Social Participation and Community Health, Tokyo Metropolitan Institute of Gerontology, Tokyo, Japan, 2. Graduate School of Agriculture, Tokyo University of Agriculture, Tokyo, Japan*

Background: Aging is associated with reduced lean mass and physical function; however, little is known about association between dietary variety and body composition and physical function in the elderly. This cross-sectional study examined these associations in community-dwelling older Japanese. Methods: Participants were 1063 individuals aged 65 years and over. Dietary variety was assessed with a food frequency questionnaire which covers the 10 main food items in Japanese meals (meat, fish/shellfish, eggs, milk, soybean products, green & yellow vegetables, potatoes, fruits, seaweed, and fats and oils), and scored (range, 0-10). Body composition was determined with multi-frequency bioelectrical impedance analysis (InBody720). Physical function was measured on handgrip strength and usual walking speed. Multiple linear regression analysis was used to examine the independent association between dietary variety and body composition and physical function. Results: Even after adjusting for potential confounders (sex, age, study site, BMI), higher dietary variety scores were significantly associated with higher fat free mass [β(SE):0.215(0.049), p<0.001], soft lean mass [β(SE):0.203(0.046), p<0.001], and skeletal muscle mass [β(SE):0.127(0.029), p<0.001], but not with body fat mass. Those with higher dietary variety scores showed greater handgrip strength and faster usual walking speed [β(SE):0.231(0.067), p=0.001 and β(SE):0.011(0.003), p<0.001, respectively]. Conclusion: Although the causal relationship remains to be determined in prospective study, this cross-sectional study indicates that higher dietary variety may contribute to preserve lean mass and better physical function.

WEIGHT LOSS ADDED TO RESISTANCE TRAINING DOES NOT ATTENUATE POSITIVE EFFECTS ON BMD IN OLDER ADULTS

K.M. Beavers[1], E. Chmelo[1], D.P. Beavers[2], S.A. Shapses[3], A. Marsh[4], S.B. Kritchevsky[1], B. Nicklas[1], *1. Internal Medicine, Wake Forest School of Medicine, Winston-Salem, North Carolina, 2. Biostatistical Sciences, Wake Forest School of Medicine, Winston-Salem, North Carolina, 3. Rutgers University, New Brunswick, New Jersey, 4. Wake Forest University, Winston-Salem, North Carolina*

Background. Exercise has a positive effect on bone mineral density (BMD) in weight-stable, older adults, and it may be an effective means to prevent bone loss during weight loss in this population. The purpose of this study is to compare the effects of a 5-month resistance training (RT) plus caloric restriction (CR) program to RT alone on change in BMD at clinically important sites of osteoporotic fracture. Methods. 126 overweight and obese (BMI: 30.6±2.3 kg/m2), older (69.5±3.7 years) adults (56% female) completed a 5-month standardized, progressive RT program with (RT+CR) and without (RT-only) caloric restriction (600 kcal/d deficit). DXA-acquired BMD (total hip, femoral neck, lumbar spine) and total body, fat, and lean mass were assessed at baseline and 5-months. Results. Participants randomized to RT+CR lost 5.0±3.9 kg (5.7±4.3%) of initial body mass, with 76% of losses coming from fat mass and 24% coming from lean mass (all p<0.01), while RT-only participants did not significantly change body mass (-0.1±2.2 kg; -0.2±2.5%). Although differential treatment effects were not observed for regional BMD, when compared to baseline, the adjusted percentage change estimate for lumbar spine BMD increased in the RT-only group (0.82±0.36%, p=0.02), and femoral neck BMD was marginally increased in the RT+CR group (0.82±0.44%, p=0.06). Interestingly, in both groups, effect size estimates were positive for all BMD change measures (range: 0.03-0.83%). Conclusions. Modest, intentional, weight loss does not attenuate the positive effects of a 5-month resistance training program on regional BMD in overweight and obese, older adults.

LONG-TERM EFFECTS OF A 5-MONTH WEIGHT LOSS PROGRAM ON BODY COMPOSITION IN OBESE, OLDER ADULTS

D.P. Beavers[1], K.M. Beavers[2], E. Chmelo[2], A. Marsh[3], B. Nicklas[2], *1. Biostatistical Sciences, Wake Forest School of Medicine, Winston-Salem, North Carolina, 2. Internal Medicine, Wake Forest School of Medicine, Winston-Salem, North Carolina, 3. Wake Forest University, Winston-Salem, North Carolina*

Background. The purpose of this study is to explore how global and regional body composition changes in the year following intentional weight loss in older adults. Methods. A convenience sample of 24, obese (BMI: 30.0±2.0 kg/m2), older (70.1±3.8 years) adults (50% female), randomized to 5-months of resistance training (RT) plus caloric restriction (CR; -600 kcal/d) (RT+CR; n=13) or RT only (n=11) were followed for an additional 13 months. DXA (total fat and lean mass) and CT (thigh subcutaneous and intermuscular fat, and muscle volume) acquired measures of body composition were assessed at baseline, 5-months, and 18-months. Results. RT+CR participants lost 7.1±2.4 kg during intervention (74% of weight lost as fat mass and 26% as lean mass; all p<0.01), while RT-only participants did not change weight (0.3±1.8 kg, p=0.64). Differential intervention effects were observed for all DXA and CT body composition measures at 5-months, although by 18-months, group differences persisted only for weight (RT+CR: 81.6±10.0 kg vs. RT-only: 88.5±14.9 kg; p=0.03) and lean mass (RT+CR: 50.8±9.3 kg vs. RT-only: 54.4±12.0 kg; p<0.01). All RT+CR participants regained weight during the follow-up period (4.8±2.6 kg; range: 0.4-9.1 kg). Total body fat mass and thigh fat volume (total, subcutaneous and intermuscular) increased during the follow-up period, while percent total body lean mass and thigh muscle volume decreased in RT+CR participants (all p<0.05). Conclusions. Data suggest fat mass accretion but lean mass loss, both globally and regionally, in older adults in the year following completion of a weight loss program.

HIGH DIETARY ACID LOAD CORRELATES WITH FASTER DECLINE IN KIDNEY FUNCTION IN ELDERLY:HEALTH ABC STUDY

S. Petrovic[1], J. Rushing[1], T. DuBose[1], M.Z. Vitolins[1], L.F. Fried[3,5], M. Shlipak[2,4], S.B. Kritchevsky[1], *1. Wake Forest School of Medicine, Winston-Salem, North Carolina, 2. University of California, San Francisco, California, 3. University of Pittsburgh, Pittsburgh, Pennsylvania, 4. VA Medical Center, San Francisco, California, 5. VA Medical Center, Pittsburgh, California*

High dietary acid load has recently emerged as a potential risk factor for the progression of chronic kidney disease (CKD), however, its effects on the loss of kidney function with aging are unknown. We examined dietary acid load as net endogenous acid production (NEAP, a balance of acid-producing dietary protein vs. base-producing fruits and vegetables) in 1315 individuals (73-79 years of age) from the Health Aging and Body Composition cohort (Health ABC). Estimated GFR was calculated from plasma cystatin C measured in years 3 and 10, using the CKDEpi equation (eGFRcys). Change in eGFRcys was calculated as (eGFRyear10-eGFRyear3)/7. NEAP was calculated from food frequency questionnaires collected at the year 2 Health ABC assessment and adjusted to average caloric intake. Average NEAP was 56.9 mEq/day(sd=23.5) and the eGFRcys decline average was -1.23 ml/min/1.73m2/year(se=0.14). The rate of decline of eGFRcys was greater for those with higher baseline NEAP levels (p=0.011): average (se) annual decline rates for those with low (<30), average (30-99) and high NEAP (>100mEq/day) were: -0.78(0.14), -1.22(0.09), and -1.60 (0.48) ml/year, respectively, in unadjusted analysis. These results persisted after adjustment for age, race, gender, baseline eGFR and urine albumin/creatinine ratio (p=0.046). In conclusion, our results indicate that high net dietary acid load is associated with a greater rate of decline in eGFR in elderly individuals.

THE STUDY ON GLOBAL AGEING AND ADULT HEALTH (SAGE): GLOBAL TRENDS IN OBESITY AMONG OLDER ADULTS

J. Snodgrass[1], M.A. Liebert[1], P. Kowal[2,3], S. Chatterji[2], *1. University of Oregon, Eugene, Oregon, 2. World Health Organization, Geneva, Switzerland, 3. University of Newcastle, Newcastle, New South Wales, Australia*

An increasing prevalence of adult obesity in higher income nations is well documented but less information is available about prevalence in lower income countries and among older age groups. The present study uses nationally-representative samples of older adults (50+ years old) from the Study on global AGEing and adult health (SAGE) Wave 1 to examine obesity prevalence in six middle-income countries (China, Ghana, India, Mexico, Russia, and South Africa). Measurements of height, weight (for body mass index [BMI; kg/m2], and waist circumference (WC; cm) were obtained. Weighted prevalence estimates were calculated for standard BMI categories (underweight, normal, overweight, obese) and WC categories (normal, increased risk) by sex and country; modified BMI and WC cutoffs were used in China and India. Between countries, men had major differences in prevalence of underweight (0.5% in Mexico to 40.3% in India) and obesity (4.3% in India to 39.3% in South Africa). Substantial variation was also seen in women in prevalence of underweight (0.7% in Mexico to 38.7% in India) and obesity (8.4% in India to 52.7% in South Africa). Significant differences in BMI and WC were seen between age groups (50-59, 60-69, 70-79, 80+ years) in Mexico, Ghana, and India. Older adults from Mexico and South Africa had high obesity levels, with substantial burden from malnutrition in India. Viewers of this poster will gain an appreciation for the extent to which obesity prevalence varies among older adults within and between a diverse set of middle-income nations. Support: NIH NIA YA1323-08-CN-0020; NIH R01-AG034479

NUTRITIONAL ASSESSMENT OF BRAZILIAN NONAGENARIANS

A.G. Bós, P. Martins, M.S. Cabral, *Institute of Geriatrics and Gerontology, Pontifical Catholic University of Rio Grande do Sul, Porto Alegre, RS, Brazil*

Background: Given the importance of identifying nutritional needs, dietary intake of centenarians and other nonagenarians groups has been studied on several prospects, dietary patterns of the nonagenarians as well as predictors of nutritional deficiency in this population. Methods: The study population consisted of elderly aged over 90 years living in Porto Alegre. The nutritional assessment was conducted analyzing dietary parameters, such as 24 hours Food Recall and Food Frequency Questionnaire (FFQ). We also checked the anthropometric, biochemical and socioeconomic characteristics. Results: We evaluated 44 elderly, 33 (75%) women and 11 (25%) men. The nonagenarians respondents, 31 (72%) did not need financial assistance to buy food, but only 31% purchased or participated in the acquisition of food. Participation in the preparation of their own meal was 29.5%, and 20.5% said the longevity prepare your meal without assistance. Men had a higher socioeconomic status than women, with significant p = 0.0174. It was verified low calcium intake, fruit and vegetables and high consumption of sweet foods and drinks. Conclusion: In this study we found that most of the oldest patient was outside the nutritional risk and total caloric intake of the oldest was adequate. However we observed some important micronutrient deficiencies. In this case, the oldest of nutritional assessment was of paramount importance, since it allows developing strategies for implementing nutritional interventions directed in order to meet the demands of this population and consequently generate improved quality of life. Keywords: Nutritional assessment, nonagenarians, nutrition, eating habits.

ATTITUDINAL PERCEPTION AND GENDER VARIATION AMONG SENIOR DENTAL STUDENTS TOWARDS THE ELDERLY

A. Mohammad, *College of Dentistry,King Saud Bin Abdulaziz University for health Sciences, Riyadh, Saudi Arabia*

In 2040, the elderly population is projected to reach 20% of the US total population. studies have shown that students in medical and dental programs are still reluctant to work with the elderly. This reluctance has been shown to be associated with negative attitudes imparted upon the elderly. The purpose of this study is to survey senior dental students at The Ohio State University College of Dentistry (OSU COD) prior to and after completing their Geriatric Dentistry (GD) rotation toward the elderly and identify any variables such as gender that may influence students' perception. Method: A two-stage survey was configured and distributed to senior dental students. A total of 94 responses were received comprising 56 male and 38 female students. Questionnaires were distributed before and after completion of their geriatric program. Attitudinal perceptions were compared using the Rosencranz and McNevin Aging Semantics Differential (ASD). The test measures attitudes in three dimensions: the instrumental-ineffective (I-I) dimension, the autonomous-dependent (AD) dimension and the personal acceptability–unacceptability (PA-U) dimension. Students answered questions as to their age and gender. Results: No significant differences were found between the three dimensions prior to and after completing their GD training. However, there was a greater change in the female variables compared to the male's following their training. Conclusion; Female students showed a greater positive change in their perception of the elderly after completion of GD training compared to male students. However, there was no significant difference in students' attitudes before and after GD training.

MULTIPLE TRAJECTORIES OF PERIODONTAL DISEASE AMONG OLDER AMERICANS: ROLE OF CHRONIC DISEASES

J. Liang[1], B. Wu[2], B.L. Plassman[2], J.M. Bennett[1], C. Hybels[2], L.R. Landerman[2], J. Beck[3], *1. Health Management & Policy, University of Michigan, Ann Arbor, Michigan, 2. Duke University, Durham, North Carolina, 3. University of North Carolina, Chapel Hill, North Carolina*

Following a person-centered approach, this research depicted distinct courses of periodontal disease among older Americans and ascertained how these trajectories were associated with chronic diseases (i.e., hypertension, heart disease, stroke, diabetes, and cancer). Data came from the Piedmont Dental Study, which involved repeated observations of 810 dentate individuals aged 65 and over in North Carolina from 1988 to 1994. Attachment loss (AL) and pocket depth (PD) were clinically assessed through a full-mouth probing and classified by the proportion of sites equal to or greater than 4mm. Group-based, semi-parametric mixture models (Proc Traj) were used for data analysis. For AL, four trajectories were identified: (a) low and stable AL (40.5%); (b) accelerated AL (8.2%); (c) moderate and fluctuating AL (21.3%); and (d) high and stable AL (30.1%). For PD, we also identified four trajectories: (a) low and stable PD (37.2%); (b) increasing PD (18.1%); (c) moderate but stable PD (18.6%); and (d) high but fluctuating PD (26.1%). Even when age, sex, race, education, and income were adjusted, heart disease and diabetes at the baseline significantly increased the risks of having trajectories of high and stable AP and high but fluctuating PD. Our data showed four distinct courses of change in periodontal disease over a five-year period. Whereas prior research has shown that oral health predicts heart disease and diabetes in old age, our findings suggest that these diseases may increase the risk for poor oral health as well. Supported by NIH/NIDCR (R21 DE019518-01, R01DE019110)

PROFILING HYDRATION STATUS IN COMMUNITY-DWELLING OLDER ADULTS USING SALIVARY OSMOLALITY

J. Mentes, S. Cobb, G. Flores, T. Thomas, M. Yefimova, *School of Nursing University of California Los Angeles, Los Angeles, California*

Dehydration is an ongoing problem for older adults that can lead to increased morbidity and mortality. Older adults are often unaware of daily requirements for fluid intake, and because of age-related decreased thirst or concerns about incontinence, do not consume sufficient fluids. To better quantify the problem of under-hydration in community dwelling adults, this ongoing pilot project was conducted to: 1) evaluate feasibility of saliva collection in this population, and 2) profile salivary osmolality collected over three days. We recruited 25 older adults attending 2 senior centers in the greater Los Angeles area, 19 females and 4 males whose mean age was 79 years (range 65-94). In addition to demographics and salivary osmolality, data on dietary intake, health related information, and hydration habits were collected. We used a Fiske mini freezing-point osmometer to analyze the specimens. Although adequate amounts of saliva were collected, about 1% of specimens were difficult to analyze because of viscosity. Mean results ranged from 95-129 mOsmol/Kg. Although there are no established norms for salivary osmolality, these values are high when compared with younger middle-aged adults of 60-90 mOsmol/Kg reported in the literature. Responses about hydration habits that may contribute to these findings are: 28% don't feel thirsty, 24% don't like to drink water, 28% don't drink because of fear of incontinence, and 40% don't know how much to drink. It is important to make older adults aware of the importance of hydration to overall health.

THE ROLE OF TREATMENT IN EXPLAINING OBESITY TRAJECTORIES AND MORTALITY IN OLDER ADULTS: RESULTS FROM THE HEALTH AND RETIREMENT STUDY

A. Sonnega, J. Faul, *Institute for Social Research, Ann Arbor, Michigan*

Scientists have reported on the well-documented obesity epidemic including its negative health consequences. Recently, they have begun to explore weight trajectories over the life course and the potential impact of different patterns of weight gain and loss on health. However, very few studies have examined trajectories in older adults. A notable exception uses data from the Health and Retirement Study (HRS) to examine heterogeneity in body mass index (BMI) trajectories and mortality risk in adults over age 50. While the worst survival was for obese individuals who gained more weight as they aged, the overweight stable trajectory had the highest survival rate. This supports research suggesting that being slightly overweight may actually be considered healthy. The models controlled for covariates including baseline chronic health conditions affected by obesity. However, they did not consider medications and treatment for health conditions. We hypothesize that treatment for conditions like diabetes and heart conditions obscure the true effect of weight and weight gain on the risk of dying for middle age to older adults. We utilize data from three nationally-representative cohorts in the HRS through 2012. Our sample includes 26,582 in the age range of 51-81 yrs including 11,092 deaths over 14-20 years of follow-up. We employ Cox proportional hazard adding as covariates time-varying behavior and health status variables along with medication and treatment for blood pressure, diabetes, heart failure, stroke, and high cholesterol. Our analysis provides evidence that older age weight gain may be worse for mortality risk than previously estimated.

SESSION 1020 (POSTER)

MENTAL HEALTH

INCIDENT DEPRESSION IN OLDER PRIMARY CARE PATIENTS: THE ROLE OF HOPELESSNESS AND SOCIAL SUPPORT

L. Dong, J. Gallo, *Mental Health, The Johns Hopkins Bloomberg School of Public Health, Baltimore, Maryland*

Objectives: Primary care doctors may ask about sadness but we hypothesized that hopelessness and poor social support may be stronger signals of risk for onset of depression among older adults. Methods: PROSPECT (Prevention of Suicide in Primary Care Elderly: Collaborative Trial) was a multi-site randomized controlled trial. For this study, the sample consisted of 552 adults aged 60 years and older who did not meet criteria for major or minor depression ascertained at baseline with the Structured Clinical Interview for DSM-IV disorders (SCID). The outcome was depression diagnosed by the SCID at follow-up over a 2-year period. Primary independent variables, hopelessness and social support, were assessed at baseline by the Beck Hopelessness Scale and Duke Social Support Index (DSSI) respectively. We used the life table method and pooled logistic regression to model discrete time events. Results: During the 2-year follow-up, 108 out of 552 participants developed depression (cumulative incidence, 22.4%). Hopeless patients were more likely to develop depression (Mild: Hazard Odds Ratio (HOR), 2.6; 95% Confidence Interval (CI), 1.6 to 4.2; P<0.0001. Moderate or Severe: HOR, 4.1; 95% CI, 2.0 to 8.2; P<0.001). Participants with perceived social support scores below the first quartile of the study sample had 2.3 times greater risk for depression compared to those with full scores (95% CI, 1.3 to 4.0; P=0.005). We did not find significant interactions between hopelessness and perceived or instrumental social support. Conclusion: Depression was common among older primary care patients, and hopelessness and poor social support signal an increased risk.

PHONE SCREENERS' ESTIMATION OF INITIAL EVALUATION ATTENDANCE AMONG ADULTS 50 OR OLDER WITH COMPLICATED GRIEF

S. Duncan[1], N. Skritskaya[2], A. Lee[3], C. Mauro[3], Y. Wang[3], M. Shear[2,4], *1. Teachers College, Columbia University, New York, New York, 2. Columbia University School of Social Work, New York, New York, 3. Mailman School of Public Health, Columbia University, New York, New York, 4. Columbia University College of Physicians and Surgeons, New York, New York*

Non-attendance at scheduled appointments is problematic because it wastes valuable clinic resources and keeps patients from securing treatment. To better predict non-attendance, we added a measure of likelihood of intake attendance based on the phone screeners' perceptions. The study aim was to identify patient and clinic characteristics, including the measure above, that are associated with non-attendance at the initial evaluation in a complicated grief research clinic. This analysis examined 200 bereaved individuals 50 to 99 years of age who contacted our clinic and were scheduled for an evaluation after completing a phone screening interview. Of these, 148 attended a subsequent intake appointment, while 52 did not. Basic demographic variables, grief severity, time since the loss, relationship to the deceased, a previous mental health diagnosis, distress level during and at the end of the phone screen, as well as wait-time between the phone screen and intake and the likelihood of attendance measure were examined to identify characteristics associated with non-attendance. Logistic regression analyses showed significant results only for the likelihood of attendance measure. Participants with a 75% or higher likelihood of attendance estimate were significantly more likely to come for an intake appointment compared to participants with an estimate of 50% or less. Our results support the usefulness of the likelihood of attendance measure in predicting participants' attendance of an initial evaluation. Information that influenced phone screeners' judgments, including examples, will also be presented.

CEREBRAL STIMULATION IN A BIOFEEDBACK MODE: BENEFITS FOR MUSCLE STRENGTH IN ELDERLY INDIVIDUALS

V. Silva[1], G. Vieira[3], P.U. Cabral[2], M. Calomeni[4], S. Lages[2], A. Silva[5], M. Siza[6], *1. State University of Rio de Janeiro - UERJ, Rio de Janeiro, Rio de Janeiro, Brazil, 2. State University of Piaui - UESPI, Teresina, Piauí, Brazil, 3. Federal University of Juiz de Fora, Juiz de Fora, Minas Gerais, Brazil, 4. Higher Institutes of Education of Censa - ISECENSA, Campos dos Goytacazes, Rio de Janeiro, Brazil, 5. University of Trás-os- Montes e Alto Douro, Vila Real, Trás-os- Montes e Alto Douro, Portugal, 6. University Center of João Pessoa - UNIPE, João Pessoa, Paraíba, Brazil*

Objective: To investigate if a program of brain stimulation in the form of biofeedback training could improve quadriceps force production in elderly individuals. Method: Thirty subjects divided into two groups named experimental (EG) and control (CG). Stimulation photic/auditory was applied when subjects only mentally experienced the quadriceps muscle contraction. Related literature affirms this procedure being as effective as biofeedback training. Instrumentation: electroencephalogram was used to verify brain waves patterns, electromyography for quadriceps muscle signals and a stand up from a chair test to verify the subjects capability for repetitions. Results: Electroencephalogram data taken by scalp electrodes distributed in the international 10/20 format, did not show considerable brain waves difference between the pre and post training scores for any group. In a similar comparison, electromyography signals during the stand up from a chair test increased by a 23% for the EG and remained same for the control one. Higher dispersion of the same signals was also observed. Mann Whitney test analysis indicated no differences between groups in terms of the quadriceps muscle activity (p = 0.90). The within group comparison performed by the t student test was of p> 0.05. However, with a high tendency for statistical significance related to the EG (p= 0.07). Better performance of the EG was also verified on the stand up from a chair test, whose repetitions increased by 5.4% and the CG only 0.03%. Conclusions: Those above results may add new insights to therapeutic treatment of older functionally impaired individuals.

DEVELOPMENT OF THE FAMILY FUNCTION SCALE FOR MEASUREMENT OF FACTORS RELATING TO ELDERLY PEOPLE'S DEPRESSIVE TENDENCY

S. Yamazaki[1,2], H. Imuta[3], H. Haga[4], R. Takahashi[5], S. Yasumura[2], *1. Bunkyo Gakuin University, Saitama, Japan, 2. Fukushima Medical University School of Medicine, Fukushima, Japan, 3. Tokyo Metoropolitan University, Tokyo, Japan, 4. J.F.Oberlin University, Tokyo, Japan, 5. Tokyo Metoropolitan Institute of Gerontology, Tokyo, Japan*

BACKGROUND: Elderly people's depressive tendency is one of the risk factors for needing long-term care. It is suggested that issues with family relationships have the potential to influence elderly people; however, there are few evaluation scales for such a factor. OBJECTIVE: To develop a family function scale for depressive tendency among community-dwelling elderly people, and to establish its reliability and validity. METHODS: In a preliminary survey, we collected 43 items and selected 14 items associated with depressive tendency. The main survey was conducted through airmail. 2,000 randomly selected community-dwelling elderly people and one of their family members who was living with them in Tokyo. The questionnaire included health related variables and the selected scale items. RESULTS: A total of 659 elderly people (337 men and 322 women, mean age 72.6±5.0 years) were analyzed. A factor analysis was utilized, and a six-item scale was developed (Cronbach's alpha = 0.56). Those who scored high on this scale were found to have a higher depressive tendency. This scale correlated significantly with social support from family members, mental health, and interactions with a higher number of family members. CONCLUSION: We developed the Family Function Scale for measurement of factors relating to depressive tendency. It is composed of a six-item and one-factor structure, and it produced high validity and moderate reliability. The scale may be a useful scale to evaluate high risk elderly people for nursing care.

RESILIENCE, NEUROTICISM, AND HEALTH-RELATED OUTCOMES IN OLDER ADULTS

R.H. Fortinsky[1], H. Tennen[2], A. Kleppinger[1], D.C. Steffens[3], *1. UConn Center on Aging, University of Connecticut Health Center, Farmington, Connecticut, 2. Department of Community Medicine and Health Care, University of Connecticut Health Center, Farmington, Connecticut, 3. Department of Psychiatry, University of Connecticut Health Center, Farmington, Connecticut*

There is growing recognition of the capacity of individuals to rebound favorably in response to stressful events in later life. At the same time, neuroticism is being studied as a potentially critical factor in the pathway to depression and other health-related outcomes such as functional disability among older adults. Little is known, however, about the relative importance of resilience and neuroticism as correlates of later life depression and functional disability. As part of a larger study on physiological and psychological roles of neuroticism in late life depression and cognitive impairment, we examined the extent to which resilience and neuroticism were associated with depression and dependence in conducting instrumental activities of daily living (IADL). In this study sample (n=37), 84% were female with a mean age of 74 (range=63-89). Resilience, neuroticism, and IADL dependency were measured by the Brief Resilience Scale (BRS), the NEO-PI neuroticism subscale, and the Duke Depression Evaluation Schedule IADL scale, respectively. Subjects were classified as depressed or not based on clinical examination. Depressed subjects had lower resilience scores than non-depressed controls (mean BRS scores=16.8 and 24.4, respectively; p<0.001), and higher neuroticism scores (mean scores=102.8 and 60.0, respectively; p<0.001). In multivariate forward stepwise logistic regression analyses predicting depression, BRS entered the model first (odds ratio=0.53; 95%CI=0.34-0.84; p=0.007) and neuroticism did not achieve statistical significance. Similar results were found when IADL dependency was examined (BRS odds ratio=0.78; 95%CI=0.64-0.94; p=0.01). We concluded that resilience should be considered when examining neuroticism's role in depression and IADL disability among older adults.

CAUSE OF DEATH IN OLDER ADULTS WITH AND WITHOUT DEPRESSIVE SYMPTOMS

P. St. John[1], S. Tyas[2], *1. University of Manitoba, Winnipeg, Manitoba, Canada, 2. University of Waterloo, Waterloo, Ontario, Canada*

Background: Depression predicts mortality, but it is less clear which causes of death are most closely associated with depressive symptoms. Objective: To determine which causes of death are associated with depressive symptoms. Methods: Prospective cohort study. Sample: 1751 community-living older adults were interviewed in 1991 and followed over five years. Measures: Age and gender; the Center for Epidemiological Studies – Depression (CES-D) scale was used to measure depressive symptoms using a cut-point of 15/16. Death certificates were obtained for those who agreed, and were reviewed independently by two reviewers using ICD-9CM diagnostic groups. Reviewers were blinded to other data. Analysis: Multinomial logistic regression models were constructed, with specific causes of death compared to the reference category of being alive at time 2. Results: 14% of the sample had depressive symptoms at time 1. Death certificates were available for 253 of the 429 participants (59%) who died. Those with depressive symptoms were more likely to die from cardiac causes (Odds Ratio (OR)=1.97; 95% confidence interval (CI)=1.18, 3.27); stroke (OR=4.83; 95% CI=1.84, 12.6); respiratory failure (OR=6.74; 95% CI=2.56, 17.7) or non-specific causes (OR=4.04; 95% CI=1.69, 9.70). Depressive symptoms were not associated with deaths due to infections, neoplasms, or renal failure. Conclusions: Depressive symptoms may be associated with cardiovascular death more strongly than neoplastic or infectious causes of death.

CONCORDANCE BETWEEN CLINICAL DIAGNOSIS AND MEDICARE CLAIMS OF DEPRESSION AMONG OLDER PRIMARY CARE PATIENTS

S. Hwang[1], R. Jayadevappa[2], J. Zee[2], K. Zivin[5,6], H.R. Bogner[2], M.L. Bruce[3], C. Reynolds[4], J.J. Gallo[1], *1. Johns Hopkins University Bloomberg School of Public Health, Baltimore, Maryland, 2. University of Pennsylvania Perelman School of Medicine, Philadelphia, Pennsylvania, 3. Weill Cornell Medical College, White Plains, New York, 4. University of Pittsburgh School of Medicine, Pittsburgh, Pennsylvania, 5. VA Ann Arbor Health System, Ann Arbor, Michigan, 6. University of Michigan Medical School, Ann Arbor, Michigan*

Objective: To identify patient characteristics associated with concordance of clinically identified depression with Medicare claims. Design: Cohort of 742 older primary care patients linked to Medicare claims data. Measurements: Structured Clinical Interview for DSM-IV major depressive disorder (MDD) and clinically-significant minor depression. Results: Among 474 patients with depression, 198 patients had a Medicare claim for depression (sensitivity: 42%, 95% confidence interval (CI) 37% to 46%). Among 268 patients who did not meet criteria for depression, 235 patients did not have a Medicare claim for depression (specificity: 88%, 95% CI 83% to 91%). After adjustment for demographic and clinical characteristics, non-white participants were nearly twice as likely not to have Medicare claims for depression among patients who met criteria for depression ("false negatives"). Depression severity, hypertension, and chronic pulmonary disease were also significantly associated with decreased odds to be false negatives. In contrast, after covariate adjustment, white race, congestive heart failure, and chronic pulmonary disease were associated with increased odds of a Medicare claim for depression among patients who did not meet criteria for depression ("false positives"). Using weights based on the screened sample, the positive predictive value of a Medicare claim for depression was 66% (95% CI [63%, 69%]), while the negative predictive value was 77% (95% CI [76%, 78%]). Conclusion: Investigators using Medicare data to study depression must recognize that diagnoses of depression from Medicare data may be biased by patient ethnicity and the presence of medical comorbidity. Key words: claims analysis; depression; Medicare; primary health care

THE EFFECT OF NURSE-LED PROBLEM-SOLVING THERAPY ON COPING, SELF-EFFICACY AND DEPRESSIVE SYMPTOMS FOR OLDER PATIENTS WITH CHRONIC OBSTRUCTIVE PULMONARY DISEASE: A RANDOMIZED CONTROLLED TRIAL

H. Lee[1], J. Yoon[2], H. Park[3], *1. Pusan National University, Yangsan, Republic of Korea, 2. School of Nursing, Univ of Wisconsin-Madison, Madison, Wisconsin, 3. Pusan National University Hospital, Busan, Republic of Korea*

The purpose of this study was to examine the effects of problem-solving therapy (PST) on coping, self-efficacy, and depressive symptoms for older patients with chronic obstructive pulmonary disease (COPD). This was a randomized controlled trial with six-month follow-up. A total of 254 patients with COPD were recruited from 5 clinics in South Korea, screened and randomly allocated into the intervention and control groups, with 151 patients completing the study. Intervention with nurse-led PST (n=73) was compared to usual care (n=78). The PST program was developed to improve a patient's appraisal of problems (e.g., COPD symptom exacerbation) as a challenge or opportunity for benefit, which helps patients manage aggravating symptoms and maintain a healthy lifestyle. The PST program in this study was telephone-based and highly individualized format considering physical and mental condition of COPD patients. The patients included in the comparison group received usual care by their physicians. As a major finding, there were no group differences between the pre- and post-test scores of problem-oriented coping, self-efficacy and depressive symptoms. However, a subgroup analysis with clinically depressed patients with COPD (n=25) showed that depressive symptoms decreased and self-efficacy increased. Nurse-led PST offered to older patients with COPD did not demonstrate the effectiveness compared to usual care over six months, possibly due to the seasonal effect of the exacerbation of COPD and relatively high levels of self-efficacy in the study subjects at baseline. However, PST was effective to improve self-efficacy and decrease depressive symptoms for clinically depressed older patients.

CARDIOVASCULAR OUTCOMES ASSOCIATED WITH LATE-ONSET DEPRESSION: THE JOHNS HOPKINS PRECURSOR STUDY

N. Armstrong[1], L. Meoni[1,2], J. Gallo[1], A.L. Gross[1], *1. Johns Hopkins Bloomberg School of Public Health, Baltimore, Maryland, 2. Johns Hopkins University School of Medicine, Baltimore, Maryland*

Background: The vascular depression hypothesis posits a relationship between cardiovascular outcomes and late-onset depression. We evaluated this hypothesis in the Johns Hopkins Precursors Study, a cohort of medical students that has been prospectively followed since

1948. Methods: We assessed the association of cardiovascular outcomes with onset of depression after age 50 in a cohort of 1,090 white male medical students. Diagnoses of depression and cardiovascular outcomes, which included coronary heart disease, stroke, and cardiovascular disease, were determined based on self-reports of the doctors and chart reviews in clinical consensus panels. We used Cox proportional hazard analyses to determine associations between cardiovascular outcomes and late-onset depression. Results: Participants contributed 21,510 person-years between age 50 and depression onset or censoring. After adjusting for age, diagnoses of coronary heart disease (Hazard ratio, HR = 1.42, 95% confidence interval, CI: 1.04, 1.92), stroke (HR = 1.89, 95% CI: 1.38, 2.59), and cardiovascular disease (HR = 1.82, 95% CI: 1.35, 2.46) were associated with hazards of developing late-onset depression. Conclusions: Findings are consistent with the vascular depression hypothesis that cardiovascular outcomes increase the risk of developing late-onset depression, which could help clinicians better identify late-onset depression after screening patients for cardiovascular diseases.

CONCEPTUALIZING SUB-THRESHOLD GENERALIZED ANXIETY DISORDER IN OLDER ADULTS

B. Miloyan[1], N.A. Pachana[1], G. Byrne[2,3], *1. School of Psychology, University of Queensland, Brisbane, Queensland, Australia, 2. School of Medicine, University of Queensland, Brisbane, Queensland, Australia, 3. Royal Brisbane & Women's Hospital, Herston, Queensland, Australia*

Symptoms and disorders of anxiety are highly prevalent among older adults, yet remain underdiagnosed. Previous findings have suggested that sub-threshold anxiety is more highly prevalent and of comparable clinical significance compared to full-blown anxiety. However, these studies have all conceptualized sub-threshold anxiety differently. The objective of this study was to determine the nature of differences between existing sub-threshold GAD criteria. A sample of 13,420 adults aged 55 years and older was derived from Wave 1 of the National Epidemiological Survey of Alcohol and Related Conditions (NESARC). Participants were stratified into asymptomatic (n=12,247), 12-month GAD (n=206), and one of two sub-threshold groups: at least 6 months of worry symptoms not meeting 12-month GAD criteria (n=635), or lifetime GAD without a 12-month diagnosis (n=332). The weighted prevalence of 12-month GAD, sub-threshold GAD with worry, and sub-threshold GAD with lifetime history were 1.36%, 4.53%, and 2.49%, respectively; and the combined prevalence of sub-threshold GAD was 7.03%. Both sub-threshold groups were interposed between 12-month GAD and asymptomatic groups based on disability and health variables. Both sub-threshold groups were very similar in terms of current health and disability; however, the lifetime group had greater lifetime psychiatric morbidity. Sub-threshold GAD is highly prevalent among older adults and represents a middle-ground between asymptomatic and full-blown GAD status. More work is needed to determine appropriate interventions, and their efficacy, in this sub-group.

THE EFFECT OF ANTIDEPRESSANTS ON THE RISK OF STROKE AMONG OLDER ADULTS WHO DEVELOP DEPRESSION AFTER A TRAUMATIC BRAIN INJURY

B. Khokhar[1], J.S. Albrecht[1], Y. Tsang[1], Z. Kiptanui[1], L. Simoni-Wastila[1], I.H. Zuckerman[2,1], *1. PHSR, University of Maryland Baltimore, Baltimore, Maryland, 2. IMPAQ International, LLC, Columbia, Maryland*

Objective: Traumatic brain injury (TBI) affects more than 80,000 adults 65 or older each year. TBI increases the risk of serious negative outcomes such as stroke. Elderly TBI patients have a high prevalence of depression and are often prescribed antidepressants, which can further increase the risk of stroke. The primary aim of this study was to determine if antidepressants increase the risk of stroke among older adults with incident depression following TBI. Methods: This was a retrospective cohort study of Medicare beneficiaries 65 or older who were diagnosed with depression post hospitalization for a TBI during 2006-2010. The primary exposure was new antidepressant use following TBI. New use was defined as having no antidepressant use during the six months prior to TBI. Antidepressant use was obtained from Medicare Part D prescription drug event files, and was categorized as selective serotonin reuptake inhibitor (SSRI) use, all other antidepressant use, or no use. The primary outcome was the occurrence of ischemic or hemorrhagic stroke, defined by inpatient claims. Results: Of the 8,095 beneficiaries with incident depression post-TBI, 5,475 (67.6%) were new users of antidepressants. In adjusted regression analysis, the relative risk of stroke was 0.96 (95% confidence interval (CI): 0.81, 1.14) for SSRI use and 0.95 (95% CI: 0.75, 1.20) for all other antidepressant use, compared to no use. Conclusion: These results suggest that there is not enough evidence to indicate a significant association between antidepressant use and risk of stroke among older TBI patients with incident depression.

LOW SELF-RATING OF OUTGOING FREQUENCY CAUSES MENTAL DISTRESS AMONG COMMUNITY-DWELLING ELDERLY PEOPLE?

K. Fujita, Y. Kaneko, Y. Motohashi, *Department of Public Health, Akita University Graduate School of Medicine, Akita, Japan*

OBJECTIVE: The aim of this study was to confirm low self-rating of outgoing frequency are predictors of future mental health outcomes among community-dwelling elderly people. METHODS: We conducted a population-based cohort study of 24 months term with the elderly population (age 65-89) in rural community of Akita Prefecture using self-administered questionnaires. 69.6% of the baseline participants (1,259 out of 1,808 people) responded for the follow-up survey. Mental distress was assessed using the 6-item Kessler Psychological Distress Scale (K6). The scores of K6 were ranged from 0 to 24, and a score of 9 and above indicated psychological distress. Outgoing frequency was self-rated by asking the following question "How often do you think you get out of the house?" with 4-point Likert scale, "very often", "often", "rare", "very rare". Logistic regression analysis examined correlations between self-rating of outgoing frequency and mental distress, independently of potential confounders. RESULTS: 68 (7.6%) of the 893 subjects without mental distress(K6<9) at the baseline was found to have mental distress (K6≥9) at follow up study. Multiple logistic regression analysis adjusted for age and sex revealed that the adjusted odds ratio of low self-rating of outgoing frequency ("rare" and "very rare") vs. high self-rating of outgoing frequency ("very often" and "often") for mental distress (K6≥9) was 2.36 (95%CI: 1.36-4.11). Conclusion: Our results suggest low self-rating of outgoing frequency is a risk factor for mental distress among community-dwelling elderly.

EMOTIONAL DISTRESS IN OLDER ADULTS WITH DIABETES: A MULTILEVEL LONGITUDINAL STUDY

M.D. Fields, D.D. Boamah, A.C. Faul, T. Schapmire, *Kent School of Social Work, University of Louisville, Louisville, Kentucky*

Background: Approximately 27% of older adults living with diabetes are affected by depression. Health and Retirement Study data were used to examine factors influencing emotional distress in older adults with diabetes, and to learn whether these distress trajectories differ from older adults without diabetes. The model investigated the influence of life course factors, and internal, external, and health-related resources on distress over ten years among a nationally representative sample of older adults ages 50-89. Methods: This longitudinal panel study tested a multilevel random intercept multinomial ordered categorical model with a two-nested-level structure using empirical Bayes Markov-chain-Monte-Carlo (MCMC) estimation. The model examined individual differences in distress over ten years (2000–2010), testing multiple potential predictors which were either time-variant within-person or time-invariant between-person data. Results: Overall, 52.8% of the sample reported one or more depression symptoms in 2000, and by 2010, the number decreased to 51.0%. Individuals with diabetes had a 63% probability of having depression symptoms in 2000, and 61% in 2010, compared to 48% and 47% respectively of those without diabetes. Significant two-way interaction effects were detected between having diabetes and absence of spouse/partner in the home, and having diabetes and rating their perceived health to be less positive; each resulted in higher probabilities of depression symptoms. Conclusions: Individuals with diabetes were more likely to have symptoms of depression than those without diabetes; differences persisted over time. Having a spouse/partner in the home and positive perceived health were protective factors against the probability of having symptoms of depression.

DEPRESSION AND PERCEIVED STRESS AMONG WOMEN DEMENTIA CAREGIVERS: EXAMINING THE INFLUENCE OF SPIRITUALITY AND RESOURCEFULNESS

W. Yolpant, N. Lekhak, J.A. Zauszniewski, *FPB School of Nursing, Case Western Reserve University, Cleveland, Ohio*

Providing care for elders with dementia has been linked with increased stress and depressive symptoms. Although research suggests that caregivers with greater resourcefulness and spirituality may have better health outcomes and psychological well-being, studies have not examined whether caregivers who are highly resourceful as well as spiritual have greater psychological well-being than those who are less resourceful and spiritual. This secondary analysis of data obtained from 138 women caregivers of elders with dementia, examined the combined effects resourcefulness and spirituality on the caregivers' stress and depressive symptoms. Using the median split technique (e.g., high spirituality above median), four groups were formed: Low spirituality and Low resourcefulness (LSLR); Low spirituality and High resourcefulness (LSHR); High spirituality and Low resourcefulness (HSLR); and High spirituality and High resourcefulness (HSHR). Findings from regression analyses reveal lower depressive symptoms among all three groups compared to LSLR group. However, only HSHR group experienced significantly lower perceived stress. The results suggest that resourcefulness and spirituality had a combined effect on dementia caregivers' psychological wellbeing. Higher resourcefulness and higher spirituality had a negative effect on depressive symptoms and perceived stress among the women dementia caregivers. This study highlights the significance of resourcefulness and spirituality for enhancing caregiver's psychological well-being and it provides evidence for the need to incorporate these components into future interventions to reduce stress and depressive symptoms among women dementia caregivers.

TRENDS IN SUICIDE RATES AND ASSOCIATED MEDICAL CONDITIONS IN THE UNITED STATES AMONG PERSONS AGED 65 AND OLDER, 2000-2010

N. Barragan[1], F. Sorvillo[2], T. Kuo[1,3], *1. Los Angeles Department of Public Health, Los Angeles, California, 2. UCLA Fielding School of Public Health, Los Angeles, California, 3. David Geffen School of Medicine at UCLA, Los Angeles, California*

Introduction: Death due to intentional self-harm (suicide) is the 10th leading cause of death in the United States. We examined national multiple-cause-of-death (MCD) data to better understand the trends and distribution of suicide mortality and associated conditions among older adults. Methods: Records of deaths caused by suicide in adults aged 65 and older were examined for 2000-2010. Using MCD data, decedents were identified using ICD-10 coding for "intentional self-harm" (X60-X84). Poisson regression analysis was performed to model mortality trends over time. A matched case-control analysis was conducted to describe the relationships between suicide and comorbid conditions that contributed to death. Results: A total of 60,315 deaths from suicide were identified. A majority were whites (92%, n=55,454) and males (84%, n=50,924). The age-adjusted rate ratio for males, using females as the referent group, was 7.04 (95% CI 6.90-7.18). Those aged 85 and older had the highest age-specific mortality rate (17.03 per 100,000 population, 95% CI 16.69-17.38), as compared to the 65-74 and 75-84 age groups. Mortality rates indicate a downward trend over the 10-year study period, decreasing .41% per year ($p<0.01$). Several comorbid conditions were found to be associated with suicide: Depression (MOR = 18.33; 95% CI 17.04-19.71), pain (MOR = 3.61; 95% CI 3.11-4.19); and bipolar disorder (MOR = 2.15; 95% CI 1.67-2.77). Discussion: Elderly suicide's association to manageable conditions such as depression and pain suggest that it can be prevented. Suicide mortality is substantial and public health can play a stronger role in its reduction.

ANXIETY AND RISK OF COGNITIVE IMPAIRMENT IN OLDEST OLD WOMEN

A.M. Kassem[1], K. Yaffe[2], K. Ensrud[3], J. Wilson[1], J.A. Cauley[1], *1. University of Pittsburgh, Pittsburgh, Pennsylvania, 2. University of California, San Francisco, San Francisco, California, 3. University of Minnesota, Minneapolis, Minnesota*

Cognitive impairment in older adults is a significant public health problem. Accumulating evidence suggests that depression may increase risk of dementia. However, few studies focused on other common mental health problems, such as anxiety, as potential risk factors. In these analyses, we were interested in assessing whether anxiety, independent of depression, is associated with an increased risk for cognitive impairment. We utilized data of 1425 community-dwelling women aged 80 years and older (mean = 82.8 years) from the Study of Osteoporotic Fractures (SOF), a prospective cohort study. Goldberg Anxiety Scale (GAS) was used to assess anxiety symptoms at baseline (2002-2004) and an expert clinical panel adjudicated dementia and mild cognitive impairment (MCI) at follow-up (2006-2008). A total of 190 (13%) women met criteria for anxiety (GAS ≥5); 16% developed dementia and 24% developed MCI. After assessing bivariate associations between anxiety and our outcomes, we fit multivariable logistic regression models of dementia and MCI by anxiety, adjusted for potential confounders. At baseline, we found that women with clinically significant anxiety symptoms were more likely to have depressed mood, poor sleep, history of stroke and more functional impairments compared to those with fewer anxiety symptoms. In addition, they performed worse on 2 neuropsychological tests: Short Mini-Mental Status Exam at baseline and Category Fluency Test at follow-up. Nevertheless, our models showed that baseline anxiety was not associated with incident dementia, MCI or both combined. Despite their poor overall health, oldest old women with anxiety are not at increased risk for incident cognitive impairment.

LINKING WORK-STRESS TO NEGATIVE AND POSITIVE EMOTIONAL SUPPORT: FINDINGS FROM THE HEALTH AND RETIREMENT STUDY

R.L. Watson, F.J. Infurna, *Arizona State University, Tempe, Arizona*

Work stress plays an important role in the development and maintenance of cognitive functioning and health throughout adulthood and old age. However, relatively little is known about the role that work stress can have on the quality of social relationships and interactions outside of the workplace. Using data from the nationwide Health and Retirement Study (n = 2,768; M age = 61.03, SD = 8.37; 54% women), we examined the extent to which work stress is associated with positive and negative emotional support from one's spouse or partner. We used data from the psychosocial questionnaire administered in 2006 and 2010 to evaluate our research question. Results revealed that higher levels of work-related stress was associated with 4-year increases in negative emotional support and 4-year decreases in positive emotional support with one's spouse or partner. Put differently, lower levels of work-related stress was associated with 4-year increases in positive social interactions and less negative social interactions. Additionally, the effects of work stress remained significant regardless of socio-demographic factors (age, gender, and education). Our results suggest that stressors that occur in the workplace play an important role in relationship quality in midlife and old age. Our discussion focuses on the importance of stress management in the work place for maintaining positive social interactions with loved ones, as well as developing further constructive social relationships.

DEVELOPMENT OF SCALES TO DETERMINE THE ABILITIES OF PEOPLE WHO IMPLEMENT GROUP REMINISCENCE THERAPY

S. Uchino[1], K. Nonaka[2], K. Otani[1], I. Yoshida[1], *1. International University of Health and Welfare, Odawara, Japan, 2. Group House Satchannoie, Narita, Japan*

[Purpose]The present study was conducted to develop scales (questionnaire- and observation-based) to determine the ability to implement group reminiscence therapy, and examine their reliability and validity. [Methods]Scenes of group reminiscence therapy were recorded, observed, and classified into categories according to their similarities. A survey was conducted to develop the above-mentioned scales, and relationships with similar concepts, including Cronbach's alpha coefficient, professional autonomy, burnout, and coping, were taken into account to examine reliability and validity. In the development of the observation-based scale, the observation of three persons implementing reminiscence therapy was conducted twice using the recorded data to calculate Kendall's coefficient of contingency and examine the reliability of the scale. [Results]A scale including 35 items was first developed based on the observation results, and it was modified into a scale consisting of 27 items and six factors following simulation-based factor analysis. Cronbach's alpha coefficient of the questionnaire-based scale consisting of 27 items was 0.949, and moderate and significant correlations with similar concepts were noted. Kendall's coefficients of contingency of the observation-based scale for Subjects A, B, and C were 0.365, 0.330, and 0.291, respectively; all coefficients were significant. [Discussion] The reliability and validity of the scales (questionnaire- and observation-based) to determine the ability to implement group reminiscence therapy were established. It will also be necessary to create manuals, in addition to conducting further examinations of the reliability and validity, to increase the usefulness of the scales in practical settings. This work was supported by JSPS KAKENHI Grant Number 22592615

SESSION 1025 (POSTER)

ACUTE CARE

CAUSES, INJURY TYPES, INJURY PLACES, HOSPITALIZATIONS AND DAYS LOST FROM WORK DUE TO INJURY AMONG OLDER ADULTS, UNITED STATES 1997-2013

D. Xu, J.A. Drew, *university of minnesota, Saint Paul, Minnesota*

Injury is recognized as an important contributor to the global burden of disease and initiatives in injury prevention and control are a major health concern. However, detailed information on injury causes, places and consequences among older adults is limited. Characterization of the nature and consequences of injuries in the older population is needed in order to direct priorities for prevention and evaluate the effectiveness of prevention programs in reducing the incidence of serious injury. An injury here refers to the traumatic event in which the person was injured from an external cause (e.g., fall). Data representing US older adults aged 65 years or older between 1997 and 2013 were retrieved from the Integrated Health Interview Series (IHIS), a harmonized database of the National Health Interview Surveys. The objective was to identify the cause of injury, the type of injury, where the person received medical advice, treatment, or follow-up care and gender differences in patterns of injury. We also explored what the person was doing at the time of the injury episode, and the place of occurrence. The consequences from injury such as hospitalizations and days lost from work were also investigated. Moreover, the IHIS allows us to make consistent comparisons across time of changes in injury. All individuals who completed injury interviews were included and the analysis was performed in Stata. Our analysis addresses several gaps in the literature related to injury among older adults. The empirical investigation will help define intervention needs and enable more effective targeted, long-term preventions.

DELIRIUM IN CATHETER-ASSOCIATED URINARY TRACT INFECTIONS

A. Mazzone[1,2], S. Perego[1,2], P. Mazzola[1,2,3], G. Bellelli[1,2,4], G. Annoni[1,2], *1. University of Milano-Bicocca, Department of Health Sciences, Monza, Italy, 2. San Gerardo University Hospital, Geriatric Clinic, Monza, Italy, 3. Icahn School of Medicine at Mount Sinai, Department of Neurology, New York, New York, 4. Geriatric Research Group - GRG, Brescia, Italy*

Background and aims. Indwelling urinary catheter (IUC) is a device commonly used in acute hospital wards, particularly in older patients. Its placement is related to negative outcomes like catheter-associated urinary tract infections (CAUTI) and delirium, both very frequent. Aim of this study is to evaluate if delirium develops more frequently in CAUTI than in UTI non-IUC related. Methods. Retrospective analysis of all patients directly and consecutively admitted to the Geriatric Clinic of San Gerardo University Hospital in Monza (Italy), between September 2012 and October 2013. A comprehensive geriatric assessment was obtained for all patients on admission. Delirium was screened with the Confusion Assessment Method algorithm. Results. We considered 209 patients who developed an UTI: 80 of them (38.3%, group 1) had no IUC; 129 (61.7%, group 2) had a CAUTI according to 2009 HICPAC guidelines. Prevalence of delirium was higher in group 2 than in group 1 (58.7% versus 32.5% respectively, $p<0.001$). Patients with CAUTI had lower mini-mental state examination scores, Katz's activities of daily living score, and albumin serum levels. On the contrary, they displayed higher C-reactive protein and creatinine serum concentrations than their non-IUC counterparts. Conclusions. In our study, patients with CAUTI had a higher prevalence of delirium. These patients were also more demented, disabled and malnourished. It is not possible to define if delirium prevalence was higher because of CAUTI or because these subjects were frailer. Anyway, these results suggest that more attention is needed in placing IUCs as they are the main risk factor for CAUTI.

UNINTENDED CONSEQUENCES OF FALL PREVENTION STRATEGIES AMONG HOSPITALIZED OLDER ADULTS

K.E. Pecanac, B. King, B.J. Bowers, J. Mahoney, *University of Wisconsin-Madison, Madison, Wisconsin*

Background: Falls among hospitalized older adults can result in longstanding pain, functional impairment, disability, premature nursing home admission, prolonged length of hospital stay and mortality. Patient falls are considered a nursing-sensitive quality indicator and responsibility for falls are often placed directly on nursing staff. Little is known about how nurses respond to this responsibility in their care of fall-risk patients. Method: Grounded Dimensional Analysis was used to explore how hospital registered nurses (RNs) care for older adult fall-risk patients. Forty RNs from two large hospitals in the Midwest were interviewed using open and focused questions. Open, axial, and selective coding was used to analyze the data. Results: Nurses indicated their care is focused on preventing falls through three primary strategies: general announcement of fall risk, structuring the patient, and structuring the staff. General announcement included using alarms and putting "fall risk" paraphernalia on the patient, the patient's medical record, and the patient's room. Structuring the patient included use of physical (low beds, bulky chairs) and/or verbal restraints (constant reminders to not move) to prevent the patient from moving. Structuring the staff included management enforcement of the staff rounding hourly, rushing to alarms, and being with the patient in the bathroom Conclusion: Consequences of the described fall prevention strategies include restrictions in patient privacy, mobility, and independence. Restricting mobility is especially concerning, as it may actually increase an older adult's risk for falls. Research is needed to further explore the implications of such consequences.

THE IMPACT OF THE ENHANCED SENIORS TEAM (EST) ON ACUTE CARE OUTCOMES FOR FRAIL AND/OR AT-RISK OLDER ADULTS

D.J. Sheets[1], A. Holroyd[2], L. Cummings[3], K. Mukai[3], W. Collishaw[3], *1. University of Victoria, Victoria, British Columbia, Canada, 2. Vancouver Island University, Nanaimo, British Columbia, Canada, 3. Island Health, Victoria, British Columbia, Canada*

The Enhanced Seniors Team (EST) is an interdisciplinary evidence-based gerontological model (e.g., nursing, case managers, occupational and physical therapy) created to screen incoming frail elderly patients identified as at risk of cognitive decline and/or loss of functional capacity. The EST was implemented in an urban hospital in British Columbia with the goals of reducing unnecessary health care utilization and the promotion of excellence in gerontological care. Analyses of administrative data compare the EST (n=662) to the control group (n=1763) on selected outcomes that include acute hospital days and discharge disposition (e.g. home, skilled nursing care, etc.). Independent t-test analyses indicate that patients in the EST group had 1.7 fewer acute hospital days (p<.001) than the control group. Logistic regression models and odds-ratios indicate that patients in the EST group were 3 times more likely to be discharged home (p<.0000) than patients in the control group. Multivariate regressions, controlling for age and comorbidities, indicate that the EST intervention was a significant predictor in reducing number of acute hospital days, days awaiting placement, and total hospital days. This evaluation suggests that the presence of a geriatric team had a significant impact on gerontological care. The availability of timely geriatric patient assessment, early, goal-oriented care planning, evidence-based interventions and improved coordination and collaboration between health professionals resulted in significantly shorter lengths of hospital stay and a greater likelihood of the frail older patient being discharged to home.

EDMONTON FRAIL SCALE (EFS) AND ITS ASSOCIATION WITH RECENT FALLS IN HOSPITALIZED ELDERLY - A PILOT STUDY

K. Alagiakrishnan[1], B. Laxton[1], R. Padwal[1], D. Rolfson[1], C. Fisher[1], A. Senthilselvan[2], *1. Medicine, University of Alberta, Edmonton, Alberta, Canada, 2. School of Public Health, Edmonton, Alberta, Canada*

Background: Frailty is a state of increased vulnerability to catastrophic functional decline typically seen in older adults. The Edmonton Frail Scale (EFS) is a valid, reliable tool to assess frailty. The association between EFS and falls has not been tested in the hospitalized elderly. Objective: This study examined the association between EFS and falls. Methods: In this cross-sectional pilot study, subjects were recruited from the University of Alberta Hospital Geriatric and General Internal Medicine units. Those with medical instability, delirium or impending death were excluded. Frailty was assessed using the Edmonton Frail Scale (EFS). A dichotomous variable was to indicate absence or presence of recent fall prior to this hospital admission. Logistic regression analysis was performed to analyze the association of frailty with recent fall. Statistical analysis was performed with SPSS. A p-value of < 0.05 was considered as significant. Results: 40 subjects were recruited [males=20, females=20, mean age 80.6 years (SD: 8.03)]. Sixteen subjects had recent falls (40%). The mean EFS score was 7.20 (SD 2.20). In the logistic regression analysis, there was a significant association between EFS and recent falls with more than 2-fold increase in the odds of recent fall (OR: 2.46; 95% CI: 1.21- 5.01; p <0.01) after adjusting for age, sex, postural hypotension, post-prandial hypotension, vision problems and osteoporosis. Conclusion: EFS were significantly associated with recent falls in this population. Routine screening for frailty is indicated given this high prevalence and the potential that this knowledge may help to prevent falls.

ASSOCIATION OF HOSPITAL ADMISSION RISK PROFILE SCORE WITH NURSING FACILITY DISCHARGES IN HOSPITALIZED OLDER ADULTS

S.K. Liu, J.A. Batsis, J.R. Wuchenich, J. Montgomery, L.L. Madden, S.J. Bartels, *Medicine, Dartmouth-Hitchcock Medical Center, Lebanon, New Hampshire*

Introduction: The Hospital Admission Risk Profile (HARP) is a validated tool which identifies patients at risk for functional decline following a hospitalization. Its association with discharge disposition in hospitalized older adults has not been studied. Methods: We retrospectively identified 235 hospitalized patients aged ≥70 years old from a medical-surgical inpatient unit in a tertiary care hospital from October 2013 - February 2014. Patients with hospitalizations >14 days were excluded. All patients on admission were evaluated with a comprehensive geriatric assessment that included the HARP score based on patient age, an abbreviated mini-mental status examination, and pre-admission Instrumental Activities of Daily Living. Results: Mean age of the cohort was 80.5±7.2 years, 128 (54%) were female, with a mean length of stay of 4.64±2.75 days. We identified 70 (30%) high, 80 (34%) intermediate, and 85 (36%) low HARP score patients. Patients with high HARP scores were more likely to be female (60% vs. 40%; p=0.053), had similar length-of-stay (4.41 vs. 4.35 days; p=0.087), and were significantly more likely to be discharged to a nursing facility (43.5% vs. 27.1%; p=0.026) when compared to the low HARP score patients. Conclusion: The HARP score may potentially identify patients at increased risk for nursing facility discharge at the time of admission. Early identification of patients at risk for nursing facility discharge would allow for targeted inpatient interventions to prevent functional decline, more time for shared decision making with patients/families about post-acute care needs, and expedite discharge planning which could reduce unnecessary hospitalization time.

CONDITION OF CARE FOR PATIENTS WITH DEMENTIA AT ACUTE HOSPITALS IN JAPAN: COMPARISON WITH CARE FOR ELDERLY PATIENTS AND ANALYSIS OF THE EFFECT OF DEMENTIA STUDY EXPERIENCE

C. Greiner[1], M. Kita[2], T. Isowa[3], T. Ooishi[4], H. Higashiura[7], E. Strauss[5], S. Paillard-Borg[5], S. Monkong[6], *1. Kobe University, Kobe, Japan, 2. The Jikei University, Tokyo, Japan, 3. Mie University, Tsu, Japan, 4. Kanagawa University of Human Services, Yokosuka, Japan, 5. Swedish Red Cross University College, Stockholm, Sweden, 6. Mahidol University, Bangkok, Thailand, 7. The Japanese Red Cross College of Nursing, Tokyo, Japan*

Purpose The purpose of this study was to investigate the condition of care for patients with dementia at acute hospitals as compared with that for general elderly patients, as well as the effect of dementia study experience. Methods Cross-sectional exploratory research design was conducted using self-description questionnaires. Participants were nurses working at acute hospitals in Tokyo possessing more than 300 beds. This research was conducted after approval from the first presenter's Institutional Review Board. Results Respondents were 335 nurses (318 female; mean nursing experience 11.3±8.1 years; mean age 34.9±8.3 years). The comparison between elderly patients and patients with dementia comprised contents on assessment, nursing practice, attitude toward patients, ensuring privacy, and considering the family. Significant differences (<.05) were confirmed for each content topic. For assessment, scores for patients with dementia were significantly higher than those for elderly patients, whereas for attitude toward patients, ensuring privacy, and considering the family, scores were significantly lower. Nurses who participated in dementia lectures had significantly more knowledge about dementia, consideration of BPSD prevention, and work satisfaction. Discussion Nurses performed assessment of patients with dementia more carefully than that of elderly patients, taking in consideration their patient's way of thinking. However, care that protects human dignity and ensures privacy was less performed than for elderly patients, so that an approach to improve the perception of nurses for patients with dementia is required. Co-researchers in Sweden and Thailand will also use the questionnaire and the three countries' results will be compared.

THE BRIDGE PROGRAM: EARLY POST-DISCHARGE NURSE PRACTITIONER AND SOCIAL WORKER HOME VISITS REDUCE EMERGENCY ROOM VISITS AND READMISSIONS

E.F. Smilovich, R. Banks, J. Slivka, D. Hixson, C.J. Burant, S. Ober, T. Hornick, *Medicine/Geriatrics, Cleveland VAMC, Cleveland, Ohio*

Introduction: The transition from hospital to home is a vulnerable period for older patients. We will report on 6 month data from the Cleveland Veterans Affairs Medical Center "Bridge" program: a Nurse Practitioner (NP) and Social Worker (SW) conduct early - 2 and 5 days respectively - post-discharge home visits for patients 65 and older. The Bridge team addresses discharge plan non-adherence, lingering medical problems, and caregiver issues. Standard Home Based Hospital Primary Care (HBPC) visits by a registered nurse, dietitian and a physical/occupational therapist follow. Methods: This descriptive report of a convenience sample (the first patients to complete 6 months in Bridge) compares emergency room (ER) visits and hospitalizations 6 months pre and 6 months post Bridge initiation. Controls were discharged from the same hospital wards to the traditional HBPC program 1 year prior to Bridge. Results: 79 Bridge patients (MEAN age= 81) had 184 ER visits 6 months prior to index hospitalization and 99 ER visits 6 months post (46.2% reduction). The 91 Controls (MEAN age=75) had 71 ER visits 6 months prior and 111 ER visits 6 months post (56.3% increase)(chi square = 30.25, df = 1, $p < .001$). Bridge patients had 69 hospitalizations pre and 64 readmissions post (7.2% reduction), compared to Controls with 29 hospitalizations pre and 65 readmissions post (124% increase) (chi square = 9.93, df = 1, $p = .002$). Conclusions: A transitional care program consisting of early NP and SW visits with HBPC can reduce 6 month hospital ER visits and readmissions.

HOSPITALIZATION FOR TOTAL HIP REPLACEMENTS: UNITED STATES, 2001-2010

M.L. Wolford, S. Williams, A. Bercovitz, *DHCS, NCHS, Hyattsville, Maryland*

Total hip replacement (THR) is performed to restore movement to patients whose hips have been damaged by osteoarthritis, late-stage degenerative bone and cartilage disease, or other injuries and disease. The number of THRs is expected to continue to increase in the coming decades. Artificial hips are expected to last 15 or 20 years before a revision is needed. This poster uses data from the National Hospital Discharge Survey (NHDS) to present trends in THR by age group. The number and rate of THRs have increased significantly between 2001 and 2010 among all age groups. The largest increases in absolute numbers and percentages were among those aged 55 to 64. The distribution by age group has also changed significantly. While in 2001, 61% of total hip replacements among adults were performed among those 65 and older, by 2010, this had dropped to 52%. The mean age among women decreased between 2001 and 2010 from 69 to 66. For all age groups under 75 years old, a routine discharge to the patient's home was the most common outcome. Among the 75 and older age group however, the most common outcome of hip replacement was a discharge to a long-term care facility, suggesting different locations for post-surgical rehabilitation by age group. The combination of decreasing age at THR and increasing life expectancy suggest that increasing numbers of people may need to replace an artificial hip replacement during their lifetime. These trends have implications for planning for rehabilitative care and hospital utilization in the coming decades.

WAS THIS BROKEN BONE DUE TO ABUSE? CHARACTERISTICS OF POSSIBLE RED FLAGS FOR ELDER ABUSE IN OLDER ADULTS WITH FRACTURES

M.W. Gironda, A.L. Nguyen, L. Mosqueda, *Family Medicine, UCI School of Medicine, Orange, California*

Background: Literature and clinical anecdotes suggest possible red flags for elder abuse, including bruising, head injury, burns, strangulation, malnutrition, dehydration, abrasion, laceration, pressure ulcers, weight loss, and signs of neglect. Fractures are also possible sequelae of physical abuse. This study examines the relationship between abuse/neglect red flags and characteristics of patients with fractures. Methods: Data on all medical center patients age 65+ (N=652) with a primary diagnosis of fracture over a 3 year period (2010 -2012) were examined. Variables included age, gender, race, fracture type, cause (E-codes), comorbidities (ICD-9), point of service, and number of visits. Eleven potential abuse/neglect indicators were summed. Descriptive statistics (t-tests and chi-squared tests) and regression models were analyzed. Results: The sample was 39% 80+, 58% female, 60% white. Falls accounted for 50% of fractures and 29% had multiple, most common being hip (26%), followed by chest (20%), head (18%), back (18%), arm (15%), and leg (11%). Younger elders (65-79) were more likely to have fractures of arm, chest, and leg. Older (80+) elders were more likely to have hip fractures. In a regression analysis predicting red-flag indicators, 80+ age (B=0.173, SE=0.073), seen somewhere than emergency department (B=-0.402, SE=0.097), multiple visits (B=0.123, SE=0.048), and back (B=0.284, SE=0.078) or head fracture (B=0.593, SE= 0.097) were significantly associated with more red flag indicators of possible abuse or neglect. Conclusions: These preliminary findings suggest ways in which clinical markers may be used to explore the complex manifestation of elder abuse or neglect. Practice and research implications will be discussed.

HOSPITALIZATION RATES OF FALL-RELATED EMERGENCY DEPARTMENT CASES INFLUENCED BY CELLULITIS LOCATION

G. Flores, D. Wiley, *Nursing, University of California, Los Angeles, Los Angeles, California*

Falls caused >21,000 unintentional injury-related deaths among adults ≥ 65 years in 2010 alone. Fall-related costs exceed $81 billion annually. In addition, the care and treatment cost for cellulitis is great: with ~24/1000 (person-years) Americans affected and over 9 million office and emergency department (ED) visits, costing >$98 million annually. Cross-sectional population-based data were evaluated using the 2009 Nationwide Emergency Department Sample, to assess hospitalization rates for ED patients admitted following a fall. The exposures of interest, upper extremity (UE) and lower extremity (LE) cellulitis, were identified from ICD-9 coded ED-diagnoses. The outcome of interest, hospitalization rates (/100,000), were estimated using weighted, tabular age-specific stratified analyses. Overall, hospitalization rate was associated with age. Among patients that presented to the ED with a fall as an external cause of injury, those with LE cellulitis showed 1.8-5.6 fold higher rates of post-ED hospitalization than did similar patients unaffected by cellulitis (p-values≤0.05). Children older than 1 year, adolescents and adults with LE and UE cellulitis showed 2.2-8.2 fold higher hospitalization rates than unaffected ED patients (p-values≤0.05). UE cellulitis increased hospitalization risk slightly for those 65 years of age or older, (RR=1.19, (1.18, 1.20)); conversely, similarly diagnosed adults and children younger than 65 years were less likely than those without cellulitis to be hospitalized (RR= 0.40-0.94, p-values ≤0.05). Thus, while hospitalization rates increase with advancing age, location and co-occurrence of cellulitis among fall-related ED cases significantly influence hospitalization risk for infants, children and adults.

SESSION 1030 (POSTER)

DEMENTIA/DELIRIUM

PAIN IN PERSONS WITH DEMENTIA: ASSOCIATION WITH DELIRIUM AND FUNCTION DURING REHABILITATION

A.M. Kolanowski, J. Mogle, J.E. Nadler, N.L. Hill, D.M. Fick, P.M. Mulhall, *Penn State University, University Park, Pennsylvania*

Inadequate pain management for older adults during post-acute care may be a risk factor for delirium, a prevalent and costly neuropsychiatric syndrome. Unresolved pain is also a risk factor for poor physical function in this population. In older adults with cognitive impairments, pain is frequently unrecognized and under-treated because communication problems interfere with adequate assessment. Little data describe the association of pain with rehabilitation outcomes in people with dementia. The purpose of this exploratory study was to examine the effect pain has on delirium and functional outcomes in older adults with dementia who receive rehabilitation services. Data from an ongoing randomized clinical trial were used to address the aim of the study (ClinicalTrials.gov identifier: NCTO1267682). Participants were 109 older adults with adjudicated dementia and delirium diagnoses on admission to post-acute care and who were randomized to control. These participants had a mean age of 86 years, a Charlson Co-morbidity Index of 2.79, and a Clinical Dementia Rating scale score of 1.21; 66% were female. We took daily observational measures of pain, delirium and function using the PAIN-AD, Confusion Assessment Method (CAM), and Barthel Index respectively. Controlling for age, gender, race, dementia stage, co-morbidity and facility, we used multilevel modeling to examine the daily relationship of pain to delirium and function. On days when pain was greater, delirium scores were higher ($p<0.0001$) and function was lower ($p<0.0006$). Adequate pain management is important to prevent adverse outcomes in this vulnerable population.

IMPLEMENTATION OF THE CONFUSION ASSESSMENT METHOD ON THREE GERIATRIC UNITS

A. Berall, L. Jones, A. Corcoran, D. Sewell, J. Karuza, *Baycrest Centre, Toronto, Ontario, Canada*

Background: The Confusion Assessment Method (CAM) is a validated tool used to screen for delirium. Elderly patients are at significant risk for developing delirium in hospital. Early identification and treatment of delirium results in improved outcomes, decreased mortality rates and shorter hospital stays. Purpose: To evaluate the training and implementation of the Confusion Assessment Method (CAM) on three geriatric units. Methods: A learning plan was developed to train nurses to screen for delirium using the CAM. This included a web-based independent component and group sessions. Post evaluation surveys of the training and implementation were completed. A retrospective chart review was conducted. Patients admitted less than 48 hours were excluded. Results: There was a strong correlation between liking the training and implementation of the CAM into practice. ($p < 0.0001$) Overall the scores in evaluating the training and the perception of how helpful the CAM will be in clinical practice were high, 3.4 to 3.8, on a 4 point likert scale. The more the nurses liked the training the better they felt the CAM would be integrated into practice. Nurses who rated patients with a positive CAM found the CAM to be more helpful in screening for delirium than nurses who had not, scoring higher on confidence and helpfulness of the tool. An audit of 88 admission CAMs on three units revealed a compliance of 85.2%. Conclusion: This evaluation demonstrates the importance of providing educational modules with capacity building skills, best practice champions and a unit process for completing the CAM.

MEDICATION NONADHERENCE AND HEALTH RESOURCE UTILIZATION IN COMMUNITY DWELLING PERSONS WITH MEMORY LOSS

J. Lingler, L.K. Tamres, S.M. Sereika, M. Happ, F. Tang, J.A. Erlen, *School of Nursing, University of Pittsburgh, Pittsburgh, Pennsylvania*

Adherence to medication regimens is of vital importance to individuals undergoing treatment for chronic disorders, with cognitively impaired older adults representing a key group at risk for nonadherence. This study examined the relationship of medication nonadherence to health resource utilization among older adults with memory loss whose medications are being managed at home by a family caregiver. Patients with memory loss and their caregivers (n=91 dyads) were recruited from the community for a randomized controlled trial of an intervention to promote safe medication management by caregivers in this population. Baseline interviews included measures of demographic and clinical characteristics, as well as frequencies of patients' unplanned medical office and emergency room (ER) visits. Medication nonadherence was measured using the Morisky Medication Adherence Questionnaire. Medication taking deficiencies were measured using an investigator developed Medication Deficiency Checklist. On average, patients had 9+3.8 chronic illnesses and took 10+5.3 daily medications. Twenty-seven percent of patients had an unplanned medical office visit and 12% percent had visited an ER within 60 days of study baseline. Binary logistic regression analyses showed that lower levels of medication adherence were associated with ER use (OR=0.03; 95% CI: 0.00-0.78), and revealed a trend toward a positive association between number of medication deficiencies and ER use (OR=1.34; 95% CI: 0.96-1.87). Neither medication nonadherence nor deficiencies were associated with unplanned medical office visits. Given the relationship between medication nonadherence and ER use, interventions to maximize adherence within this population have the potential to positively impact patients' health status and healthcare costs.

HOSPITAL DISCHARGE COMMUNICATION REGARDING COGNITIVE STATUS FOR PATIENTS WITH DEMENTIA

A.L. Gilmore-Bykovskyi[1,2], J. Porter[2], M.L. Hovanes[2], A. Kind[2], *1. University of Wisconsin-Madison School of Nursing, Madison, Wisconsin, 2. University of Wisconsin-Madison School of Medicine & Public Health, Department of Medicine Geriatric Division, Madison, Wisconsin*

Twenty-five percent of Medicare beneficiaries discharged to a Skilled Nursing Facility (SNF) experience re-hospitalization within 30 days. The majority of SNF patients have dementia, which increases re-hospitalization risk by 40%. Dementia patients also have an increased risk for hip fracture, which represents the largest category of readmissions from SNF. Research suggests that poor quality written hospital discharge communication contributes to re-hospitalization for dementia patients, who often cannot communicate their care needs. SNF providers have identified communication about patients' cognitive status as frequently missing, vague or inaccurate in discharge summaries—typically the only written discharge communication available to SNFs. The purpose of this study was to examine the extent and content of hospital discharge communication regarding cognitive status for SNF patients with dementia. Retrospective medical record abstraction of discharge summaries for patients with Medicare-documented dementia and a primary discharge diagnosis of hip fracture discharged from an academic hospital to a SNF during 2006-2008 identified prevalence of discharge communication of dementia diagnosis and vague statements about cognitive status (N=69). Vague statements regarding cognitive status were transcribed verbatim and subsequently analyzed using Summative Content Analysis. Thirty-three percent of discharge summaries omitted information about dementia diagnosis completely. Only 13% included any statement regarding cognitive status, and all were vague. These included the words: "confused/confusion," "mental status change," “sundowning,” “waxing/waning,” “cognitive changes,” “cloudy mental state” and “disoriented.” Lack of detailed discharge communication regarding cognitive status may limit the SNF’s capacity to implement a safe plan of care and to identify meaningful changes in condition.

A BLENDED EDUCATIONAL INTERVENTION FOR DELIRIUM ASSESSMENT AND INTERVENTION AMONG NURSES ON A MEDICAL UNIT

D. D’Avolio[1,2], K.A. Barba[2], P. Fitzgerald[2], L. Caracci[2], A.J. Guarino[3], *1. School of Nursing, Northeastern University, Boston, Massachusetts, 2. Massachusetts General Hospital, Boston, Massachusetts, 3. MGH Institute of Health Professions, Boston, Massachusetts*

Delirium is a serious health issue associated with poor clinical outcomes which include increased morbidity and mortality, increased use of chemical and physical restraints, and falls. Despite the high incidence of delirium and, its adverse outcomes and costs, it is often unrecognized, misdiagnosed or undertreated, by healthcare professionals and poor rates of delirium recognition remain a serious issue. The purpose of this study was to assess the feasibility and efficacy of a blended educational intervention for delirium assessment and intervention using a one-group pretest-posttest quasi-experimental design Data were collected from a delirium educational intervention (DEI) implemented among a nurses on a medical unit. The nurses received an educational packet, on site delirium education, followed by bedside teaching and utilization of a delirium assessment and intervention tool. After the training the nurses conducted assessments and provided non-pharmacologic interventions on their patients (N=643). There was no significant difference on the nurses’ pre-test (7.3) and post-test (8.93) delirium quiz knowledge scores. This may indicate that participants had some baseline nursing knowledge about delirium but may not have been screening due to lack of a standardized tool assessment tool or understanding of delirium interventions. Seven of 12 intervention categories were used more than 50% of the time. There were no significant gender differences for those patients diagnosed with delirium, patients with delirium were statistically significantly older. Data show the a blended educational intervention may improve patient outcomes and ultimately reduce healthcare costs for those at risk of delirium.

LONGITUDINAL ANALYSES OF FACTORS RELATED TO REJECTION OF CARE AND ABUSIVE BEHAVIORS IN DEMENTIA

F. Galindo-Garre[1], L. Volicer[2,3], J.T. van der Steen[4], *1. VU University Medical Center, EMGO Institute for Health and Care Research, Department of Epidemiology and Biostatistics, Amsterdam, Netherlands, 2. University of South Florida, School of Aging Studies, Tampa, Florida, 3. Charles University 3rd Medical Faculty, Prague, Czech Republic, 4. VU University Medical Center, EMGO Institute for Health and Care Research, Department of General Practice & Elderly Care Medicine, Amsterdam, Netherlands*

Objective: The aim of this study is to analyze factors related to rejection of care (resistiveness to care) and abusive behaviors in nursing home residents with dementia. Methods: Relationship of lack of understanding, depression, psychosis and pain to rejection of care and abusive behaviors was explored using longitudinal Minimum Data Set (MDS) information on 1101 residents of Dutch nursing homes with dementia and four assessments within a period of 15 months. Presence of depressive symptoms was ascertained using a validated scale, and presence of lack of understanding, rejection of care, psychosis and pain through the individual MDS items. A structural equation modeling (SEM) approach and latent growth models were used to investigate the longitudinal relationship between changes in rejection of care and abusive behaviors and changes in lack of understanding, pain, depression and psychotic symptoms. Results: Changes in rejection of care were predicted by changes in lack of understanding and there was also a relationship between changes in depression and rejection of care. Changes of abusive behavior related to changes in lack of understanding and depression. Pain and abusive behavior were unrelated. A mediation model suggested that a relationship of lack of understanding and depression with abusive behavior was mediated by rejection of care. Conclusions: These results indicate that the lack of understanding and depression are the most important factors in development of rejection of care, which may escalate into abusive behavior. Improvement in communication between residents and caregivers, and effective treatment of depression may prevent or ameliorate these behaviors.

LOW FREE LEPTIN AVAILABILITY AS RISK FACTOR FOR DEMENTIA IN CHILEAN OLDER PEOPLE

C. Albala[1], B. Angel[1], L. Lera[1], H. Sanchez[1], C. Marquez[1], P. Fuentes[2], *1. INTA, University of Chile, Santiago, Chile, 2. Dep of neurology, Clinic Hospital, University of Chile, Santiago, Chile*

Background. Adipokines acting in certain brain regions. have been involved in the association between obesity and dementia. Objective To study the contribution of obesity and adipokines in developing dementia Methods. Follow up of ALEXANDROS cohorts, designed to study disability associated with obesity in Chilean older people. At baseline, 1374 subjects were free of dementia. Available participant in 2010 were 664 (71.2% women), 416 were died and 294 were lost to follow up. Among the 664 participants evaluated in 2010, 425 had frozen baseline blood samples available. Among the later, 29 (68.4% women) incident cases of dementia were identified. Leptin, soluble leptin receptor (sOB-R) and adiponectin were measured. Free leptin index (FLI) was calculated as the ratio of leptin over sOB-R. Dementia was defined with a MMSE score<22 and a score >5 in the Pffefer activities questionnaire. Results. At baseline a U shaped association between IMC categories and dementia was observed. No differences in Adiponectin were observed. Leptin was lower in cases (19.7ng/mL) than non-cases (25.0ng/mL),p=0.058; sOB-R was higher in demented than in non-demented (49.4 vs 33.6 ng/mL, p<0.001). FLI was lower in cases (0.53) than controls 1.04), p=0.05. After logistic regression analysis the sex, age and BMI adjusted OR of having dementia increased with higher log sOB-R (OR=3.44;95%CI:1.15-10.28,p=0.012) and the lower the log FLI (OR=0.62, 95%CI 0.419-0.919, p=0.017). Conclusion. Our results demonstrate lower availability of free leptin in demented than in non-demented indicating a role of leptin in cognition. Further studies are needed to clarify the mechanisms involved. Funded by Fondecyt grant 1130947

ASSOCIATION BETWEEN PHYSICAL FUNCTION AND RISK OF DEMENTIA

S. Swami[1], S. Satterfield[2], T. Harris[3], A.B. Newman[4], K. Yaffe[5], M.E. Miller[6], M. Pahor[1], T. Manini[1], *1. University of Florida, Gainesville, Florida, 2. University of Tennessee Health Science Center, Memphis, Tennessee, 3. National Institute of Health, Bethesda, Maryland, 4. University of Pittsburgh, Pittsburgh, Pennsylvania, 5. University of California San Francisco, San Francisco, California, 6. Wake Forest University, Winston-Salem, North Carolina*

Introduction: Recent evidence suggests that physical function loss is associated with dementia symptoms. This prospective study investigated whether low physical function is a predictor for incident dementia in older adults. Methods: The Short Physical Performance Battery (SPPB) was used to measure physical performance at baseline in 3,043 healthy older adults enrolled in the Health, Aging and Body Composition Study. Physical function impairment was categorized according to SPPB scores as: ≤7 (Substantial), 8 (Moderate), 9 (Mild) and 10-12 (None). Incident dementia was determined as hospitalization that was directly related to dementia or was complicated by dementia. Modified Mini-Mental State Examination (3MS) scores were used to evaluate the effect of global cognition on the associations. Results: Baseline

3MS median score was 92 (Interquartile range: 86-96), indicating a predominantly cognitively healthy cohort of older adults (73.6±2.9 years). Over 11±4.73 years of follow-up, 582 (19.13%) participants developed dementia. Individuals with substantial impairment had a higher likelihood of incident dementia (Odds Ratio: 1.69; 95% Confidence Interval: 1.07-2.66) than individuals with no impairment after adjusting for demographics, 3MS score, socioeconomic factor, co-morbidities, ApoE4, alcohol use, smoking, and cytokines. Additionally, SPPB scores were similarly associated with risk of dementia in subgroups stratified at the median baseline 3MS score. Conclusions: Despite normal baseline cognition, older adults with low physical function are at increased risk of incident dementia. Further studies are needed to assess whether interventions to improve physical function may prevent or delay development of dementia among older adults.

MOBILIZING SYSTEM-WIDE IMPLEMENTATION OF A DELIRIUM PROTOCOL

E. Perweiler[1], A. Chopra[1], C. Roller[2], T.L. Spoltore[2], J. Galletta[2], K. Eclar[1], *1. Rowan University School of Osteopathic Medicine, Stratford, New Jersey, 2. Inspira Health Network, Vineland, New Jersey*

Rowan University-School of Osteopathic Medicine (ROWAN-SOM), New Jersey Institute for Successful Aging, was awarded a 5-year grant (7/1/2010-6/30/2015) by the U.S. Department of Health and Human Services-Health Resources and Services Administration, Bureau of Health Professions (DHHS-HRSA, BHPr), to fund the New Jersey Geriatric Education Center (NJGEC). Inspira Health Network (IHN) is a consortium partner in the NJGEC and has undertaken an evidence-based interprofessional education/training and quality improvement project based on system-wide implementation of a delirium evidence-based practice. To ensure successful implementation in two hospitals of a comprehensive delirium assessment and intervention protocol in those patients identified as being “at risk” for developing delirium, critical foundational elements were put in place to prepare staff and provide the structure and processes to support protocol implementation. A nurse serving as the consortium site leader, a physician champion, and a Geriatric Resource Council of nurse champions spearheaded the effort. Delirium protocols and guidelines were developed. Based on feedback from a pilot program, a web-based training program via Healthstream was implemented between June 1, 2013-December 31, 2013. Of 350 nurses on adult floors caring for patients 65 and older, 99.43% (N=348) completed the training. Results of pre/post knowledge assessments for those nurses who consented to participate in the study will be presented. Uptake of the practice will be reported based on results of a retrospective chart review for the presence of accurate, complete delirium assessment tools. These will include a Mini-COG and CAM for patients meeting inclusion criteria. The poster will present challenges and lessons learned.

COGNITIVE STATUS OF OLDER NURSING-HOME RESIDENTS: RESULTS OF A PREVALENCE STUDY IN TUSCANY, ITALY

N. Zaffarana[1], M. Cavallini[1], F. Collini[2], C. Lorini[3], G. Bonaccorsi[4], N. Marchionni[1], M. Di Bari[1], *1. Department of Experimental and Clinical Medicine, Research Unit of Medicine of Aging, University of Florence and Careggi Teaching Hospital, Florence, Italy, 2. Regional Health Agency of Tuscany, Florence, Italy, 3. Department of Health Science, University of Florence, Florence, Italy, 4. Department of Experimental and Clinical Medicine, University of Florence, Florence, Italy*

Background and purpose. In the last 20 years, the case-mix of Italian nursing homes (NH) has deeply changed, especially for the increasing prevalence of residents with dementia-related problems and the consequent burden of care. At our knowledge no studies analyzed changes in cognitive status after institutionalization and prevalence of advanced dementia in older NH residents in Italy. Our research, part of a Italian Ministry of Health Project, aimed to assess cognitive changes by Short-Portable-Mental-Questionnaire (SPMQ) in two waves 12-month apart and the prevalence of advanced dementia (stage 7 at the Global Deterioration Scale) in a large sample of older NH residents in Tuscany. Data were collected by trained NH staff. Results: 2732 residents in 67 NH (23% of those registered in Tuscany), were examined. When baseline and follow-up data were compared, 54% of residents showed no cognitive changes, whereas 20% deteriorated and 14% improved. Prevalence of advanced dementia was 28% of the sample(n=751), significantly larger in resident in NH for ≥12 months than in resident for <12 months(32% vs 18%, p<0.001). Conclusions: In our analysis, the great majority of older NH residents in Tuscany shows a preservation of cognitive function at one-year follow up, maybe due to appropriate assistance and therapeutic strategies. On the other hand, prevalence of advanced dementia in NH older resident is large, that entails the need of urgent adaptation of assistance strategies and staff-training to provide adequate end-of-life quality of care.

PERCEPTIONS OF DEMENTIA AMONG ELDER CAREGIVERS

K. Kopera-Frye, *University of Louisiana at Monroe, Monroe, Louisiana*

There are many misconceptions among adults of what dementia is and if it is a normal process of aging. There may be much anxiety and fear associated with getting older among young-old adults because of misconceptions. Palmore’s seminal work indicated older adults, as well as younger aged college students, equally hold these misconceptions. The purpose of this study was to examine how older adults define dementia and if they think it is part of normal aging. The study participants are currently enrolled in the Louisiana Aging BRAIN Study (LABrainS), a prospective study on dementia development among older adult community-dwellers. Thirty three older adults, primarily women and Caucasian, were asked two open-ended questions: 1) Define dementia; and 2) if dementia is related to normal aging, and in what ways. The majority of these older adults signed up for the Project because they either had a positive family history of dementia in their first degree relatives (often parent), and/or are a caregiver of a family member with dementia. Interestingly, approximately one-third (33%) of the older adults had misconceptions about dementia, i.e., just a bad case of forgetting; the remaining noted it was a disease, brain damage. When asked if just a normal part of aging and to explain, 21% did not know if it was normal aging; the remaining noted that increased age increases likelihood of the disease. The results suggest there are many myths surrounding the disease process of dementia and many older adults may fear aging because of these misconceptions.

FEASIBILITY OF PHYSIOLOGICAL AND OBSERVATIONAL METHODS IN PERSONS WITH DEMENTIA

J.S. Sefcik, J.R. Libonati, P. Cacchione, *University of Pennsylvania, Philadelphia, Pennsylvania*

The objective of this study was to test the feasibility of using a BioHarness system (BioHarness), the Cohen-Mansfield Agitation Inventory (CMAI), and the Verbal Behavior Scale (VBS) with older adults with moderate to severe dementia. The BioHarness consists of a garment belt with built in skin contacts worn around the torso with a monitoring device which collects and transmits physiological data (heart and respiration rate, and body temperature) and accelerometer data to a laptop. This observational study piloted the BioHarness in four participants, 2 male and 2 female; all African American, the mean age was 81 with a mean Mini Mental State Examination score of 9.5. Each participant was individually observed wearing the BioHarness for 2 hours. A checklist to determine tolerance of wearing the BioHarness was developed to guide the observation. The BioHarness was found to be well tolerated and easy to put on and remove, transmitted a strong signal, and did not create restlessness or agitation. The participants were able to continue with their usual activities, and they did not try to remove the BioHarness. The results of the CMAI and VBS which were completed during the same observation period provided further support that the BioHarness did not precipitate behavioral disturbances. The BioHarness is a noninvasive method to collect biophysical data with persons with dementia without exacerbating behavioral disturbances. This study provides support for the use of the BioHarness as a method to measure biophysical data in persons with dementia during behavioral disturbances.

WHAT BEHAVIORAL DISTURBANCES ARE EXHIBITED BY OLDER ADULTS DURING TRANSPORTATION TO AND FROM A PACE CENTER?

J.S. Sefcik, C. Bradway, P. Cacchione, *University of Pennsylvania, Philadelphia, Pennsylvania*

The purpose of this study was to explore van assistants' and van drivers' experiences with transporting older adults to and from a Program for All-Inclusive Care for the Elderly (PACE) center. Currently, no evidence exists regarding the scope or impact of behavioral disturbances on van transportation safety for elders accessing day services. This qualitative study solicited van assistants' and drivers' experiences with transporting 89% of one centers' members on vans. A total of 4 focus groups were held, 2 for van assistants (all Certified Nursing Assistants) and 2 for van drivers in August 2012. Our convenience sample consisted of 19 van assistants and 11 van drivers. Directed content analysis was used to analyze focus group data. Three prominent behaviors emerged from the data. The employees described: 1) being disturbed by PACE members' restlessness; 2) vocally abusive behaviors toward staff and other PACE members; and 3) physical aggression toward the van assistants and van drivers. Restlessness while the vans are in motion was identified as the most frequent disturbing behavior and includes members unbuckling their seatbelts and attempting to get out of their seats, and attempting to get off the van before arriving at the appropriate destination. The behaviors identified pose potential safety risks to the PACE centers' van assistants, the van drivers, and the members on the vans. This study is the first step in examining this important issue and in developing additional strategies for evaluating and managing behavioral disturbances and safety issues that occur among PACE center members.

H2-RECEPTOR BLOCKER AND ANTIFUNGAL COMBINATION THERAPY IN MANAGING NURSING HOME RESIDENT WITH INAPPROPRIATE SEXUAL BEHAVIOR

M. Walia, H. Okhravi, *EVMS, Norfolk, Virginia*

Case study: An 87 y/o long-term, fully dependent Caucasian NH male with advanced Alzheimer's dementia, who began approaching female nursing home residents, staff, and visitors with hypersexual behavior. He was making inappropriate verbal and frequently physical sexual advances. His behavior was escalating during personal care which was found extremely disruptive and upsetting by nursing staff. These behaviors would occur randomly throughout the day and night without any precipitating factors. Non-pharmacological strategies, including redirection techniques were initially enacted with no success. Ativan was administered and caused more outbursts and agitation in the patient. Patient's Risperdal was tapered up but did not affect the frequency or intensity of the inappropriate behavior. After conducting a family meeting to review treatment options, Cimetidine, as an anti-androgenic agent, was started. Within one week, there was a 50% reduction in sexual behavior reported by nursing staff. Due to sub-optimal control of his sexual behavior, Ketoconazole was added to this regimen. Over the course of six weeks, inappropriate sexual behavior decreased to 10%. In an effort to de-escalate therapy, Ketoconazole was discontinued, and frequency of symptoms remained stable on Cimetidine alone. Patient remained on Cimetidine for the management of inappropriate sexual behavior without any apparent medication side effects. Discussion: This case illustrates the challenges faced by nursing homes, staff and medical providers in identifying, describing, and managing inappropriate sexual behaviors displayed by demented patients. This is an occurrence that frequently goes unreported with few off-label treatment methods available for use. Allowance for these behaviors can compromise the care provided in the nursing home and affect the morale of staff. With a lack of research data to support treatment interventions, and also potential side effects of hormonal therapy, effective miscellaneous agents such as H2 receptor blockers and antifungal medications, alone or in combination, could be tried first in the attempt to manage inappropriate sexual behaviors in demented patients.

ADRD IN THE WORKPLACE: A CHALLENGE FOR EMPLOYERS

C. Cox, M. Pardasani, *Grad School of Social Service, Fordham University, New York, New York*

The Alzheimer's Association estimates that 5.3 million Americans have Alzheimer's Disease (AD) or a related disorder (ADRD) with approximately 500, 000 of these persons younger than 65. Moreover, the number of people affected by the disease will increase 350% by the middle of this century. Although there is some research on organizational policies with regards to caregivers, very little is known about how organizations deal with employees who are themselves experiencing the first stages of ADRD. This paper reports on a pilot study of 103 employers' responses to dementia as it impacts both caregiving employees and employees who themselves may be experiencing symptoms of cognitive impairment. Utilizing a web-based survey of human resource professionals, it examines the types of policies and practices that employers have for each of these groups and the areas in which they feel further assistance is needed. The particular questions being addressed explored the ways in which human resource professionals are responding to employees who are caregivers of persons with ADRD and how they respond to employees who may be showing symptoms of the disease. Generally, they were more familiar in working with caregivers than with impaired employees but they also felt that with the aging of the workforce, the subject was very important and that it was necessary to be proactive rather than reactive. Among their recommendations were more training in understanding the symptoms of ADRD and more flexible workplace policies that could better accommodate both caregiving employees and those employees who may have symptoms of ADRD.

SESSION 1035 (POSTER)

CARDIOVASCULAR DISEASE

MANUAL OCCUPATION AND GOUT IN OLDER ADULTS: RESULTS FROM THE ATHEROSCLEROSIS RISK IN COMMUNITIES STUDY COHORT STUDY

B.T. Burke, A. Baer, J. Coresh, M. McAdams DeMarco, *Johns Hopkins Bloomberg School of Public Health, Baltimore, Maryland*

Objective: We examined gout incidence in adults age fifty-five and older and tested whether socioeconomic status as indicated by working in a manual occupation in middle age and education predicted gout onset in older age using the Atherosclerosis Risk in Communities (ARIC) cohort. Methods: ARIC is a prospective population-based cohort study of adults (1987-1989) with ongoing follow-up (analytic population=11,958). The adjusted HR and 95% CI of incident gout by occupation type, education, and traditional risk factors in middle age were estimated using a Cox Proportional Hazards model. Results: The mean age of onset for participants with gout was 67.9 (SD 8.0) in women and 65.4 (SD 7.5) in men. Working in a manual occupation during middle age increased gout risk in older age for women (HR 1.36; 95% CI 1.03-1.80), but not for men (HR 0.89; 95% CI 0.71-1.13;

p=0.02 for interaction). Educational attainment was not associated with gout risk. Conclusions: Working in a manual occupation in middle age increased the risk for new-onset gout in women age fifty-five and older. Considering occupational history in addition to traditional risk factors could help identify those at risk of gout in older age.

ELDERLY PATIENTS WITH ADVANCED HEART FAILURE IN GERMANY: A QUALITATIVE LONGITUDINAL STUDY ON THE PATIENTS` NEEDS AND EXPERIENCES

K. Klindtworth[2], K. Hager[1], P. Oster[3], N. Schneider[1,4], *1. Center for Medicine in the Elderly, Hanover, Germany, 2. Hannover Medical School, Institute for Epidemiology, Social Medicine and Health Systems Research, Research Group Palliative Care and Ageing, Hannover, Germany, 3. AGAPLESION Bethanien Hospital, Geriatric Centre at the University of Heidelberg, Heidelberg, Germany, 4. Hannover Medical School, Institute for General Practice, Hannover, Germany*

Aims: Heart failure is a major cause of death in Germany and worldwide. In advanced stages it is associated with a high symptom burden and poor long-term prognosis. This study aims, for the first time in Germany, to prospectively explore the experiences and needs of elderly patients with advanced heart failure. Methods: Qualitative longitudinal study with 25 patients with advanced heart failure (NYHA III/IV), aged ≥70 years. Initial interviews were carried out during hospital admission followed by interviews at the patients` home every 3 months for up to 18 months. Interviews were tape-recorded and transcribed verbatim. Qualitative content analysis was conducted across and within the cases. Results: The mean age of the patients (14 female, 11 male) was 85 years (71-98 years). Overall 95 interviews were carried out. Qualitative analyses show that the patients do not focus heart failure as a genuine disease. Moreover, discomforts due to acute crisis or overlapping disease are central, as well as age associated health problems which progressively limit the activities of daily living. The salient loss of familiar concepts such as mental vigour, body image and autonomy matters most. Open questions about emerging needs of support or end of life-issues are recurrently unmet. Although the need for information and dialogue varies depending on changing conditions and individual preferences, a reliable person (e.g. family carer, family doctor) available to address these issues is highly appreciated. Conclusion: The needs of elderly patients with advanced heart failure are various and exceed the capabilities of a single person, e.g. a family doctor. To ensure continuity of care a multidimensional model is required which should be established including both various professions in the community and available family carers. Advanced care planning could be a start to communicate relevant issues of emerging care needs. Key words: advanced heart failure, end of life-care Funding: Robert Bosch Foundation

CARDIOVASCULAR DISEASES AND LOWER HEMODYNAMIC PARAMETERS ARE ASSOCIATED WITH FRAILTY AMONG ELDERLY OUTPATIENTS: DATA FROM FRAGICOR I

A. Frisoli, F. Martin, A. Paes, V. Pintarelli, I. Helber, J. Borges, A. Carvalho, *internal medicine, Cardiogeriatria-UNIFESP, Sao Paulo, Brazil*

The association between Frailty and Cardiovascular diseases (CVDs) has been documented among older adults from community dwelling, but not yet among elderly outpatients. We hypothesized that, as more as any CVDs higher will be the association with frailty. Additionally, lower hemodynamic parameters (HPs) will increase this association. Aim: To evaluate the association among CVDs and lower PHs with frailty in elderly outpatients. Methods: Cross sectional analyses of FRAgiCOR-I an epidemiologic study of 1 year about frailty and its outcomes among elderly outpatients of Cardiology Division of University (UNIFESP) Sao Paulo, Brazil. Variables at base line: CVDs (Diastolic or systolic heart failure -HF, atrial fibrillation -AF, Myocardial infarction (>3months) -MI, Angina pectoris-AP, hypertension–HP) as individually as 3 or more (CVD3+) and PH: systolic (SBP) and diastolic blood pressure (DBP), heart rate (HR), ejection fraction (EF) categorized by quartiles; Frailty phenotype was classified by Fried Criteria. Results : 172 older adults, mean age of 77 (±8,4) years old initiate the cohort. Frailty was prevalent in 39.8%, pre frail 51.5% and robust 8.7%. Among Frailty, 60.3% were Caucasian and 67.7% female. Frailty was associated with MI, CVD3+, and lower quartile of SBP and DBP, described on table I. Table I – Binomial and Multinomial logistic regression analysis of CV and non CV actors and Frailty. Conclusion: Our data suggest that myocardial infarction and 3 or more any CVDs were significantly associated with Frailty. Additionally, lower diastolic and or systolic blood pressure was associated with Frailty independently of CVD. Binomial Multinomial OR CI(95%) p OR CI(95%) p Age (years) 1.08 1.02 – 1.14 0.005 Medication 1.20 1.05 – 1.37 0.007 Disability 4.12 2.13-7.95 <0.001 2.37 0.99-5.67 0,053 MI 2.41 1.41 – 4.12 0.001 3.01 1.09 – 8.34 0.033 CVD3+ 2.42 1.26 – 4.62 0.007 2.98 1.06-8.35 0.038 DBP <70 mmHg 21.50 3.88-118.93 <0.001 11.47 1.91-68.77 0.008 SBP<120mmHg 10.20 1.87-55,38 0.007 2.66 1.05-6.70 0.038 SBP and DBP 9.50 2.00-45.05 0.005 <9 years of education 0.39 0.18 – 0.88 0.023 ≥ 9 years of education 0.2 0.06 – 0.84 0.026

RENAL FUNCTION HAS A DIFFERENT EFFECT ON PREDICTING CVD RISK IN VARIOUS POPULATIONS - A CHINESE LONGITUDINAL STUDY

X. Bai[1], B. Jin[1], J. Liu[2], L. Han[1], W. Zhang[3], X. Chen[3], *1. Shengjing Affiliated Hospital of China Medical University, Shenyang, China, 2. Asia Heart Hospital, Wuhan, China, 3. General Hospital of Chinese PLA, Beijing, China*

Background: Chronic kidney disease (CKD) is generally considered an independent risk factor for cardiovascular disease (CVD) development, but rates in individuals with estimated glomerular filtration rate (eGFR) > 60 ml/min/1.73 m2 are uncertain. The purpose of this study was to examine the association exists between eGFR and Framingham global CVD risk score (FRS) in a Chinese population with no CKD or CVD. Method: A total of 333 participants were divided into three groups based on FRS. The Chronic Kidney Disease Epidemiology Collaboration (CKD-EPI) equation and CKD-EPI equation for Asians (CKD-EPI-ASIA) were used to measure eGFR. Result: A significant inverse association between eGFR and FRS was confirmed with Pearson correlation coefficients of –0.669, –0.698 (eGFRCKD-EPI, P < 0.01) and –0.658, –0.690 (eGFRCKD-EPI-ASIA, P < 0.01). This association gradually diminished with progression from the low- to high-risk groups (eGFRCKD-EPI, r = –0.615, –0.282, –0.197, P < 0.01, P < 0.01, P > 0.05; similar results according to the CKD-EPI-ASIA equation). In the low- or moderate-risk new-groups, this association became stronger with increased FRS (eGFRCKD-EPI-ASIA, r = –0557, –0.622 or –0.326, –0.329, P < 0.01). In contrast to the results from 2008, eGFR was independently associated with FRS following adjustment for traditional cardiovascular risk factors (P < 0.05). Conclusion: Renal function has a different effect on predicting CVD risk in various populations. With increasing FRS and decreasing eGFR, it is also independently associated with CVD, even in individuals with eGFR > 60 ml/min/1.73 m2.

THE RELATIONSHIP BETWEEN STRESSFUL LIFE EXPERIENCES AND SELECTED CARDIOVASCULAR DISEASE RISK FACTORS IN MID-LIFE AND OLDER AFRICAN AMERICANS

Y. Mendez[1], P.A. Ralston[1], K.K. Wickrama[2], J. Ilich-Ernst[3], I. Young-Clark[1], *1. Center on Better Health and Life for Underserved Populations, Florida State University, Tallahassee, Florida, 2. Department of Human Development and Family Science, University of Georgia, Athens, Georgia, 3. Department of Nutrition, Food & Exercise Sciences, Florida State University, Tallahassee, Florida*

Cardiovascular disease (CVD) is the leading cause of death in the U.S. African Americans (AAs) have higher age-adjusted rates of CVD than Caucasians. Stressful life experiences are associated with CVD risk, especially hypertension and overweight/obesity. AAs may have higher cumulative stressful life experiences due to racism and discrimination, but few studies have examined the link of cumulative stress and CVD risk in this population. The purpose of this study was to determine the relationship of stressful life experiences (four items of Satisfaction with Life Scale, $\alpha = .86$) and selected CVD risk factors (diastolic and systolic blood pressure [BP], BMI, and waist, abdomen, hip and waist/hip ratio circumferences) in mid-life and older African Americans participating in a 18 month church-based health intervention that included reducing stress as a key component. Participants were 104 mid-life and older African Americans (45+) from the broader study conducted in North Florida. Using the Transtheoretical model of change (TTM), analyses were performed at baseline, 6, 18 and 24 months to examine (a) how stressful life experiences are associated with CVD risk factors, and (b) how changes in participants' psychological competence and vulnerabilities over the course of intervention moderate the relationship between stressful life experiences and selected CVD risk factors. Results are discussed in relation to TTM theory and implications are provided for church-based health programs.

AGING RELATED CHANGES IN BONE MINERAL DENSITY AND ITS ASSOCIATION WITH SUBCLINICAL ATHEROSCLEROSIS BIOMARKERS IN HEALTHY POPULATION IN CHINA

X. Bai[1], D. Liang[2], L. Han[1], X. Zhao[1], K. Yu[1], B. Jin[1], X. Chen[3], *1. Shengjing Affiliated Hospital of China Medical University, Shenyang, China, 2. First Affiliated Hospital of China Medical University, Shenyang, China, 3. General Hospital of Chinese PLA, Beijing, China*

Objective Both osteoporosis and atherosclerosis-related disease belong to the ordinary diseases of elderly. The aim of this study was to explore the changes of bone mineral density (BMD) with aging and its association with subclinical atherosclerosis biomarkers in healthy population in China. Method 505 qualified healthy subjects were screened from 1500 participants from fifteen communities in Shenyang between September 2007 and June 2008. The BMD was measured at the total hip and lumbar spine using dual-energy x-ray absorptiometry and categorized into the normal BMD (T score >-1.0), osteopenia (-1.0 <T score < -2.5), or osteoporosis (T score < -2.5) groups. The ABI, PWV, and CIMT were measured to assess sunclinical atherosclerosis. Results In women the lumber BMD (r=-0.587, p<0.001) and total hip BMD (r=-0.575, p<0.001) were significantly correlated with age. However, in men only total hip BMD were significantly correlated with age (r=-0.251, p<0.001). Total hip BMD was correlated with ABI in women after adjustment for age (r = 0.156, per SD decrease in ABI: -0.130 g/cm2, p=0.022), and was borderline significant after full adjustment (P =0 .045). Total hip BMD and lumbar spine BMD were not associated with ABI, PWV, and CIMT after full adjustment in participants without a fracture history. The risk of osteoporosis was not associated with ABI, PWV, and CIMT. Conclusion The changes of BMD with aging are different between women and men. The association between low BMD and subclinical atherosclerosis biomarkers depends on the aging, blood pressure and internal environment.

URINARY INCONTINENCE ABSORBENT PRODUCT USE IN ADULTS WITH HEART FAILURE

C.S. Marquez[1], J. Busby-Whitehead[2], M.H. Palmer[3], *1. School of Nursing, University of North Carolina at Chapel Hill, Chapel Hill, North Carolina, 2. University of North Carolina at Chapel Hill - School of Medicine, Chapel Hill, North Carolina, 3. University of North Carolina at Chapel Hill - School of Nursing, Chapel Hill, North Carolina*

Background/Introduction: Urinary Incontinence (UI) is prevalent among adults with heart failure (HF), but little is known about how they manage it. Understanding factors that explain use of widely available absorbent products may help clinicians target screening and patient education efforts to ensure evidence-based practices are incorporated into self-management. The aim of this study was to identify the factors that increased the odds of absorbent product use in incontinent adults with HF. Methods: An existing dataset from 296 adults with HF was used to determine prevalence of UI absorbent product use. Personal and disease-condition characteristics were examined using bivariate analyses and logistic regression. Results: UI was present in 134 (45%) adults with HF and 54 (40.3%) used absorbent products to manage UI. Majority were women (76%), white (74%), and single (51.8%). Mean age was 65.6 years (SD 16.5). About half reported becoming incontinent after HF diagnosis, and 65.8% did not seek help for UI. Variables significant at the p< 0.05 level were entered into a regression model. No significant risk factors (age, HF stage, UI change over time, level of priority for UI treatment and help-seeking behavior) were identified except sex (female): OR 15.5 95% CI 6.49-37.23. Conclusion: Women with HF who use absorbent products to manage UI are potentially living with additional disease burden. Clinicians need to proactively ask about UI to learn about self-management strategies women are using and to provide evidence-based strategies to achieve optimal continence status and potentially improve the quality of life in this population.

SESSION 1040 (POSTER)

END OF LIFE CARE

THE ELDER PROJECT: EVALUATING END OF LIFE KNOWLEDGE AMONG HEALTH CARE PROVIDERS

D.R. Mager[1], J. Lange[2], *1. School of Nursing, Fairfield Universtiy, Fairfield CT, Connecticut, 2. Quinnipiac University, Hamden, Connecticut*

Purpose: This phase of the "Expanded Learning and Dedication to Elders in the Region" (ELDER) project focused on educating nurses, nursing assistants and healthcare professionals (N=60) from five long term or home care agencies about EOL care. Methods: EOL curriculum based on best practices from the EOL Nursing Education Consortium (ELNEC) (2009) was used to inform 10 sessions per agency over one year. Innovative teaching strategies used in sessions included role play, case study analysis, values clarification and self reflective exercises. Cultural variations, teamwork and collaboration in EOL care were emphasized. The ELNEC Knowledge Assessment Tool (KAT), adapted from the original works of Ferrell et al., (2005) was further modified to address participant variation in role and educational level, and was used to evaluate change in EOL knowledge. Qualitative data regarding benefits, challenges, and future opportunities derived from participation were also gathered. Outcomes: ELNEC-KAT mean post scores improved in all nine instrument subscales. Despite the heterogeneous sample, p values indicated significant improvement in four categories, suggesting improved knowledge post session participation. Additionally, qualitative results revealed participants: found sessions helpful; were able to list new EOL care knowledge obtained; stated they had better understanding of palliative care and the way cultural differences may affect EOL decisions. Implications: Use of interactive group sessions for interprofessional education on EOL care was an effective venue in long term and home care settings. In this sample of heterogeneous health care workers, the modified ELNEC-KAT was effective in measuring changes in EOL care knowledge.

PREDICTORS OF CARE SETTING TRANSFERS AT THE END OF LIFE

P. St. John[1,2], V. Menec[2], S. Nowicki[2], *1. Section of Geriatric Medicine University of Manitoba, Winnipeg, Manitoba, Canada, 2. Centre on Aging, University of Manitoba, Winnipeg, Manitoba, Canada*

Objective. Transfers between different care settings at the end of life have been identified as potentially problematic. The objective of this study was to examine personal and system-related factors that predict transfers across care settings. Methods. The study was based a complete cohort of individuals aged 65 or older who had died in fiscal years 2003–04 to 2005–06 in the province of Manitoba, as determined from Vital Statistics data (N = 23,052). Administrative health care records (hospital, nursing home, home care) were used to identify transfers from one care setting to another in the last six months of life before death. We considered settings to be: home, home with home care, hospital, palliative care unit, and nursing home. Results. The number of transfers ranged from zero to 25; 30% of decedents had no transfers and 10% had 5 or more transfers. In multiple regression models, decedents 75-85 and 85+ years old were less likely to have transfers than those aged 65-74, and certain causes of death (sudden death, dementia, and acute myocardial infarction) were associated with fewer health care transitions. Higher hospital bed rates in the health care region, and higher home care use rates were associated with more transfers; higher physician rates and higher nursing home bed rates per region were associated with fewer transfers. Similar patterns emerged when comparing decedents with the most transfers (5 or more) to those with fewer transfers. Conclusion. There is considerable heterogeneity in transitions across health care settings among older adults who die in Manitoba. Transfers are the end of life are impacted by both personal factors and system-related factors.

PROGNOSTICATION: A CONCEPT ANALYSIS

D.M. Price, *SUNYIT, Utica, New York*

Prognostication of illness is of vital importance to older adults. Older adults have a great need for information regarding the expected time frame for their death. If their time to death is not as long as expected, they may not have had sufficient time to prepare their loved ones or their resources in a timely manner. If they live longer than expected, families may face a burden in caring for their loved one over a longer period of time. While this unexpected longer life is usually celebrated and families find it to be a joyful time, resources are stretched thin and expectations of family members may grow. A concept analysis of the term prognostication was performed. Part of this analysis included a literature review. Findings of the literature review revealed a substantial amount of scholarly sources including research articles and books. Topics covered by the articles were easily transferable to an older adult population including frailty and cancers often suffered by this cohort. The Palliative Prognostic Index was discussed. Often not used in the United States, the Palliative Prognostic Index is a reliable tool in assisting the health professionals accurately predict prognosis. Defining and exploring the topic of prognostication is the first step in learning how to apply this important concept.

FEASIBILITY AND ACCEPTABILITY FOR ADVANCE CARE PLANNING READINESS AND GOAL-SETTING IN VETERANS

K.K. Garner[1,2], P.M. Dubbert[1,2], D.H. Sullivan[1,2], S.Y. Lensing[2], M.M. Bopp[1], *1. Geriatric Research, Education and Clinical Center, Central Arkansas Veterans Healthcare System, North Little Rock, Arkansas, 2. University of Arkansas for Medical Sciences, Little Rock, Arkansas*

Background: Planning for future medical decisions is important for achieving end-of-life (EOL) wishes. Identifying readiness for an advance care planning (ACP) discussion can facilitate tailored patient-centered interventions. Purpose: To assess the feasibility and acceptability of ACP readiness assessment and goal setting in older Veterans. Methods: In a pilot study with chronically ill, older Veterans in long-term and outpatient settings, (n=23), subjects were assessed for readiness using a validated Steps in Planning tool and then were offered option to set an ACP goal. Results: Subjects (all male) were age 71.8±12.1 years, mostly white (90%), with some college (63%), urban/suburban (63%) and had all health care provided at VA (73%). In this chronically-ill sample with high healthcare utilization, stage of change at baseline was action/maintenance for naming a proxy (72.7%) and having a living will (95.5%). However, most subjects were precontemplative for other important components of ACP such as talking to their provider about EOL (54.5%) or quality vs. quantity of life (63.6%) and for discussing quality vs quantity with someone they trust (40.9%). With the intervention, these precontemplative scores decreased to 38.1%, 47.6% and 28.6% respectively. A month later, most subjects who remembered a goal reported completing it (91.7%). Satisfaction scores were high; subjects were comfortable with questions (85.7%) and discussing topic (81%), and satisfied with assessment process (95.3%). Conclusions: ACP is a multifaceted process. Assessing stage of change is feasible and may be an important first step in providing tailored, patient-centered care to assist patients in achieving their end-of-life wishes.

ENABLING ADVANCE DIRECTIVE COMPLETION BY RURAL ALABAMA VETERANS: A PILOT STUDY – PRIMARY OUTCOMES

A.F. Mahaney-Price[1], L. Davis[1,6], C. Uphold[2], K.L. Burgio[6], M. Stanton[3], R.S. Allen[3], D.P. Olsen[4], J. DeCoster[5], *1. VA Medical Center, Tuscaloosa, Alabama, 2. VA Medical Center, Gainesville, Florida, 3. University of Alabama, Tuscaloosa, Alabama, 4. Michigan State University, East Lansing, Michigan, 5. University of Virginia, Charlottesville, Virginia, 6. VA Medical Center, Birmingham, Alabama*

Objectives: The objectives of this study were to (1) test the feasibility of recruitment, randomization, and retention; (2) test the feasibility of a standardized Nurse-Supported Advance Care Planning Intervention; (3) evaluate the feasibility of the assessment process and data collection procedures; (4) evaluate the Veterans' satisfaction with the intervention and their Advance Directive decisions; and (5) evaluate preliminary effects of the Nurse-Supported Advance Care Planning Intervention. Methods: Alabama Veterans (*N* = 50) who received care through the Tuscaloosa VA Medical Center were randomized to either the Nurse-Supported Advance Care Planning Intervention (*n* = 33) or Care-as-Usual (*n* = 17) in a 2:1 ratio. The Nurse-Supported Advance Care Planning Intervention was a manualized education, support, and guidance session provided by a Registered Nurse that included information about risks, benefits, and alternatives of specific choices. Results: Predetermined expected outcomes for recruitment, randomization, retention, and data completion were met. Thirty-one (94%) of the participants randomized to the Nurse-Supported Advance Care Planning Intervention received the intervention. Thirty (94%) of the participants in the Nurse-Supported Advance Care Planning Intervention group completed an Advance Directive, and all reported satisfaction with their new Advance Directive decisions. Conclusions: The study design is feasible with regard to recruitment, randomization, retention, assessment processes, and data collection. The Nurse-Supported Advance Care Planning Intervention can be conducted in a full-scale randomized controlled trial as in the pilot.

RACIAL/ETHNIC DIFFERENCES IN SITE OF DEATH AMONG US HOSPICE ENROLLEES: RESULTS FROM A NATIONAL STUDY

J. Laguna, *Davis School of Gerontology, USC, Los Angeles, California*

Recent research identifying racial/ethnic differences in care planning and utilization following hospice enrollment suggests that additional variation in other care quality indicators may exist. Notwithstanding, population-level research investigating racial/ethnic differences in site of death (SOD), a critical within-hospice outcome, remains relatively scarce. Identifying differences in SOD among hospice decedents is essential understanding disparities and improving the care quality of vulnerable populations at end of life. Using the 2007 wave of the National Home Health and Hospice Care Survey (NHHCS), this study investigated SOD differences among 3,661 White, Black, and Hispanic hospice decedents ages 65 and older. When weighted for national representation, these data represent 800,872 older adults. Adjusted mixed effects models were employed to test for racial/ethnic differences in 1) home death and, 2) hospital death. Tested predictors included patient age, gender, race/ethnicity, marital status, primary diagnosis, number of chronic conditions, and documented advance directives. Compared to White patients, Hispanic patients were less likely to die in the home (OR=0.643; p<.001), and more likely to die in the hospital (OR=7.899; p<.001). Additionally, patients with a documented advance directive were less likely to die in the hospital (OR=0.363; p=.002). Although previous research has suggested that racial/ethnic differences in SOD may exist among hospice decedents, this study is among the first to report that such differences do exist, and that they persist following adjustment for care planning. Additional research is needed to better understand the factors associated with SOD among Hispanic hospice decedents, and to investigate SOD preference congruency in this population.

SESSION 1045 (POSTER)

LONG TERM CARE

EFFECTS OF A PREVENTIVE HOME VISITS WITH STRUCTURED ASSESSMENTS ON QUALITY OF LIFE IN FRAIL ELDERS

A. Kono[1], Y. Kanaya[1], K. Izumi[2], N. Yoshiyuki[1], C. Tsumura[3], L. Rubenstein[4], *1. School of Nursing. Osaka City University, Osaka, Japan, 2. School of Nursing, Osaka Prefecture University, Osaka, Japan, 3. School of Nursing and Rehabilitation, Konan Women's University, Kobe, Japan, 4. College of Medicine, The University of Oklahoma, Oklahoma City, Oklahoma*

The purpose of the randomized controlled trial (RCT) was to investigate effects on quality of life (QoL) of a preventive home visit program for frail elders living at home who were certified as being in the two lowest care levels under the Japanese long-term care system. The present program started in 2011 and included care manager visits every three months for two years, utilizing a structured assessment to prevent elderly frailty by systematically clarifying problem lists. A total of 360 elders living in three Japanese communities were recruited and randomly assigned to the intervention group (IG: n=179) or the control group (CG: n=181). QoL parameters (including ADLs, IADLs depression, cognitive capacity, daily life satisfaction, and self-efficacy for health promotion) were measured using a postal questionnaire at baseline and at 12- and 24-month follow-up visits. At 24 months, 15 persons in the IG had died vs 7 in the CG, and 5 persons in the IG were in nursing homes vs 9 in the CG (not significant). The scores of ADLs in the CG declined more than those in the IG (p=0.0041), particularly in the subgroup who had at least one ADL dependency at baseline (p=0.0297). Changes over this period in scores for IADLs, depression, daily life satisfaction, cognitive capacity, and self-efficacy for health promotion did not differ between groups. The results suggest that a preventive home visit program could effectively reduce on ADL decline among frail elders, especially those with baseline ADL dependency.

RANKING GOALS PRIORITY OF PRESCRIBING DRUG THERAPY FOR NURSING HOME (NH) RESIDENTS AMONG THE 3RD YEAR MEDICAL STUDENTS: A PILOT NEW WAY TO TEACH PHARMACOLOGY

H. Cheng, *Medicine, University of Virginia, Charlotteville, Virginia*

Background: integrating patients' value and preference of goals is not covered in traditional way to teach pharmacoly. Previous study has shown that goals prirotiy of drug therapy for geriatric patients from clinic and nursing home was symptom relief and improving function among patients, families, and medical interns. However, it is unknown how medical students rank goals priority of drug therapy for frail NH residents. This pilot study is to explore the third medical students how to rank goals priority of prescribing drug therapy for NH residents among five goals: 1). Relieve symptoms; 2). Reduce complications; 3). Live longer; 4). Reduce hospitalization; 5). Improve independent function. This could help medical educator design a new way to teach pharmacology in undergraduate medical education. Methodology: It was an observational study. Two-week geriatrics rotation was required for all third year medical students. One of clinical rotation sites was NH. After the 3rd year students interviewed and examined patients, they presented the case to the preceptor (author). At the end of presentation, the author asked students to rank goals priority of drug therapy for the NH residents they saw. Five goals were ranked from most important to very important, important, less important, and maybe important. Descriptive analysis was performed using SPSS. Results: twenty seven 3rd year medical students rated goals priority of drug therapy for NH residents they saw. 48% medical students ranked preventing complications as most important or very important goal and 74% ranked living longer as less important or maybe important goal of prescribing drug therapy for their patients. However, ranking goals priority varied among medical students. Conclusions: This small pilot study demonstrated that the 3rd year medical students ranked preventing complications as top goal priority of drug therapy for NH residents. Life-prolonging was ranked as the lowest goal priority of drug therapy, which was consistent with previous findings. This could reflect the immediate effect of the organ-based teaching pharmacology in pre-clerkship and brief exposure of geriatrics. Patients' value and preference in drug therapy should be integrated with teaching pharmacology in undergraduate medical education.

CLINICAL PLACEMENTS AND LONG TERM CARE: A SURVEY ASSESSMENT OF STUDENT NURSE ORIENTATION

J.S. Pohl[1], C. Leppa[2], S. Sikma[2], B.B. Cochrane[1], *1. University of Washington, Seattle, Washington, 2. University of Washington Bothell, Bothell, Washington*

Background: With the projected rise in the need for older adult nursing care, difficulties in recruitment and retention of nurses for gerontological nursing practice are identified in the literature as a significant societal concern. Research indicates that nurses find nursing home work to be less prestigious than other specialties that may require more technological proficiency. Researchers also report that a strong, supportive and welcoming orientation to this nursing specialty, when provided by the nursing leadership in the long term care (LTC) facility, may increase a student nurse's intention to choose this career specialty. The theory of reasoned action provides a useful framework for understanding the issues that guide a nurse's intention to follow a particular career pathway. Purpose: To evaluate orientations for student nurses as they begin their placements in LTC facilities. Methods: A survey was first conducted via email with eleven associate nursing degree programs. The second phase included telephone interviews with 27 Directors of Nursing Services from the LTC facilities that provided placements for the nursing programs. Quantitative and qualitative survey data was analyzed. Results: In 22 of the 27 LTC facilities, orientations were accomplished with new hire employee orientations. The nursing programs reported gerontology-specific coursework used in pre-placement, with only 4 of the 11 reporting an orientation in the specific facility. Conclusions/Implications: Research is needed regarding the potential for student nurse orientations to increase the number of nurses who choose gerontological nursing as a career specialty and best strategies for structuring such orientations.

SLEEP AND DAYTIME ACTIVITIES IN ASSISTED LIVING RESIDENTS WITH DEMENTIA: PILOT OF A PERSON-CENTERED CARE INTERVENTION

J. Li[1,2], Y. Chang[1,2], C.R. Jungquist[1], D. Porock[1,2], *1. University at Buffalo School of Nursing, Buffalo, New York, 2. Institute for Person-centered Care ; University at Buffalo, Buffalo, New York*

Introduction: Evidence suggests that more daytime physical and social activities enhance the normal sleep-wake pattern in people with dementia. Person-centered dementia care (PCDC) aims to improve the well-being of people with dementia by fulfilling their individualized needs and engaging them in meaningful physical and social activities. This pilot study aimed to examine the effects of training staff in PCDC on sleep in assisted living residents with dementia. Methods: Pre-post controlled study of twenty-nine residents living in two dementia units at different assisted living facilities. Staff were trained in PCDC with 3 modules of classroom-based experiential learning plus supervision and support in practice. The sleep-wake patterns and daytime physical activities were measured using Actiwatch for three consecutive days. Dementia care mapping was used to estimate social activity. Statistical analyses were performed using descriptive statistics, independent t-test, Chi-square, and paired t-test statistics. Results: Seventeen residents from intervention unit and six residents from control unit completed the study. The intervention group had significantly more nighttime sleep at posttest than pretest. After adjusting for baseline differences, intervention group exhibited significantly less daytime napping and higher physical activity as measured by actigraphy. No significant differences were found in nighttime sleep, sleep latency, sleep efficiency, and social activities between two groups Conclusions: PCDC approaches may be effective for improving sleep of residents with dementia. Randomized controlled studies of larger sample size are needed to confirm the beneficial effect of PCDC on sleep of assisted living residents with dementia.

THE UTILITY OF DO-NOT-HOSPITALIZE ORDERS IN REDUCING INAPPROPRIATE HOSPITALIZATIONS INLONG-TERM CARE

A.B. Cohen[1], T.R. Fried[1,2], *1. Department of Internal Medicine, Section of Geriatrics, Yale University, New Haven, Connecticut, 2. VA Connecticut Healthcare System, West Haven, Connecticut*

BACKGROUND: Do-not-hospitalize (DNH) orders have been proposed as a mechanism for reducing burdensome care transitions for long term care residents, but they are infrequently used. Little work has been done to understand the role of these directives in nursing homes. METHODS: Data from LTCFocUS.org were used to identify nursing homes in Connecticut with hospitalization rates in the highest and lowest deciles. In-depth, semi-structured interviews are being conducted with key respondents, including physicians, nurses, social workers, and administrators. Interviews are ongoing to reach thematic saturation; 12 have been completed, at 3 facilities. Qualitative content analysis is being performed concurrently with data collection. RESULTS: Major themes emerging from the data are: (1) End-of-life hospitalizations are not a priority. Nursing home staff concentrate efforts to reduce hospital transfers on identifying medical problems that can be treated in the facility. DNH orders are recognized as a way of limiting hospitalizations for end-of-life care, but such hospitalizations are not a primary focus. (2) A champion is needed. DNH orders are utilized more frequently when there is a leader who coordinates discussions and has a unified team. (3) Family perceptions remain a major barrier to DNH orders. Patients' families often lack the nursing home staff's understanding of the risks of hospitalizating frail elderly. CONCLUSIONS: Our interim analysis demonstrates that the limited use of DNH orders may reflect a need for nursing home staff to focus attention on end-of-life hospitalizations and more actively educate patients and families about the hazards of hospital transfers.

BURDEN OF HEPATITIS C AMONG ELDERS IN LONG-TERM CARE SETTINGS: A SYSTEMATIC REVIEW AND META-ANALYSIS

K. Alvarez[1], A. Smaldone[2], E.L. Larson[2], *1. Columbia University Mailman School of Public Health, New York, New York, 2. Columbia University School of Nursing, New York, New York*

Background: Although hepatitis C virus (HCV) is the most frequent cause of acute viral hepatitis in elders, there is a paucity of data on HCV prevalence in older residents of long term care facilities (LTCFs). The objective of this study was to estimate HCV burden in LTCFs and identify risk factors for disease transmission. Methods: A systematic search of MEDLINE, PubMed, and Scopus was performed to identify original research on HCV prevalence in elders living in LTCFs, using PRISMA guidelines. HCV risk factors were identified and included if statistically significant in regression analysis. A pooled HCV prevalence was estimated using a random effects meta-analysis model; heterogeneity was assessed with Cochran Q and I2 statistics. Results: Six studies met inclusion criteria. For all studies, primary objective was to assess HCV prevalence among institutionalized elders and primary outcome was HCV antibodies. Three were conducted in Europe and one each in the US, Canada, and Iran. All but one used a cross-sectional design. HCV prevalence varied from 1.4% to 11.8%. A pooled HCV prevalence of 3.3% (95% CI: 1.5%-7.2%) was estimated based on data from 1,920 LTCF residents; substantial heterogeneity was ($Q=51.1$, $p<.001$; $I2=90.2$). Significant risk factors for HCV include older age, female gender, transfusion history and short duration of LTCF residence. Conclusions: HCV infection is not uncommon in LTCFs. Precise estimation of prevalence was limited by heterogeneity between and within studies, as well as variation in sampling and recruitment methodologies. Routine surveillance for HCV infection of residents in LTCFs is warranted.

EVALUATING THE IMPACT OF ELDER-CLOWNING: AN INNOVATIVE APPROACH TO PERSON-CENTERED DEMENTIA CARE

R. Colobong[1], P.C. Kontos[1,2], L. Palma Lazgare[2], M. Binns[3,2], L. Low[4], K. Miller[1,2], C. Surr[5], G. Naglie[3,1,2], *1. Toronto Rehabilitation Institute-University Health Network, Toronto, Ontario, Canada, 2. University of Toronto, Toronto, Ontario, Canada, 3. Baycrest Centre for Geriatric Care, Toronto, Ontario, Canada, 4. University of New South Wales, Sydney, New South Wales, Australia, 5. University of Bradford, Bradford, United Kingdom*

Elder-clowning, which draws on artistic modalities such as music, humor, and slapstick, is a novel person-centered intervention for long-term care residents with dementia. The objectives of this study were to evaluate the impact of elder-clowning on challenging resident behaviors and quality of life, and health care practitioners' burden of care. Twenty-three residents and 16 practitioners in an urban long-term care home in central Canada participated. Each resident received two interactions per week with a pair of elder-clowns (approximately 9.5 minutes/visit) for 12 weeks. Outcome measures included the Neuropsychiatric Inventory-Nursing Home Version, Dementia Care Mapping, the Cohen-Mansfield Agitation Inventory, and the Modified Nursing Care Assessment Scale. A significant decrease in challenging resident behaviors and a corresponding increase in quality of life were observed over 12 weeks. The results for burden of care were conflicting. Findings suggest that elder-clowning can reduce challenging behaviors and improve quality of life in residents with dementia.

THE INFLUENCE OF PERCEIVED PERSON-CENTERED CARE ON RESIDENTS' LIFE ADJUSTMENT AND SATISFACTION IN LONG-TERM CARE SETTINGS

J. Yoon[1], B. Grau[2], G. Lee[3], Z. Yu[1], C. Moon[1], *1. School of Nursing, Univ of Wisconsin-Madison, Madison, Wisconsin, 2. UW Health, Madison, Wisconsin, 3. Dong-A University, Busan, Republic of Korea*

The recent trend of emphasizing person-centered care and homelike supportive environments in the care of older adults has become prevalent within long-term care settings. The term person-centered care is widely used and its underlying components have been well articulated in the literature. However, there are few valid instruments to measure the concept of person-centered care. Moreover, there is little empirical evidence delineating the relationship between person-centered care and the resulting outcomes in long-term care settings. The purpose of this study was to examine the relationship between perceived person-centered care and psychological outcomes (life adjustment and life satisfaction) for long-term care residents using a validated instrument to measure person-centered care. A total of 113 long-term care residents who were cognitively able to respond to the questionnaires were recruited from five long-term care facilities. Most participants were white (97%) and primarily women (73%) with a median length of stay of 240 days. Controlling for age, gender, race, length of stay, ADL function and type of facility, residents who perceived the care provided as more person-centered were likely to indicate higher levels of life adjustment to the facility ($\beta=0.50$, p-value<.0001) and higher levels of life satisfaction ($\beta=0.44$, p-value<.0001). The study findings highlight the importance of person-centered care to improve residents' life adjustment and satisfaction in long-term care settings. Further analysis of specific items within the perceived person-centered care scale may help develop strategies to improve residents' psychological outcomes, such as improving the interpersonal skills of staff and respecting residents' routines and preferences.

SALIVARY CORTISOL, DEPRESSION, AGITATION AND QUALITY OF LIFE IN RESIDENTS WITH DEMENTIA

D. Porock, Y. Chang, J. Li, *Institute for Person-Centered Care, University at Buffalo SUNY, Buffalo, New York*

Difficulties in caring for residents with dementia in long term care often stem from what are regarded as unpredictable behaviors including aggression, agitation, and resisting care-related activities. Challenging behaviors and poor quality of life are usually explained as inevitable consequences of neurological damage and to be expected in dementia. In person-centered care, residents' agitated behaviors are hypothesized to be related to the person-caregiver interaction and the cultural milieu of the facility as much as the degree of neurological damage. In this framework agitated behavior represents a distress response. To test these hypotheses, our study aimed to examine the associations between these variables. For 29 residents in two assisted-living dementia units, we analyzed relationships among salivary cortisol (over 2 days), Cornell Scale for Depression in Dementia (CSDD), Quality of Life-Alzheimer's Disease (QOL-AD), Cohen-Mansfield Agitation Inventory (CMAI) and Dementia Care Mapping (DCM) (structured observation of residents' behavior, mood and engagement). Residents had moderate-severe dementia, mean age 85, 80% female. About 55% presented flattened diurnal salivary cortisol profiles (FDSCP), 16% displayed early evening elevations; the remainder demonstrated relatively normal diurnal patterns. FDSCP was significantly associated with higher CMAI and staff rated CSDD and lower DCM Well/Ill Being scores (WIBs). In addition, DCM WIBs were significantly positively correlated with CMAI and staff rated QOL-AD, and negatively correlated with staff rated CSDD. Findings suggest that residents with moderate-severe dementia showed signs of chronic stress and may be particularly susceptible to stress dysregulation resulting in behavioral and emotional stress responses affecting quality of life.

PERSON-CENTERED CARE STAFF TRAINING AND OUTCOME IN LONG-TERM CARE FACILITIES: A SYSTEMATIC REVIEW

S. Rajamohan[1,2], D. Porock[1], *1. University at Buffalo, Buffalo, New York, 2. Roberts Wesleyan College, Rochester, New York*

Purpose and Background Providing quality dementia care and retaining staff is challenging in long-term care (LTC) facilities. Culture change involving the training of the LTC work force focusing on person-centered care (PCC) is recommended to increase staff satisfaction and improve the quality of care (QOC). Method PubMed, CINAHL, EBSCO and ProQuest databases were searched with published dates from 2003-2013, producing 98 journals. Review of the abstracts revealed 12 papers (randomized, quasi-experimental designs, mixed methods, systematic reviews and descriptive studies) for inclusion. Results Communication skills trainings, train-the-trainer model, mentoring and experiential evidence-based online learning approaches are effective in increasing staff knowledge about PCC and dementia. Web-based training programs are time and cost-effective training methods. However, knowledge of PCC did not always translate into daily practice and was identified as a gap. Conclusions and Implications PCC interventions are multifactorial and successful implementation of PCC necessitates management support. Staff education and training are significant strategies in promoting PCC. However, if knowledge does not impact daily care practices, the focus should shift to nursing schools before RNs are influenced by other traditional methods of care delivery. Integrating PCC-philosophy in undergraduate nursing education is essential as Registered Nurses (RN) lead the health care team in the LTC settings. Future research is required to examine the best staff development strategies for LTC staff in promoting PCC. Training will equip RNs to mentor CNAs and other nurses in improving QOC, thus enhancing the quality of lives of residents.

CAN SPECIFIC PHYSICIAN ORDERS ABOUT PAIN MEDICATIONS IMPROVE PAIN MANAGEMENT IN LTC?

T. Monroe[1,2], S. Mirsa[4], R. Habermann[4], R.L. Cowan[2,4], M.S. Dietrich[1,2,4], S. Bruehl[4], P. Newhouse[1], S.F. Simmons[3,4], *1. Vanderbilt University School of Nursing, Nashville, Tennessee, 2. Vanderbilt University Department of Psychiatry, Nashville, Tennessee, 3. Vanderbilt University School of Public Health, Nashville, Tennessee, 4. Vanderbilt University School of Medicine, Nashville, Tennessee*

Aim of Investigation: to determine if specific physician pain orders would improve pain outcomes in the NH setting. Methods: This was a longitudinal quality improvement project with a pre and post intervention among (N=43) NH residents. Trained research staff abstracted information from medical records, medical information, and their most recent MDS assessment. Two MDS scales were used to assess cognition (CPS) and physical functioning (ADLs). In addition to research staff observing routine delivery of care, chart documentation of pain medication administration was collected before and after the intervention. Finally, each participant was approached for interview by research staff before and after the intervention. Results: Median age=84, 76% were female, 67% were Caucasian, and 37% had dementia. The median LOS was 13 months. Participants were mild to moderately cognitively-impaired (CPS=3) and moderately physically-impaired (ADLS=17of 28). All participants were able to provide self consent. Prior to intervention, nurses were observed to ask participants about their pain in 21% of routine medication passes and this increased to 68% ($p<0.001$). Participants were observed to report pain at a rate of approximately 13% at baseline and this rate increased to 23% ($p = 0.065$). Conclusions: Results confirm that specific pain orders resulted in nurses asking about pain more frequently and administering more PRN pain medications. Our baseline observational data indicated that licensed nurses did not routinely ask residents about pain. Nurses anecdotally reported, as part of this study, that they knew which residents had pain and who preferred pain medicine although our study results indicated that this was not the case.

THE INFLUENCE OF THE LENGTH OF STAY ON RESIDENTS' LONG TERM CARE FACILITY ADJUSTMENT

Z. Yu[1], J. Yoon[1], B. Grau[2], *1. School of Nursing, University of Wisconsin Madison, Madison, Wisconsin, 2. UW Health, Madison, Wisconsin*

Moving into a long-term care facility is internationally recognized as a major life transition for older adults. It is important to explore how residents adjust to their new life environment over time after admission so health professionals can develop timely appropriate interventions to improve residents' quality of life. Despite several qualitative studies exploring life adjustment processes after admission, more research is still needed to understand how residents' life adjustment changes over time in long-term care settings. The purpose of this study was to examine the influence of length of stay in long-term care facilities on residents' life adjustment. Data were collected from four nursing homes and two assisted living homes by interviewing residents using validated questionnaires. A total of 113 cognitively intact residents completed questionnaires. Controlling for age, gender, race, ADL function, and type of facility, a regression analysis showed that a longer length of stay was associated with better life adjustment for long-term care residents (β=0.34, p-value=0.0009). However, additional ANOVA analyses indicated that the means of life adjustment scores by length of stay classifications did not show a linear pattern (95.1 [0–3 months], 92.2 [3–12 months], 97.8 [1–3 years], and 105.6 [over 3 years]). The study findings indicate that a longer length of stay might lead to better life adjustment for residents, but life adjustment may be an on-going dynamic process not a static state after stabilization. Further exploration is needed on why and how residents' life adjustment changes over time with a longitudinal research design.

LONG-TERM CARE AND OFFSPRING MENTAL HEALTH: EVIDENCE FROM THE HEALTH AND RETIREMENT STUDY

K. Rice, S. Ratliff, B. Mezuk, *Family Medicine and Population Health, Division of Epidemiology, Virginia Commonwealth University, School of Medicine, Richmond, Virginia*

Introduction Forty percent of individuals over 65 will require long-term care. Adult children frequently have an active role in the often-stressful decision of whether their parents move into a long-term care facility. To date there is limited research on how this transition affects the mental health of adult children. Methods Data come from the 2002-2010 waves of the Health Retirement Study. The sample is restricted to respondents with at least one living parent at baseline (N=7161). Depressive symptoms were assessed using the Center for Epidemiologic Studies-Depression scale. Generalized estimating equations with a Poisson function were used to assess the longitudinal association between parental residence (community-dwelling or long-term care) and depression within respondents before, during, and after a parent transitioned to long-term care, and between respondents who had a parent transition during the study period and those that did not. Models were stratified by age (50-60 and 61+) and adjusted for demographic and health characteristics. Results Over the study period 16% of respondents had a parent transition into long-term care. Among the younger cohort, parental transition was not associated with depressive symptoms (IRR: 0.96 CI: 0.88-1.03). Among the older cohort, there was suggestive evidence (p-value 0.07) that respondents with a parent who transitioned had a 10% decline in depressive symptoms (IRR 0.90 CI: 0.80-1.01). Conclusion Parental transition into long-term care does not have a lasting impact on the mental health of adult offspring, but further research is needed to assess the role of caregiving stress related to this transition.

THE PERCEPTION OF MOBILITY AND ACCESSIBILITY FOR RESIDENTS, STAFF AND VISITORS IN AND AROUND LONG-TERM CARE FACILITIES

E. Verté, L. De Donder, N. De Witte, D. Brosens, T. Buffel, A. Smetcoren, S. Dury, D. Verté, *Vrije Universiteit Brussel, Ixelles, Belgium*

This study examines how residents, staff and visitors of long-term care facilities experience accessibility in and around long-term care facilities in the Belgian province East-Flanders, and which barriers to mobility they experience. Both quantitative and qualitative designs were used. The preliminary quantitative survey (N=88 long-term care facilities) presented an overall view on accessibility. Based on the results thereof we selected 4 care facilities where participants reported relatively high levels of accessibility. In each one we conducted 3 focus groups with respectively residents (N=24), staff (N=22) and visitors (N=19). The focus groups aimed to give a deeper insight in the meaning of accessibility and mobility. The findings demonstrated five important dimensions of mobility of residents, visitors and staff of long-term care facilities: (1) Internal spatial component (e.g. importance of accommodation for social interaction nearby the resident's room); (2) external spatial component (e.g. the location and the age-friendly design of the neighborhood of long-term care facilities); (3) transportation component (e.g. low use-rate of public transportation); (4) Individual component (e.g. importance of the emotional aspect of the life in long-term care facilities); and (5) time component (e.g. time of season). Our findings stress the need for recognizing the various multidimensional facets of mobility in and around long-term care facilities. Simple guidelines and recommendations are therefore inadequate. Nevertheless, this study gives insight into the meaning of mobility and gives handles to improve the mobility for residents, visitors and staff.

PAIN, RACE AND FUNCTIONAL IMPAIRMENTS IN NURSING HOME RESIDENTS WITH ARTHRITIS

H. Ahn, C. Garvan, R.B. Fillingim, *University of Florida, Gainesville, Florida*

There are 1.4 million nursing home (NH) residents in the United States and the majority has pain and functional impairments. The purpose of this study was to examine the effect of pain and race on functional impairments in NH residents with arthritis. Data from the first comprehensive Minimum Data Set (MDS 3.0, 2013) were used in this study. Subjects included NH residents aged 65 years and older with arthritis who reported experiencing pain 5 days prior to assessment. Subjects (N = 5,852) had a mean age of 78.4 years (SD = 8.3 years) and the majority were female (76.4%). Seven percent were black (n = 414), 3% were Hispanic (n = 201), and 89% (n = 5,237) were white. The mean functional impairment score of the study sample was 15 (range: 0-28); and 50% reported having mild pain, 26% reported having moderate pain, and 24% reported having severe pain. Pain was a significant predictor of functional impairments ($p < .05$) such that more severe pain was significantly associated with increased functional impairment. Race also significantly predicted functional impairments ($p < .001$), such that Hispanics and blacks reported significantly greater impairment than whites. Also, race and pain significantly interacted to predict functional impairment. Specifically, pain was a stronger predictor of functional impairment in Hispanics and blacks compared to the whites ($p = .01$). These findings add to the growing literature regarding ethnic and racial influences on pain. Further investigation is needed to ensure that racial disparities in functional impairment are ameliorated.

LONG-TERM CARE ARRANGEMENTS AND POTENTIALLY AVOIDABLE HOSPITALIZATION

W. Chang, S. Wu, F. Lu, *Institute of Health Policy and Management, National Taiwan University, Taipei City, Taiwan*

Background: Potentially avoidable hospitalization (PAH) is an important quality of care indicator for people with long-term care (LTC) needs. The information of whether LTC arrangements influence the risk and medical utilizations of PAH is limited. The aim of this study is to examine the effects of LTC arrangements on PAH. Methods: We analyzed the data of a nationwide representative sample of 12054 persons aged 50 years or older from the 2002 National Long-Term Care Need Survey in Taiwan. The PAHs were identified according to the ambulatory care sensitive conditions. Four categories of LTC arrangements were defined: family care or home- and community- based services (HCBS), without caregiver, private care assistant, and LTC institutions. Multivariable logistic regression and generalized linear models with Poisson or gamma distribution and log link were applied to analyze the risk, frequency, length of stay (LOS), and medical cost of PAH in 2003. Results: After adjusting for other covariates, being in the care assistant group significantly increased the risk of experiencing a PAH by 16% (95% confidence interval (CI) = 1.02-1.32), number of PAHs by 19% (95% CI = 1.09-1.30), LOS by 41% (95% CI = 1.18-1.68), and cost by 32% (95% CI = 1.13-1.54) over the family care or HCBS group. The effect of LTC institution was even stronger (odds ratios ranged from 1.49 to 2.03, all with $p<0.001$). Conclusions: The findings indicated different LTC arrangements could influence the risk and medical utilization of PAH. Integration between LTC and medical care is needed to improve the quality of care and control medical costs.

SESSION 1050 (POSTER)

FROM HEALTH PROMOTION TO END-OF-LIFE CONCERNS

PREDICTING SNAP PARTICIPATION IN OLDER ADULTS: DOES AGE CATEGORIZATION MATTER?

S. Wilks, J.R. Geiger, M.M. Livermore, *School of Social Work, Louisiana State University, Baton Rouge, Louisiana*

Purpose Prior, Supplemental Nutrition Assistance Program (SNAP) research reveals limited age cohort analyses that may not accurately reflect nuanced age differences in SNAP participation. The purpose of this study was to add depth to older age analysis and SNAP participation via four models of age categorizations. Methods This secondary data analysis used a sample of 10,116 older adults from the 2010 Health and Retirement Study. Logistic regression tested four age categorization models, controlling for demographic, socioeconomic, and physical factors. Model A reflected Third Age (ages 60-79) and Fourth Age (80 and over) groupings. Model B consisted of young-old, middle-old, and oldest-old cohorts. Model C reflected decade cohorts. Model D reflected continuous age. Hypotheses for each model predicted older age as negative to SNAP participation. Results Significant predictors of SNAP participation included female gender, nonwhite non-Hispanic and Hispanic ethnicities, lower household income, inadequate food budget, and difficulty in self-dressing. Odds ratios confirmed age as a negative factor to SNAP participation. Addition of age categorizations into each model yielded nominal, effect size change. Yet, addition of age into the models changed the relationship between control variables and SNAP receipt, namely gender (higher female odds) and Hispanic ethnicity (lower odds). Implications While age categorizations offered marginal effect predicting SNAP participation, difficulty dressing most strongly predicted increased participation across all models. This finding is relevant, as standard SNAP participation models for younger individuals rely heavily on socioeconomic indicators. These results suggest future research modeling SNAP participation in older individuals that emphasizes physical/medical issues.

ADVANCE CARE PLANNING AMONG OLDER ADULTS: DOES SOCIAL STRATIFICATION PLAY A ROLE?

N. Khosla[1], A.L. Curl[2], K.T. Washington[3], *1. University of Missouri - Department of Health Sciences, Columbia, Missouri, 2. University of Missouri - School of Social Work, Columbia, Missouri, 3. University of Missouri - Department of Family and Community Medicine, Columbia, Missouri*

Older adults are often encouraged to engage in advance care planning (ACP), including completing written advance directives and having conversations with family members and friends, to increase the likelihood that the treatment they receive at end-of-life will be in accordance with their values and preferences. Existing research has generated mixed results with regard to rates of ACP behaviors and the extent to which social stratification factors predict these behaviors among older adults. We conducted a pooled regression analysis of data regarding 6,062 deceased individuals (mean age at death = 80.11 years, SD = 10.60) whose proxies were interviewed between 2002 and 2010 as part of the Health and Retirement Study. We studied three specific ACP behaviors: discussing end-of-life care preferences, providing written instructions for end-of-life care, and appointing a durable power of attorney. Results indicated that ACP behaviors increased among older adults between 2002 and 2010. Contrary to our hypothesis, social stratification factors (i.e., older age; higher education, income, and wealth; White race) did not significantly predict ACP behaviors or explain changes over time. Instead, time (i.e., year data were collected) and having an expected (vs. unanticipated) death were the only two variables that statistically significantly predicted all three types of ACP behaviors. Health-specific factors such as memory problems, cause of death, duration of illness, and location of death were significant predictors for certain ACP behaviors, providing potential target areas for ongoing efforts to increase ACP among older adults.

OLDER ADULTS' MOTIVATIONS FOR DRINKING: FINDINGS FROM A CONTINUING CARE RETIREMENT COMMUNITY

K. Burruss[1], C. Smith[2], P. Sacco[1], *1. School of Social Work, University of Maryland Baltimore, Baltimore, Maryland, 2. University of Maryland Baltimore County/University of Maryland Baltimore, Baltimore, Maryland*

Few studies have examined older adults' perspectives about their own drinking habits, and very little of this research has examined use among those residing in Continuing Care Retirement Communities (CCRC). The current study explored beliefs and attitudes about drinking among residents in a CCRC. We carried out in-depth individual interviews with eleven CCRC residents defined as regular drinkers (drank 6 of 8 days) based on data from a diary study conducted at a large CCRC in the Baltimore/Washington DC metropolitan region. Participants reflected the population of older adults in CCRCs in that they represented the "oldest-old" (mean age=82 years) and the majority were female (55%). In-person interviews focused on older adults' perceptions of their own current use of alcohol as well as in relation to their own drinking history, their experience of drinking in retirement, their understanding of alcohol use and health, the social context of their drinking, and perceptions of alcohol use as part of living at a CCRC. Older adults reported alcohol use as a long-term habit and normalized their drinking as a form of routine socialization carried forward from earlier life stages. Data suggest that older adults recognize that they may drink more as a result of being in the company of peers who are drinking and perceiving the CCRC as a setting where alcohol is readily available. Drinking may provide older adults living in a congregate setting with a sense of continuity from before retirement and preserve their identity and autonomy.

CORRELATES OF DEPRESSION AMONG OLDER PUBLIC HOUSING RESIDENTS

S.M. Cummings, S.M. Trecartin, R.L. Cooper, *Social Work, University of Tennessee College of Social Work, Nashville, Tennessee*

Depression affects 6.5 million Americans over the age of 65 (NAMI, 2009). Research indicates older adults living in deprived neighborhoods have heighten risk for depression (Kubinsky, 2005,). The current study examined the level and predictors of depression among older (50 years +) public housing residents (N=187). The Social Antecedents Model of Psychopathology was used to guide the rational selection of predictor variables. Over half (54.5%) of the participants were male, 74.9% were African American, and mean age was 66 (SD= 7.58). Eighteen percent were identified as having clinically significant depression. Because BSI depression scores were non-normally distributed, the generalized linear model with gamma distribution and a log link was used. Variables identified as being significantly correlated with depression (pain, functional impairment, health, years smoking, social support, opioid misuse, funds sufficiency, number of medical conditions) were entered into the regression model. Results indicated that pain, self-reported health, years smoking, social support, and opioid misuse predict depression LR $\chi 2$ (10) = 88.519, p <.001. Participants who misused opioids were 73.8% more likely to have increased depression than those who did not. For each unit increase in pain, depression increased by 5.8%. Each unit increase in self-reported health resulted in a 19.2% decrease in depression. For each additional year of smoking, there was a .9% increase in depression. A one unit decrease in social support resulted in a 2.9% increase in depression. Thus, current negative health conditions and behaviors and poor social support exerted the greatest influence on depressive symptomatology. Implications discussed.

SELF-RATED HEALTH AMONG OLDER ADULTS IN CHINA: FINDINGS FROM THE WHO STUDY ON GLOBAL AGEING AND ADULT HEALTH (SAGE)

N. Jiang[1], A.C. Mui[1], Y. Li[1], Y. Zhang[1], H. Chen[2], *1. School of Social Work, Columbia University, New York, New York, 2. Washington University in St. Louis, St. Louis, Missouri*

The secondary research is based on the WAVE I (2010) of the WHO Study on Global AGEing and Adult Health (SAGE). This study analyzed a nationally representative sample aged 60 and older from China (n = 4,817). Health status and residency differences were examined (urban=2,962; rural=1,853). Data showed that urban residents were older than their rural counterparts (mean age: 69.3 vs. 66.8), there were more women in the rural setting than in the urban area (64.9% vs. 52.3%), and urban elders were more educated (high school or above schooling) than rural elders (35% vs. 3%). In terms of physical well-being, rural elders reported poorer health than urban elders. Almost 26.2% of the rural elders reported poor to worse health conditions versus 16.3% of the urban elders. However, rural elders reported fewer numbers of chronic illnesses than urban elders (1.0 vs. 1.6). Data suggests that rural elders were less able to identify types of chronic illnesses that may be affecting them. Multiple regression results indicate that the elders who reported poorer self-rated health tended to be rural residents, male gender, not married, less sense of control, less financial satisfaction, lower level of psychological well-being, and more chronic illnesses. Findings point to the importance of taking into account all these correlates in designing health promotion and intervention programs to enhance the sense of physical well-being among the older population in China.

PREDICTORS OF ONLINE HEALTH INFORMATION SEEKING AMONG ELDERLY CANCER SURVIVORS

Y. Oh, A.L. Townsend, *Case Western Reserve University, Cleveland, Ohio*

The Internet can play a crucial role for elderly cancer survivors by providing health information, but little is known about online health information seeking (OHIS) by older cancer survivors. Drawing upon the Comprehensive Model of Information Seeking (CMIS, Johnson, 1997), this study examined predictors of whether elderly cancer survivors use the Internet for health information. Data came from 212 elderly cancer survivors (age ≥ 60 years, who reported ever having been diagnosed with cancer) in the 2012 Health Information National Trends Survey from the National Cancer Institute. OHIS was measured by whether the respondent uses the Internet to seek information about health or medical topics (yes/no). Four predictors were investigated: family cancer history (yes=62%/no=38%), salience (0=low to 6=high), self-efficacy (0=low to 4=high), and trust in the Internet (0=not at all to 3=a lot). Demographics (age, gender, education, income, employment status, and marital status), self-rated health, and cancer characteristics (cancer type and years since diagnosis) were control variables. Binary logistic regression results showed that odds of using the Internet for health information seeking were significantly higher for male than female survivors (OR = 2.26), and for survivors with higher levels of education (OR = 1.14), higher levels of salience (OR = 1.72) and higher trust in the Internet (OR = 1.80), all else equal. Findings highlight that survivors' perceptions to the Internet are significantly related to OHIS and that understanding the relationships between perception and Internet use provides a broader view of survivor's health care and self-management.

GERMANIMPACT: A COLLABORATIVE CARE MODEL FOR LATE-LIFE DEPRESSION IN THE GERMAN PRIMARY CARE CONTEXT

I. Wernher[1], F. Bjerregaard[2], L. Hölzel[3], M. Scherer[4], M. Härter[5], W. Niebling[6], H. König[7], M. Hüll[3], *1. Institute on Aging, Portland State University, Portland, Oregon, 2. Center for Geriatric Medicine and Gerontology, University Medical Center Freiburg, Freiburg, Germany, 3. Department of Psychiatry and Psychotherapy, University Medical Center Freiburg, Freiburg, Germany, 4. Department of Primary Medical Care, University Medical Center Hamburg-Eppendorf, Hamburg, Germany, 5. Department of Medical Psychology, University Medical Center Hamburg-Eppendorf, Hamburg, Germany, 6. Department of General Practice, University Medical Center Freiburg, Freiburg, Germany, 7. Department of Health Economics and Health Services Research, University Medical Center Hamburg-Eppendorf, Hamburg, Germany*

GermanIMPACT is an ongoing cluster-randomized controlled trial on the implementation of a collaborative, stepped care model to treat late-life depression in German primary care. We developed the concept as an evidence-based adaptation of a successful US American model (IMPACT). The model's key mechanism is the close collaboration of three professional care providers: a general practitioner, a specialized care manger, and a supervising mental health specialist. This "treatment triad" works with the patient to design an individually tailored, stepped intervention plan. Core elements of this plan, applied by the care manager, include: patient education, behavioral activation, relapse prevention, and training of problem solving techniques as needed. To evaluate the efficacy and cost-effectiveness of the intervention, we are comparing the development of depressive symptoms in 300 primary care patients (60+ years of age) with moderate depressive symptoms (ICD-10 diagnosis) who either receive treatment as usual or treatment according to GermanIMPACT. Positive outcomes will support the future integration of specialized care managers into outpatient depression treatment in Germany. A further purpose of the study is to evaluate the model's applicability to the German primary care setting, which differs significantly from the American context (e.g., regarding general practice office structures). Experiences gathered during the development and implementation of the study protocol yielded valuable insights with respect to care manager training, identification and enrollment of patients, and the establishment of communication structures between patient, care manager, general practitioner, and mental health specialist. GermanIMPACT is funded by the German Federal Ministry of Education and Research.

OLDER ADULTS ARE SUPPORTIVE OF GOVERNMENT AND INDUSTRY SODIUM REDUCTION EFFORTS IN LOS ANGELES COUNTY

T. Kuo[1,3], N. Barragan[1], L. Gase[1,2], P.L. Cummings[1,2], *1. Los Angeles County Dept. of Public Health, Los Angeles, California, 2. UCLA Fielding School of Public Health, Los Angeles, California, 3. David Geffen School of Medicine at UCLA, Los Angeles, California*

Introduction: Knowledge of daily recommended sodium intake is generally lacking in the population in spite of health marketing efforts to educate the public. This is especially relevant to older adults who are at higher risk of hypertension and cardiovascular disease. Recent efforts to reduce sodium in the food supply have focused on increasing demand for lower sodium food products through policies or business practices such as healthy food procurement. To date, a paucity of studies has examined public support for wide use of these approaches. This study addresses this gap. Methods: A telephone survey of registered voters in Los Angeles County was administered in English and Spanish among a registration-based-RDD sample of eligible adults. Interviews using a CATI system were carried out in October 2013. The interviews included questions on participant knowledge, attitudes and views about food access, food policy, program planning, and socio-demographics. Results: A total of 1,007 interviews were completed yielding a cooperation rate of 65.7%. Overall, 17.8% of the sample (n=179) were aged 65+; of this group, 36.9% (n=66) were male, 42.5% minorities (n=76), and 43.0% (n=77) reported being in very good/excellent health. More than 90% of older adults (aged>65) reported being supportive of policies or business practices that reduce sodium content in food industry products. Discussion: Survey participants, including older adults, are supportive of government and industry sodium reduction efforts in Los Angeles County. These efforts could complement national efforts to reduce cardiovascular disease morbidity such as the Million Hearts and National Sodium Reduction Initiatives.

PROVISION OF PALLIATIVE CARE BY HOSPICES IN FLORIDA: A STATEWIDE SURVEY

E. Sikorska-Simmons, H. Pletcher, C. Kursewicz, *UCF, Orlando, Florida*

Hospice was originally established as a specialized form of palliative care (PC) for terminally ill patients. With its emphasis on palliative medical treatments and psychosocial support, hospice aims to improve the quality of life for dying patients. Under the Medicare Hospice Benefit, treatments, including aggressive ones (e.g., chemotherapy, radiation, surgery), are covered if their goal is to relieve suffering and manage symptoms of terminal illness. Despite the recognition that palliative treatments are critical in quality hospice care, the extent to which hospices incorporate them has not been systematically assessed. This study examined the extent to which palliative medical treatments are provided by hospices in Florida. All 222 hospices (as listed by the National Hospice and Palliative Care Organization, NHPCO) were included. Data were collected from the NHPCO website and on-line searches of hospice programs. Of the 222 hospices, 58 (26%) offered PC consultation, including 39 (18%) that specialized in pediatric PC. According to NHPCO, 7 (3%) hospices had an "Operational PC Status," and 2 (1%) were in the planning stage. The contents of PC programs were examined according to the disease specific aspects of palliative treatments, the palliative care team, and the frequency of symptom assessment. This review suggests that few hospices offer access to palliative medical treatments. Delivering high quality hospice care to the rapidly growing population of older patients in Florida remains a major challenge.

URBAN-RURAL RESIDENCE, AREA ECONOMIC DEVELOPMENT, AND DEPRESSION OF OLDER ADULTS IN CHINA: A MULTILEVEL ANALYSIS OF THE CHARLS

L. Li, J. Liu, *School of Social Work, University of Michigan, Ann Arbor, Michigan*

This study aimed to investigate how urban-rural residence and area economic development are related to depression in older Chinese. We used data from the 2011 survey of the Chinese Health and Retirement Longitudinal Study (CHARLS) and included respondents aged 60 or older in our sample. Depression was measured by the 10-item Center for Epidemiological Studies Depression Scale (CESD-10). A community survey conducted by the CHARLS provided information about the type of community (urban or rural) that respondents lived in. Area economic development was indicated by GDP per capita of prefectures, obtained from Statistics Yearbooks of China. We merged the individual-level dataset with the community survey and prefecture-level data. A total of 4,692 individuals, 443 neighborhoods, and 125 prefectures were included in the analysis. Descriptive findings show that depression prevalence among older adults in China was 33.5%, and the rate was higher for those living in rural (37.3%) areas than it was for those in urban (23.0%) areas. Results from the 3-level logistic regression analysis show that effects of prefecture GDP on depression varied by community type; higher GDP was negatively correlated with depression for those living in rural communities, whereas prefecture GDP was not significantly correlated with depression for urban elders. Findings suggest that urban-rural differences in late-life depression vary by economic development of the area, and that rural elders living in economically backward prefectures are particularly vulnerable to depression.

THE IMPACT OF HEGEMONIC MASCULINITY ON THE HEALTH OF OLDER MEN

T.L. Peak, J. Gast, *Social Work Program, Utah State Univ, Logan, Utah*

This overview of recent research and interventions explores current efforts to improve men's health-related behaviors with special attention given to the hegemonic masculinity framework and its influence on those behaviors. Attention is focused on whether men's health-related behaviors change as they age, do men modify masculinity precepts in later life to better fit their changing health needs? If so, what influences these actions? Themes in the review include whether hegemonic masculinity and masculine gender scripts promote bad-for-you health-related behavior, the influence of age on men's health behaviors, and whether marital status modifies men's health behaviors. Also included is a discussion of the existing evidence that aging adults can change health-related beliefs and behaviors. For example, working with a group of 49 older adults (ages 52-91) Stephan and colleagues (2013), were able to successfully manipulate the older adults to feel younger through positive performance messages about a handgrip test; the older participants improved their scores of handgrip strength simply because they felt younger, no physical indicator had changed. Other examples of efforts to improve men's health-related behaviors include NIMH's Real Men/Real Depression campaign, North Carolina's PRECEDE health planning model, and interventions that deliver health education in male-friendly settings such as.barbershops and bars. Given the current attention being paid to men's health, e.g. their higher risk of morbidity and mortality, and the associated health care costs tied to those risks, the implications of this enhanced attention to improving men's health is quite timely.

LONELINESS AND DEPRESSION OF EMPTY NESTERS IN CHINA

X. Pan[1], J. Liu[2], L. Li[2], *1. Southwest University, Chongqing, China, 2. University of Michigan, Ann Arbor, Michigan*

Empty nesters refer to individuals whose children have all grown up and moved out of the household. This population will be over 100 million by 2014 in China. There are concerns about the well-being of the aging parents in the empty nest households. This study examined how socioeconomic status, social relationships and health status are related to depression and loneliness of empty nesters. The sample (N=500) was obtained from Western China through stratified sampling procedures. The respondents were equally distributed in gender, with 71.4% aged between 60 and 70, 66.4% living with spouse, 40.6% urban residents and 59.4% rural residents. Geriatric Depression Scale (GDS) and UCLA Loneliness Scale were used to assess depression and loneliness. Multiple linear regression was conducted to examine how socio-demographic characteristics (age, gender, urban/rural, socioeconomic status), social relationships (with children, relatives and neighbors), and health status (ADL) were related to depression and loneliness. Descriptive statistics show that 13.48% of the sample had significant depressive symptoms and 47.4% reported somewhat lonely. Regression results indicated that poor relationship with neighbors, living in rural areas and more ADL limitations were significantly associated with higher levels of depression. Being female, low economic status, poor relationship with children, poor relationship with neighbor, and more ADL limitations were significantly associated with higher levels of loneliness. Our findings suggest that some empty nesters are quite vulnerable and in need of service support.

RACIAL DIFFERENCES IN THE MEASURE OF RELIGIOSITY AND SPIRITUALITY FOR AFRICAN AMERICAN AND WHITE ELDERS

K.T. Chan[1], T. Tran[2], R. Miller[1], L. Jones[1], D. Andrade[1], S. Chun[1], J. Shi[1], S. Ahn[1], *1. University at Albany SUNY, Albany, New York, 2. Boston College, Chestnut Hill, Massachusetts*

Recent research has highlighted the role of religiosity/spirituality as a source of internal and/or external resources for aging populations. Religiosity/spirituality has been linked to improved family relationships, prosocial behaviors, forgiveness, social integration, and increased health and mental health, especially with elderly populations. The multidimensional nature of religiosity and spirituality has been elaborated on in past studies. Measurements used to capture religiosity and spirituality include religious identification, religious practices, religious participation, religious/spiritual coping, and spiritual experiences. This study aims to critically examine the cross-cultural psychometric properties of three measures of religiosity/spirituality newly created for the second wave of the Mid-Life in the US data: Religious/Spiritual Coping, Daily Spiritual Experiences, and Mindfulness. These measures capture a deep-felt sense of connection to others and to a higher power. Reliability and confirmatory factor analyses were conducted for separate samples of Whites (n = 2873) and African Americans 50 and older (n = 132). Results indicated that the Daily Spiritual Experiences and Mindfulness Scales have good internal consistency for both samples (Cronbach's Alpha > 0.84), while the Religious/Spiritual Coping Scale did not do as well for Whites (Cronbach's Alpha = 0.70) or African American elders (Cronbach's Alpha = 0.64). Additionally, confirmatory factor analyses suggest that African American elders perceive religious/spiritual coping differently, where abandonment from God was more strongly represented with African American elders compared to White elders. Results suggest that the perception of religiosity and spirituality is intertwined with structural issues of racism in the US.

PSYCHOLOGICAL FACTORS AND URBAN/SUBURBAN/RURAL HEALTH DIFFERENCES: FINDINGS FROM THE HRS

B. Gaines, B. Kim, J.S. Chae, S. Thapa, E. Dugan, *University of Massachusetts Boston, Quincy, Massachusetts*

Healthy aging is influenced by many factors that have been extensively examined in research. However, the role of psychological variables (i.e., mastery, self-efficacy, and constraints) on differences in health status among older adults living in urban, suburban, and rural areas is not established. Thus, the purpose of this study was to investigate demographic, functional, health behaviors, geographic residence, and psychological factors associated with health status among older community dwelling adults. We were especially interested in the role of rural residence and Hispanic origin as it relates to health. Data from the HRS Leave Behind Questionnaire (2010 wave) were analyzed. Our nationally representative sample consisted of 7,352 older adults (50+) living in the community with an average age of 65 years old. 58% of the sample was female, 60% of the sample was married, and 10% was either separated or divorced. Also, nearly 20% of this sample lived in rural areas. Logistic regression analyses showed that rural residence had no statistically significant relationship with health. However, significant relationships were found for demographic, functional, health behaviors, and psychological variables including marital status (OR 1.46), race (OR 0.52), education (OR .90), activities of daily living (OR 1.72), instrumental activities of daily living (OR 1.22), body mass index (OR 1.03), regular exercise (OR 0.55), cigarette smoking (OR 1.71), self-efficacy (OR 0.81), mastery (OR 0.89), and constraints (OR 1.18) (Pseudo Rsq 0.23, p<.01). The results show the role of psychological variables on health as it relates to older adults living in various geographic regions.

STAFF KNOWLEDGE AND PERCEPTIONS OF SEXUALITY OF OLDER ADULTS IN NURSING HOMES

M. Szumska[1], M. Grabowska[2], *1. University of Kansas, Lawrence, Kansas, 2. Kazimierz Wielki University, Bydgoszcz, Poland*

Introduction: A number of barriers exist for older adults' sexual expression in nursing homes. One of them is staff's lack of knowledge about sexuality and their attitudes towards sexuality among older adults. Nursing home staff attitudes impact upon how older adults perceive and manage their sexuality. However, how sexuality in later life is perceived and managed by nursing home staff remains relatively unexplored. Out of the few studies conducted on the subject, most examined Western cultures, and even less is known Eastern cultures. The purpose of the study was to explore cultural beliefs regarding sexuality in nursing homes in Poland. Methods: Fifty nursing home personnel who were involved in providing care for older adults, were asked to complete the Brief Sexual Attitudes Scale and the Aging Sexual Knowledge and Attitudes Scale. Results: A majority of participants indicated that they felt embarrassed talking about sexuality and viewed older adults' sexual expression as problematic (75%). The responses to ASKAS showed that nursing staff had limited knowledge about older adults' sexuality. The positive attitudes toward sexuality in the elderly was positively correlated with permissive attitudes towards sexuality. Older participants had more positive attitudes towards sexuality among older adults than younger participants. Conclusion: The results suggest that staff's knowledge of sexuality supports the need for educational interventions on sexuality in nursing homes. Sexuality of older adults should be discussed during trainings for nursing home staff. There is also a need for creating a clear guideline for staff that address sexuality of older adults.

PSYCHOLOGICAL PREDICTORS OF EATING PATHOLOGY IN OLDER WOMEN

A. Kronen, E. Midlarsky, *Columbia University, Teachers College, New York, New York*

At any age, the physical repercussions of an eating disorder are myriad, but the risks are even greater for older women than for younger women. The older body is generally more vulnerable, as organ systems have weakened or become diseased,Eating disorders are generally considered to affect females during adolescence and early adulthood, but there has been a growing recognition that eating disorders occur in middle aged and older women as well. The current research employed a sample of 245 women aged 60-90, obtained using an Internet survey, and designed to assess the psychological risk factors associated with eating pathology in this age group. A hierarchical regression analysis was used to examine the relationship between eating pathology and predictors. Results indicated that the variables significantly associated with eating pathology—perfectionism, depression, and sociocultural pressure to be thin—closely parallel those previously reported for both younger and middle aged women.

DOES THE CANADIAN MEDIA PROMOTE NEGATIVE STEREOTYPES ABOUT AGE-RELATED HEALTH CONDITIONS?

S. Fraser[1,2,3], V. Kenyon[1,2], W. Wittich[3,1,5], M. Lagace[4], K. Southall[1,2], *1. McGill University, Montreal, Quebec, Canada, 2. Institut Raymond Dewar, Montreal, Quebec, Canada, 3. MAB-Mackay, Montreal, Quebec, Canada, 4. University of Ottawa, Ottawa, Ontario, Canada, 5. Concordia University, Montreal, Quebec, Canada*

Negative stereotypes about people with health conditions (e.g., presbycusis, macular degeneration) can influence help seeking behaviours. The current discourse analysis study examined how health conditions and assistive technologies are presented in print media. Specifically, newspaper articles from The Globe and Mail (2009-2013) were selected if they included text on specific search strings (i.e., seniors, vision, hearing, health, and assistive devices). Of the 1248 articles identified, 68 fit the inclusion criteria for the study: the article had to refer to an individual with a health condition as well as to a stereotype related to that health condition. A qualitative discourse analysis of these texts was conducted. Coding of the text revealed stereotypes of: inevitable decline, economic and family burden, as well as incompetence. Consequences of the stereotypes associated with health conditions included: isolation, shame, discrimination and a reduction in help seeking behaviours. A subset of the articles were coded 'stigma layering', such that they included ageist stereotypes as well as stereotypes about a health condition, or stereotyping of multiple health conditions, a "double-whammy". The discourses about assistive technologies (ATs) were both negative and positive. Although the articles described ATs as facilitating communication and functional autonomy, they also included negative characterizations of AT users. Health promotion campaigns addressing age-related health conditions and assistive technologies may help reduce stigma, and increase social inclusion and help seeking behaviour.

TRAJECTORIES OF BODY MASS INDEX AND ALL-CAUSE MORTALITY: FINDINGS FROM THE NATIONAL SURVEY OF THE JAPANESE ELDERLY

H. Murayama[1,2], J. Liang[2], J.M. Bennett[2], B.A. Shaw[3], A. Botoseneanu[2], E. Kobayashi[1], H. Akiyama[4], S. Shinkai[1], *1. Research Team for Social Participation and Community Health, Tokyo Metropolitan Institute of Gerontology, Tokyo, Japan, 2. University of Michigan, Ann Arbor, Michigan, 3. State University of New York at Albany, Rensselaer, New York, 4. The University of Tokyo, Tokyo, Japan*

Background: Little research has addressed the association between the heterogeneity in long-term changes in body mass index (BMI) and all-cause mortality in old age, particularly in a non-Western population. Such researches could provide useful recommendations on weight management to improve the health status of older adults. Methods: We evaluated this relationship by applying latent class trajectory models to data derived from the National Survey of the Japanese Elderly, which consisted of 4,869 adults aged 60 and older, with up to seven repeated observations between 1987 and 2012. Results: Four distinct trajectories of BMI were identified: (a) underweight (BMI=18.8 at baseline) with a slow decline over time (23.8%); (b) normal but slowly decreasing weight (BMI=21.9 at baseline) (44.6%); (c) high-normal (BMI=24.8 at baseline) with a slight decrease (26.5%), and (d) persistently high-overweight (BMI=28.7 at baseline) (5.2%). Survival analysis with average follow-up of 13.8 years showed that the underweight subgroup had higher risk of dying (HR=1.12), while the high-normal-weight and high-overweight subgroups had lower risk of dying (HR=0.82 and 0.73, respectively), compared with the normal-weight subgroup. These results were robust, even after controlling for demographic and socioeconomic characteristics, health behaviors, chronic diseases, self-rated health, and functional status at baseline. Conclusion: In sharp contrast with prior observations made in Western populations, our research from Japan identified the trajectory of underweight and found that this trajectory was a significantly higher risk of mortality in old age. On the other hand, trajectories characterized by high normal weight and high overweight were associated with lower mortality.

MARITAL STATUS AND SEVERITY OF DISABILITY AMONG COMMUNITY-DWELLING ELDERS BETWEEN 2000 AND 2010

M. Dai[1,4], B. Stuart[2], S.E. Tom[2], P. Roberto[2,3], E. Sheldon[1,4], *1. Division of Gerontology, University of Maryland Baltimore School of Medicine, Baltimore, Maryland, 2. Department of Pharmaceutical Services and Research, University of Maryland Baltimore School of Pharmacy, Baltimore, Maryland, 3. Pharmaceutical Research and Manufacturers of America, Washington, District of Columbia, 4. Doctoral Program of Gerontology, University of Maryland Baltimore County, Baltimore, Maryland*

Background Marital status has been found to influence various functional outcomes of older adults. Being married appears to be most beneficial for elders with disability in terms of receiving help as compared to being widowed, divorced or never married. However, it is unknown whether marital status is associated with the severity of disability. Methods This study included 42,349 unique community-dwelling elders aged 65 years and older drawn from Medicare Current Beneficiary Surveys (MCBS) from 2000 to 2010. Disability was defined as no disability, any limitation to Instrumental Activities of Daily Living (IADL), mild disability (1-2 limitations in Activities of Daily Living), and moderate-to-severe disability (3+ ADL limitations). The impact of marital status on the risk of disability at defined severity levels was estimated by multinomial logistic regression models adjusting for socio-demographic characteristics and self-reported chronic conditions. Results Overall, moderate-to-severe disability among community-dwelling elders had declined by 15% since 2000. Married elders were most likely to be disability-free and least likely to have mild disability compared to never married, divorced and widowed elders. The risk of moderate-to-severe disability was 38%, 34%, and 37% higher, respectively, for widowed, divorced or never married elders, respectively, compared to their married counterparts. Conclusions Independent of the effect of socio-demographic profile and health conditions, marital status affects the risk of disability. Being married confers the greatest benefit in reduced risk of moderate-to-severe disability. Disability interventions targeting community-dwelling elders should consider marital status as a risk factor.

THE TRANSITION FROM LIVING WITH TO DYING FROM CANCER: HOSPICE ENROLLMENT DECISION-MAKING

D. Waldrop[1], M. Meeker[1], J. Kutner[2], *1. University at Buffalo, Buffalo, New York, 2. University of Colorado, Denver, Colorado*

Despite increases in hospice utilization, older cancer patients have shorter enrollments than people with other terminal illnesses. How older cancer patients and their families make hospice decisions is largely unknown. The purpose of this study was to compare decision-making in late-stage cancer in people who enrolled in hospice with those who declined or were ineligible. In-depth interviews included open-ended questions about the illness trajectory and decision-making process as well as scaled measures of quality of life, activities of daily living and social support. Study participants included 42 patients (24 non-hospice and 18 hospice) and 38 caregivers (15 non-hospice and 23 hospice) for a total sample of 80. Concepts from the Carroll and Johnson (1990) decision-making framework guided the development of a hospice decision-making model. The phases include: Recognition, Information and Communication, Formulation, Alternative Generation, and Evaluation. Recognition that the cancer had become advanced was similar in both groups. Information and communication needs were present in both groups across the illness trajectory. Formulation: Hospice patients reported greater physical decline, higher symptom burden that was life changing; non-hospice participants described the changes as livable. Alternative Generation: The availability of cure-focused treatment was highly influential; hospice patients had no options while 80% of the non-hospice patients were either eligible or receiving active cancer treatment. Evaluation of hospice enrollment was understood as a future option in the non-hospice group. Hospice patients described enrollment as a substantive cognitive shift and an identity transformation. Practice implications: provider sensitivity about this life-changing decision is crucial.

THE IMPACT OF FLORIDA'S NURSE STAFFING POLICIES ON NURSING HOME QUALITY OF CARE

K. Smith[1], K. Hyer[1], K. Thomas[3], J. Harman[4], C. Johnson[2], R. Weech-Maldonado[5], *1. Florida Policy Exchange Center on Aging, School of Aging Studies, University of South Florida, Tampa, Florida, 2. Department of Health Services, University of Washington, Seattle, Washington, 3. Department of Health Services, Policy and Practice, Brown University, Providence, Rhode Island, 4. Department of Health Services Research, Management & Policy, University of Florida, Gainesville, Florida, 5. Department of Health Services Administration, University of Alabama at Birmingham, Birmingham, Alabama*

A report from the Centers of Medicare and Medicaid Services in 2001 recommended a federally mandated increase to 4.1 hours per resident day (HPRD) for direct care staffing in U.S. nursing homes (NHs). In the absence of federal action, many states enacted legislation to improve the quality of care in NHs. Florida was the first state to significantly increase staffing for all facilities allowing examination of changes of quality associated with incentives to increase direct care staffing in 2001 and mandated increases in 2002 and 2003. Utilizing Donabedian's structure process outcome model and data from 1999 to 2007, this longitudinal study analyzes the relationship between legislative staffing efforts and facility-level process and outcome measures and compares quality in 552 Florida NHs to 285 Tennessee NHs, a similar southeastern state which did not implement staffing initiatives to improve quality. Generalized estimating equations with a Gaussian distribution and a log link function were utilized to compare process and performance-based outcome measures. Results indicate that increased mandates for certified nursing assistants were significantly associated with improvement in 4 point ADL decline (Est. = -.003, p<.0001) and bladder incontinence (Est.= -.004, p=.012). Increases in RN staffing was associated with improvement in bladder incontinence (Est.= -.086, p<.001) and bowel incontinence (Est.= .026, p<.0001). Findings illustrate the success of Florida's state policy which targeted nursing home quality improvement through legislative efforts to increase direct care staffing levels.

USE AND PATTERNS OF OSTEOPOROSIS PHARMACOTHERAPY IN MEDICARE BENEFICIARIES WITH OSTEOPOROSIS

F. Loh, *University of Maryland School of Pharmacy, Baltimore, Maryland*

Background: It is unknown how clinicians use the guideline suggested evidence-based medicines to treat osteoporosis in the elderly. Study Design: Pooling from a random 5% sample of Medicare beneficiaries, this study included 90,956 women and 8,465 men with osteoporosis aged 70 years and older enrolled in stand-alone Part D plans from 1/1/2006 through 12/31/2008, or death and examined the impact of residential status on (1) use of any and (2) use of a specific class of the 5 FDA-approved classes of drugs for osteoporosis treatment/prevention. Residential status was defined as community only, LTCF only, and both. A modified Poisson regression was used to assess the impact of residential status on any use and a multinomial logistic regression to measure the effect of residential status on use of a specific class of osteoporosis pharmacotherapy. Principal Findings: Prevalence of osteoporosis medication use ranged from 46.6% to 44% in women and 25.2% to 24.5% in men from 2006 to 2008. Prevalence of use was the lowest among women (35.4% to 31.8%) and men (24.3% to 21.6%) in LTCF only. Bisphosphonates were the top choice of medication prescribed and prevalence of use ranged from 76.4% to 78.3% among female and 91.3% to 93.3% among male medication users. Calcitonin was much more likely to be prescribed to women and men in LTCF only and in both settings than in the community only. Conclusions: Prevalence of use of osteoporosis medication is especially low in LTCF residents, and patterns of osteoporosis pharmacotherapy differ substantially by residential status.

ANTIPSYCHOTIC UTILIZATION IN MEDICARE PART D BENEFICIARIES WITH SEVERE MENTAL ILLNESS IN WASHINGTON

I. Pintak, *School of Social Welfare, University of California Berkeley, Berkeley, California*

Medicare Part D is insurance for people who are either disabled or over 65 years old or suffer from End Stage Renal Disease. It provides coverage for outpatient prescription drugs and is a departure from the traditional Medicare program in which the benefits are uniform. Coverage has a minimum drug formulary packaged in a standard plan or an actuarially equivalent plan that offers more benefits. Objective: (1) to examine the effects of coverage on utilization of select antipsychotic drugs, (2) to understand out-of-pocket expenditure patterns among beneficiaries with schizophrenic and bipolar disorders in Washington State. Design: a cross-sectional, retrospective study design using 2008 Part D Event data derived from beneficiaries with schizophrenia and bipolar disorders (1922 unique individuals). Measurements: utilization of four antipsychotics (in Proportion of Days Covered/PDC) and out-of-pocket expenditures before the gap-in-coverage period (pre-ICL), during the gap-in-coverage period (ICL), and post gap-in-coverage period (post-ICL). Results: For all antipsychotics, the greatest percentage of PDC adherence was during the post-ICL period with the exception of olanzapine. PDC adherence dropped for all antipsychotics during the ICL period except for quetiapine. Out-of-pocket expenditure per prescription fill measured in patient pay amount ranged from zero to $1169.82. Non-adherent beneficiaries (low PDCs) paid a greater average than adherent beneficiaries: low PDC beneficiaries paid an average of $27.95 and a median of $2.25, while high PDC beneficiaries paid an average of $7.50 and a median of $ 0. Conclusion: Utilization of antipsychotics is affected by the extent of coverage of Part D plan designs.

HOW DO SEXUAL MINORITY OLDER ADULTS NEGOTIATE SEXUAL ORIENTATION DISCLOSURE TO HEALTH CARE PROVIDERS?

S.A. Keary, *Boston College Graduate School of Social Work, Chestnut Hill, Massachusetts*

Sexual minority older adults have been shown to have poorer health outcomes as compared to heterosexual individuals of the same age group. There are a number of possible explanations for these health disparities, such as their increased likelihood of living alone, being childless, being single, having had limited access to health care and a history of negative experiences with the health care system. Fear of rejection or discrimination may prevent sexual minority older adults from disclosing their sexual orientation and/or gender identity (SOGI) to their physicians. This study uses qualitative data from the Health and Social Life of Boston-Area Elders that were collected from 22 sexual minority older adults between 2009-2011 to explore the processes of sharing their SOGI with their physicians. Constant comparative analysis was used to understand facilitators of and/or barriers to sexual minority older adults' SOGI disclosure to their physicians. Many participants reported having disclosed to their health care providers; however, there is variation in how they came to share this information. Participants tended to disclose if they either they knew or assumed their physicians were also gay, if participants were HIV positive, or if they were asked directly. Others were unsure whether or not their physicians knew this information about them, highlighting the difference between discussions about sexual health and SOGI. Participants suggested ways in which physicians could communicate support for sexual minority individuals, which could offer a positive step toward beginning to address health disparities among sexual minority older adults.

TRAJECTORIES OF TERMINAL DECLINE AND THE IMPLICATIONS FOR END-OF-LIFE CARE

J. Xu, *1. University of Maryland, Baltimore County, Baltimore, Maryland, 2. University of Maryland, Baltimore, Baltimore, Maryland*

A trajectory is a pattern of change over time. Trajectories of terminal decline has been increasingly investigated and discussed, however, not yet been integrated with the practice of end-of-life care. A systematic review is conducted and fifteen epidemiological studies of terminal trajectories are identified since 2000. Results suggest dying course is complex and heterogeneous, and policy reform is needed to make end-of-life care be available to and benefit a larger elderly population. There are four theoretical trajectories for terminal functional decline: sudden death, cancer, organ failure, and frailty. However, categorization and measurements are inconsistent across studies. Elder individuals often suffer from multiple chronic conditions, a series of social, psychological and spiritual distress, as well as symptom burdens, which make death a complicated event. The current Medicare Hospice Benefit and end-of life care model were established mainly for people with cancer or people with six-month of life-limiting prognosis. A proper end-of-life must be multi-dimensional over different trajectories, which calls for strategies that drive practical changes. It is important for medical professionals and policy makers to be aware of the variation in terminal trajectories and the unpredictable death events for people with progressive decline, such as frailty and cognitive impairment. After attending the poster session, participants will be able to: 1. Identify different trajectories of terminal functional decline. 2. Understand symptom burdens and the psychological, spiritual and social decline trajectories at the end of life. 3. Discuss the policy implications of terminal decline trajectories on the current end-of-life care system.

DYING ALONE AND END-OF-LIFE PLANNING: OLDER LGBT ADULTS' PERSPECTIVES AND PERCEPTIONS

K. Niles-Yokum[1], M. Brennan-Ing[2], D.L. Wagner[3], K. de Medeiros[4], *1. York College of PA, York, Pennsylvania, 2. ACRIA, New York, New York, 3. New Mexico State University, Las Cruces, New Mexico, 4. Miami University, Oxford, Ohio*

Fear of dying alone is common among older adults in general and is of concern for members of the LGBT community. While the prevalence of dying alone is increasing in many countries including the US, research on this topic is limited. We report on findings from a survey examining issues specific to dying alone and end-of-life planning in the lesbian, gay, bisexual and transgender (LGBT) community. These older adults are less likely to have a partner/spouse, have fewer children, and more likely to live alone than heterosexual counterparts. Our survey was fielded through LGBT advocacy groups and distributed its members. Respondents (N = 85) were highly educated, female (60%), and living with a significant other (59%). A relatively large proportion of respondents had done end-of-life planning (68%); compared to a 28% of the US population in general (CDC, 2012). Nearly half of the respondents were at risk for dying alone (44.9%). This poster will provide an analysis of the respondent characteristics as well as the factors that are associated with end of life planning and concerns about dying alone within the LGBT community, as well as practice and policy implications of these findings. Such implications include encouraging providers working with older LGBT adults who are isolated to address end of life planning issues. Overall, the implications of these findings may be generalized to other groups of older adults who may lack caregiving resources due to geographic dispersion or unavailability of family members and face end-of-life decisions alone.

SESSION 1055 (POSTER)

COMMUNITY CARE AND VULNERABLE ADULTS

LAWYERS FOR WARDS?: LEGAL AND ETHICAL BARRIERS TO PROTECTING RIGHTS OF OLDER ADULTS

N. Kohn[1], C. Koss[2], *1. Syracuse University, Syracuse, New York, 2. Gerontology, University of Kansas, Lawrence, Kansas*

Approximately 1.5 million adults in the U.S. are subject to guardianship. When a court appoints a guardian for an older person, the person becomes a "ward" and typically loses a wide range of rights, including the right to choose where to live, accept or reject medical treatments, manage finances, and decide with whom to associate. If a ward objects to the guardian's decisions or to having a guardian, her only legal recourse is to seek court intervention. As a practical matter, this requires legal representation. Unfortunately, the ethical rules governing attorney conduct are often interpreted as preventing lawyers from zealously representing wards, or even representing them at all. Our study of U.S. case law and ethics opinions issued by state bar associations finds significant disagreement about what an attorney's role is when representing a ward. Courts and bar associations take three competing approaches: (1) expressed interest advocacy, where the ward directs the attorney much as any other client would; (2) best interest advocacy, where the attorney defines the client's interests; and (3) derivative representation, where the ward's attorney takes directions from the guardian. We propose that expressed interest advocacy, in which the ward directs and defines the objectives of the representation, is the proper model. It is consistent with attorneys' underlying ethical obligations and maximizes the autonomy of wards. However, we identify significant obstacles to implementing this model, including the ward's lack of legal capacity, conflicting ethical duties, paternalistic attitudes, and denial of the adversarial nature of guardianship proceedings.

HOME AND COMMUNITY-BASED SERVICE USE BY VULNERABLE OLDER ADULTS

R.H. Weaver, K.A. Roberto, *Human Development, Virginia Tech, Blacksburg, Virginia*

Home and community based services (HCBS) are designed to provide services that meet the increasing and diverse needs of the older adult population who wish to age in place for as long as possible in their homes and community. Yet, little is known about selection of services. The purpose of this study was to assess HCBS use among vulnerable older adults. Andersen's (1995) behavioral model of health services use provided theoretical guidance for selecting and explaining predisposing, enabling, and need-based variables associated with service use within the Community Living Program (CLP) federal initiative. Through consumer direction of services, 18 routine or one-time services were offered to 86 participants enrolled in the Virginia CLP. Two-step cluster analysis identified four distinct, naturally occurring profiles of service users, ranging in size from 7 to 34 members. Services used within the groups ranged from 11 to 16 services. Use of personal care services (p=.033) and respite (p=.010) were significantly associated with membership differentiation. Within each cluster, the percentage of participants using each service varied greatly. The most important variables that differentiated service user membership were caregiver relationship to participant, participant living arrangement, participant disability type, and length of time caregiver provided care. Between-cluster membership was significantly different with regard to average service cost per day (p=.002) and the likelihood of moving to a nursing home if services were not provided (p=.047). Findings inform future research and have implications for practitioners assisting vulnerable older adults in selecting services to meet different care needs.

FAMILY TRANSITIONS IN EARLY ONSET DEMENTIA: A QUALITATIVE FRAMEWORK ANALYSIS

P. Roach, N. Drummond, *University of Alberta, Edmonton, Alberta, Canada*

As the global focus on dementia care increases due to the demand on health, social, legal and financial services it is imperative to further understand the experience of those living with a diagnosis of dementia. Within this area, a particular lack of research focused on younger people (under the age of 65) with dementia exists as this population does not easily fit into current research, policy and practice structures and as such are often located with gerontological services. The study reported here focuses on the family experience of transition in early onset dementia, as transitions have been reported to significantly increase stressors on families living with early onset dementia. These experiences were explored during the course of a qualitative repeated interview study with younger people with dementia and their families. Nine families (20 participants) took part in semi-structured research interviews that were transcribed and analysed using a Framework approach to qualitative analysis, resulting in over twenty hours of interview data. Four overarching themes have emerged from the Framework analysis: 1) Diagnosis; 2) Finances; 3) Relationships; and 4) Meaningful Activity. These themes are discussed in relation to how a greater understanding of the lived experience of early onset dementia may have significant clinical implications in the provision high-quality, age-specific services for this population. Such provision has the potential to decrease the direct and indirect costs of dementia to global economies while also impacting the quality of life for younger people with dementia and their families.

LIVING ALONE WITH COGNITIVE IMPAIRMENT: A CALL TO ACTION

A.K. Gibson, *College of Social Work, The Ohio State University, Columbus, Ohio*

Background: In 2012, the Alzheimer's Association proposed a "call to action" to address the needs of older adults living alone with cognitive impairment (CI). The report concluded that studies of those living alone with dementia are extremely limited— primarily due to the challenges in recruiting participants for research (see Soniat, 2004). While most individuals diagnosed with dementia live with a caregiver, as many as 800,000 of individuals diagnosed with CI live alone—perhaps without any identified caregiver (Alzheimer's Association, 2012; Webber, Fox & Burnette, 1994; Prescop, Dodge, Morycz & Ganguli, 1999; Nourhashemi et al., 2005). As these individuals may have little or no support for conducting activities of daily living (ADLs) (Nourhashemi et al., 2005), they are likely to be even more isolated from formal sources of support (Miranda-Castillo, Woods & Orrell, 2010; Tierney et al., Tuokko, MacCourt & Heath, 1999; Webber, Fox & Burnette, 1994). Further, research has found this population is more likely to be undiagnosed for their CI (Edwards & Morris, 2007; Waugh, 2009). Methods: A cross-sectional survey design was utilized to better understand the population of persons living alone with CI. The National Health and Aging Trends Study (NHATS, 2011) is a nationally-collected and publicly available dataset which annually collects self-reported measures of CI on study participants sixty and older. A sample of 1,554 individuals, living on their own in a private residence met the criteria for the study (n=1554). Descriptive statistics were generated to describe the sample of persons living alone with CI. Scale means, standard deviations, and correlations will also be presented. Results: Of those living alone with CI, 73.8% were female. While many had identified formal supports from family, much of the population was utilizing friends and neighbors as care providers. While 49.4% received mild to severely impaired cognitive impairment scores, only 3.0% reported they had been formally diagnosed with a form of Alzheimer's or dementia. Conclusions: Presentation will conclude with some suggestions on how to possibly alleviate challenges diagnosing CI for persons living alone, as well as recommendations for providing a continuum of social support services to this unique population.

TRAJECTORY OF HEALTH AND FUNCTIONING OF MINORITY IMMIGRANT ELDERS: A LATENT GROWTH CURVE ANALYSIS

H. Luo, T.Y. Lum, G. Wong, N. Jiang, *Sau Po Centre on Ageing, The University of Hong Kong, Hong Kong, Hong Kong*

Using 1992 to 2010 longitudinal data from the Health and Retirement Study, this study investigated the health trajectories over the life course for non-immigrants, and immigrants who came to the United States at different age. This research analyzed the initial HRS cohort (born 1931 to 1941) in the US (N=8,803). Birth place was examined (foreign born=864). The outcome variables included biennial measure of whether they were still alive or not, self-reported health, number of ADL/ IADL difficulties, depression (CES-D), and number of diagnosed diseases. We fit Cox proportional hazards models to identify the risk factors of mortality. Latent Growth Curve (LGC) modeling is performed to estimate changes of different health outcomes across the 18-year period. The results indicated that immigrants are 39% less likely to die than their non-immigrant counterparts. Further, estimates from LGC analysis showed that immigrant elders reported significantly worse health conditions and ADL, with a faster rate of deterioration. Immigrants also reported a higher level of depression. However, the decline rate of mental health was slower among immigrants than non-immigrants. When comparing across the immigrant groups, elders who moved to the United States at the older age (50 or older) had a hazard ratio of 28% comparing with the younger age (below 18) group. Findings point to the importance of considering all these correlates in improving the overall quality of care for minority immigrants to reduce racial and ethnic health disparities among older population in the US.

CAN YOU DETECT DEMENTIA-RELATED SYMPTOMS? AN INVESTIGATION AMONG COMMUNITY-DWELLING NON-DEMENTIA OLDER ADULTS IN BEIJING URBAN AREAS

Z. Wang, *School of Nursing, Peking University, Beijing, China*

Objective Early detection of the symptoms of dementia is of great importance for early diagnosis and treatment. This study aims to determine if older adults can detect dementia-related symptoms and to investigate their knowledge demands and attitudes toward dementia. Methods We designed 10 simulated cases with typical dementia-related symptoms and 5 cases with normal age-related complain. Totally 182 older adults were recruited from two urban communities in Beijing, China. They were asked to judge whether the actors in the simulated cases had possible dementia or not (will get one point on each case for a correct answer; the total score is 15). Their information demands and attitudes toward dementia were investigated with a self-designed questionnaire. Results The total score on the detection of the 15 simulated cases was (8.11±3.02). The correct detection rate in the 10 dementia cases was 52.86% and the error detection rate in the 5 non-dementia cases was 37.80%; 41.21% of the participants would be hesitant to expose dementia diagnosis to others; 44.51% thought that dementia patients were discriminated. They expected to obtain information on dementia prevention (96.70%), early symptoms (80.22%) and risk factors of dementia (71.43%) through public media (81.32%) and health lectures (78.02%). Conclusion Half of older adults can correctly detect the symptoms of dementia, while 37.8% tend to judge the normal complains of aging as dementia-related symptoms. Public dementia education needs to be further strengthened to improve the detection rate of dementia. [Key words] Aged; Dementia; Symptom Detection; Attitude; Knowledge

OLDER HISPANICS AND DENTAL CARE PARTICIPATION

T. Cadet[1,2], L. Bakk[3], P. Maramaldi[1,2,4], *1. School of Social Work, Simmons College, Boston, Massachusetts, 2. Harvard School of Dental Medicine, Boston, Massachusetts, 3. University of Buffalo, Buffalo, New York, 4. Harvard School of Public Health, Boston, Massachusetts*

Reducing oral health care disparities is a national priority. Older minority adults are likely to have the poorest oral health care in the US population (Healthy People, 2020). Periodontal disease—a potentially debilitating condition that increases risk of other medical conditions—is greatest among Mexican Americans. Empirical findings support the contributions of increased age and membership in minority population to poor oral health (Centers for Disease Control, 2013). However, few studies have investigated oral health outcomes among the older Hispanic population. Guided by cumulative advantage/disadvantage theory, this paper presents findings from a secondary analysis of the 2010 wave of the Health and Retirement Study to investigate the relationship between dental care, socio-demographic, cost-related factors among older Hispanics. The analytic sample consisted of 2,646 respondents age 50 and older who identified as Hispanic. Multivariate regression models were conducted to identify factors associated with dental care participation. Results indicate that while controlling for demographic factors, older Hispanics who did not see a dentist compared to those who did see a dentist were more likely to indicate their health was poor, less likely to have a high school degree, more likely to have an income less than $10,000, and more likely not to have dental coverage. Findings suggest that socio-demographic factors similar to other populations remain critical to participation in oral health care for the older Hispanic population. This investigation provides formative data for the development of interventions that will increase older Hispanics' participation in dental care initiatives.

AN EVALUATION OF MEMORY TRAINING PROGRAM FOR COMMUNITY-BASED ELDERLY

T. Kuo[1], A. Lai[3], Y. Lin[2], L. Hsu[4], *1. Chung Shan Medical University, Taichung, Taiwan, 2. Hsiang Shang Culture Foundation, Taichung, Taiwan, 3. National Taichung University of Science and Technology, Taichung, Taiwan, 4. Central Taiwan University of Science and Technology, Taichung, Taiwan*

The purpose of this paper was to evaluate an innovative memory training program for older adults in Taichung, Taiwan. The training program was designed based on the five domains of cognitive functions: orientation, registration, attention and calculation, recall, and language. The program was also administered using recreational therapeutic techniques such as arts therapy, narrative therapy, and pressure-point head massage. A total of 317 older adults age 65 and over living in 10 different communities participated in a weekly program for three months. The research design was a pseudo-experimental design comparing the pre- and post-tests of the Mini Mental State Examination (MMSE) and Montreal Cognitive Assessment (MoCA). The results showed half of the older adults were illiterate, 25% were living alone and 60% were between 75 and 84 years old. The older adults in all ten communities improved their cognitive scores. The MMSE and MoCA improved by an average of 5.8% and 5.9%, respectively. The subjective ratings of the older adults revealed that memory improvement and age were positively correlated. Based on the conventional assessment tools (MMSE and MoCA) and subjective ratings, this memory training program improved the cognitive functions for older adults (even with increased ages). This paper concludes by making suggestions about where and how this program can be implemented further, by making the content of the program published or developing computer-based training programs, so more older adults can benefit from maintaining their cognitive functions.

THE EFFECTS OF UNSECURED CONSUMER DEBT ON DEPRESSIVE SYMPTOMATOLOGY AND PSYCHOLOGICAL WELL-BEING AMONG OLDER AMERICANS

K.A. Zurlo[1], W. Yoon[3], H. Kim[2], *1. School of Social Work, Rutgers University, New Brunswick, New Jersey, 2. University of Kentucky, Lexington, Kentucky, 3. Retirement Research Center at Samsung Life Insurance, Seoul, Democratic People's Republic of Korea*

Unsecured consumer debt is an increasing problem among Americans. The deleterious consequences of holding debt transcend economic well-being and also may affect the psychological health of older adults As older adults experience the effects of unsecured debt, a potentially significant source of stress, control beliefs directly related to the domain of control over personal finances, may be a pathway to improved mental health. We evaluated the association between unsecured debt and two distinct outcomes: depressive symptomatology and psychological well-being. Data from the 2006 Health and Retirement Study were utilized. There were 5,817 adults aged ≥ 51 years who responded to a core survey and psychosocial leave-behind questionnaire. Depressive symptoms were assessed using the revised 8-item Center for Epidemiologic Studies Depression Scale. Psychological well-being was evaluated in a leave-behind questionnaire that had 3 dimensions: self-acceptance, personal growth, and purpose in life. Our results indicated that thirty percent of the respondents had unsecured debt. The magnitude or amount of unsecured debt and the occurrence of unsecured debt were significant predictors of depressive symptoms and lower psychological well-being. Perceived control over personal financial circumstances was a significant predictor of higher psychological well-being. Among older Americans, unsecured debt has negative effects on mental health because of the associated depressive symptoms and decreased psychological well-being. The negative effects of unsecured debt on mental health are largely accounted for by perceived control over personal financial circumstances. Interventions enhancing older adults' control over personal financial circumstances may protect against the psychological decrements experienced by those grappling with unsecured debt.

ANALYSING FACTORS AFFECTING THE SUICIDE IDEATION AND ATTEMPTED SUICIDE OF THE ELDERLY AT RISK FOR DEPRESSION IN RURAL KOREA

S. Moon[1], E. Sohn[2], *1. Daejin University, pocheon, Republic of Korea, 2. Baejae University, Dae jeon, Republic of Korea*

Suicide rate by age group is rapidly rising in rural Korea. Yet, elderly at risk for depression properly has met community-based interventions against depression. This study examines factors related to suicide ideation and suicide attempt caused by depression for elderly who are living in rural Korea. The participants of this study are elderly suffering from depression and over 65 years old. Among the 7,310 participating respondents, 25.1% experienced suicide ideation and 4.6% attempted suicide. According to the result of logistic regression analysis, elderly under 74 years old living in town, with high level of education, low level of physical function, high depression and stress level, and low level of family relationship and social relation were more likely to have suicide ideation. And elderly under 74 years old living in urban area, with high depression and stress level, low level of family relationship and suicide ideation were more likely to attempt suicide. This study of the result shows that community mental health center systematically has to be managed.

MENTAL HEALTH CARE FOR KOREAN ELDERS: ORGANIZATIONAL AND INDIVIDUAL PERSPECTIVES

D. Nguyen, C. Vu, J. Chun, D. Tanh, *New York University, New York, New York*

Low-stigma, community-based settings have the potential to reach underserved older adults with unmet mental health needs. Asian elders have extensive depression needs, but few seek care from mental health specialists. This qualitative study takes a new direction by using a multi-level approach to examine mental health services from the perspectives of an ethnic nonprofit community-based organization and older Korean adult service users. Data were collected in two phases with all participants being from Korean descent (N=30). During Phase 1, organizational stakeholders, including direct service staff, executive administrators, and a board member (n=6), responded to questions about the agency's role in the community, older adults' needs and access to mental health care. Phase 2 involved three focus groups of Korean elders (n=24), where the elders were asked similar questions as organizational interviewees, with additional questions about perceptions of stigma, and mental health help-seeking resources. The study's multi-level findings show differences in the views of mental health care for Korean elders. Organizational stakeholders identified cultural and linguistic enabling factors as the prominent barriers to care. Meanwhile, service users identified issues related to mental health needs as the primary barrier to mental health service use. This study contributes to current literature by using a multi-level approach to examine community, organizational, and individual perspectives on mental health service use in a low-stigma setting. An integrated perspective that merges organizational and community perspectives is necessary to extend culturally-competent mental health care to minority elders.

A SOCIETY-TO-CELLS MODEL FOR UNDERSTANDING DIGNITY AND DISPARITIES AMONG COMMUNITY-DWELLING OLDER ADULTS

R. Klimmek[1], L.J. Samuel[2], S. Szanton[1], *1. Johns Hopkins University School of Nursing, Baltimore, Maryland, 2. Johns Hopkins University Bloomberg School of Public Health, Baltimore, Maryland*

Aims: The purpose of this discussion is to reframe existing knowledge about the concept of dignity among older adults in order to fill knowledge gaps regarding: (a) how dignity is experienced by diverse groups of community-dwelling older adults; (b) potential relationships between dignity and health; and (c) which groups of older adults may be at higher risk for a loss of dignity (and associated health consequences). Background: Dignity plays a crucial role in health and well-being in later life. However, there has been little research on dignity among diverse groups of the community-dwelling elderly. This is important because globally, the majority of older adults reside in community settings (as opposed to hospitals, hospice, or longterm care). Methods & Data Sources: Major databases such as PubMed, CINAHL, and Scopus were searched for articles with abstracts available in English containing the word 'dignity' published anytime until July 2013. The Society-to-Cells Model of Resilience for Older Adults was used as a theoretical lens for classification of relevant abstracted findings. Implications: Certain community-dwelling older adults may experience synergistic effects of multiple, concurrent risk factors for a loss of dignity which could translate to health disparities. By reorganizing existing knowledge within a socio-ecological resilience framework, we discuss factors at the individual, family, and societal levels that could play a role in shaping dignity and related health outcomes (including possible physiological and cellular effects). Conclusion: This re-imagined framework provides a potential roadmap for the design of interventions aimed at promoting dignity and health in later life.

AUTHENTICITY & ANXIETY: THEORIZING PUBLIC HEALTH PERSPECTIVES ON PERSON-CENTRED DEMENTIA CARE

K. Aubrecht, J. Keefe, *Mount Saint Vincent University, Halifax, Nova Scotia, Canada*

Historically, dementia has been regarded as a social, rather than medical, problem (Kurz & Lautenschlager, 2010). While this may be the case, a public health perspective currently shapes the appearance of entitlements and supports for individuals with dementia diagnoses and their family and friend caregivers. Within a public health perspective on dementia, the prioritizing of personhood over dementia is ever widely accepted as a strategy healthcare professionals can use to combat the dehumanization of "severe disability" (Kitwood, 1997, p. 14). Within the person-centred philosophy advanced by Kitwood, anxieties concerning dementia are framed both as barriers to optimal care and as symptoms of maladapted relations to self and other. Social life, Kitwood suggests, is episodic; a series of situations. How individuals define and respond to situations has implications for the type of person they become. According to the logic of Kitwood's understanding of person-centred care, personal and collective anxieties about dementia are troubling primarily because of the way they can deplete an individual's "stock of learned [adaptive and experiential] resources for action" (p. 15), leading to a less developed personality (and by implication, a person of an inferior type). This paper draws from the fields of social psychology and critical disability studies to theorize contemporary understandings of person-centred dementia care. It analyzes how the expression 'persons with dementia' operates as a "narrative prosthesis" (Mitchell & Synder, 2000) that supports recognition of dementia as a threshold for the recovery of authentic personhood.

PENSION PROTECTION DIFFERENCES AMONG OLDER INDIVIDUALS IN THE UK: WHAT IS THE ROLE OF ETHNICITY?

A. Vlachantoni[1,2], Z. Feng[1], M. Evandrou[1,2], J.C. Falkingham[2,1], *1. Centre for Research on Ageing, University of Southampton, Southampton, United Kingdom, 2. ESRC Centre for Population Change, University of Southampton, southampton, United Kingdom*

The receipt of a pension could significantly affect one's economic and social resources in later life. This is particularly important for minority ethnicity groups in the UK as they are less likely to be covered by a pension scheme and more likely to live in poverty than the White British majority population. Using data from the first wave of the UK Household Longitudinal Study, this paper examines the impact of ethnicity on differentials in pension protection among men aged 65 and over and women aged 60 and over. This paper focuses on three types of pension protection for older individuals: state pension, pension credit (which means a guarantee credit for those people's income below £145.40; or a savings credit for those people who have saved some money towards their retirement) and occupational or private pension. The results show that, after controlling for key demographic, health, work history and socio-economic characteristics, minority ethnicity groups are less likely to receive state pension and occupational/private pensions than the White British; while, Indian and Bangladeshi older individuals are more likely to receive pension credit than the White British. Once the model is separated for men and women, men from minority ethnic groups are much less likely to receive a state or occupational/private pension than White British men; while, they are substantially more likely to receive the pension credit than their White British counterparts. Similarly, women from minority ethnic groups are less likely than White British older women to receive a state or occupational/private pension, however no significant results are found for the receipt of the pension credit.

IDENTIFYING OLDER VICTIMS OF FRAUD

M. DeLiema, *University of Southern California, Los Angeles, California*

Background: Previous research proposes that loneliness and cognitive decline make elders more susceptible to fraud, yet provides little consensus in identifying vulnerable groups. This is the first study to use nationally-representative data to classify U.S. adults over age 50 in the Health and Retirement Study (HRS) based on shared socioeconomic (SES)/demographic characteristics, and to determine which groups are most at risk of fraud and whether they have greater levels of loneliness and cognitive decline. Methods: First, latent class analysis was used to classify the full sample (N=12,703) into five distinct SES/demographic groups based on age, sex, race, marital status, education, and income. Second, multinomial logistic regression was used to determine which groups were associated with fraud victimization, and whether they had higher levels of loneliness and cognitive decline. Results: Five percent of respondents reported fraud. Compared to middle-class married older (65+) adults (reference class), high-SES younger (55 average age) married males (38% of the sample) and low-SES younger (55 average age) unmarried females (18% of the sample) had higher odds of fraud victimization (OR=2.64 and 1.92, respectively). Low-SES younger unmarried females had two times greater odds of loneliness, but neither group was more likely to experience cognitive decline compared to the reference class. Implications: The two populations most susceptible to fraud fall on opposite ends of the SES/demographic spectrum, with the exception that both groups are younger and less impaired than the literature suggests. Prevention efforts need to be tailored to each group specifically and begin targeting adults as young as fifty.

INCORPORATING INTEGRATION OF EVIDENCE-BASED INTERVENTIONS INTO CLINICAL SETTINGS: AN OVERVIEW OF IMPROVEMENTS IN PRACTICE

J. Manchester[1], J. Weiss[2], K. Peplinski[2], *1. Case Western Reserve University, Cleveland, Ohio, 2. DHHS-HRSA-BHPr, Rockville, Maryland*

Since 2010, the Health Resources and Services Administration has required that Geriatric Education Centers (GECs) (N=45) identify and train health professionals to implement Evidence-Based Practices (EBP) in the topic areas of Delirium, Depression, Diabetes, Falls Prevention, or Palliative Care. HRSA facilitated the creation of EBP clinical protocols with GEC grantees and clinical experts in order to evaluate the outcomes of education and training. During the first two years of implementation (2011-2013) GEC grantees executed training related to the assessment and interventions of the clinical areas identified. The presentation will focus on practice outcome data of interventions being implemented in the EBP areas. GECs chose primary disciplines from which to evaluate provider behaviors in clinical settings, with 68% choosing nursing, 22% choosing medicine and 10% choosing other types. A total of 4,657 providers were trained in the appropriate uses of evidence-based interventions, of which 73% were from the identified primary disciplines. Grantees relied on chart audits and other data collection methodologies to report rates of EBPs pre and post training. Post-training rates of implementation for interventions averaged 60% across EBP areas, with a practice change rate of 36% on average across EBP areas. Additional analyses investigating the impact of practice setting, provider type, and EBP area on practice outcome will be presented. This evaluation demonstrates that federal investments in geriatric education have the potential to improve practice and quality of care. Additional investigations into challenges facing EBP adoption are needed in order to alleviate the barriers to implementation for GEC grantees.

PREDICTORS OF INSPECTION DEFICIENCIES IN FLORIDA'S ASSISTED LIVING FACILITIES: THE CONTRIBUTION OF REGION, SIZE, LICENSE TYPE AND PAYMENT SOURCE

J.R. Salmon, *Aging Research Group, Gulfport, Florida*

This study was conducted in response to a rash of forced closures among Florida's Assisted Living facilities (ALs). Structure and process variables are obtained from the ALF license and deficiency data available from the Floria Agency for Health Care Administration. The analysis is based on 3,460 ALs) with a capacity to serve 88,306 residents. More than half (53%) accepted public funding . Most served six or fewer residents (N=1,890; 55%) while the remainder were split between 7-16 and 17 or more. Half of the ALs (47%) operated with just a Standard license that is required of all ALs. ALs may hold multiple licenses. Very few ALs (8%) held an Extended Congregate Care (ECC) License. One-third of Florida ALs are located in Miami-Dade while just 4% of ALs are in the Florida Panhandle. During the study time period, there were 16,002 inspections that generated 66,925 deficiencies. The average number and severity of deficiencies per investigation varied by region, size, licenses, and payment source. Multivariate analyses show the relative weight of each on total deficiencies. The results have implications for staffing, use of licenses for very impaired residents, and calibration of investigators in different regions of the state and other approaches to ensuring quality of care.

HIGHLIGHTING LATE LIFE POTENTIAL THROUGH AN ETHNODRAMA INTERVENTION

J. Eaton, *University of Utah, Salt Lake City, Utah*

One barrier to the expansion of geriatric health care providers is the limited desire of nursing students to work with older adults. The purpose of this study is to evaluate the feasibility of utilizing ethnodrama as an intervention to highlight late life potential with nursing students and older adults. Twelve baccalaureate nursing students were paired with twelve residents of an assisted living facility. The intervention involved transformational learning activities involving self reflection, discussion, and student meetings with adult partners at three time points to complete semi-structured interviews on the topic of late life potential. The intervention culminated in a professional performance of the ethnodrama developed from these data. Data analysis involved reviewing participation logs and journals documenting the process of intervention construction and delivery. Transcripts of initial student meetings, performance, post-performance discussion, and open ended survey questions were analyzed utilizing invivo and pattern coding in order to examine the ability of this intervention to highlight late life potential. Results demonstrate difficulty in recruitment of nursing students, fear of participating in data collection, as well as positive feedback regarding the overall process. Older adult participants recognized positive late life potential, and emphasized this in their feedback, while students explored potential throughout the lifespan and reflected on its meaning in their own lives. Negative potential, while presented in the ethnodrama, was not prominent in participant feedback. Increasing discussion about late life potential may alter the stigma associated with aging, increasing student interest in working with the older adult population.

HOW DO RACIAL/ETHNIC SEDENTARY OLDER ADULTS JUSTIFY THEIR LOW PHYSICAL ACTIVITY LEVELS?

D. Araiza[1], I. Lee[1], L. Trejo[2], M.R. Moore[3], C.A. Sarkisian[1], *1. Medicine-Geriatrics, UCLA, Los Angeles, California, 2. City of Los Angeles Department of Aging, Los Angeles, California, 3. UCLA, Los Angeles, California*

Background: Though exercise is an established component in the management of age-related chronic diseases, physical activity declines with age. Many seniors acknowledge the benefits of regular exercise yet do not participate in such activities. Knowing respondents' motivations for physical inactivity might inform interventions to increase physical activity among racial/ethnic minority seniors. Methods: Using principles of community-based participatory research, our team conducted 12 ethnic-specific focus groups with Chinese-Americans, Korean-Americans, African-Americans, and Latinos to assess cultural beliefs and practices around stroke and exercise. We enrolled 132 seniors aged 60 and older (mean age = 73) with hypertension history. Participants completed a questionnaire on exercise levels and audio were transcribed and coded by two independent raters. Themes from the transcripts were explored. Results: Over 30% (n=33) of participants reported not exercising at least 20 minutes 3 times a week or more. Most were knowledgeable about stroke risk factors and indicated exercise as a proponent of overall good health. Frequent justifications for physical inactivity from sedentary participants were: low perceived efficacy, dislike of exercise, self-reported laziness, medical concerns, and concerns for safety. Conclusions: Unstable attributions (i.e. those that can be changed, like perceptions and attitudes) were frequently used to justify physical inactivity. Implications: Attribution retraining targeting low perceived efficacy, dislike of exercise and self-reported laziness offers potential as a means to increase physical activity.

SESSION 1060 (SYMPOSIUM)

GEROSCIENCE - AGING BIOLOGY AS THE COMMON RISK FACTOR FOR CHRONIC DISEASES

Chair: F. Sierra, *Division of Aging Biology, National Institute on Aging, Bethesda, Maryland*

This symposium will focus on the emerging field of geroscience, an interdisciplinary field that aims to understand the relationship between the basic biology of aging and age-related diseases. A central concept of geroscience is that multiple human diseases arise from a common cause, aging itself. Thus, slowing down the process of aging (as it has been done in animal models) represents a potentially fruitful approach to concurrently address and combat the many chronic conditions of the elderly. The Geronscience Interest Group (GSIG) is a collaborative effort across several NIH Institutes to support the development of new tools, models and paradigms that address the basic biological underpinning of these multiple diseases. By pooling resources and expertise, the GSIG identifies major cross-cutting areas of research and proposes coordinated approaches to identify hurdles and envision solutions to the health problems of our burgeoning elderly population. While most of the effort of the GSIG focuses on increasing awareness within and across the NIH, some activities are also open to the scientific community at large, and these will be discussed. Current GSIG members will discuss progress and initiatives.

DRAMATIC EPIGENOMIC CHANGES IN HUMAN CELLULAR SENESCENCE PRESAGE AGING AND CANCER

S. Berger, *University of Pennsylvania, Philadelphia, Pennsylvania*

Genomic structure and function is regulated in part through covalent post-translational modifications (PTMs) of histones and altered nucleosomal structure. We are interested in the role of chromatin in regulating lifespan of cells and organisms. We are interested in evolutionarily conserved aspects of chromatin in aging, and study the yeast S. cerevisiae replicative cell aging and human primary fibroblast replicative senescence (RS) and oncogene-induced senescence (OIS) as models. We will report recent findings that show dramatic changes in the epigenetic landscape in both RS and OIS human senescent cells, and additional striking differences in OIS, which partially explain their pathway to cancer. These alterations reflect a profound reorganization of chromatin structure, that both alters architecture and gene-specific expression.

PSYCHOLOGICAL STRESS, PHYSIOLOGICAL STRESS, AND INDICES OF CELLULAR AGING

E. Epel, *Psychiatry, UCSF, San Francisco, California*

The basic biology of aging overlaps in part with aspects of the stress response. Important processes such as regulation of inflammatory proteins, oxidative stress, and mitochondrial health are implicated in aging and are affected by chronic psychological and physiological stresses. In recent years a growing body of research has revealed associations between chronic stress or malleable lifestyle factors and indices of cellular aging, notably telomere length. Telomere length in turn is a reliable and significant predictor of early onset of many chronic diseases of aging, and may be helpful indicator of the aging process. New intervention studies that modify stress and/or health behaviors have used telomerase activity or telomere length as a barometer, with promising findings. Both the obstacles and promises of this intervention research for both biomarkers of aging and healthy lifespan will be discussed.

BIODEMOGRAPHIC MODEL FOR ANALYSES OF GENETIC EFFECTS ON PHYSIOLOGICAL DYSREGULATION IN AGING

K.G. Arbeev, L.S. Arbeeva, D. Wu, A. Kulminski, I. Akushevich, S.V. Ukraintseva, A.I. Yashin, *SSRI, Duke University, Durham, North Carolina*

Recent advances in biodemography of aging resulted in development of mathematical models of aging incorporating several essential mechanisms of aging-related changes and development of approaches for assessing associations of physiological dysregulation with age and mortality. We implemented the novel measure of physiological dysregulation (DM) based on the statistical distance of biomarker profiles (Mech. Ageing Dev. 134: 110-117, 2013) in the frameworks of the genetic stochastic process model (J. Theor. Biol. 258: 103-111, 2009). This approach allows us to analyze genetic effects on physiological dysregulation and to evaluate how they are related to different aging-related characteristics (such as decline in stress resistance and adaptive capacity) indirectly from age trajectories of biomarkers and data on mortality collected in longitudinal studies. DM also allows working with multiple biomarkers in a one-dimensional setting instead of using multidimensional modeling. We illustrated the methodology by application to DM calculated from longitudinal measurements of blood pressure, heart rate, cholesterol, glucose, hematocrit, body mass index and mortality data for carriers of different numbers of single-nucleotide polymorphism alleles associated with survival in the genome-wide association study in the Framingham Heart Study data. We found differential patterns of physiological dysregulation among carriers of different numbers of such alleles and that these groups of individuals also differ in terms of other aging-related processes such as decline in stress resistance and adaptive capacity. This shows that there is a genetic component in such hidden mechanisms of aging-related changes that may ultimately affect risk of death in carriers of such alleles.

SESSION 1065 (SYMPOSIUM)

HEALTH AND FUNCTIONING AMONG OLDER AMERICANS:TIME TRENDS AND COHORT CHANGE

Chair: E. Crimmins, *University of Southern California, Los Angeles, California*

This paper will examine changes in physical and cognitive functioning among older Americans over the past three decades using data from both the National Health and Nutrition Examination Survey (NHANES) and the Health and Retirement Study (HRS). Physical functioning has been improving among the oldest old in America in the last two decades but the rate of improvement has slowed in recent years. Cognitive functioning has also improved among these cohorts. We relate changes to levels of disease, health behaviors, and changes in cohort characteristics including education. We also investigate changes in mortality among those with and without functioning problems of both types. The combination of changes has resulted in an increase in physically and cognitively healthy life, with the increases in cognitively healthy life exceeding those in physically healthy life.

HEALTH AND FUNCTIONING AMONG PEOPLE AGED 90 AND OLDER IN TAMPERE, FINLAND – TIME TRENDS AND ASSOCIATIONS WITH AGE

M. Jylhä, L. Enroth, T. Luukkaala, J. Raitanen, *University of Tampere, Tampere, Finland*

This paper will examine time trends in chronic disease, self-rated health and physical functioning in people aged 90 and older in Tampere, Finland. Data were collected by mailed interviews with everyone in the age group irrespective of health or place of living in 2001, 2001, 2007, 2010, and 2014. In the first four waves, the response rate varied between 79 and 86%. Between 2001 and 2010, the number of chronic disease was stable, but self-rated health worsened. ADL functioning improved slightly but mobility and the combined indicator of functioning did not change. Each year, functioning declined with increasing age, but multimorbidity and self-rated health were not associated with age. Between the years 2001 and 2010, disability-free life expectancy at age 90 increased for men, but remained almost stable for women. In the presentation, we will also include new findings from the year 2014.

PRESIDENTIAL SYMPOSIUM: RECENT TRENDS IN HEALTH AND FUNCTIONING AMONG THE OLDEST OLD – FINDINGS FROM THREE EUROPEAN COUNTRIES AND THE US

M. Jylhä, J. Robine, *University of Tampere, Tampere, Finland*

Both in Europe and in the US, survival to age 80 or 90 has increased and people who have reached very old age live longer now that they did in the past. Yet it is not clear whether health and functioning among long-lived people have improved or whether more years are spent in poor health and disability at the end of life. Existing findings imply that trends may differ according to the health indicator used, between time periods, and also between the countries. Many studies, however, are limited by exclusion of institutionalized individuals or by low participation rates. In this symposium we will present findings from three representative population-based studies in Northern Europe and the US. The presentations focus on time trends in physical and cognitive functioning, chronic disease and self-rated health, and the differences between the genders. The data presented include the Swedish Panel Study of Living Conditions of the Oldest Old (SWEOLD), the study in cohorts born in 1905 and 1915 in Denmark, the Vitality 90+ Study in Tampere, Finland, and the National Health and Nutrition Examination Survey (NHANES) and the Health and Retirement Study (HRS) in the US. The discussant will bring the results together, focusing on similarities and differences across the studies and addressing the methodological challenges in population studies in very old age groups.

FUNCTIONING OF PEOPLE OLDER THAN 90 YEARS: A COMPARISON OF TWO DANISH COHORTS BORN 10 YEARS APART

K. Christensen[1,5,6], M. Thinggaard[1], A. Oksuzyan[1], T. Steenstrup[3], K. Andersen-Ranberg[1], B. Jeune[1], M. McGue[2], J.W. Vaupel[1,4,5], *1. Danish Aging Research Center, University of Southern Denmark, Odense, Denmark, 2. Department of Psychology, University of Minnesota, Minneapolis, Minnesota, 3. Department of Biostatistics, University of Southern Denmark, Odense, Denmark, 4. Max Planck Institute for Demographic Research, Rostock, Germany, 5. Max Planck Odense Center, University of Southern Denmark, Odense, Denmark, 6. Department of Clinical Genetics and Department of Clinical Biochemistry and Pharmacology, Odense University Hospital, Odense, Denmark*

We compared the cognitive and physical functioning of two cohorts of Danish nonagenarians, born 10 years apart: 2262 born in 1905 and 1584 born in 1915. The chance of surviving from birth to age 93-95 years was approx. 30% higher in the 1915 cohort than in the 1905 cohort. The 1915 cohort scored significantly better on the mini-mental state examination than did the 1905 cohort (22.8 [SD 5.6] vs 21.4 [6.0]; $p<0.0001$). The cohorts did not differ consistently in the physical performance tests, but the 1915 cohort had significantly better activities of daily living scores than the 1905 cohort (2.0 [SD 0.8] vs 1.8 [0.7]; $p<0.0001$). Despite being 2 years older at assessment, the 1915 cohort scored significantly better than the 1905 cohort on both the cognitive tests and the activities of daily living score, which suggests that more people are living to older ages with better overall functioning.

TRENDS IN HEALTH AND DISABILITY AMONG THE OLDEST OLD IN SWEDEN

S. Fors, M.G. Parker, J. Fritzell, *Aging Research Center, Stockholm, Sweden*

As the oldest old population in Sweden, as in most other countries, have grown in numbers as well in the proportion of the total population, a crucial question is whether or not this trend has been accompanied by changes in the health status of the oldest old. We study the development using data from the Swedish Panel Study of Living Conditions of the Oldest Old (SWEOLD), a nationally representative study of older people (aged 77+). The first wave of SWEOLD was conducted in 1992 with follow-up surveys in 2002, 2004 and 2011. The survey comprises both community dwelling individuals and people living in institutions. The interviews encompass a wide range of health indicators as well as objective tests of physical and cognitive functions. Our results indicate increasing prevalence rates of self-reported pain, psychological problems and impaired mobility. However, at the same time we find that an increasing proportion can manage their activities of daily living (ADL) without help. These findings suggest an attenuation of the association between health problems and ADL-disability over the study period.

SESSION 1070 (SYMPOSIUM)

WAYFINDING TECHNOLOGIES: KEYS TO TO OLDER ADULT MOBILITY AND COMMUNITY ENGAGEMENT?

Chair: R.H. Hunter, *UNC Center for Health Promotion and Disease Prevention, Chapel Hill, North Carolina*
Co-Chair: W. Satariano, *University of California, Berkeley, Berkeley, California*
Discussant: J.A. Sanford, *Georgia Institute of Technology, Atlanta, Georgia*

Wayfinding is the process whereby people use environmental information to locate and find their way within familiar and unfamiliar settings. Being able to find one's way from place to place is basic to daily life and may affect health-related behaviors such as walking and community engagement. This symposium explores the status, strengths and limitations of existing and emerging technologies to facilitate wayfinding in older adults and people with varying functional capabilities. It draws upon a three-year investigation of wayfinding research, practice and policy by the CDC-Healthy Aging Research Network, and it includes findings from a scoping review of the literature specific to wayfinding technologies. Technologies addressed are those that are either user or environmentally based or permit user-environment interaction. Presenters will establish the relevance and importance of wayfinding to older adults and people with varying functional capabilities, building on established person-environmental models. Presenters will summarize key findings from a review of literature on wayfinding technologies and older adults, people with visual impairments and people with cognitive limitations. They will provide insight into the state of wayfinding technologies and the potential to aid wayfinding. In addition, presenters will explore the limitations of wayfinding technologies, either inherent in the applications or uninvestigated effects on safety or other factors important to older adults. Presenters will highlight next steps for research, practice and policy. This work underscores the need for increased attention to the distinctive challenges in older adult wayfinding and the role of technology, especially given our rapidly aging and functionally diverse population.

WAYFINDING TECHNOLOGIES: OLDER ADULTS

W. Satariano[1], M. Maus[1], R. Hunter[2], B. Belza[3], D.B. Friedman[4], S. Mullen[5], A.E. Vandenberg[6], *1. University of California, Berkeley, California, 2. University of North Carolina, Chapel Hill, North Carolina, 3. University of Washington, Seattle, Washington, 4. University of South Carolina, Columbia, South Carolina, 5. University of Illinois, Urbana, Illinois, 6. Emory University, Atlanta, Georgia*

Ensuring effective wayfinding (WF) is critical for maintaining mobility among older adults. Reduced mobility, associated with either age or disability, is a public health burden. The purpose of this presentation is to discuss the role of technologies in facilitating WF in older adults. Wayfinding technologies used by people to support mobility and/or navigation include, but are not limited to, smartphones and environmentally-embedded devices, such as "talking signs." We report the results of a review and synthesis of the literature on technologies as related to WF. We propose new research directions, including the need to better understand the use of these technologies in everyday settings and how they are related to public health outcomes such as increased mobility. We summarize opportunities and challenges of WF technologies, such as those associated with barriers and their equitable distribution in underserved populations.

WAYFINDING TECHNOLOGY FOR PEOPLE WITH COGNITIVE IMPAIRMENT: HOW EFFECTIVE, FUNCTIONAL, USABLE, AND USEFUL?

A.E. Vandenberg[1], B. Belza[2], R.G. Logsdon[2], S. Mullen[3], R.H. Hunter[4], *1. Emory University, Atlanta, Georgia, 2. University of Washington, Seattle, Washington, 3. University of Illinois, Urbana, Illinois, 4. University of North Carolina, Chapel Hill, North Carolina*

There is a need for people with age-related cognitive impairment (CI) to go places to remain physically, socially, and productively engaged. An integral aspect of navigation is wayfinding, which recruits executive brain functions and spatial representations and is therefore particularly challenging for people with CI. Yet technological solutions are emerging to overcome these challenges. We examined articles featuring CI wayfinding technologies' functionality, usability, effectiveness, and usefulness. Salient functional components include just-in-time prompts, dual (caregiver-wayfinder) user interfaces, and routing algorithms based on need. Usability issues include communication modality for least cognitive load. Many studies show proof of concept, but questions remain as to the usefulness of limited testing outside of complex real-world settings and the impact of specific types of cognitive impairment on usability. Findings are contextualized amid a full range of solutions including wayfinding skills training, environmental modification, and policies to track and locate missing elders with CI.

WAYFINDING TECHNOLOGIES: OLDER ADULTS AND VISUAL DISABILITIES

M. Maus[1], W. Satariano[1], B. Belza[2], *1. UC Berkeley, Berkeley, California, 2. University of Washington, Seattle, Washington*

Visual disabilities are a major contributor to decreased mobility and impairment among older adults. Way Finding Technology (WFT) is a rapidly expanding area of research and practical application that promises to help address the problems associated with decreased visual function. We will discuss some of the technologies available and being studied that are especially relevant to older adults. Examples of these technologies include wearable interfaces for orientation and wayfinding, smart environments,tactile technology, wearable computers, and GIS systems adapted for the visually impaired. We will also consider the difference between low vision aids and WFT. Finally, we examine the effects of WFT as related to clinical levels of impairment and its effect on navigation, driving, transportation use and walking.

SESSION 1075 (SYMPOSIUM)

HOUSING FOR LOW-INCOME OLDER ADULTS: INNOVATIVE MODELS

Chair: N.J. Webster, *University of Michigan, Ann Arbor, Michigan*
Co-Chair: S. Park, *University of Michigan, Ann Arbor, Michigan*
Discussant: R. Stone, *LeadingAge, Washington, District of Columbia*

A growing literature focusing on middle and high-income older adults has documented positive influences of independent living retirement communities on residents' well-being. Nevertheless, more research is needed to better understand the role of housing in the context of fewer economic resources. This symposium focuses on diverse housing options available to low-income seniors, drawing upon multiple methodologies to explore innovative and theoretically grounded models. Using data from the Health and Retirement Study, Park and Kim in their application of the person-environment fit perspective found that among frail and cognitively impaired low-income older adults, living in affordable senior housing compared to other housing types was associated with lower odds of nursing home admission. Lehning and colleagues examined co-op housing offered to low-income older adults, finding three emergent themes: complementary and conflicting functions of service coordinators and member volunteers, bureaucratic barriers to coordination and communication, and member reluctance to seek support. Antonucci and colleagues present findings from a field experiment to adapt and implement the successful aging model in affordable housing communities. They found residents generally were satisfied with their living environment, but less satisfied with their influence on the community. Lewinson describes a community-based participatory research project conducted with older adults living in hotels. Residents developed a community identity and prioritized four areas for improvement: community monitoring, social engagement, walkability, and interior design. These studies document contexts in which senior housing is most beneficial for low-income seniors, as well as barriers encountered. Implications for future application and intervention research will be discussed.

HEALTH, RESIDENTIAL ENVIRONMENT AND NURSING HOME ADMISSION AMONG LOW- INCOME OLDER ADULTS

S. Park, B. Kim, *university of michigan, Ann Arbor, Michigan*

Affordable senior housing has been promoted as a long-term care policy for low-income elderly. However, little research exists that empirically examines its role in helping elders age-in-place. Drawing from person-environment fit and person-centered perspectives, this study explores the association between housing typeon and likelihood of nursing home admission across health contexts among low-income older adults. The 2006 wave data of Health Retirement Study was used (N = 1948, age range 61-109). Latent class analysis identified four health subgroups (physically impaired, cognitively impaired, frail, and healthy), and propensity score matching technique estimated senior housing. Affordable senior housing (22%) was not related a nursing home admission. However, among the frail and the cognitively impaired subgroup, older adults living in affordable senior housing wereless likely to be admitted to a nursing home. The findings provide needed empirical evidence for housing policy and intervention programs for low-income older adults.

AGING IN PLACE IN LOW-INCOME COOPERATIVE SENIOR HOUSING: THE ROLE OF VOLUNTARY AND PROFESSIONAL SUPPORT

A.J. Lehning[1,2], R. Dunkle[2], S. Park[2], H. Wiseman[1], *1. School of Social Work, University of Maryland, Baltimore, Maryland, 2. University of Michigan, Ann Arbor, Michigan*

Cooperative housing, which emphasizes autonomy and community, offers a promising setting for aging in place. We examined a co-op model offered to low-income older adults in the Detroit area. These co-ops have historically taken a volunteer approach to service provision through a program in which members provide support to other members. In recent years, however, several co-ops have opted to hire a professional service coordinator. Focusing on 4 co-ops, we analyzed data from multiple sources, including member surveys, service coordinator interviews, observations, document reviews, and interviews with member volunteers. Common themes included 1) complementary and conflicting functions of service coordinators and member volunteers, 2) bureaucratic barriers to more effective coordination and communication between formal and informal support, and 3) member reluctance to seek out assistance from any source of support. Implications for cooperative housing, as well as aging-in-place interventions combining voluntary and professional support, will be discussed.

SUCCESSFUL AGING MODEL: PRELIMINARY EVIDENCE FROM AN AFFORDABLE HOUSING INTERVENTION

T.C. Antonucci, R.L. Kahn, N.J. Webster, *University of Michigan, Ann Arbor, Michigan*

Application of Rowe and Kahn's Successful Aging Model to senior housing has mostly been limited to continuing care retirement communities (CCRCs) consisting of residents relatively high in income and education. This paper reports findings from a field experiment to adapt and implement the model in affordable housing communities. Comparison of preliminary baseline findings with data from CCRCs suggests considerable demographic and health differences. The affordable housing residents are older, more likely to be female, less educated, less likely to be married, and generally report worse health. Affordable housing residents were generally very satisfied with their living environment, but less satisfied with their influence on their community. These findings guided the intervention's focus on empowering residents. The implementation of programs and activities focused on meals, exercise, computer use, vegetable gardens, and group social outings. Follow-up data on the effectiveness of the ongoing intervention will also be reported.

WHEN AGING IN PLACE ISN'T ENOUGH, AGE IN COMMUNITY: BUILDING INTENTIONAL COMMUNITIES WITH PHOTOVOICE

T. Lewinson, *School of Social Work, Georgia State University, Atlanta, Georgia*

Although extended stay hotels are welcomed housing solutions for some displaced and chronically-ill older adults desiring to stay independent, many experience challenges with social isolation, resource deficiency, and environmental threats to well-being (Lewinson, 2014). A focus on "aging-in-place" often prioritizes dwelling-based interactions and obscures the influence of complex community conditions affecting the quality of one's home. The concept of "aging-in-community" provides a lens for considering broader community influences and is especially useful for exploring the social worlds of adults residing in unique housing arrangements, like extended stay hotels. This panelist will describe a photovoice project with 16 older adults residing in 9 different hotels that resulted in the formation of one "intentional community" (Thomas & Blanchard, 2009). Through individual photography, four guided focus group discussions, and three teleconferences, participants developed an intentional community identity and prioritized four areas for improved aging-in-community: community monitoring, social engagement, safe walkability, and interior design.

SESSION 1080 (SYMPOSIUM)

OLDER ADULTS AND DIABETES: THE SOCIAL AND CULTURAL CONTEXTS SHAPING PATIENTS' ILLNESS MANAGEMENT

Chair: S. Chard, *Sociology & Anthropology, UMBC, Baltimore, Maryland*

Co-Chair: J. Eckert, *Sociology & Anthropology, UMBC, Baltimore, Maryland*

Discussant: R. Rubinstein, *Sociology & Anthropology, UMBC, Baltimore, Maryland*

Diabetes is a leading cause of morbidity and mortality among older adults in the U.S. The Subjective Experience of Diabetes among Urban Older Adults is a 3-year NIA-funded cross-sectional study exploring older adults' diabetes experiences. Grounded in social constructionist theory, this study argues that progress in diabetes control requires understanding patients' own ideas about diabetes, including diabetes' nature, progression, and treatment, as well as how these ideas are shaped through clinical encounters and lay experiences. Our community-based sample of African-American and non-Hispanic white older adults is drawn from the larger longitudinal study, Healthy Aging in Neighborhoods of Diversity across the Life Span (HANDLS). We employ an adaptation of the McGill Illness Narrative Interview (MINI) for our in-depth interviews. This symposium examines our findings related to how participants' diabetes beliefs and diabetes self-management are heavily grounded in cultural and gendered understandings of diabetes, the body, and social roles. More specifically, in the four papers presented here we explore 1) how participants conceptualize health and well-being in the context of diabetes, 2) how African-American women in particular frame their illness in terms of gender and ethnicity, 3) the unintended ways in which practitioner encounters shape diabetes understandings, and 4) the operationalization of self-management in complex daily lives. Together, these papers illuminate the importance of considering the personal meaning of diabetes in both one-on-one clinical encounters and in the design of diabetes interventions.

DEFINING 'HEALTHY' ON THEIR OWN TERMS: REFLECTIONS OF OLDER ADULTS WITH TYPE 2 DIABETES

A.M. Reese, *UMBC-Center for Aging Studies, Baltimore, Maryland*

In our ethnographic research examining older African Americans' and non-Hispanic whites' diabetes experiences in Baltimore, participants express varying notions of what it means to be healthy. These varied subjective understandings of healthiness are embedded in the overall contexts of participants' lives which sometimes include multiple chronic conditions, economic hardships, and providing care for others. This paper explores how participants define healthiness and how they see themselves in relation to both subjective definitions and whether such states of healthiness are obtainable. These subjective understandings of healthiness demonstrate the malleability and the nuanced nature of beliefs about healthiness. They also suggest that participants' understanding of their healthiness is not solely influenced by their current health conditions or by what their physicians tell them; rather, participants' draw from various information sources, including media, friends, family, and their own experiences.

EXPLORING AFRICAN-AMERICAN WOMEN'S EXPRESSIONS OF POWER AND STRENGTH AS A MEANS TO MANAGING DIABETES

B. Harris-Wallace, *Sociology and Anthropology, University of Maryland Baltimore County, Baltimore, Maryland*

This paper uses in-depth, qualitative interviews with African-American women (n=20) to examine and develop gender-and culturally-specific modes for understanding diabetes and disease treatment. In U.S culture, African American women often take on the role of the 'strong Black woman,' who is resilient against adversity. We contend that as our sample of African-American women struggle to make sense of and master diabetes self-management they exert their strength and power in multiple ways, including taking on the identity of caretaker for others, drawing on faith and spiritual resources for support, and utilizing culturally-influenced lay models of care instead of the physician-recommended traditional medical models of care. Acknowledgement of these power strategies may help healthcare providers in the development of gender and culturally sensitive approaches to diabetes treatment.

THE PERLOCUTIONARY EFFECT OF HEALTH CARE PROVIDERS' WORDS ON OLDER ADULTS WITH TYPE 2 DIABETES

E.G. Roth, L. Girling, *Sociology & Anthropology, UMBC, Baltimore, Maryland*

Literature suggests effective treatment of diabetes is largely dependent on management of lifestyle and diabetes self-care. Provider communications can significantly impact patient adherence. In this paper, we will address the perlocutionary effect of patient-provider communication, where the provider's message (locution) impacts patient behavior (or self-care actions) whether intended or not. This paper draws from in-depth, qualitative interviews with older adults with diabetes mellitus to better understand their subjective interpretations and consequent effect upon health behaviors. In particular, we explore the individual's logic and coping strategies used to negotiate and internalize provider's verbal communications. Providers' messages and their perlocutionary effects will be considered in terms of clinical implications on treatment adherence and health outcomes.

OPERATIONALIZING DIABETES SELF-MANAGEMENT: THE PATIENT'S PERSPECTIVE

S. Chard[1], C.C. Quinn[2], *1. Sociology & Anthropology, UMBC, Baltimore, Maryland, 2. University of Maryland School of Medicine, Baltimore, Maryland*

The biomedical model of diabetes presents self-management as key to controlling diabetes. Through a biomedical lens, self-management involves nutritional management, regular physical activity, glucose-testing, and medication. Based on our ethnographic interviews among African-American and non-Hispanic white older adults in a major mid-Atlantic city, this paper examines how participants operationalize self-management. The findings suggest that participants develop complex, highly individualized self-management schema in order to be "in control." These self-management plans often involve the careful balancing of long-term priorities, the contingencies of daily life, and subjective understandings of biomedical self-management. This paper highlights the importance of exploring how participants themselves conceptualize self-management in efforts to improve patient outcomes.

SESSION 1085 (SYMPOSIUM)

LONG-TERM EFFECTS OF MILITARY SERVICE ON THE HEALTH AND WELL-BEING OF AGING VETERANS

Chair: A. Spiro, *MAVERIC/NAS, VA Boston, Boston, Massachusetts, Boston University, Boston, Massachusetts*
Discussant: R.J. Waldinger, *Massachusettes General Hospital, Boston, Massachusetts*

We examine the long-term effects of military service, both positive and negative, on the health and well-being of aging veterans. These contributions capitalize on longitudinal studies to conduct empirical analyses and evaluate theoretical arguments concerning the varied nature of these effects. Spiro and colleagues suggest that although most consider short-term negative consequences of military service there are important positive outcomes as well, and they outline an agenda for future research. Stawski and colleagues describe the veteran population of cohorts in the Health and Retirement Study, noting that about 25% report military service. Given its breadth and longitudinal design, the HRS is valuable for examining long-term effects of military service. Franz and colleagues examine the impact of PTSD symptoms on brain structures among Vietnam veterans, and found that having more symptoms was associated with reduced hippocampal and amygdala volumes nearly 20 years later. Landes and colleagues linked the NHIS to NDI to compare mortality between veterans and the general population; while wartime veterans had higher mortality, peacetime veterans did not. Smoking mediated and/or moderated the mortality effects, as did various socioeconomic factors. Silverstein and colleagues found that WW2 veterans in the LSOG showed greater civic engagement than did other veterans or non-veterans, and that this influenced their children's engagement. Our discussant will illustrate how these studies, combined with other ongoing longitudinal studies, can yield evidence of the long-term outcomes of military service, and that both positive and negative effects of military service should be considered in the study of lifespan development.

ARE THERE LONG-TERM BENEFITS OF MILITARY SERVICE?

A. Spiro[1,2], R.A. Settersten[3], C.M. Aldwin[3], *1. MAVERIC/NAS, VA Boston, Boston, Massachusetts, 2. Boston University, Boston, Massachusetts, 3. Oregon State University, Corvallis, Oregon*

Most evidence on the effects of military service focuses on short-term negative consequences, especially mental and physical injuries for those deployed to war zones. In contrast, lifespan studies surprisingly reveal long-term effects – both early effects that grow over time and new ones that emerge later. These effects, which exist in a variety of domains of health and well-being, have been found in aging veterans of WWII and the Korean War, and are now being found in veterans of the Vietnam War. There are individual differences in these long-term effects, as well as changes over time within individuals. Each war also has unique characteristics and contexts that modify these effects. We synthesize and evaluate evidence for long-term benefits of service for veterans of different wars, offer possible explanations, and set an agenda for dedicated inquiry into both positive and negative long-term effects of military service on aging and health.

EXPLORING THE VETERAN MORTALITY DIFFERENTIAL: THE INFLUENCE OF WAR AND SMOKE

S. Landes[1], M. Ardelt[1], A.T. Landes[2], *1. University of Florida, Gainesville, Florida, 2. North Florida/South Georgia Veterans Health System, Gainesville, Florida*

Compared with the general population, veterans are reported to have poorer reported health and increased psychological distress. While an important finding, prior research has not fully explored how these health differences influence mortality outcomes. Using a sample of 242,397 adults from the linked National Health Interview Survey – National Death Index, this research explores the veteran mortality differential. Overall, veterans had a higher mortality risk than non-veterans. Exploration by veteran cohorts revealed that the increased veteran mortality risk was evident only for those whose possible service entry year coincided with a major conflict (World War II, Korea, Vietnam). However, smoking status mediated/moderated the veteran mortality differential. Disability status and income also were significant delimiters of the veteran/non-veteran mortality differential for the Korean War and Vietnam War cohorts,respectively. Results show that although a veteran/non-veteran mortality differential exists, it can possibly be addressed by attending to health behavior and socioeconomic circumstances.

MILITARY SERVICE AND CIVIC ENGAGEMENT OVER THE LIFE COURSE AND ACROSS GENERATIONS

M. Silverstein[1,2], A.S. London[1,2], J. Wilmoth[1,2], *1. Sociology, Syracuse University, Syracuse, New York, 2. Aging Studies Institute, Syracuse, New York*

This paper uses a life-course perspective to investigate the association between prior military service and civic engagement in later life and across generations. Using data on 322 fathers and 758 of their offspring from the Longitudinal Study of Generations, we compare World War II veterans to veterans who served in other periods and non-veterans with respect to volunteer activities between 1971 and 2005. Veterans who served during World War II tended to have high rates of volunteer activity in post-retirement compared to veterans who served at other times and non-veterans. We also investigate whether volunteering by these fathers promoted pro-social values and volunteering among their adult children. Results are discussed in terms of the unique life course position of veterans whose World War II service reinforced a culture of civic engagement.

PREVALENCE AND TENURE OF MILITARY SERVICE AMONG OLDER ADULTS: FINDINGS FROM THE HEALTH AND RETIREMENT STUDY (HRS)

R.S. Stawski[1], G.G. Fisher[2], C. Wu[1], *1. Oregon State University, Corvallis, Oregon, 2. Colorado State University, Fort Collins, Colorado*

Investigating the impact of military service is important for understanding the effects of major early life experiences and transitions on later-life outcomes. The current study examined the prevalence and tenure of military service among older adults (age 50+), drawing on data from four cohorts of the Health and Retirement Study: HRS Cohort (born 1931-1941), AHEAD (born <1924), Children of the Depression (CODA: born 1924-1930) and the War Baby Cohort (WB: born 1942-1947). Of the 23,691 participants represented across these cohorts 26.5% of HRS, 20.8% of AHEAD, 25.9% of CODA, and 24.6% of WB respondents identified as having served in the military. Average tenure of service was 4.1 years (range 0-37) across all cohorts. Furthermore, on average respondents with military service have 5-7 waves (10-14 years) of longitudinal data (range 1-10 waves). Thus, HRS is a rich resource for examining the impact of military service on health and wellbeing in aging.

LONGITUDINAL NEUROANATOMICAL CORRELATES OF POSTTRAUMATIC STRESS SYMPTOMS

C.E. Franz[1], M.J. Lyons[2], W.S. Kremen[1,3], *1. Psychiatry, University of California San Diego, La Jolla, California, 2. Boston University, Boston, Massachusetts, 3. VA San Diego Center of Excellence for Stress and Mental Health, San Diego, California*

Neuroimaging studies contribute to our knowledge of the development and consequences of posttraumatic stress disorder (PTSD). Most research on the neurocircuitry of posttraumatic stress (PTS) focuses on individuals who exceed the diagnostic threshold for PTSD rather than on individuals who are subthreshold but may suffer emotional and functional impairment. 502 Vietnam Era Twin Study of Aging participants were assessed at age 37 for military-service-related PTS symptoms and combat exposure, and underwent magnetic resonance brain imaging at age 55. We observed small but significant negative phenotypic associations of PTS symptoms with hippocampal volume, amygdala volume, and hippocampal occupancy (an indicator of hippocampal shrinkage). Combat exposure was not associated with these brain measures. Associations remained significant after excluding individuals with probable PTSD diagnoses. Thus these effects are not limited to individuals meeting PTSD diagnostic criteria. Given the large cohorts of aging veterans, these longitudinal results have implications for aging and public health.

SESSION 1090 (SYMPOSIUM)

CIVIL SOCIETY, GENERATIVITY AND THE THIRD AGE

Chair: I.R. Jones, *Social Sciences, Cardiff University, Cardiff, United Kingdom*

Discussant: G. O'Neill, *National Academy on an Aging Society, Washington, Washington*

Do the attributes and dispositions which strengthen or weaken social participation vary over time and place and between different social groups? Are we living through a time when the interests of one 'selfish generation', the boomers, clash with the interests of a newer, but equally 'selfish generation', the children of the boomers or so-called 'echo generation' brought up to be even more self-obsessed than their parents? The aim of this symposium is to consider the future of civil society in the light of these changing times. While promoting intergenerational solidarity has been a key aim of policy at national and international levels, others in academia and the media have been prophesying the demise of such solidarity and with it the demise of civil society itself. This symposium will examine the concept of civil society, its relationship with generativity and inter-generational relationships and the extent to which the rise of the third age – as ideology and as cultural practice – might confound the realisation of national and international policy goals associated with social participation and social solidarity across the generations. In so doing the symposium will present theoretical and empirical work addressing cohort and generational differences in volunteering and social participation and the relationships between trust, inequality, democracy and civic engagement in later life.

CHANGING THEORETICAL PERSPECTIVES ON CIVIL SOCIETY AND LATER LIFE

I.R. Jones, *Social Sciences, Cardiff University, Cardiff, United Kingdom*

Civil Society is subject to often intense theoretical debates about how it should be defined and what it represents. Some scholars, relating associational life with social capital, have suggested we are witnessing its long term decline with deleterious effects for social cohesion. Some see its resurgence in new social movements and protest, while for others it offers a means to social renewal. It is seen as; a third force resisting the systemic colonization of the life world; a non-governmental space of plurality, transparency, rights based approaches and solidarity; a radical reaction to global capitalism and; an alternative to statism most recently conveyed through the rhetoric of a 'Big Society'. It therefore inspires appeals to virtue and the good life that cross the political spectrum while its negative potential and contradictions are often glossed over. This paper will explore the implications of these debates for later life.

THE THIRD AGE, GENERATIVITY AND INTERGENERATIONAL SOLIDARITY

P. Higgs, *Faculty of BrainSciences, University College London, London, United Kingdom*

Over the past decade European societies have seen the rise of a concern about the relative balance of benefits accruing to different cohorts or generations. Generally this has been expressed in terms of older generations benefitting from the stability and prosperity of the period leading up to the economic recession of 2008 while younger cohorts have suffered greater instability and costs that have in turn constrained their opportunities. The third age has entered Into this mix by projecting a habitus for those in retirement that seems to validate these unfair circumstances. As a consequence some political commentators see intergenerational conflict emerging as a line of fracture in European societies at a time of austerity and political re-allignment. This paper addresses the extent to which the third age undermines intergenerational solidarity and interrogates the discourse of the decline of generativity among older cohorts.

THE IMPACT OF TRUST, DEMOCRACY AND INEQUALITY ON LATE LIFE VOLUNTEERING IN EUROPE

M. Hyde, *Stress Research Institute, Stockholm, Sweden*

Aim Studies rarely consider how political and institutional factors influence volunteering. This paper examines cohort differences in volunteering and the relationships between trust, inequality, corruption and democracy on volunteering in later life. Methods The sample comes from the European Social Survey (N=44,243). Doing any voluntary work in the last year and trust in institutions were based on self-reported data. The Corruption Perceptions Index, Gini index and Democracy Index were matched to each country. Results. Older cohorts are less likely to volunteer but this varies internationally. Trust in institutions was positively associated with volunteering in later life. Cross-national comparisons show that this holds for Western and Northern European countries but not elsewhere. Also less corrupt, more equitable and more democratic countries have higher rates of older volunteers. Conclusion. Creating more open, accountable and equitable societies will encourage older people to volunteer, which in turn contributes to a healthy civil society.

GENERATIVITY AND GENERATIONAL RELATIONS

C. Gilleard, *UCL, London, United Kingdom*

This contribution will outline various formulations of Erikson's concept of generativity before considering their applicability to conceptualizations of the third age and civil society. Recent debates concerning 'generational equity' imply that generativity is a quality in short supply amongst current baby boomer cohorts (more particularly, those born in the period 1945-1960). Such arguments suggest that social circumstances influence the patterning of adult development. A distinction can be made between inter-generational familial and intra-generational societal generativity, and the present paper argues that while levels of intra-generational societal generativity may have declined, inter-generational familial generativity has not. While modernity enhanced civil society and reduced the influence of the family, late modernity, I suggest, is reversing that trend.

SESSION 1095 (SYMPOSIUM)

SPIRITUALITY, HEALTH AND AGING: MODERATORS OF THE SPIRITUALITY - HEALTH ASSOCIATION

Chair: J.H. Patrick, *West Virginia University, Morgantown, West Virginia*
Co-Chair: P.S. Fry, *Trinity Western University, Langley, British Columbia, Canada*
Discussant: P.M. Wink, *Wellesley College, Wellesley, Massachusetts*

That religiousness and spirituality are associated with physical health and well being is well documented. Newer research examines the conditions under which the effects of spirituality are attenuated and those under which it is enhanced. This collection of papers discusses various moderators of the spirituality-health relation among diverse samples of adults. Related to age and coping, Graf, Patrick and Henrie discuss the role of age, spirituality, and morbidity among 800+ bereaved adults. Within the context of emotional health, Ronneberg, Miller, Dugan, and Porell examine the effects of religiousness and spirituality. Situating the spirituality-health link within the context of intergenerational relationships, Prem S Fry presents mortality data from 460 adults who engaged in sharing their beliefs, values and ideals with younger family members. Hannum and Black present data in which current and future care needs, social support among childless women, and religious- or spiritually-based faith systems are examined. Finally, turning to specific health contexts, Park, Aldwin, Choun, and George examine the role of spirituality for promoting emotion regulation and reducing mortality among adults with congestive heart failure. Our discussant, Paul Wink, highlights the variety of contexts in which spirituality does and does not influence morbidity and mortality.

TO EVERYTHING THERE IS A SEASON: RELIGIOUS BELIEFS, SPIRITUALITY AND COPING WITH BEREAVEMENT OVER TIME

A.S. Graf[1], J.H. Patrick[1], J. Henrie[2], *1. West Virginia University, Morgantown, West Virginia, 2. Research Inst. on Addictions, SUNY, Buffalo, New York*

Religious and spiritual coping are known to help alleviate grief, contributing to both emotional and physical health (Wortmann & Park, 2008). Other coping mechanisms, such as positive reappraisal and avoidance, are also associated with specific positive and negative health outcomes (Aldwin & Yancura, 2004). It is important to understand how available internal resources come together to reduce detrimental health effects common during bereavement. The current study examined the interrelations and effects of religious beliefs, spirituality, and coping on physical well-being among bereaved adults (N = 766, mean age = 32.53, SD = 11.61, range 18 to 80 years). Age and gender effects were also examined. Using structural equation modeling, an initial test of model fit indicated reasonable fit to the data (Chi sqr (18) = 127.27, p< .001, GFI = .971, RMSEA = .089). We anticipated these effects might differ between recently bereaved individuals (< two years; n = 386) and those who have had more time to adjust (> two years; n=380). Multi-group comparisons revealed structural differences between the models (CMIN (24) = 40.177, p = .020), suggesting different patterns of association among the variables of interest. Religious beliefs and spirituality did not directly influence physical well-being for either group in this sample, but indirect effects were found through coping methods. Religious beliefs and spirituality therefore represent important personal resources associated with preventing health declines, especially among the recently bereaved.

CHILDLESSNESS, CHRONIC ILLNESS, AND RELIGION IN LATER LIFE CARE NEEDS

S. Hannum[1], H. Black[2], *1. Johns Hopkins Bloomberg School of Public Health, Baltimore, Maryland, 2. University of Maryland, Baltimore County, Baltimore, Maryland*

The latter years of an individual's life are often punctuated with increased morbidity, prompting older persons to seek various sources of support, the balance of which often falls to biological children. For those who remained childless, however, issues of current or future care needs may be a primary concern. We therefore sought to answer: How are conceptualizations of aging and time affected by religious belief in the lives of childless older women? Utilizing data from the Generativity and Lifestyles of Older Women (GLOW) study (N=200), we analyzed relevant qualitative interviews regarding current and future care needs, the role of social support among childless women, and the impact of a religious- or spiritually-based faith system in projections of both the future and future care needs. This paper thus explores emergent themes surrounding care needs and expectations in the lives of childless older women, as affected by religious belief.

THE PROTECTIVE EFFECTS OF RELIGIOSITY ON DEPRESSION: A 2-YEAR PROSPECTIVE STUDY

C.R. Ronneberg, E.A. Miller, E. Dugan, F.W. Porell, *Gerontology, University of Massachusetts Boston, Boston, Illinois*

This study examines whether religiosity protects against depression and/or aids in recovery. Data are from the 2006 and 2008 waves of the Health and Retirement Study. The baseline (2006) sample consists of 1,992 depressed and 5,740 non-depressed older adults (mean age=68.12 years), for an overall sample size of 7,732. Logistic regressions analyzed the relationships between organizational (OR), non-organizational (NOR), and intrinsic (IR) measures of religiosity and depression onset as well as recovery, at follow-up (2008), controlling for other baseline factors. Results indicate that individuals not depressed at baseline remained non-depressed two years later if they frequently attended religious services (OR), while those depressed at baseline were less likely to be depressed at follow-up if they more frequently engaged in private prayer (NOR). Strategies to prevent and relieve depression among older adults include improving access and transportation to places of worship and encouraging discussions around religious activity with mental health professionals.

INTER-GENERATIVITY AS A PREDICTOR OF MORTALITY AMONG OLDER ADULTS: A 6.5 YEAR LONGITUDINAL STUDY

P.S. Fry, *Trinity Western University, Langley, British Columbia, Canada*

For purposes of this study, inter-generativity is defined as "concern and activity dedicated to contributing to the well-being of others, especially younger generations" (Erikson, 1982) and is postulated to be a driving motivation for social activity and productive engagement in old age (Narushima 20050). Within the predetermined scope, conceptualization and formalization of the concept of inter-genrativity, we also included the concerted attempts of older generations of individuals to share with younger generations their beliefs,values and ideals of spiritualism, religion, universality, and humanity. The study had a sample of 460 older adults between the ages of 70 to 90 years. Results of the longitudinal analysis derived from a set of Cox regressions showed that inter-generativity was a significant predictor of longevity. Participants with low levels of inter-generativity at the time of baseline assessment were at a 35% higher risk of mortality compared with those at high levels of inter-generativity at the time of baseline assessment. Implications of the findings are discussed in terms of successful aging

DO RELIGIOUSNESS AND SPIRITUALITY HAVE DIFFERING PATHWAYS TO MORTALITY? TESTING THE SELF-REGULATION MODEL IN CONGESTIVE HEART FAILURE PATIENTS

C. Park[1], C.M. Aldwin[2], S. Choun[2], L. George[1], *1. University of Conecticut, Storrs, Connecticut, 2. Oregon State University, Corvallis, Oregon*

We tested a recently proposed self-regulation model of the effects of religiousness and spirituality on health by examining mortality in a prospective study of 191 congestive heart failure patients (64% male; Mage = 68.6 years, SD = 10.1) followed for five years. Effects of religiousness (e.g., service attendance) were expected to occur through behavioral self-regulation of health habits and adherence, while the effects of spirituality (e.g., self-transcendence) were expected to be mediated via emotional regulation, reflected in positive and negative affect. The model was partially supported: Controlling for age and health status, religiousness was unrelated to mortality, but spirituality had a protective effect, decreasing mortality risk by 70%. Effects of religiousness on mortality were weak and indirect through health behaviors, while effects of spirituality on mortality were direct as well as partially mediated by depressed affect. Spirituality appears to be an important independent protective factor in this very ill sample.

SESSION 1100 (SYMPOSIUM)

FOR BETTER OR FOR WORSE? AGE-RELATED DIFFERENCES IN EMOTION REGULATION AND RECOGNITION

Chair: G. Luong, *Affect Across the Life Span Research Group, Max Planck Institute for Human Development, Berlin, Germany*
Co-Chair: C. Cohrdes, *Affect Across the Life Span Research Group, Max Planck Institute for Human Development, Berlin, Germany*

The symposium focuses on understanding emotional competencies (emotion regulation, processing, and recognition) across the life-span. Previous work suggests emotion regulation improves while emotion recognition declines with age. The presentations shed light on potential motivational, contextual, and methodological effects contributing to these age differences. The studies employed diverse methods (e.g., experience sampling, music-selection paradigm, presentation of laboratory stimuli, dyadic interactions) to investigate age-related improvements and limitations in the regulation and recognition of affect. With respect to emotional well-being across the lifespan, implications for daily life and social interactions are discussed. English and Carstensen will present results from a 5-year longitudinal experience sampling study pointing out age-related improvements in emotion regulation abilities in daily life. Cohrdes, Wrzus and Riediger will present results from a study investigating age-related differences in the motivation and efficiency to regulate affective states when experiencing tense arousal. Freund and Niktin will discuss age-related differences in frequency estimates of angry and happy faces in a stream of pictures rapidly presented. Ngo and Isaacowitz will discuss the importance of context for the perception of emotion in varying modalities (e.g. faces, objects and scenes) and different age groups. Blanke, Rauers and Riediger will present how age differences in empathic skills relate to communication satisfaction in a naturalistic dyadic interaction.

AGE-RELATED IMPROVEMENTS IN DAILY EMOTION REGULATION

T. English[1], L. Carstensen[2], *1. Psychology Department, Washington University in St. Louis, St. Louis, Missouri, 2. Stanford University, Stanford, California*

Aging is associated with reliable improvements in emotional well-being. Emotion regulation has been suggested to play a role in producing these emotional benefits. In the present study we examine whether there are age-related enhancements in emotion regulation ability in daily life. Adults ranging in age from 18 to 94 participated in a 5-year longitudinal experience sampling study with assessments occurring five random times a day for one week during two waves of data collection. Older adults reported being better able to control both their inner experience and outer expression of emotion than did relatively younger adults, although this effect was somewhat diminished later in life. Notably, this age-related improvement in emotion regulation ability held even when taking into account valence of the situation, suggesting that older adults do not report being better able to control their emotions simply because the situations that they encounter in daily life are less aversive.

CALM DOWN! – AFFECT REGULATION VIA MUSIC FROM ADOLESCENCE TO OLD AGE

C. Cohrdes[1], C. Wrzus[2], M. Riediger[1], *1. Affect Across the Lifespan, Max Plack Institute of Human Development, Berlin, Berlin, Germany, 2. Johannes Gutenberg Universität, Mainz, Rheinland-Pfalz, Germany*

This study employed a novel music selection paradigm to investigate age-related differences in the motivation and efficiency to regulate one's affective states when experiencing tense arousal. Participants ranging from adolescents to old age completed a complex task under time pressure. The task difficulty was adjusted to the participants' performance levels in order to elicit comparable arousal levels in all participants. Bogus feedback of either above-average or below-average performance was provided to induce positive or negative affect. Following that, participants freely browsed a pre-piloted music selection, and their listening behavior was recorded. We found age differences in the preference for music with divergent levels of valence and arousal as well as in the course of the regulatory process. The results emphasize that it is important to consider the level of arousal to understand age differences in the efficiency of regulatory processes.

ADULT AGE DIFFERENCES IN FREQUENCY ESTIMATIONS OF HAPPY AND ANGRY FACES

J. Nikitin[1], A.M. Freund[2], *1. Department of Psychology, UiT The Arctic University of Norway, Tromsø, Norway, 2. University of Zurich, Zurich, Switzerland*

With increasing age, the ratio of gains to losses becomes more negative, which is reflected in expectations that positive events occur with a higher likelihood in young adulthood, whereas negative events occur with a higher likelihood in old age. Little is known about expectations of social events. Given that younger adults are motivated to establish new social relations, they should overestimate positive relative to negative signals. Older adults, who are particularly motivated to avoid negative encounters, should overestimate negative relative to positive signals. Two studies (Study 1: n = 91 younger and n = 89 older adults, Study 2: n = 50 younger and n = 50 older adults) supported these hypotheses using frequency estimates of happy and angry faces. Although both younger and older adults overestimated the frequency of angry compared to happy faces, the difference was significantly more pronounced for older adults.

AGING AND EMOTION PERCEPTION COMPETENCE: THE ROLE OF CONTEXT

N. Ngo, D. Isaacowitz, *Northeastern University, Boston, Massachusetts*

While the age-associated deficit in facial emotion perception is well-established, the traditional emotion perception task in which the target facial expression is presented out of context may not reflect the kind of emotion perception that older adults do in daily life. Context has proved to be important to older adults in various cognitive processes, although not much is known about its role in emotion processing. In two studies (total N=144), we explored age differences in contextual influence on emotion perception as a function of types of contextual cue, target emotions, and top-down attentional control. Across both studies, older adults were more influenced by context than younger adults regardless of context types, target emotions, and instructions to ignore context or view it as irrelevant. Older adults' attention to context seems to result from both an inhibition deficit and motivation to utilize useful cues for emotion perception.

DOES BEING EMPATHIC PAY OFF? – SOCIAL IMPLICATIONS OF EMPATHIC SKILLS IN YOUNGER AND OLDER WOMEN

E. Blanke, A. Rauers, M. Riediger, *Max Planck Institute for Human Development, Berlin, Germany*

Previous research suggests that empathic skills might decline with age. These findings were mostly obtained using paradigms that have been criticized for their lack of ecological validity. Moreover, little is known about potential social implications of such an age-related decline. We compared three indicators of empathic skill (self-reported empathy, emotion recognition from pictures, and empathic accuracy during a naturalistic dyadic interaction) in 102 younger (20-31 years) and 106 older (69-80 years) women, and investigated associations with interaction satisfaction. Younger women outperformed older women in the emotion-recognition task and in empathic accuracy for negative but not positive affect. These age differences, however, seemed to have limited immediate social implications: Only self-reported empathy and empathic accuracy for positive affect predicted interaction satisfaction. In conclusion, age differences in empathic skills might be less pronounced than past research suggested, and older adults' social adjustment may not be strongly affected by their declining empathic skills.

SESSION 1105 (PAPER)

ECONOMICS OF AGING

IMPACT OF WAGE GROWTH ON PROJECTED INCOMES OF FUTURE SOCIAL SECURITY BENEFICIARIES

H. Iams, P. Purcell, D. Shoffner, *Office of Research Evaluation and Statistics, Social Security Administration, Bethesda, Maryland*

MINT (Modeling Income in the Near Term) is SSA's premier microsimulation model for estimating the dsitributional effects of Social Security reform proposals. SSA uses MINT to respond to requests for estimates from OMB, Congress, and others. Assessing the sensitivity of MINT estimates to underlying assumptions is important for maintaining the quality of the MINT model. The proposed paper assesses the impact of differential wage growth by education level on the projected income of future Social Security Beneficiaries in 2030 using the most recent version of MINT (MINT7). We estimate that there is substantially more wage growth among college educated persons than those with less educational attainment. This differenital wage growth may affect the retirement benefits and income of future retirees. To the best of our knowledge, modeling of the future incomes of retirees has not considered the effect of differential wage growth on the projected income os future retirees. MINT7 uses the 2004 and 2008 panels of the Census Bureaus Survey of Income and Program Participation (SIPP) matched to SSA benefits and earnings records. SSA researchers previously published the results of MINT analyses in the Gerontologist with a simulation of SSA benefit earnings sharing (Vol. 50, no. 4, pp. 495-508).

FINANCIAL FRAUD AMONG OLDER ADULTS: ONE-YEAR INCIDENCE AND CORRELATES FROM A POPULATION-BASED SURVEY

S. Beach, *University of Pittsburgh, Pittsburgh, Pennsylvania*

Financial fraud and scams targeting older adults is a problem that is receiving increased attention from researchers and policy makers. This paper reports data on financial fraud from a random digit dialing telephone survey (n = 1,000) of adults age 55 and older in Allegheny County (Pittsburgh), PA (U.S.A.) Two items – In the past 12 months, “Have you paid for a product or service that was never received?;” “Have you been billed for a product or service that you had not agreed to purchase?” – were included in a survey covering a broad range of financial, health and quality of life indicators. The paper presents one year incidence of financial fraud, and significant financial, health, social support, and other correlates of fraud. Preliminary results show a one year incidence (yes to either question) of approximately 12%. Significant bivariate correlates of financial fraud from preliminary analyses include being single or divorced; living alone; frequent internet use; use of internet social networking sites; having difficulty paying for basic necessities; receiving SSI/government assistance; high debt levels; knowing few and rarely talking to neighbors; low social support; feeling left out and isolated; poor self-rated health; high stress in past month; taking medication for a mental health problem; and low overall life satisfaction. The final paper will include multivariate discriminant analyses to determine variables that best distinguish those reporting fraud from those not reporting. Findings will have implications for theory development, screening, detection, and potential interventions to prevent financial fraud and scams in older adults.

HOSPITALISTS AND HOSPITALS’ BOTTOM LINE: IS THERE A BUSINESS CASE?

J. Epane[1], R. Weech-Maldonado[2], N. Menachemi[2], B. Sen[2], *1. Health Care Administration and Policy, University of Nevada Las Vegas, Las Vegas, Nevada, 2. University of Alabama at Birmingham, Birmingham, Nevada*

Hospitalists are a group of hospital-based physicians specializing in the provision of hospital medicine. Hospitalists have grown unprecedentedly since first introduced in the U.S in the mid-1990s. Studies on hospitalists have mainly focused on efficiency as measured by costs and length of stay (LOS). The purpose of this study is to explore the association between the use of hospitalists and financial performance. This longitudinal study (2007-2010) consisted of a national sample of U.S. acute care hospitals (N=3,792). Data for this study was extracted from the American Hospital Association (AHA) Annual Survey, the Area Health Resource File (AHRF), and CMS’ Medicare costs reports and Case Mix Index (CMI) files. A panel design with facility and year fixed effects regression was performed to assess these relationships controlling for organizational and market factors. We found that an increase in the use of hospitalists is associated with both higher costs and higher revenues. Our study also showed that an increase in the use of a low proportion of hospitalists is associated with both lower costs and lower revenues, while an increase in the use of a high proportion of hospitalists is associated with both higher costs and higher revenues. This increased/decreased costs and revenues offset one another and does not translate into increased profitability. As stakeholders in the health care industry explore strategies to reduce costs, the adoption of hospitalists is a staffing strategy which may necessitate further exploration to determine if this staffing strategy holds its potential promises.

CAN AGING IN PLACE BE COST EFFECTIVE? A SYSTEMATIC REVIEW

E.M. Graybill[1,2], P. McMeekin[1,2], J. Wildman[1,3], *1. Newcastle University, Newcastle Upon Tyne, Tyne & Wear, United Kingdom, 2. Institute of Health & Society, Newcastle Upon Tyne, Tyne & Wear, United Kingdom, 3. Business School, Newcastle Upon Tyne, Tyne & Wear, United Kingdom*

Purpose of the study: To systematically review cost and cost-effectiveness studies for assisted living technologies (ALTs) that specifically enable older people to ‘age in place’ and highlight what further research is needed to inform decisions regarding aging in place. Design: People aged 65+ and their live-in carers (where applicable), using an ALT to age in place at home opposed to a community-dwelling arrangement. Methods: Studies were identified using a predefined search strategy on two key economic and cost evaluation databases NHS EED, HEED. Studies were assessed using methods recommended by the Campbell and Cochrane Economic Methods Group and presented in a narrative synthesis style. Results: Eight eligible studies were identified from North America spread over a diverse geographical range. The majority of studies reported the ALT intervention group as having lower resource use costs than the control group; though the low methodological quality and heterogeneity of the individual costs and outcomes reported across studies must be considered. Implications: The studies suggest that in some cases ALTs may reduce costs, though little data were identified and what there were was of poor quality. Methods to capture quality of life gains were not used, therefore potential effects on health and wellbeing may be missed. Further research is required using newer developments such as the capabilities approach. High quality studies assessing the cost-effectiveness of ALTs for ageing in place are required before robust conclusion on their use can be drawn.

HAPPINESS, SUCCESSFUL AGING, AND ECONOMICS: AN INTERNATIONAL COMPARISONS ACROSS 31 NATIONS

H. Weng, *Institute of Gerontology, National Cheng Kung University, Tainan City, Taiwan*

Introduction: Many studies indicate that the more nation’s economic performance improves, the less happiness its citizens perceive. However, there is limited evidence of differences among age groups and countries. Methods: Data sources included subjective data and external data. Subjective data from 31 nations was obtained from the database of International Social Survey Programme: Health and Health Care - ISSP 2011. Total sample size for the elderly over 65 was 9245 (20.4 %) of the total population (n= 45385). The sample size for each countries ranges from 124~845. The mean age ranges from 68.9 to 74.8 and the percentage of female aged 65 or above ranges from 36.1 to 73.1. Using definition of Rowe and Kahn’s successful aging, three components were adapted: avoiding disease, engagement, and maintaining high cognitive and physical function External data includes gross domestic product (GDP), life expectancy, population ages 65 and above, and health expenditure total % of GDP, and corruption index. A hierarchical cluster analysis was initially performed using Ward’s method to identify the correct number of clusters. A k-means cluster was then used for the clustering. Results: The study results indicate that 31 countries are classified into three clusters: better economics and social policies with higher score of happiness, poorer economics with medium score of happiness, and developing countries or with lowest score of happiness. These studies findings indicate that the elderly people living in developed or under-developed countries achieve higher scores of happiness than those living in developing countries.

SESSION 1110 (PAPER)

DEMOGRAPHY OF AGING I

AGING IN THE CONTEXT OF COHORT EVOLUTION AND MORTALITY SELECTION

H. Zheng, *Sociology, Ohio State University, Columbus, Ohio*

This study examines historical patterns of aging through the perspectives of cohort evolution and mortality selection, where the former emphasizes the correlation across cohorts in the age dependence of mortality rates, and the latter emphasizes cohort change in the acceleration of mortality over the life course. In the analysis of historical cohort mortality data, I find support for both perspectives. The rate of demographic aging, or the rate at which mortality accelerates past age 70, is not fixed across cohorts; rather, it is affected by the extent of mortality selection at young and late ages. This causes later cohorts to have higher rates of demographic aging than earlier cohorts. The rate of biological aging, approximating the rate of the senescence process, significantly declined between the mid- and late-19th century birth cohorts and stabilized afterwards. Unlike the rate of demographic aging, the rate of biological aging is not affected by mortality selection earlier in the life course, but by cross-cohort changes in young-age mortality, which cause lower rates of biological aging in old age among later cohorts. These findings enrich theories of cohort evolution and have implications for the study of limits on the human lifespan and evolution of aging.

POVERTY AND HEALTH AMONG OLDER PERSONS IN MYANMAR

B.P. Teerawichitchainan, *School of Social Sciences, Singapore Management University, Singapore, Singapore*

Myanmar is one of the world's poorest countries and has some of the worst health indicators (Lancet 2012). Until recently, it was also one of the most isolated nations. Little is empirically known about the country's population health, including health status of older persons – many of whom are not only poor but have endured years of civil strife, economic hardship and unfavorable living conditions such as inadequate healthcare and weak infrastructure. This study examines the associations between poverty, wealth inequalities, and health outcomes of adults aged 60 and older in Myanmar. Data for our analysis come from the 2012 Myanmar Aging Survey, the country's first national survey of approximately 4,000 elders. The wealth inequality is based on an index that operationalizes wealth as ownership of household assets and housing quality. A variety of health outcomes, including self-rated health, functional health, ADL difficulties, and sensory impairments, are examined. Results indicate differentiation in health outcomes across wealth gradients. The bottom quintile, which consisted of older persons living in households that own nothing, reports the most health problems. There is significant health improvement moving from the lowest to the second quintile, suggesting that relative inequality matters and that a very small difference in wealth makes a large difference in health in an economically deprived settings. Policy implications of our empirical findings are discussed.

MULTIPLE CHRONIC CONDITIONS AND LIFE EXPECTANCY: A LIFE TABLE ANALYSIS

E. DuGoff[1,2], V. Canudas-Romo[3,2], C. Buttorff[2], B. Leff[2], G. Anderson[2], *1. University of Wisconsin-Madison, Madison, Wisconsin, 2. Department of Health Policy and Management, Johns Hopkins Bloomberg School of Public Health, Baltimore, Maryland, 3. Epidemiologi, Biostatistik og Biodemografi Max-Planck Odense Center, Odense C, Denmark*

Background: The impact of having multiple chronic conditions on life expectancy in is unclear. Objectives: We quantify the impact of having multiple chronic conditions on life expectancy in Medicare beneficiaries. Research Design: A retrospective cohort study using single-decrement period life tables. Subjects: Medicare fee for service beneficiaries (N=1,372,272) ages 67 and older as of January 1, 2008. Measures: The Medicare Chronic Conditions Warehouse (CCW) file was used to identify each subject's number of chronic conditions diagnosed prior to January 1, 2008. Life expectancies were estimated using single decrement life tables by sex and race, selected chronic conditions (heart diseases, cancer, chronic obstructive pulmonary disease, stroke, and Alzheimer's disease), and by number of comorbid conditions. Results: Each additional chronic condition reduces life expectancy in older adults by approximately 1.5 years per condition (ranging from 0.3 years to 2.5 years). We find that a 67 year old with no chronic conditions will live an on average of 22.5 additional years. Compared to a person with no chronic conditions, life expectancy at 67 is on average 7 years shorter for a person with five chronic conditions and 16.9 years shorter for a person with 10 or more chronic conditions. We observe substantial differences in life expectancy by the selected conditions ranging from 10 years (males with Alzheimer's Disease and dementia) to 21.2 years (males with heart disease). These differences diminish with increasing numbers of comorbid conditions. Conclusion: Social Security and Medicare actuaries should account for the growing number of beneficiaries with multiple chronic conditions when determining population projections and trust fund solvency.

INCORPORATING BIOMARKERS INTO THE STUDY OF SOCIOECONOMIC STATUS AND HEALTH AMONG OLDER ADULTS IN CHINA

M. Brasher[1], Y. Zeng[2], L.K. George[2], Z. Yin[3], X. Shi[3], *1. University of Rhode Island, Kingston, Rhode Island, 2. Duke University, Durham, North Carolina, 3. CDC, Beijing, China*

This paper examines the relationship between socioeconomic status (SES) and health among rural elderly in China, where health is measured both by objective biomarkers from blood and urine samples and self-reports of health. We also examine whether the SES-health relationship varies by gender. Biomarker measures include cholesterol measures, glucose, blood pressure, waist circumference, and body mass index. Self-reports of health include self-rated health, activities of daily living disability, and functional limitations. SES is measured by education level and former occupation. Biomarker and survey data come from the biomarkers sub-sample of the 2009 wave of the Chinese Longitudinal Healthy Longevity Survey (CLHLS), which collected data in Chinese longevity areas. We find a negative relationship between SES and health as measured by biomarkers – high SES is associated with worse health. We find a positive relationship – high SES associated with better health – for our self-reports of overall health. We also found more significant associations between SES and health for men than for women. These findings confirm previous studies that show SES and CVD have a positive association earlier in economic development due to lifestyle. The fewer significant associations for women (despite a larger sample size due to mortality selection) may be due to women's overall lower status in Chinese society.

ANOMALY IN THE GRADIENT: ADULTS WITH “SOME COLLEGE” HAVE WORSE HEALTH THAN HIGH SCHOOL GRADUATES

A. Zajacova[1], V. Johnson-Lawrence[2], *1. University of Wyoming, Laramie, Wyoming, 2. University of Michigan Flint, Flint, Michigan*

Background The health gradient by education is one of the best-documented patterns in population-health research. Recent findings reported, however, that adults with “some college” education have not better but worse self-reported health than high school graduates with less schooling. Objective To determine whether the gradient anomaly exists for objectively-measured markers of biological risk, in order to eliminate the possible differential reporting of heath by the two education groups. Methods Appropriate regression models of individual biomarkers and summary indices on educational attainment were estimated among adults aged 30-64 from the 1999-2012 National Health and Nutrition Examination Survey (NHANES). Respondents with a high school (HS) diploma, some college, as well as those with AA and BA degrees were included. The detailed education information is only available in the restricted data; we received access to the data via the NCHS RDC. Results Preliminary results show that men and women with some college education but no diploma have either statistically equivalent or worse biological risk profiles than HS graduates. Those who earned associate degree had risk profiles compatible with the health gradient: they were comparable or significantly better off than HS graduates, and BA degrees were associated with substantially better health. Conclusions The findings showed that the health disadvantage of college dropouts vis-à-vis high school graduates is not due to differential reporting. College dropouts represent 22% of US adults; the findings highlight the urgent need to understand their relatively poor health better and to investigate the causes of this pattern and potential interventions.

SESSION 1115 (PAPER)

FAMILY CAREGIVING: MEASURES AND METHODOLOGICAL ISSUES

FEELING GENERATIVE AS A BENEFIT OF CAREGIVING: VARIATION BY AGE OF CARE RECIPIENT?

M.R. Grossman, T.L. Gruenewald, *University of Southern California, Los Angeles, California*

Although a sizable body of research suggests negative psychological consequences of caregiving, such as distress and depression, little attention has been paid to potential psychological benefits one might gain from providing care. One such benefit may be an enhanced self-perception of generativity, or feeling like one plays a valuable role in others' lives. The objective of the current analysis was to utilize data from the 2nd wave and refresher cohort of the National Survey of Midlife Development in the United States (MIDUS) Study to examine differences in self-perceptions of generativity, measured with the Loyola Generativity Scale, as a function of caregiver status (last 12 months). A secondary aim was to examine variations in perceptions of generativity among caregivers as a function of care recipient's age (care to children with disabilities vs. older relatives). These associations were explored in regression analyses adjusting for sociodemographic factors in a subsample (n = 3,274) of MIDUS participants, ages 23 to 54. Caregivers had significantly higher perceptions of generativity (M=17.57) than non-caregivers (M=16.94, p<.01). However, levels of generativity among caregivers did not vary as a function of care recipients' ages. These findings suggest that enhanced feelings of generativity may be a benefit of caregiving. As greater feelings of generativity are associated with improved mental and physical functioning in later life, this potential psychological benefit of providing care may help to buffer against the adverse health and well-being states associated with caregiving. Additional longitudinal investigations are needed to examine the bidirectionality of these associations over time.

CAREGIVER RESENTMENT OVER TIME: THE INFLUENCE OF RACE AND GENDER

D.W. Durkin[1,2], G. Williamson[3], *1. Social Work, University of West Florida, Pensacola, Florida, 2. UWF Center on Aging, Pensacola, Florida, 3. University of Georgia, Athens, Georgia*

Many caregivers of older adults feel resentful; however, caregiver resentment has been understudied in the caregiving literature. Previous studies have shown that resentment has been positively linked to a greater need for assistance with activities of daily living, care recipient behavior problems, feelings of caregiver burden and the quality of care provided to the care recipient. This study is a longitudinal, secondary data analysis of the Family Relations in Late Life (FRILL) 2 study. Using the Pearlin stress process model (SPM) as a guide, the purpose of this study was to examine caregiver resentment over 36 months among African American and White caregivers of older adults living in the community. A two-level Hierarchical Linear Model (HLM) was used to predict changes over time for caregiver resentment and examined the influence of race, gender and constructs suggested by the Pearlin SPM. Caregivers with greater activity restriction reported higher levels of resentment. Caregivers who reported a better pre-illness relationship and more social support reported less resentment. There was a main effect of time, such that resentment lessened over time for the sample. Change over time also demonstrated a significant quadratic pattern suggesting a significant drop in resentment between Time 1 and Time 2. There was no significant main effect for race suggesting that there are no significant differences between African American and White caregivers in their report of resentment over time. However, there was a main effect for sex such that female caregivers reported more resentment than males over time.

CARE PARTNER RELATIONSHIPS: THEMATIC ANALYSIS OF PLANNING IN FAMILIES WITH MILD COGNITIVE IMPAIRMENT

K.A. Arsenault, K.A. Roberto, R. Blieszner, S. Kim, *Human Development, Virginia Tech, Blacksburg, Virginia*

Families who have a relative with mild cognitive impairment (MCI) conceptualize memory changes and plan for the future in various ways. Prior family relationships and dynamics are likely to influence a family's openness to accessing resources and using community services. This study addressed planning for the future care of relatives with MCI within the context of differing family perceptions and care relationships. Semi-structured qualitative interviews with 47 triads, the person with MCI and two family members, revealed differential family perception of the elders' memory changes and associated openness to and use of resources, services, and planning. Family planning varied with respect to care partner relationship status (spouse or adult child) and degree to which the family acknowledged changes in the elder's memory (completely, partially, passively, or not at all). Adult children were more likely than spouses to discuss future plans, which included using alternative care sources and making legal and financial arrangements. Adult children were also more open than spouse care partners to having conversations about employing future resources such as utilizing medical services, support groups, and long-term care housing arrangements. While family acknowledgment was the primary indicator of future planning (the greater the acknowledgement, the more likely to plan), care partner relationship further explained the intricacies of these difficult familial circumstances. Recognizing the intersection of level of understanding families have about MCI with different care partner relationships can inform strategies counselors and other service providers use to assist families facing MCI in planning future care arrangements.

CAREPRO: OUTCOMES & MAINTENANCE OF GAINS FROM A DEMENTIA CAREGIVER EBT TRANSLATED INTO COMMUNITIES

D.W. Coon, M. Todd, D. McClain, *College of Nursing & Health Innovation, Arizona State University, Phoenix, Arizona*

Evidence for the effective translation into the community of EBTs for family caregivers remains sparse, especially in terms of maintenance of gains. Alzheimer's Association Chapters, state units on aging, and area agencies on aging used the RE-AIM framework to successfully translate CarePRO (a group and coach call skills-building intervention) across two states. Funded by the U.S. Administration on Aging, over 800 family caregivers of people with dementia participated across three translation periods embedding recruitment activities, intervention delivery, and user friendly assessment tools into community organizations serving rural and urban areas. Delivered by Chapters through a train-the-trainer model implemented under an established treatment fidelity protocol, CarePRO included: a) an intensive 10-week phase of skill groups and coach calls; and, b) a maintenance of gains phase providing three booster calls across the next 9 months. Pre-post analyses of CarePRO's intensive phase yielded significant outcomes (p's < .001) in all domains of significance outlined by Schulz et al. (2002) including clinical significance (e.g., reduction in depression, anger, etc.); quality of life indicators (increases in positive coping, social support; reductions in negative coping, etc.); and social validity (caregiver perceptions of overall benefit). Analyses across the booster phase demonstrated either ongoing improvement (e.g., increases in positive affect, social support, etc.) or maintenance of gains (e.g., maintenance of reduction in depression, negative coping, etc.) in all domains. In terms of social significance, cost analyses suggest that CarePRO's train-the-trainer group-based model can be effectively translated while substantially reducing organization delivery costs when compared with other caregiver interventions.

CHILDHOOD ABUSE AND PROVISION OF SUPPORT TO AGING PARENTS: EVIDENCE FROM STRUCTURAL EQUATION MODELS

J. Kong, *Boston College, Brighton, Massachusetts*

Although studies have established important links between childhood abuse and diminished social functioning over the course of one's life, it is unknown whether the harmful effects of childhood abuse will interfere with intergenerational relations in later life. Drawing from the attachment perspective, the present study aims to examine the effect of childhood abuse on adult children's provision of support to aging parents, mediated through internal working models (i.e., self-esteem and perceived social support) and maladaptive coping strategies (i.e., disengagement and denial). This study mainly focused on the second wave of the National Survey of Midlife Development in the United States (MIDUS II). The final sample was comprised of adult children whose parent was alive at the data collection among 4,963 MIDUS II respondents. A structural equation modeling approach was utilized to estimate the proposed theoretical model. The result showed that there was a significant association between childhood verbal/physical abuse and provision of emotional or instrumental support to aging parents in a way that childhood abuse was related negatively to adult children's self-esteem and perceived social support, which was then associated with the greater use of maladaptive coping and less support giving to their older parents. This result suggests that earlier abusive treatment from parent(s) may influence later-life intergenerational relationships through negative internal working models and maladaptive coping mechanisms. This study emphasizes that interventions aimed at self-esteem and perceived social support should be a starting point for adult children with histories of childhood abuse who are engaged with their aging parents.

SESSION 1655 (PAPER)

CHRONIC DISEASE MANAGEMENT

INFLUENCE OF ZERO CLASSES ON CHRONIC DISEASE SELF-MANAGEMENT PROGRAM ATTENDANCE

M.L. Smith[1], L. Jiang[2], S. Chen[4], S. Ahn[3], K. Kulinski[5], K. Lorig[6], M.G. Ory[2], *1. College of Public Health, The University of Georgia, Athens, Georgia, 2. Texas A&M Health Science Center, College Station, Texas, 3. The University of Memphis, Memphis, Tennessee, 4. Texas A&M University, College Station, Texas, 5. National Council on Aging, Washington, DC, District of Columbia, 6. Stanford University, Pallo Alto, California*

Objectives. Although most evidence-based programs have a predetermined number of class sessions, hosting a zero class (i.e., a pre-workshop session) is a useful strategy to orient participants to the program and collect evaluation data without detracting from intervention activities. However, little is known about the nature and consequences of zero classes. Using the national dissemination of the Chronic Disease Self-Management Program (CDSMP), this study identifies the utilization of zero classes in various delivery settings and examines the influence of zero classes on successful program completion (i.e., attending 4 or more of 6 offered workshops). Methods. Data were analyzed from the first 100,000 adults enrolled in CDSMP workshops spanning 45 states and two territories from 2010-2012. To assess the association between zero classes and CDSMP workshop attendance, generalized estimating equation (GEE) models with a logit link were fitted, controlling for participants' sociodemographics and clustering effects at the workshop level. Results. In total, 21% of CDSMP participants attended workshops offering a zero class. More than one-quarter of participants attended CDSMP at residential facilities (26.3%) and senior centers (25.8%) with a zero class. Conversely, less than 10% of participants attended CDSMP at tribal centers with a zero class. The final multivariate GEE model showed that participants who attended a zero class had significantly higher odds of successfully completing the workshop (OR=1.09, P=0.003). Conclusion: Offering zero classes can increase intervention dose among CDSMP participants. Program deliverers are encouraged to weigh the relative health advantages when considering additional costs of hosting an additional workshop session.

CHRONIC DISEASE SELF-MANAGEMENT PROGRAM (CDSMP) DELIVERY AND ATTENDANCE AMONG URBAN-RESIDING AFRICAN AMERICANS

C.A. Mingo[1], M.L. Smith[2], S. Ahn[3], L. Jiang[1], J. Cho[4], S.D. Towne[4], M.G. Ory[4], *1. Gerontology Institute, Georgia State University, Atlanta, Georgia, 2. University of Georgia, Athens, Georgia, 3. University of Memphis, Memphis, Tennessee, 4. Texas A&M, College Station, Texas*

Objective: The purpose of this study was to identify the personal characteristics of urban-residing African Americans with chronic disease participating in the Chronic Disease Self-Management Program (CDSMP) and examine factors related to successful program completion (i.e., attending at least 4 of the 6 classes). Methods: Data were analyzed from 11,895 African Americans who attended the CDSMP at one of the five leading delivery sites (i.e., senior center, healthcare organization, residential facility, community location, faith-based organization). Logistic regression was used to assess the associations of personal, delivery site, and neighborhood characteristics with successful completion. Results: Approximately half of these African American participants were aged 65-79 years, 83% were female, and 92% lived alone. Approximately 44% of participants had three or more chronic conditions and 35% resided in an impoverished area (i.e., 200% below poverty level). Older participants ($p<.001$), females ($p<.001$), and those with fewer chronic conditions ($p<.001$) were significantly more likely to successfully complete the intervention. Participants who attended CDSMP at a residential facility ($p<.001$) or a community/multi-purpose facility ($p<.001$) were more likely to successfully complete the CDSMP. Conclusion: Findings highlight the unique patterns of attendance and delivery within the context of self-management interventions among this unique and traditionally underserved target population. Understanding such patterns can inform efforts to engage more organizations in urban areas to increase CDSMP adoption. For example, expanding delivery site recruitment among faith-based organizations may increase reach to African American participants, a population that may be at a greater risk for poor management and negative outcomes.

A STRUCTURAL EQUATION MODEL OF THE EFFECTS OF LONELINESS, SELF-EFFICACY, AND SOCIAL SUPPORT ON DEPRESSIVE SYMPTOMS AMONG WOMEN WITH CHRONIC ILLNESS

A. Roberts[1], C. Warner[2], K.B. Adams[3], *1. Miami University, Oxford, Ohio, 2. Case Western Reserve University, Cleveland, Ohio, 3. Walden University, Minneapolis, Minnesota*

The purpose of this study is to understand how risk and resilience factors, including loneliness, social support, and self-efficacy for managing chronic illness, affect depressive symptoms among older women living in the community over time. A total of 130 older women completed surveys six months apart. On average, participants were 72.7 years old (SD = 6.2) and reported nearly four chronic conditions (MT1=3.82, SD T1=2.08). The aims of this study were: (1) to determine whether loneliness (DeJong-Gierveld Loneliness Scale, 1999), a known risk factor for depression, was associated with depressive symptoms (CES-D, Radloff, 1977) six months later, and (2) to examine whether two protective factors, social support and self-efficacy for managing chronic illness (Lorig, 2001), were associated with fewer depressive symptoms over time. Finally, (3) we tested whether social support served as an intervening variable to mediate the relationship between initial loneliness and later depressive symptoms. We controlled for participants' race, physical health, and total number of chronic conditions. Alternative models were tested, and the fit of the final model was acceptable ($\chi 2$=20.587, df=10, p=.024, CFI=.965, RMSEA=0.91). As expected, women with higher initial social support and greater self-efficacy reported fewer depressive symptoms six months later. Because social support was the most important predictor of depression, and it mediated the relationship between loneliness and depression six months later, increasing social support may effectively prevent depression. This and other research and practice implications for older women managing chronic illnesses will be discussed.

PATIENT CHARACTERISTICS PREDICTING READMISSION AMONG INDIVIDUALS HOSPITALIZED FOR HEART FAILURE

M. O'Connor[1], C.M. Murtaugh[2], S. Shah[2], Y. Barrón[2], K.H. Bowles[3], T. Peng[2], C. Zhu[4], P.H. Feldman[2], *1. College of Nursing, Villanova Univeristy, Villanova, Pennsylvania, 2. Visiting Nurse Service of New York, New York, New York, 3. University of Pennsylvania, Philadelphia, Pennsylvania, 4. Mount Sinai School of Medicine, New York, New York*

Heart failure (HF) is increasingly common and difficult for patients, caregivers and their clinicians to manage with costs exceeding $37 billion in 2009. It is estimated that 5.1 million Americans age 20 or older suffer from HF with a 46% increase expected by 2030. Little is known about the characteristics consistently associated with higher rates of readmission. A review of the literature was conducted on the evidence of HF patient characteristics related to readmission. Database searches yielded 603 potential articles, of which 31 studies fulfilled inclusion criteria. Twenty-two were retrospective and 9 were prospective with the majority of studies conducted in the United States. All-cause 30-day readmission rates ranged from 13% to 28%; 30 day readmission rate for HF ranged from 9% to 24%. Sixty, 90 and 180-day readmission rates were also examined. Overall, patient characteristics measured before hospital discharge had a modest effect on all-cause or HF-related readmission within 30 to 180 days of index hospital discharge. Men, older adults, Medicare beneficiaries and blacks are more likely to be readmitted. A prior diagnosis of HF had a large positive effect on readmission and a range of cardiac diseases had a positive but small effect. Findings underscore the challenge of developing successful interventions to reduce HF readmissions. No single patient factor stands out as a key contributor to readmission indicating multiple conditions contribute to readmission. Interventions may need to be general in design to allow decisions about the specific intervention to be made depending on each patient's clinical profile.

SESSION 1125 (SYMPOSIUM)

APPLIED INTERVENTION AND TRANSLATIONAL RESEARCH: IMPLICATIONS FOR OLDER LATINOS

Chair: F. Andrade, *Kinesiology and Community Health, UIUC, Champaign, Illinois*
Discussant: A.P. Herrera, *University of Maryland Baltimore County, Baltimore, Maryland*

The older Latino population is increasing at a faster rate than the non-Hispanic Whites which will affect public sources of geriatric care and test family support systems. Chronic conditions, responsible for high health care expenditures, are especially prevalent in this community. Behavioral interventions around physical activity and diabetes management, and home care, are examples of preventive care that can substantially improve disease management and independent living. This panel provides examples of the sociocultural nuances and health systems structures that pose challenges to the effective delivery of these services, and offer health policy and practice recommendations for improving their widespread translation. Salinas presents a new methodology for pinpointing modifiable diabetes risk factors among Mexican Americans. Mendez-Luck et al provide an overview of a new pilot program, Juntos, for caregiver-elder dyads to improve diabetes management. Cardenas and Sommerfeld offer lessons learned from the implementation of the Salud Program, a successful evidence-based strategy for providing culturally tailored mental health and diabetes prevention for older Latinos in primary care. The work by Crist discusses inequities found in the rates of referrals to home health services between non-Hispanic Whites and Latinos, and the health system structures that may be responsible for these disparities. Finally, Marquez and colleagues describe the challenges and lessons learned in their recruitment and retention efforts from a physical activity program targeting older Latinos. They highlight the influence of time allocation, cultural norms, age-related syndromes, on their ability to engage in behavioral change. Co-Chairs: Flavia Andrade and Angelica P. Herrera

JUNTOS CONTROLANDO LA DIABETES (CONTROLLING DIABETES TOGETHER)

C.A. Mendez-Luck[1], M. Miranda[2], C.M. Mangione[2], *1. College of Public Health and Human Sciences, Oregon State University, Corvallis, Oregon, 2. University of California, Los Angeles, Los Angeles, California*

Most type 2 diabetes interventions focus on self-management and thus fall short for diabetic older adults who rely on their families to help them manage the disease. The purpose of this study was to develop and test the feasibility of a culturally appropriate diabetes intervention for Mexican-origin older adults and their primary caregivers to improve the dyad's communication and negotiation of diabetes management. The intervention was developed from formative research with Mexican-origin caregiver-care receiver dyads. Thirty-six dyads completed a six-week program of one-on-one sessions with a trained program facilitator. The curriculum consisted of communication skill building and dyad decision-making on lifestyle changes to improve care receivers' blood sugar levels. Preliminary results show that an intervention on building dyad cooperation and teamwork is acceptable to Mexican-origin diabetic older adults and their caregivers as well as a promising approach for effectively controlling type 2 diabetes among older Latinos with family caregivers.

LESSONS LEARNED IN CONDUCTING HEALTH-RELATED RANDOMIZED CONTROLLED TRIALS WITH OLDER LATINOS

D.X. Marquez, M. Caceres, S. Aguiñaga, P. Vasquez, S.J. Janicek, *Kinesiology and Nutrition, Univ of Illinois at Chicago, Chicago, Illinois*

Physical activity (PA) can affect declines in health outcomes of older adults. Unfortunately, older Latinos are less likely than non-Latino whites to engage in leisure time PA. Few interventions have been developed to improve the PA of older Latinos aged 55+; and there are many cultural and logistical challenges that we have encountered in conducting intervention research in this population. Issues stemming from culture, age, and a culture x age interaction have influenced our research. Cultural issues include placing family needs ahead of individual needs and travelling back to the home country for long periods of time. Age-related issues interfere with the research process (e.g., doctor appointments), and an interaction of culture and age issues are prevalent (e.g., many older Latinos have caregiving duties). Awareness of and consideration for such challenges are necessary when working with older Latinos. Funded by Alzheimer's Association (NIRGD-11-205469), NIH/NIA (P30AG022849), and NIH/NINR (5R01NR013151-02).

ASSESSMENT OF TRANSITIONAL CARE FOR MEXICAN AMERICAN ELDERS

J.D. Crist, J.T. Hepworth, A. Pasvogel, K.M. Koerner, *Community and Systems Health Sciences Division, College of Nursing, The University of Arizona, Tucson, Arizona*

Home health care services (HHCS) reduce costly post-hospital care. However, Latino elders underuse HHCS. Although culturally focused interventions increased Latino elders' willingness to use HHCS, they may receive fewer referrals. Through retrospective health record reviews of non-Hispanic white (NHW) and Latino elders aged 55+ discharged in 2012 from two hospitals (N=33597), differences in referral rates to HHCS were found. The odds for NHW elders receiving referrals were significantly higher than for Latino elders (OR=1.47, p<.001). When controlling for age and payer group (e.g. Medicare), NHW elders still received referrals more frequently than Latino elders (OR=1.31, p=.001). The uninsured received fewer referrals than those with Medicaid (OR=2.68, p=.005), Medicare (OR=4.14, p<.001), or private insurance (OR=3.04, p=.001). The most appropriate post-hospital care may not be offered when not covered by insurance, perpetuating disparities. Ways to ensure HHCS equity for vulnerable populations should be examined in local practice and state and federal policy.

IMPLEMENTING THE SALUD PROGRAM: AN EVIDENCED-BASED TREATMENT FOR IMPROVING DEPRESSION AND DIABETES IN OLDER LATINOS

V. Cardenas, D.H. Sommerfeld, *Psychiatry, University of California, San Diego, La Jolla, California*

Having diabetes substantially increases the likelihood for also experiencing depression, especially within the Latino community. The elevated rates of diabetes among Latinos, combined with limited participation in mental health services, result in high levels of untreated depression among this group. This presentation will provide an overview of the relationship between depression and diabetes, particularly among older Latinos. It will also include a description of and interactive experiences with the components of a culturally tailored strategy, the Salud Program, designed to promote greater access to evidence-based, integrated depression and diabetes care for older Latinos (age 60 and over) in a primary care setting. Results suggest that the program is achieving the primary goals of reducing depression, improving diabetes self-management activities, and reducing diabetes related symptoms. Key considerations will be discussed for implementing this program in other primary care settings such as specific provider and agency characteristics.

MODELING MORTALITY RISK BY DIABETES STATUS IN THE HISPANIC EPESE USING CART ANALYSIS. A NEW APPROACH FOR ASSESSING RISK

J.J. Salinas, *Epidemiology and Disease Control, UT School of Public Health, Brownsville, Texas*

This study will make use of Classification and Regression Tree (CART) analysis to model hierarchical predictive relationship between diabetes, comorbidities, sociodemographic covariates and mortality using the Hispanic EPESE data in order to differentiate the impact of multiple comorbidities or other covariatiates such as medication use or socioeconomic characteristics as cumulative factors that ultimately contribute to longevity or earlier mortality. The Hispanic EPESE (H-EPESE) (Markides et al 1997) is a rich data set from an ongoing cohort study that began in 1993. In addition to basic information on sociodemographics, health and psychosocial characteristics, data was collected on healthcare utilization (including hospitalizations and nursing home stays), medication use (and name of medication), anthropometrics and blood pressure. Preliminary findings for this study suggest that while the cohort of 75+ subjects in wave 5 had greater hypertension and higher ADL disability, they had lower depression and MMSE scores than the subjects that were 75+ years at baseline. Moreover, subjects who were 75+ in 2004/2005 on average had diabetes 16.9 years compared to 14.8 years in the baseline 75+ group and 13.1 years in the group that died between the ages of 65 and 74 years. The final outcome of this analysis is a set of risk factors that can distinguish groups at risk and provide concrete factors that can be addressed through prevention and education programming in this population.

SESSION 1130 (SYMPOSIUM)

GRECC SYMPOSIUM: HEART FAILURE, AN AGE-RELATED DISEASE: NEW INSIGHT INTO EXERCISE INTOLERANCE

Chair: R.S. Richardson, *Umiversity of Utah, Salt Lake City, Utah*

Exercise intolerance is widely recognized as a defining symptom in patients with heart failure (HF), limiting physical activity and impairing quality of life. Traditionally, this attenuated exercise capacity has been attributed predominantly to the "central" limitations associated with a malfunctioning cardiac pump. However, it is now recognized that approximately half of all HF patients are characterized as HF with reduced ejection fraction (HFrEF), while the remaining portion present with normal or "preserved" ejection fraction (HFpEF). Thus, attention continues to be directed toward "peripheral" factors which may contribute to the limited exercise capacity associated with HF. Indeed, the consistent attenuation of the convective and diffusive components of O2 transport (25-30%) in patients with HF during exercise compared to controls reveals an underlying peripheral O2 transport limitation from blood to skeletal muscle in this pathology. Potential mechanisms including abnormally elevated oxidative stress, inflammation, diminished skeletal muscle homeostasis, excess sympathoexcitation, and neural feedback from group III and IV muscle afferents may each play a key role in exercise intolerance. Hence, with skeletal muscle myopathy and the regulation of skeletal muscle blood flow as a central theme, this symposium will provide new insight into the consequences of both HFrEF and HFpEF and the implications for exercise intolerance in patients with HF as a whole.

THE ROLE OF SKELETAL MUSCLE CONVECTIVE AND DIFFUSIVE OXYGEN TRANSPORT IN HFREF

R.S. Richardson, *Umiversity of Utah, Salt Lake City, Utah*

Maximal exercise capacity, an important index of health in heart failure, might be limited by central and/or peripheral factors; however, their contributions remain poorly understood. Here, with an emphasis upon skeletal muscle convective and diffusive oxygen transport, factors limiting physical function in patients with heart failure with reduced ejection fraction (HFrEF) will be presented. Additionally, the mechanisms responsible for the benefits of small muscle mass exercise training in this population, which does not tax the cardiovascular system to the same magnitude as traditional whole body exercise, will be discussed. Specifically, the consistent attenuation of the convective and diffusive components of O2 transport in HFrEF during both cycle and even small muscle mass exercise reveals an underlying peripheral O2 transport limitation which can be clearly corrected by local skeletal muscle training.

CONTROL OF SKELETAL MUSCLE BLOOD FLOW DURING EXERCISE IN HFPEF

J.F. Lee[1,2], Z. Barrett-O'Keefe[1,2], J.J. Ryan[1,2], J.N. Nativi-Nicolau[1,2], R.S. Richardson[1,2], W. Wray[1,2], *1. University of Utah, Salt Lake City, Utah, 2. George E. Wahlen VAMC, Salt Lake City, Utah*

Exercise intolerance is a hallmark characteristic of heart failure with both reduced ejection fraction (HFrEF) and preserved ejection fraction (HFpEF). Although causal abnormalities in the vasculature of the exercising muscle with HFrEF have been documented, little is known about exercise-induced hyperemia in HFpEF. Using a small muscle mass exercise modality that does not significantly stress the cardiopulmonary system, evidence will be presented that reveals dysfunction in the peripheral circulation of this cohort. One potential mechanism responsible for this condition is overactivity of the sympathetic nervous system, which may produce a level of vasoconstriction in the exercising muscle that cannot be entirely overcome, resulting in a sustained reduction in exercising skeletal muscle blood flow. Thus, work exploring whether regional sympathetic inhibition can restore skeletal muscle blood flow in HFrEF patients towards that of their healthy, age-matched counterparts will also be presented.

HEMODYNAMIC AND FATIGUE-RELATED ROLE OF GROUP III/IV MUSCLE AFFERENTS IN HFREF

M. Amann, *GRECC, Salt Lake City VAMC, Salt Lake City, Utah*

The role of group III/IV muscle afferents in the hemodynamic abnormalities and subsequent diminished fatigue resistance characterizing patients with heart failure with reduced ejection-fraction (HFrEF) is not well understood. Studies that utilized lumbar intrathecal fentanyl to impair μ-opioid receptor-sensitive muscle afferents during exercise in this population will be discussed. This work has revealed a dichotomy of central and peripheral responses. As expected, group III/IV muscle afferent feedback plays a positive and very important role in the exercise-induced central hemodynamic response in HFrEF. However, group III/IV muscle afferents appear to cause sympatho-excitation which impairs skeletal muscle blood flow and likely exercise tolerance in this population.

SKELETAL MUSCLE MYOPATHY AS A KEY PATHOPHYSIOLOGIC COMPONENT OF HFPEF

D. Forman, *1. VA Boston Healthcare System, Boston, Massachusetts, 2. Brigham and Women's Hos, Boston, Massachusetts*

Whereas there is a significant body of literature focused on skeletal muscle abnormalities and their impact upon physical function in heart failure with reduced ejection fraction (HFrEF), similar information is lacking in heart failure with preserved ejection fraction (HFpEF). Ironically, the limited studies that do exist indicate that peripheral factors likely play an even more substantial role in determining outcomes in HFpEF than HFrEF, providing strong rationale to expand the focus on intrinsic skeletal muscle as a key aspect of HFpEF pathophysiology. Increased oxidative stress, inflammation, and diminished homeostasis with age are relevant as they lead to sarcopenia and predispose to cellular biomechanics that likely compound the effects of perfusion abnormalities. The role of skeletal muscle cellular changes in HFpEF and delineation between what is what is known about skeletal muscle in HFrEF will be presented.

SESSION 1135 (SYMPOSIUM)

THE EFFECT OF PHYSICAL ACTIVITY ON MOBILITY DISABILITY, FALL INJURIES AND COGNITION: THE LIFE STUDY

Chair: S.B. Kritchevsky, *Wake Forest School of Medicine, Winston-Salem, North Carolina*
Co-Chair: M. Pahor, *University of Florida, Gainsville, Florida*
Discussant: E. Hadley, *National Institute on Aging, Bethesda, Maryland*

Over 15 million older Medicare beneficiaries report limited ability to walk. Reduced mobility is an independent risk factor for morbidity, hospitalization, cognitive decline, and mortality. Physical activity is a promising strategy for maintaining mobility and reducing many other adverse age-related outcomes. However, there is no definitive evidence that physical activity prevents the long-term risk of mobility disability or associated outcomes. The objective of the Lifestyle Interventions and Independence for Elders (LIFE) Study, an 8 center single masked randomized controlled trial, was to determine whether participation in a physical activity intervention reduces the risk of major mobility disability. In 2010 and 2011 LIFE enrolled 1,635 sedentary men and women aged 70-89 years at high risk for mobility disability and followed them for an average of 2.7 years. Participants were randomized to a structured moderate intensity aerobic, resistance and flexibility physical activity program or to a successful aging health education program. This symposium will present: the clinical and public health motivation for the trial (Guralnik); mobility disability results (Pahor); evidence relating the the dose of the intervention received to changes in physical function (Fielding); and the effect of the intervention on serious fall injuries (Gill) and cognitive function (Sink). The symposium will be the first public presentation for many of the study endpoints. The LIFE Study was supported primarily by NIH/NIA Cooperative Agreement UO1 AG22376 and NHLBI supplement U01AG022376. RESULTS ARE CURRENTLY EMBARGOED PENDING PUBLICATION OF THE PRIMARY OUTCOMES PAPER.

CLINICAL AND PUBLIC HEALTH RELEVANCE OF PREVENTING MOBILITY DISABILITY

J. Guralnik[1], S. Blair[2], A.C. King[3], A.B. Newman[4], T. Church[5], D. Bonds[6], E.J. Groessl[7], W. Rejeski[8], *1. Epidemiology and Public Health, University of Maryland School of Medicine, Baltimore, Maryland, 2. University of South Carolina, Columbia, South Carolina, 3. Stanford University, Palo Alto, California, 4. University of Pittsburgh, Pittsburgh, Pennsylvania, 5. Pennington Biomedical Research Center, Baton Rouge, Louisiana, 6. National Heart, Lung and Blood Institute, Bethesda, Maryland, 7. University of California San Diego, San Diego, California, 8. Wake Forest University, Winston-Salem, North Carolina*

The maintenance of physical independence is a major priority for the older population. A critical factor for functional independence is mobility, the ability to move without assistance. Major mobility disability, characterized as inability to walk 400 m, is an objectively measured outcome that discriminates between being able or unable to perform a critical task of daily living; its prevention would create a clear message for public health and clinical practice. Although functional improvements have been shown in physical activity trials, evidence is needed to demonstrate that physical activity prevents the long-term onset of mobility loss. The LIFE Study was designed to provide this evidence using an inexpensive, practical intervention. Its size, geographical range and diverse population increase its impact and generalizability. The primary outcome and broad set of secondary end-points and safety information will prove invaluable for the evidence-based practice of geriatric medicine.

THE LIFE STUDY: MOBILITY DISABILITY RESULTS

M. Pahor[1], S.B. Kritchevsky[2], A.B. Newman[3], T. Church[4], A.C. King[5], M.E. Miller[2], T.M. Gill[6], R. Fielding[7], *1. Aging and Geriatric Research, University of Florida, Gainesville, Florida, 2. Wake Forest School of Medicine, Winston-Salem, North Carolina, 3. University of Pittsburgh, Pittsburgh, Pennsylvania, 4. Pennington Biomedical Research Center, Baton Rouge, Louisiana, 5. Stanford University, Palo Alto, California, 6. Yale School of Medicine, New Haven, Connecticut, 7. Tufts University, Boston, Massachusetts*

Our main objective was to determine whether a physical activity intervention prevents of delays the onset of major mobility disability in older persons. We hypothesized that compared to a successful aging health education program, a long-term structured physical activity program reduces the risk of major mobility disability. Participants were recruited from urban and rural communities at 8 field centers throughout the US, and randomized to a structured moderate intensity aerobic, resistance and flexibility physical activity program, or to a successful aging health education program. The primary outcome was major mobility disability objectively defined as loss of ability to walk 400 m. Median attendance at the physical activity and successful aging center-based sessions was 71% and 82%, respectively. Safety results and incident major mobility disability in the entire cohort and in subgroups will be reported. Trial Registration: ClinicalsTrials.gov identifier NCT00116194.

THE RELATIONSHIP OF PHYSICAL ACTIVITY "DOSE" TO CHANGES IN PHYSICAL FUNCTIONING IN THE LIFE STUDY

R. Fielding[2], W. Rejeski[3], A.C. King[4], T. Manini[1], M.M. McDermott[5], A. Marsh[3], N.W. Glynn[6], C. Tudor-Locke[7], *1. University of Florida, Gainesville, Florida, 2. Tufts University, Boston, Massachusetts, 3. Wake Forest University, Winston-Salem, North Carolina, 4. Stanford University, Palo Alto, California, 5. Northwestern University, Chicago, Illinois, 6. University of Pittsburgh, Pittsburgh, Pennsylvania, 7. Pennington Biomedical Research Center, Baton Rouge, Louisiana*

Loss of mobility with advancing age is associated with loss of independence, disability, and mortality. Although physical activity interventions have been demonstrated to improve physical functioning in older "at risk" adults, the relationship between the dose of physical activity and changes in physical function has not been extensively studied. The LIFE physical activity intervention focused on walking, strength, flexibility, and balance training with two center-based visits per week and home-based activity 3-4 times per week. Adherence was calculated by number of sessions attended and activity counts from 7-day accelerometry. Participants with acute illness were temporarily suspended from the intervention until clear to return to the intervention by their health provider. Quartiles of adherence were examined relative to changes in SPPB score and gait speed during the 400 m walk. This presentation will relate improvements in physical performance to adherence.

EFFECT OF PHYSICAL ACTIVITY ON THE PREVENTION OF SERIOUS FALL INJURIES IN OLDER PERSONS: THE LIFESTYLE INTERVENTIONS AND INDEPENDENCE FOR ELDERS (LIFE) RANDOMIZED TRIAL

T.M. Gill[1], M.E. Miller[6], M.M. McDermott[2], J. Guralnik[3], T. Manini[4], M. Pahor[4], A. Marsh[5], S.B. Kritchevsky[6], *1. Yale School of Medicine, New Haven, Connecticut, 2. Northwestern University, Chicago, Illinois, 3. University of Maryland, Baltimore, Maryland, 4. University of Florida, Gainesville, Florida, 5. Wake Forest University, Winston-Salem, North Carolina, 6. Wake Forest School of Medicine, Winston-Salem, North Carolina*

The morbidity, costs, and mortality associated with serious fall injuries are immense. Yet, evidence is lacking from randomized clinical trials that serious fall injuries can be prevented. We hypothesized that a long-term, structured physical activity program, compared with a successful aging health education program, reduces the risk of serious fall injuries. The primary comparisons between intervention groups will be based on survival analyses for the outcome of time until the first post-randomization occurrence of a serious fall injury. Pre-specified subgroups include age, gender, ethnicity, and physical performance. An additional, post-hoc subgroup analysis will be conducted for self-reported fall in the year prior to randomization (yes/no). Serious fall injuries were adjudicated by a panel of expert clinicians and defined as falls resulting in a clinical, non-vertebral fracture and/or leading to hospitalization for other disabling injuries such as non-fracture head injury, consequences of a long lie, joint dislocations, and severe sprains.

PHYSICAL ACTIVITY AND COGNITIVE OUTCOMES-RESULTS FROM THE LIFE STUDY

K.M. Sink[2], M.A. Espeland[2], R. Cohen[1], S. Rapp[2], O.L. Lopez[5], J.A. Katula[3], K.F. Reid[4], J.D. Williamson[2], *1. University of Florida, Gainesville, Florida, 2. Wake Forest School of Medicine, Winston-Salem, North Carolina, 3. Wake Forest University, Winston-Salem, North Carolina, 4. Tufts University, Boston, Massachusetts, 5. University of Pittsburgh Medical Center, Pittsburgh, Pennsylvania*

Observational studies have shown beneficial relationships between exercise and cognitive function. Some clinical trials have also demonstrated improvements in cognitive function in response to moderate-high intensity aerobic exercise, however these have been limited by relatively small sample sizes and short durations. The LIFE Study is the largest and longest randomized controlled clinical trial of physical activity with cognitive outcomes in older sedentary adults at increased risk for incident mobility disability. Our hypothesis was that random assignment to a tailored physical activity intervention, compared with a successful aging education control, would result in better working memory and speed of processing (measured by the Digit Symbol Coding test) and better memory (assessed with the Hopkins Verbal Learning Test) over two years. We will present these results as well as results for the composite cognitive measure reflecting performance across the entire cognitive battery and incident all cause Mild Cognitive Impairment or Dementia (tertiary outcomes).

SESSION 1140 (SYMPOSIUM)

PSYCHOSOCIAL AND SPIRITUAL CONNECTIONS ACROSS END-OF-LIFE CARE SETTINGS

Chair: M.M. Garrido, *James J Peters VAMC, Bronx, New York, Icahn School of Medicine at Mount Sinai, New York, New York*
Discussant: D. Carr, *Rutgers University, New Brunswick, New Jersey*

Relief of psychological distress, spiritual concerns, and family discord are among the priorities of patients nearing the end of life. Despite this, most research on symptom control for patients with serious illnesses focuses on physical symptoms. Understanding how interactions among patients, family members, and providers facilitate relief of spiritual and psychosocial symptoms is key to improving end-of-life care quality. The four papers in this symposium describe ways in which connections among patients, family members, and providers affect treatment decisions and spiritual and psychosocial symptom relief across settings of end-of-life care. Two papers examine the role of chaplains in facilitating symptom relief among hospitalized palliative care patients. With qualitative interviews of hospitalized patients and their family members, Molly Perkins and colleagues explore the potential for chaplains to facilitate advance care planning through alleviation of spiritual distress and guilt. Using semi-structured interviews of palliative care providers and medical record review of hospitalized veterans, Melissa Garrido and colleagues describe the extent to which chaplains provide psychological support to distressed veterans. Isabelle van Riesenbeck and colleagues use interviews with care providers to highlight the importance of peer support for certified nursing assistants in preparedness for deaths of residents in long-term care facilities. Katherine Ornstein uses data from the Health and Retirement Study to demonstrate the role of family context in understanding patient decisions to enter hospice care. Deborah Carr, the discussant, will emphasize the need to consider factors beyond the biomedical model of disease in order to provide high quality end-of-life care.

END-OF-LIFE DECISION-MAKING IN A DIVERSE AGING PALLIATIVE CARE POPULATION: THE ROLE OF CHAPLAINS

M. Perkins[1,2], G.H. Grant[3,4], E.L. Idler[4], Z.O. Binney[5], J. Jungerman[4], L.P. Prizer[6], T. Quest[1,2,5], *1. Emory University School of Medicine, Atlanta, Georgia, 2. Atlanta VA Medical Center, Atlanta, Georgia, 3. Emory Center for Pastoral Services, Atlanta, Georgia, 4. Emory University, Atlanta, Georgia, 5. Emory Palliative Care Center, Atlanta, Georgia, 6. University of Georgia, Athens, Georgia*

This qualitative study investigated the impact of hospital chaplains on end-of-life decision-making in a diverse aging palliative care population in metropolitan Atlanta. The setting for the study was a 511-bed community-based full-service hospital where 70% of all patients that receive a palliative care consultation are African American. We conducted 24 in-depth interviews with 12 patients, 8 family members, and 2 patient-family dyads. 61.9% of interviewees were African American and 63.2% had a household income <$45,000 per year. The mean age was 60.0±13.2 years. Chaplains' primary role in end-of-life decision-making was to relieve spiritual distress, ease guilt, and comfort participants in their decisions. Key barriers to end-of-life planning were participants' low health literacy and misperceptions regarding palliative care and hospice. Findings illuminate the crucial role of chaplains in end-of-life care and point to the need for interventions to mitigate effects of low health literacy in certain at-risk palliative care populations.

AN UNTAPPED RESOURCE? THE ROLE OF CHAPLAINS IN ADDRESSING PSYCHOLOGICAL DISTRESS OF VETERANS RECEIVING PALLIATIVE CARE

M.M. Garrido[1,2], K. Boockvar[1,2,3], C. Johnson[4], K. Mayans[2], S. Jones[1], D. Sun[1], H.G. Prigerson[5], *1. James J Peters VAMC, Bronx, New York, 2. Icahn School of Medicine at Mount Sinai, New York, New York, 3. Jewish Home Lifecare, New York, New York, 4. University of Washington, Seattle, Washington, 5. Weill Cornell Medical College, New York, New York*

Spiritual care is part of high-quality palliative care (PC), and spiritual and psychological distress often co-occur. To explore the extent to which chaplains address psychological needs of seriously ill veterans, we reviewed records of 220 PC inpatients in NY/NJ and conducted semi-structured interviews with 12 PC providers (physicians, nurses, social workers, psychologists, and chaplains). Psychological distress was reported by 44% of veterans during PC consultations. PC chaplains provided at least one follow-up visit to 36% of distressed veterans, but they rarely documented providing emotional support. In interviews, all provider types noted that chaplains address psychological distress, especially among patients for whom spiritual distress exacerbates psychological distress or for whom spirituality is a coping mechanism. All providers mentioned the need for more time to adequately address psychological distress; training chaplains in PC mental health issues may enable them to address psychological symptoms in addition to spiritual distress during patient encounters.

PREPAREDNESS FOR RESIDENT DEATH IN LONG-TERM CARE: THE EXPERIENCE OF FRONT-LINE STAFF

I. van Riesenbeck[1], A. Barooah[2], K. Boerner[2,3], *1. University of Osnabruck, Osnabruck, Germany, 2. Jewish Home Lifecare, New York, New York, 3. Icahn School of Medicine at Mount Sinai, New York, New York*

This study explored the experiences of 140 certified nursing assistants (CNAs) who had lost a resident in their care within the last two months. Data collection involved comprehensive semi-structured in-person interviews. Quantitative and qualitative data were examined to better understand characteristics associated with preparedness for resident death. About one third of CNAs expressed feeling completely unprepared for the death. Those who had more information about the resident's end-of-life (EOL) care plans and more support from coworkers (i.e., sharing feelings about resident EOL) were likely to report greater preparedness. Resident on hospice was also associated with greater preparedness, especially when hospice care was perceived as positive. Findings suggest that better integration into the care team both in terms of having more information about resident status and more exchange opportunities within the care team around EOL-related challenges would strengthen CNAs' ability to provide good EOL care and help cope with resident death.

DO SPOUSAL CHARACTERISTICS IMPACT HOSPICE USE FOR OLDER ADULTS?

K. Ornstein, M.D. Aldridge, R. Gorges, A. Kelley, *geriatrics, mount sinai, New York, New York*

Disparities in hospice use by patient diagnosis, race and education are well-documented. Although family members are highly involved with end-of-life decision-making for patients and the health of the spousal caregiver may impact their ability to provide care in a home hospice setting, the influence of spousal characteristics on the decision to use hospice is unknown. We used data from the Health and Retirement Study (HRS) and Medicare claims on 1297 decedents who were married at the time of death to examine the impact of spousal demographic and clinical factors on likelihood of patient's hospice use. The following spousal factors were associated with a lower likelihood of hospice use: poor self-reported health, having multiple comorbidities, taking psychiatric medication and having diabetes. In multivariate models controlling for patient factors, only spousal use of psychiatric medications independently predict hospice use (OR=1.44). Family variables should be further considered when examining disparities in hospice use.

SESSION 1145 (SYMPOSIUM)

BIOMARKER PROFILES OF HEALTHY AGING AND EARLY FRAILTY IN LONG LIFE FAMILY STUDY PARTICIPANTS

Chair: M.P. Montano, *Boston Medical Center, Boston, Massachusetts*

Decline of physical functions due to muscle loss and sarcopenia is a major age-related phenotype with substantial impact on life-span and quality of life. Identifying biomarkers of "functional aging" that can predict rates of physical function decline and inform treatments is an important goal of the LLFS. We investigated the potential of a set of five biomarkers to classify LLFS participants into groups characterized by different rates of physical function decline and overall survival. The analysis used model-based clustering of transformed and standardized biomarkers to automatically partition LLFS participants into clusters characterized by significantly different biomarker profiles. Statistical modeling of rates of decline of grip strength and survival showed that there are profiles of biomarkers that are associated with higher risk for early mortality and faster rates of physical function declines. The analysis also identified profiles of biomarkers that are associated with an healthy aging profile.

BIO-DEMOGRAPHIC ASPECTS OF STUDYING EXCEPTIONAL LONGEVITY: THE CASE OF LONG LIFE FAMILY STUDY (LLFS)

A.I. Yashin[1], K.G. Arbeev[1], A. Kulminski[1], P. Stallard[1], K. Christensen[2], S.V. Ukraintseva[1], *1. Duke University, Durham, North Carolina, 2. University of Southern Denmark, Odense, Denmark*

The LLFS was designed to investigate the roles of genetic and non-genetic factors in extreme longevity. Six years of follow-up resulted in data on life span for about a half of study participants from the proband generation. We found that survival in the LLFS group was substantially better than in corresponding birth cohorts in populations of the US and Denmark. Using the ROC/AUC techniques we found that index of cumulative deficit (DI) is an informative covariate for life span prediction. This index was used for multiple life span imputation. Then life span data and imputed data were used in GWAS of human life span. Genetic variants showing association with life span have been used to construct polygenic score indices. We found that this association of such indices with life span is substantial and highly statistically significant and that corresponding genes participate in aging and lifespan.

GENETIC DETERMINANTS OF AGING-RELATED ENDOPHENOTYPES IN THE LONG LIFE FAMILY STUDY (LLFS)

A. Matteini[1], J. Singh[2], R. Boudreau[2], C.M. Kammerer[2], J.D. Walston[1], A.B. Newman[2], *1. Johns Hopkins Univeristy, Baltimore, Maryland, 2. University of Pittsburgh, Pittsburgh, Pennsylvania*

Endophenotypes derived from multiple physiologic measures may better characterize exceptional survival and improve the detection of genes influencing functional longevity. Five multi-domain endophenotypes were developed from data on 28 physiologic traits across five domains (cardiovascular, cognition, physical function, pulmonary, and metabolic) for 4472 individuals in 574 families in LLFS. Each endophenotype was significantly heritable and genetic factors accounted for 21-51% of the variation (P<10-12 for all). Cox regression analyses revealed that the first endophenotype (predominantly reflecting pulmonary and physical function) was associated with mortality and attenuated 26.9% of the effect of age on mortality in LLFS. In addition, whole-genome analyses identified loci on chromosomes 10p15 (p<3x10-8) and 18q11.2 (P<5x10-7) that were associated with this endophenotype. These results indicate that genetic studies of aging-related endophenotypes in a unique set of families may reveal novel findings that will increase our understanding of the genetic regulation of aging.

CANDIDATE GENE RESEQUENCING TO IDENTIFY RARE, PEDIGREE-SPECIFIC VARIANTS INFLUENCING HEALTHY AGING PHENOTYPES IN THE LONG LIFE FAMILY STUDY

T. Druley[1], J.C. Wang[1], K. Christensen[3], T.T. Perls[2], B. Thyagarajan[4], M.A. Province[1], *1. Washington University, St. Louis, St. Louis, Missouri, 2. Medicine & Geriatrics, Boston University School of Medicine, Boston, Massachusetts, 3. University of Southern Denmark, Odense, Denmark, 4. University of Minnesotta, Minneapolis, Minnesota*

We sequenced the functional variants of 464 candidate genes for longevity and/or the major diseases of aging in all 4,953 individuals from the Long Life Family Study, using a multiplexed, custom hybridization capture protocol (Ramos et al. BMC Genomics, 2012). Variants were analyzed individually or as a group across an entire gene (“burden testing”) for association to aging phenotypes using family based tests. We found significant associations to eleven genes (burden-wise) and nine single variants. Most notably, we found a novel variant in the 3’ UTR OBFC1 in 13 individuals from six pedigrees that was significantly associated with survival. OBFC1 is involved in telomere maintenance and falls within a recently reported LLFS family-based association peak for telomere length on chromosome 10 (Lee et al. Front Genet, 2014). These results demonstrate that sequencing under linkage peaks can identify rare or novel variants responsible for linkage disequilibrium.

HUMAN LEUKOCYTE TELOMERE LENGTH SHOWS HERITABILITY IN THE LLFS STUDY OF LONG-LIVED FAMILIES

L.S. Honig[1], J.H. Lee[1], R. Mayeux[1], T.T. Perls[2], N. Schupf[1], *1. Columbia University, New York City, New York, 2. Boston Medical Center, Boston, Massachusetts*

Chromosomal telomere length changes with organismal aging, shortening with repeated cell divisions. In DNA isolated from human populations, leukocyte telomere length (LTL) shortens with age. A number of studies show that LTL has some heritability, but also that decreases in LTL correlate with dementia, other age-associated processes, and mortality. Thus LTL may be a marker of biological aging. LTL varies widely between individuals in a given age group, and this variability likely relates to both environmental and genetic factors. Here we use a family-based study of longevity (the LLFS study) to study heritability of LTL obtained cross-sectionally in elderly probands and their offspring. We confirm that LTL is shorter in males, and in older individuals; we also show LTL has a high heritability. We find a graded relationship of LTL length in the offspring generation, who are in middle-life. Persons (sons and daughters) who are more-closely-related to elderly probands have longer LTL than persons less-closely-related (nieces and nephews), who in turn still have longer LTL than unrelated spouses in this offspring generation. These results support a prominent genetic underpinning of LTL. Elucidation of such genetic bases may provide a potential route for intervening in the aging process.

THE LONG LIFE FAMILY STUDY - DISCOVERING THE DETERMINANTS OF EXCEPTIONAL FAMILIAL LONGEVITY

T.T. Perls[1], E. Hadley[2], *1. Medicine & Geriatrics, Boston University School of Medicine, Boston, Massachusetts, 2. National Institute on Aging, Bethesda, Maryland*

The Long Life Family Study (LLFS) is longitudinally following 551 families (4,875 subjects) with family members demonstrating clustering for longevity. We highlight 5 recent findings from the LLFS: (1) Profiles based on five biomarkers were used to classify LLFS participants into groups characterized by different rates of physical function decline and overall survival. Statistical modeling of rates of decline of grip strength and survival showed that associations between profiles and higher risk for early mortality, faster rates of physical function decline as well as healthy aging. (2) In a different approach to profiles, five endophenotypes were derived from combinations of 28 physiologic measures across five physiologic domains. Each endophenotype was significantly heritable and genetic factors accounted for 21-51% of the variation (P<10-12 for all). We identified loci on chromosomes 10p15 (p<3x10-8) and 18q11.2 (P<5x10-7) that were associated with one of these endophenotypes. (3) Telomere length was found to be highly heritable in the LLFS and family members more closely related to probands (e.g. offspring versus nephews and nieces) had longer telomeres. (4) Functional variants of 464 candidate genes hypothesized to be associated with longevity or major age-related diseases were sequenced and tested for association with aging phenotypes. Significant associations were found with eleven genes and nine single variants and a novel variant was noted in OBFC1 (involved in telomere maintenance) in 13 individuals from six pedigrees. (5) Using the ROC/AUC techniques, the index of cumulative deficit (DI) was found to be an informative covariate for life span prediction and imputation.

SESSION 1150 (PAPER)

NUTRITION

A GROUNDED THEORY OF SHIFTING FOODWAYS IN LATE-LIFE WIDOWHOOD

E. Vesnaver[1], H.H. Keller[2], O. Sutherland[1], S.B. Maitland[1], J.L. Locher[3], *1. University of Guelph, Guelph, Ontario, Canada, 2. University of Waterloo, Waterloo, Ontario, Canada, 3. University of Alabama at Birmingham, Birmingham, Alabama*

Widowhood is an expected life event for married older women; prior research has found disruptions in diet and eating behaviors to be common among widows. Little, however, is known about the process underlying these disruptions. Accordingly, constructivist grounded theory was used to explore the shifting foodways of older women as they experience widowhood. Foodways were defined as all processes involved in the selection, acquisition, preparation, and consumption of food. Face-to-face interviews were conducted with 14 women living alone, aged 70 to 86 years, and widowed 6 months to 7 years. The emergent theory suggests that the shifts in foodways in widowhood occurred when the foodways of couplehood were no longer functional. Widows were adjusting foodways for their new social structure and context. Integral to this process was a concern for personal nourishment. For some, this concern for self needed to be developed or re-examined in widowhood. Foodways were intertwined and patterned with identity transitions experienced in widowhood. Finally, actual adjustments made to foodways were under a constant tension as widows balanced moving forward with holding on. This study provides a theoretical contribution to the literature on food choice and foodways and provides evidence that can be used to support the nutritional health of older women who are widowed.

OCCLUSAL FORCE IS A BETTER INDICATOR FOR DIETARY INTAKES THAN NUMBER OF TEETH IN 80-YEAR-OLD PERSONS

C. Inomata[1], K. Ikebe[1], Y. Gondo[2], K. Kamide[3], Y. Masui[4], R. Takahashi[4], Y. Arai[5], Y. Maeda[1], *1. Department of Prosthodontics, Gerodontology and Oral Rehabilitation,Osaka University Graduate School of Dentistry, Osaka, Japan, 2. Department of Clinical Thanatology and Geriatric Behavioral Science, Osaka University, Graduate School of Human Sciences, Osaka, Japan, 3. Department of Geriatric Medicine and Nephrology, Osaka University Graduate School of Medicine, Osaka, Japan, 4. Tokyo Metropolitan Geriatric Hospital and Institute of Gerontology, Tokyo, Japan, 5. Keio University, School of Medicine, Tokyo, Japan*

Objectives:Number of teeth has frequently been used as an indicator of oral health in investigations of dietary intakes; however, this measure doesn't represent the efficacy of the masticatory function. Masticatory function may be more important for food selection and avoidance than number of remaining teeth, because the number of teeth doesn't reflect prostheses replacing the missing teeth. The aim of this study was to investigate the association of occlusal force with dietary intakes in independently living 80-year-old persons. Methods:The study population was 456 community-dwelling people aged 79 to 81-year-old. Bilateral maximal occlusal force in the intercuspal position was measured with pressure-sensitive sheets. Removable denture wearers kept their dentures in place during the measurements. Food and nutrient intakes during the preceding month were assessed using a brief-type self-administered diet history questionnaire. Linear trends of food and nutrient intakes with decreasing occlusal force or number of teeth were tested respectively after adjusting for gender and socioeconomic factors. Results:Decline of occlusal force was significantly associated with lower intakes of green and yellow vegetables, other vegetables, protein, vitamins A, E, C and dietary fiber (P for trend<0.05). In contrast, number of teeth was significantly associated only with intakes of green and yellow vegetables. Conclusions:Occlusal force was significantly associated with intakes of vitamins and dietary fiber more than number of remaining teeth in independently living Japanese octogenarians. This finding suggests that occlusal force is a better indicator for dietary intakes than number of teeth in 80-year-old persons.

EFFECTS OF AN INNOVATIVE, EVIDENCE-BASED OROPHARYNGEAL STRENGTHENING PROGRAM ON DYSPHAGIA AND ITS SEQUELAE IN ELDERLY PATIENTS

N. Rogus-Pulia[1,2], J. Hind[2,1], J. Zielinski[1], N. Rusche[1], S.A. McCartney[1], N. Safdar[1,2], J. Robbins[1,2], *1. Wm S. Middleton Memorial Veterans Hospital, Madison, Wisconsin, 2. University of Wisconsin-Madison School of Medicine and Public Health, Madison, Wisconsin*

Purpose: Dysphagia affects up to 22% of people over the age of 60 and often leads to pneumonia, malnutrition, dehydration, and airway obstruction. Swallowing difficulties are estimated to occur in 42 to 76% of acute stroke patients resulting in longer nursing home stays and diminished rehabilitation potential. Age-associated decline in skeletal muscle strength has been linked to age-related muscle atrophy known as sarcopenia and is typical of individuals over age 60. Progressive resistance training for the oropharyngeal musculature is an emerging rehabilitation technique for dysphagia. The purpose of this study was to determine effects of Isometric Progressive Resistance Oropharyngeal (I-PRO) therapy on swallowing function. Methods: 20 dysphagic patients with multiple medical diagnoses and dysphagia (mean age= 70 years) participated. Patients completed 8 weeks of I-PRO therapy, consisting of pressing anterior and posterior portions of the tongue against a custom-molded mouthpiece. Outcome measures included bolus flow (aspiration), lingual pressure generation, quality of life, diet, pneumonia diagnoses, and hospital admissions. Results: Penetration-aspiration scale scores decreased for thin liquid boluses. Maximum isometric pressures increased at front and back sensors (p<.001). Swallowing Quality of Life (SWAL-QOL) questionnaire subscale scores improved significantly (p<.03). Functional Oral Intake Scale scores improved overall with patients moving to less restrictive diets (p<.02). several patients progressed from feeding tube dependency to full oral intake. The number of pneumonia diagnoses decreased by 88% and admissions decreased by 79%. Conclusions: Findings support the role of I-PRO therapy in effectively treating dysphagia and its consequences in older patients with various medical etiologies.

ADDRESSING AND LEVERAGING SEASONALITY OF SERUM 25-HYDROXYVITAMIN D CONCENTRATIONS IN OBSERVATIONAL AGING RESEARCH

M. Shardell, *University of Maryland School of Medicine, Baltimore, Maryland*

BACKGROUND. Observational studies have shown positive associations between serum 25-hydroxyvitamin D [25(OH)D] concentrations and health outcomes in older adults. A challenge is that 25(OH)D concentrations vary seasonally according to sunlight exposure. Investigators often adjust statistical analyses for a proxy of sunlight exposure, such as season of blood collection, to reduce bias. We aimed to 1) characterize cases where adjustment for seasonality reduces, increases, or has no effect on bias; and 2) present accessible analytic methods that leverage seasonality to reduce bias. METHODS. Using the outcome slow gait speed as an illustration, we constructed directed acyclic graphs (DAGs) to categorize mechanistic pathways by which 25(OH)D and seasonality may affect the outcome. We simulated data using models consistent with the DAGs and computed adjusted and unadjusted relative risks. We also computed relative risks using structural mean models when seasonality was an instrumental variable (did not directly affect the outcome). RESULTS. Adjustment for seasonality reduced bias when season of blood collection was a confounder (affected the outcome), whereas adjustment did not affect bias when season of blood collection was an instrumental variable and there were no unmeasured confounders. Adjustment for seasonality increased bias when season of blood collection was an instrumental variable and there were unmeasured confounders. In this case, structural mean models produced unbiased estimates. CONCLUSIONS. No single method always optimally addressed seasonality of 25(OH)D. The best method depends on scientific context, which investigators can convey using DAGs.

SARCOPENIA AND MALNUTRITION IN HOSPITALIZED ELDERLY: PREVALENCE AND OUTCOMES

A. Cerri[1,2], G. Bellelli[1,2,3], A. Mazzone[1,2], F. Pittella[1,2], P. Mazzola[1,2,4], G. Annoni[1,2], *1. University of Milano-Bicocca, Department of Health Sciences, Monza, Italy, 2. San Gerardo University Hospital, Geriatric Clinic, Monza, Italy, 3. Geriatric Research Group - GRG, Brescia, Italy, 4. Icahn School of Medicine at Mount Sinai, Department of Neurology, New York, New York*

Background: Data about the prevalence of sarcopenia among hospitalized patients are lacking and it is unclear whether the diagnostic criteria commonly used in community-dwellers are applicable in acutely ill subjects. Aims: (i) to assess whether the European Working Group on Sarcopenia in Older People (EWGSOP) criteria are applicable in the acute care setting; (ii) to assess the prevalence of sarcopenia and (iii) the mortality rate at 3 months. Methods: 103 patients admitted to the Acute Geriatric Clinic were enrolled. Inclusion criteria were: age ≥75 years, and malnutrition or risk of malnutrition, according to the Mini Nutritional Assessment Short Form. Sarcopenia was diagnosed using the EWGSOP criteria by means of bioimpedance analysis, handgrip strength (HS) and gait speed (GS), within 72 hours of admission. Information on deaths was obtained by telephone interview at 3 months following discharge. Results: We distinguished 3 groups: 58 non sarcopenic patients, 22 sarcopenic patients and 23 patients with low muscle mass but HS and/or GS not applicable (because bedridden or requiring intensive treatments). For the latter group, we were not allowed to diagnose sarcopenia, lacking at least one EWGSOP criteria. During the follow-up, 11 patients died. Kaplan-Meier survival curves showed that sarcopenic patients died significantly more frequently than others (log-rank p=0.004). Conclusions: (i) In a population of hospitalized elderly malnourished or at risk of malnutrition, sarcopenia is highly prevalent (21.4%); (ii) the EWGSOP criteria can be satisfactorily applied only in 77.7% of patients; (iii) sarcopenic subjects are more likely to die in comparison to other patients.

SESSION 1155 (PAPER)

WORKFORCE

GOOD SUPERVISION LEADS TO HEALTHIER WORKERS: BURNOUT AND THE HEALTH OF ADULT PROTECTIVE SERVICES WORKERS

S.B. Plichta[1,2], G. Rogers[2], *1. Hunter College, CUNY School of Public Health, New York, New York, 2. Brookdale Center for Healthy Aging, New York, New York*

Adult protective services (APS) workers face substantial occupational challenges which can affect their health. Little research has been conducted in this area. This pilot study examines the relationship between occupational exposures, health and workplace characteristics in a sample of 81 APS fieldworkers attending an annual state-wide training institute. These workers were mostly female (82%), college educated (91%) and had 5+ years of experience (75%). Data were collected via an anonymous on-line self-report survey. Almost all (97%) have been exposed to work-related health hazards and most (70%) were exposed in the past month. Hazards included clutter, human/animal waste, insect infestations, threats and attacks. Almost one-fifth (18%) report fair/poor health, 14% have a disability that affects their function for a week or more each month, and 41% are at risk for depression Overall, 29% are at high risk for burnout. However, 29% also have high levels of 'compassion satisfaction'(intrinsic rewards for helping others) from their job. Those who rate their supervisors favorably are at much lower risk for burnout and are much more likely to have compassion satisfaction with their job. This relationship holds true in regression models that control for experience, poor health and past-month exposure to hazards. Supervisor training may be one of the keys to APS worker health.

A SIX COUNTRY STUDY NURSES, AND STUDENT NURSES ATTITUDES TOWARDS GERONTOLOGICAL NURSING AS A CAREER

A. Kydd[1], I. Fagerberg[2], T. Touhy[3], D. Newman[3], G. Engstrom[3], *1. Nursing, University of the West of Scotland, Hamilton, United Kingdom, 2. Ersta Sköndal University College, Stockholm, Sweden, 3. Florida Atlantic University, Florida, Florida*

The purpose of this study was to describe attitudes towards caring for older people among nurses and student nurses in six participating countries; Germany, Japan, Scotland, Slovenia Sweden and the USA. Background: Working with older people has historically had a negative profile and with a global rise in the numbers of older people and a global shortage of nurses, it is essential to recruit nurses into this area. This study gathered data from six countries to explore multiple factors that may influence nurses and student nurses attitudes to nursing older people and to gerontological nursing as a career. Method: A convenience sample of 1064 nursing students and 2585 nurses in six countries answered the Multifactorial Attitudes Questionnaire (MAQ) designed to elicit attitudes towards caring for older people and to the esteem that comes with working in this field. The MAQ consists of seven positive and 13 negative statements and uses a Likert scale. A higher total score indicates a more positive attitude. Results: Differences in attitudes among the six counties was observed for both nursing students and for nurses (<.001). Nursing students in Scotland and USA had the highest mean scores and Slovenia and Sweden were the countries with the lowest mean score. The highest score for nurses were reported in Scotland and Sweden and lowest in Germany and Japan. Conclusion: From the findings, it is suggested that formal nursing education to students between 18 – 29 years of age has high importance for positive attitudes towards working with older people.

JOB SATISFACTION AMONG CARE AIDES IN RESIDENTIAL LONG-TERM CARE: A SYSTEMATIC REVIEW OF CONTRIBUTING FACTORS

J. Squires[1,2], M. Hoben[3], S. Linklater[1], H.L. Carleton[4], C.A. Estabrooks[4], *1. Ottawa Hospital Research Institute, Ottawa, Ontario, Canada, 2. University of Ottawa, Ottawa, Ontario, Canada, 3. University of Heidelberg, Heidelberg, Germany, 4. University of Alberta, Edmonton, Alberta, Canada*

Background: Staff turnover is a global problem for residential long-term care facilities (nursing homes). Numerous factors are linked to nurse turnover; however, job satisfaction is by far the most frequently mentioned. While not all dissatisfied staff will leave their job, dissatisfaction impacts their work, their coworkers, and the quality of resident care they deliver. Understanding job satisfaction in residential long-term care facilities is therefore a high research priority. **Objective:** To systematically review the evidence on which factors (individual and organizational) are associated with job satisfaction among care aides, nurse aides and nursing assistants in residential long-term care facilities. **Methods:** Nine online databases were searched through to May 2013. Two authors independently screened, extracted data, and assessed the included publications for methodological quality using 4 validated tools. **Results:** Forty-two publications met our eligibility criteria. Individual factors found to be important to care aide job satisfaction were empowerment and autonomy. Six additional individual factors were found to be not important: age, ethnicity, gender, education level, attending specialized training, and years of experience. Organizational factors found to be important were facility resources and workload. Two additional factors were found to be not important: satisfaction with salary/benefits and job performance. **Conclusions:** Factors important to care aide job satisfaction differ from those reported among hospital nurses, supporting the need for different strategies to improve care aide job satisfaction and thus retention in residential long-term care facilities.

GERIATRIC EDUCATION & TRAINING (GET) FOR ACUTE CARE NURSES: GETTING IT TOGETHER FOR OUR SENIORS

J. Baumbusch[1,2,3], M. Shaw[4,5,1], M. Leblanc[1], *1. University of British Columbia- School of Nursing, Vancouver, British Columbia, Canada, 2. Michael Smith Foundation for Health Research, Vancouver, British Columbia, Canada, 3. Vancouver Coastal Health Research Institute, Vancouver, British Columbia, Canada, 4. Vancouver Coastal Health Authority, Vancouver, British Columbia, Canada, 5. Vancouver General Hospital, Vancouver, British Columbia, Canada*

Research about older adults in acute care indicates that hospitalization has negative consequences for this population such as functional decline and onset of delirium. To date, education research in this area has focused on individual interventions rather than overall knowledge of the complex healthcare needs of older adults in acute care. To address this gap, a research and educational initiative, the Geriatric Education and Training (GET) Program, was developed to enable nurses to adapt to the changing patient demographic, meet the unique care needs and improve health outcomes for older adults. The purpose of this study was to implement and evaluate a novel approach to education for acute care nurses. This pilot study incorporates both quantitative and qualitative methods to examine the participant's uptake of knowledge and change in attitudes. Data collection includes individual questionnaires (n=25) completed at three points in time, as well as focus groups with participants (n=25) and managers (n=5). A purposive sample was recruited from RNs working in acute care hospitals. Expected results include an increased knowledge and capacity among acute care nurses to improve outcomes for hospitalized older adults as well as the development and refinement of the GET Program curriculum. The curriculum will be available through a knowledge translation workshop in the spring of 2014.

SESSION 1160 (SYMPOSIUM)

POLICY SERIES: SUPPORTING THE WORKING CAREGIVER WITH EMPLOYER PROGRAMS, A THERAPEUTIC NUTRITION TOOLKIT, AND POLICY GUIDANCE

Chair: R. Blancato, *Matz, Blancato & Associates, Washington, District of Columbia*

Today's American families are the primary providers of long-term care in their own homes and many of these family caregivers also work. Because nutrition significantly impacts an older adult's health outcomes, it also often influences the ability of working caregivers to handle the dual challenges of work and caregiving. This session highlights a new online toolkit for employers that provides therapeutic nutrition information and links to services to help workplaces better support their employees who are caregivers. Support provided by Abbott Nutrition.

SESSION 1165 (SYMPOSIUM)

INTEGRATING ACUTE AND POST-ACUTE CARE FOR OLDER ADULTS UNDER HEALTH REFORM: PROMISE AND PITFALLS

Chair: C.E. Bishop, *Heller School for Social Policy and Management, Brandeis University, Waltham, Massachusetts*
Discussant: J. Wiener, *RTI International, Washington, District of Columbia*

Medicare post-acute care (PAC, provided by a skilled nursing facility, home health agency, long-term care hospital, or inpatient rehabilitation facility) plays a valued role in the continuum of services for older adults with acute and chronic conditions, but has been identified as a significant Medicare cost-driver. Total Medicare costs might be contained by better coordinating Medicare post-acute and hospital services, although this could reduce access of beneficiaries to valued care. Strategies that reward organizations for allocating hospital, physician, and post-acute services more carefully include bundled payment methods and accountable care (ACO) approaches. Our session will consider early findings about impacts of these delivery system and payment initiatives on utilization, Medicare expenditures, and beneficiary outcomes. Presentations will address: 1) development of bundled payment methods and expected impacts on patterns of post-acute services use; 2) challenges for the development and implementation of uniform patient assessment methods that might support payment based on beneficiary needs and outcome rather than provider type; 3) survey results revealing how accountable care organizations are (or are not) coordinating services across post-acute providers; and 4) early indicators of the market-level impact of bundled payment and ACO demonstrations on rehospitalization of post-acute patients. Implications for public policy and for the well-being of older adult Medicare beneficiaries will be emphasized.

POST-ACUTE CARE AND BUNDLED PAYMENT

M. Morley, *RTI International, Waltham, Massachusetts*

Episode-based bundled payment is an important delivery system reform option being tested in the Centers for Medicare & Medicaid Services (CMS) Bundled Payments for Care Improvement Initiative. This payment approach shifts the focus from the silos of the current payment systems to the continuum of care across provider settings. Bundled payments incentivize improvements in patient-centered care via increased coordination and accountability across providers. Research has focused on the composition of service use during different definitions of episodes of care as well as on differences in episode composition and payments across different geographic areas. The parameters of episode definitions, the inclusion of initial hospitals stays or readmissions, and differences in service use across geography may lead to different behavioral responses affecting use of post-acute care services. Other important considerations for this payment approach include impact on access to care, beneficiary choice, outcomes, and subsequent service use.

EXTENDING ACCOUNTABILITY: ACOS AND THE INCLUSION OF POST-ACUTE CARE

C.H. Colla, V.A. Lewis, S. Bergquist, *The Dartmouth Institute for Health Policy and Clinical Practice, Geisel School of Medicine at Dartmouth, Lebanon, New Hampshire*

Growth and variation in post-acute expenditures, misaligned incentives, and poor coordination all call attention to the increasing need for change in Medicare post-acute care. Accountable care organization (ACO) contracts, which require accountability for the total cost of care and quality measures, may have important implications for post-acute care. Using the National Survey of ACOs, we describe ACOs' inclusion of post-acute care and whether inclusion is associated with care management capabilities. Three-quarters of ACOs include post-acute facilities; outpatient rehabilitation (64%) and home health (60%) are most common. Less than half have a relationship with a skilled nursing facility. ACOs including providers across the care continuum are more likely to report the ability to assure smooth transitions across settings and to be engaged in preventing hospital readmissions. ACOs that include post-acute providers may improve care coordination, while ACOs that do not may try to reduce use of post-acute services in their patients.

THE EFFECT OF HOSPITAL-SKILLED NURSING FACILITY LINKAGES ON RE-HOSPITALIZATIONS

V. Mor[1], M. Rahman[1], D. Grabowski[2], J. Zinn[3], *1. Brown University, Providence, Rhode Island, 2. Harvard Medical School, Boston, Massachusetts, 3. Temple University, Philadelphia, Pennsylvania*

As the most prevalent provider of Medicare post-acute care (PAC), Skilled Nursing Facilities (SNFs) look to hospitals as their primary source of referral. However, until the recent introduction of CMS's rehospitalization penalty, hospitals have not seen the SNF as part of their care system. As accountable care organizations, bundling demonstrations and other payment and delivery system innovations establish networks of PAC providers, the effects of these clinical and organizational collaboration efforts should be tracked. Based upon research from a period before the rehospitalization penalty, we estimate that if hospitals increased their concentration of discharges to one SNF by 10 percentage points, the rehospitalization rate of patients treated by that hospital–SNF pair would decline by 1.2 percentage points, largely driven by fewer rehospitalizations within a week of hospital discharge. More recent data are used to document early impacts of changes in PAC referral and utilization underway in many markets. The findings have implications for policy development in the Medicare PAC arena.

IMPLEMENTING STANDARDIZED ASSESSMENT FOR BUNDLED PAYMENT AND OTHER INTEGRATED SERVICE APPROACHES

B. Gage, *Brookings Institution, Washington, District of Columbia*

A growing number of Medicare beneficiaries use post-acute care following an inpatient stay. The Medicare program currently uses an array of assessment items to measure their case mix complexity as they cross the health care system. Work is currently underway at the Federal level to standardize the items used to measure medical, functional, and cognitive complexity across settings. These items are being used to develop setting-agnostic quality measures and will be key to establishing payment models that adjust for case mix complexity, regardless of setting. This paper will provide an overview of current initiatives in these areas and their implications for successful health reform implementation.

SESSION 1170 (SYMPOSIUM)

SUCCESSFUL AGING-IN-PLACE FOR MARGINALIZED, COMMUNITY-DWELLING ADULTS: RESEARCH FOR SOCIAL CHANGE

Chair: T. Lewinson, *School of Social Work, Georgia State University, Atlanta, Georgia*

According to the Administration on Aging, there will be nearly 77 million older adults over the age of 60 by the year 2020. The ability to age-in-place is an important consideration for these older adults who may desire to remain independently-housed while managing their health and well-being. However, poor housing affordability, accessibility, and quality make aging-in-place a stressful endeavor for many older adults attempting to transition through available housing options in the community. Panelists for this symposium address the following questions: What types of barriers do marginalized older adults residing in various housing types experience when trying to age-in-place? How do socially disadvantaged positions, such as racial/ethnic identity, homelessness, poverty and formerly incarcerated status influence access to housing and other resources? How can research lead to practice strategies that promote aging-in-place in less-than-ideal housing environments? Panelists explore barriers in prison reentry, public housing, emergency shelters, and economy hotels using sequential mixed and qualitative research methods. Across all presentations, findings identify exposure to violence, exploitation, and trauma as dominant themes for adults aging in varying community contexts. Family, peer, and community supports that facilitate productive aging-in-place outcomes are discussed. Promising practices for the successful integration and re-integration of older adults into housing communities will be presented to promote improved aging-in-place practice and policy strategies.

IT'S NOT SAFE GETTIN' ACROSS THE STREET: NAVIGATING WALKABILITY BARRIERS WHILE HOTEL HOUSED

T. Lewinson, *School of Social Work, Georgia State University, Atlanta, Georgia*

Previous research has documented the tendency for low-income older adults to move into economy extended stay hotels to avoid street homelessness when other housing options are few, un-preferred, or non-existent. This community-based, participatory study used photo-elicitation and photovoice with 16 older adults residing in hotels to explore barriers to managing health challenges. Using thematic analysis techniques for individual interview data and three photography-directed focus group discussions, three "walkability" themes emerged as barriers for navigating neighborhoods surrounding hotels. These themes were: dangerous people, perilous pathways, and tethered access. Residents believed these walkability conditions interfered with successful aging-in-place. Findings initiated resident organizing with two directives: (1) internal resident engagement and education, and (2) external resident-provider collaboration

NAVIGATING IN A LANDSCAPE OF TRAUMA: AFRICAN-AMERICAN SURVIVORS LIVING IN LOW-INCOME HOUSING

S. Bowland, *Social Work, Eastern Washington University, Cheney, Washington*

Background: Little is known about the needs and concerns of older African American women survivors of child abuse, sexual assault, and/or domestic violence. Methods: This study used a classic grounded theory approach (Glaser & Strauss, 1967), including multiple interviews with 30 older African-American women. Initially participants were invited to tell their life story. During follow up interviews they were asked about their current stress and methods of coping. Findings: Twenty-eight out of 30 women identified interpersonal trauma, including experiences of discrimination and witnessing violence. The results indicated ongoing concerns with personal safety. Frequently named strategies for self-protection were isolation of self from community and turning to God. Conclusions and Implications: Unsafe housing may exacerbate the struggles of trauma survivors and lead to re-victimization. HUD needs to rethink housing policy in light of safety issues and to consider the implications for elder mistreatment of living in unsafe communities.

BRIDGING OLDER ADULTS IN PRISON TO THEIR FAMILIES AND COMMUNITIES

T.M. Maschi, *Graduate School of Social Service, Fordham University, New York, New Jersey*

The objective of this mixed method study was to identify the factors that facilitated or create barriers to successful community reintegration of older adults with their families and communities. The study used a mixed method longitudinal design (post release 1 month and 3 and 6 months) to track the 30 older adults released from prison in New York metropolitan area. Two hour one-on-one in-depth interviews were taped and transcribed verbatim. A thematic analysis was conducted to identify factors were identified that facilitated or created barriers to their successful reintegration. Older adults identified a complex array of needs that included housing, employment, health care, substance abuse, and mental health. Participants also noted family, peer, and community support as important facilitators of community reintegration. These findings suggest the need for holistic services that include counseling, peer, family, and community support and service linkages to housing, employment, integrated healthcare and advocacy efforts.

IT WORKS AGAINST YOU: SERVICE EXPERIENCES OF OLDER HOMELESS ADULTS

L. Thomas[1], M. Clapsadl[2], *1. Social Work, University of North Carolina at Charlotte, Charlotte, North Carolina, 2. University of North Carolina at Charlotte, Charlotte, North Carolina*

Older homeless adults who temporarily reside in emergency shelters face aging without the stability of a permanent residence and with numerous physical and mental health vulnerabilities. Homeless adults die prematurely and those ages 50-64 experience chronic health and geriatric conditions at rates comparable to adults 15-20 years older in the general population. Emergency shelters are ill equipped to address their complex needs. This qualitative study examined the life histories of 31 older homeless adults ages 50-69 residing in emergency shelter. It identifies the factors that facilitate positive service experiences and the barriers they face in service contexts including shelter and program requirements, perceived staff attitudes, the lack of job and housing opportunities, and poor physical and mental health. The study situates these service experiences in the context of life histories of cumulative trauma and adversity. Findings are discussed in the light of federal policies to address and end homelessness.

SESSION 1175 (SYMPOSIUM)

MANAGING CHRONIC CONDITIONS IN LATER LIFE: DOES GENDER MATTER?

Chair: C. Tannenbaum, *Université de Montréal, Montreal, Quebec, Canada*
Co-Chair: B.B. Cochrane, *University of Washington, Seattle, Washington*
Discussant: S. Hilmer, *University of Sydney, Sydney, New South Wales, Australia*

This symposium aims to raise awareness of the way older men and women experience different lived realities of chronic conditions as a function of their sex and gender. Sex (the x and y chromosomes) influence biological aspects of aging. Gender, the social and cultural behaviours expected by society, dictate a person's representations of illness and their interactions with treatment. This symposium will review 3 concepts of chronic disease management, viewed from a sex and gender-oriented perspective. In the first paper, Dr. Cochrane (nursing) will discuss the concepts of sex versus gender by illustrating how symptom presentation of heart disease is affected by sex, while the effect of chronic disease on function emerges more frequently as a function of gender. In the second paper, Dr. Tannenbaum (geriatric medicine) will review evidence on the epidemiology of three geriatric syndromes - falls, urinary incontinence, and dementia – and highlight instances when the interdisciplinary team should (or should not) pay attention to sex or gender in their detection, evaluation and conservative management. In the third paper, Dr. Hilmer (geriatric pharmacology) will review the issue of polypharmacy from a sex and gender perspective, with a focus on sex-related pharmacokinetic and pharmacodynamics complexities, as well as an analysis of the societal perspectives of the use of medication by men and women for different chronic conditions. During the discussion period, the panelists will respond to questions and provide recommendations on how best to deal with sex and gender considerations in the research and practice of patients and their caregivers living with chronic disease.

THE INFLUENCE OF SEX AND GENDER ON CHRONIC DISEASE: CORONARY HEART DISEASE AS AN EXEMPLAR

B.B. Cochrane, *1. School of Nursing, University of Washington, Seattle, Washington, 2. Fred Hutchinson Cancer Research Center, Seattle, Washington*

The health of older men and women is influenced, to varying degrees, by both sex and gender. Sex – particularly one's lifetime exposure to endogenous sex hormones – can affect how chronic disease is manifested and treated. Gender, as a psychosocial context for one's life, can influence awareness, expectations, presentation, and self-management of chronic illness. This presentation will describe research findings on coronary heart disease (CHD) in men and women as exemplars of how the experience of chronic disease, as well as disease detection, evaluation, and management, are influenced by sex and/or gender. For example, delay in health care access for symptoms of acute CHD has been related to different symptom patterns in men and women, in addition to the individual's and health care provider's evaluation of those symptoms. Implications of these insights for informing health care of other chronic illnesses or geriatric syndromes in older men and women will be described.

WHEN SHOULD WE CONSIDER ISSUES OF SEX AND GENDER IN THE RISK, DETECTION, EVALUATION AND MANAGEMENT OF FALLS, URINARY INCONTINENCE AND DEMENTIA?

C. Tannenbaum, *Université de Montréal, Montreal, Quebec, Canada*

Few health professionals routinely apply the evidence on the way sex and gender can affect the risk, detection, evaluation and management of chronic conditions in aging individuals. This paper will highlight epidemiologic findings on sex and gender differences in the risk, detection, evaluation and management of geriatric syndromes such as falls, incontinence, dementia. Practical tips and research ideas for how to consider sex and gender in the interdisciplinary management of these conditions will be discussed. Concrete examples will be provided for better managing patients living with chronic disease.

OPTIMISING PRESCRIBING FOR OLDER ADULTS: GENDER MATTERS

S. Hilmer, *Royal North Shore Hospital, Kolling Insitute of Medical Research, University of Sydney, St Leonards, New South Wales, Australia*

Both age and sex have significant effects on most aspects of clinical pharmacology, including drug use, pharmacokinetics, pharmacodynamics, safety and efficacy. Older women use more medicines than older men, particularly antidepressants and vitamins. Polypharmacy increases the risks of drug interactions and poor adherence. Pharmacokinetic changes include reduced body size with age, particularly in females, which affects volume of distribution and loading dose; and decreased renal clearance with both age and female sex, which reduces maintenance dose requirements of renally excreted drugs. Sex hormones may directly mediate some physiologic and pharmacologic changes in ageing. Both age and sex should be considered when applying results from preclinical studies (animals usually young and/or a single sex) and clinical trials (frequently in middle aged or young-old participants who may be a single sex) to the treatment of older adults. This will optimise the safety and efficacy of medicines for these vulnerable people.

SESSION 1180 (SYMPOSIUM)

GLOBAL PERSPECTIVES ON HIV AND AGING: SOCIAL FACTORS IN MANAGING MULTIMORBIDITY AND DEPRESSION

Chair: M. Brennan-Ing, *ACRIA, Center on HIV and Aging, New York, New York, New York University College of Nursing, New York, New York*
Co-Chair: T.N. Taylor, *SUNY Downstate Medical Center, Brooklyn, New York*
Discussant: B. De Vries, *San Francisco State University, San Francisco, California*

Aging with HIV is a global phenomenon that will shape the epidemic for decades to come. In both developed and developing nations where there is widespread access to antiretroviral treatment (ART), we can expect individuals with HIV to have nearly normal life expectancies. However, there are challenges to this success; many studies find that older adults with HIV report high levels of multimorbidity and depression, complicating their treatment and care. High rates of depression have been linked in numerous studies to ART nonadherence and subsequent treatment failure. This symposium will examine multimorbidity, depression, and the social context of care for older adults with HIV in developed and developing countries. Dr. Justice will begin with an examination of multimorbidity, its causes, and clinical care of this population using the U.S. Veterans Aging Cohort Study. Dr. Brennan-Ing will present data on covariates of depression among older Ugandan's with HIV, and how multimorbidity along with perceptions of the social environment (support, stigma and loneliness) relates to this condition. Professor Minichiello will describe this aging population in Australia and New Zealand, and how managing psychosocial factors are vital in addressing the needs of these individuals. For the final paper, Dr. Porter will present findings from Brazil indicating that older adults with HIV experience deficits in social supports and health service access compared to younger adults. These papers will inform a discussion of the implications of the aging HIV epidemic on global health policy and improving treatment and care resources in developed and developing countries.

AGING WITH HIV IN NORTH AMERICA: MULTIMORBIDITY, POLYPHARMACY, AND FRAILTY

A.C. Justice, *1. VA Connecticut Healthcare System, West Haven, Connecticut, 2. Yale University School of Medicine, New Haven, Connecticut*

This presentation will provide a brief update from the Veterans Aging Cohort Study and other large observational studies of people living with HIV infection regarding increased risk of aging associated conditions among those with HIV compared with demographically and behaviorally similar uninfected individuals and whether increased risk translates into earlier onset of specific conditions including cardiovascular disease, cancer, and renal disease. It will discuss multiple mechanisms that likely lead to these observations including health behaviors, chronic inflammation, ART and non ART treatment toxicity, and immune senescence. Finally the talk will summarize clinical issues including optimizing management in the context of multimorbidity, polypharmacy, and increasing frailty.

BIOSOCIAL COVARIATES OF DEPRESSION IN OLDER HIV+ UGANDANS: COMORBIDITIES, STIGMA AND LONELINESS

M. Brennan-Ing[1,2], M. Kuteesa[3], L. Geddes[4], L. Seidel[1,6], S.E. Karpiak[1,2], J. Negin[4], J. Seeley[5,3], *1. Center on HIV and Aging, AIDS Community Research Initiative of America, New York, New York, 2. New York University College of Nursing, New York, New York, 3. MRC/UVRI Uganda Research Unit on AIDS, Entebbe, Uganda, 4. University of Sydney, Sydney, New South Wales, Australia, 5. London School of Hygiene and Tropical Medicine, London, United Kingdom, 6. Fordham University, New York, New York*

As anti-retroviral availability increases, the number of older adults with HIV in sub-Saharan Africa (SSA) is also growing, mirroring the developed world. In developed countries, older HIV-positive adults evidence high levels of depression. Little is known about depression or its biosocial covariates in older SSA HIV-positive adults. To address this gap, we examined depression, social support, loneliness, and stigma among older HIV-positive Ugandans (42 men/ 59 women; average age = 61 years, range = 50 to 83). The average CES-D 10-item score was 12.3; 40% had clinically significant depressive symptoms. In multivariate analysis (R2 = .48), poorer self-rated health and multimorbidity were covariates of depression. Direct measures of social support were not significant, but perceptions of the social environment (stigma, loneliness) were highly significant covariates. Depression in this population is linked to both biological and social factors. Implications for research, policy and programs in this resource-poor setting will be discussed.

EVIDENCE OF THE PROVISION OF SOCIAL SUPPORT TO OLDER PEOPLE LIVING WITH HIV

V. Minichiello, C. MacPhail, *University of New England, Armidale, New South Wales, Australia*

Population ageing in developed countries, a broad age risk profile in developing countries and increased access to HIV treatment have resulted in a need to manage HIV in older people. Ageing with HIV is associated with multiple comorbidities, particularly depression. Depression is an outcome of social isolation and lack of support, in association with HIV related stigma, discrimination and prevalent ageist attitudes. Social networks of older people with HIV are limited due to nondisclosure, living alone and desire for self-reliance; therefore increasing the burden on formal health structures. While there are strategies for the clinical management of depression in older people with HIV, supporting older people in managing their psychosocial experience of living with HIV is less frequently addressed. We review the global evidence of such support, particularly focused on Australia and New Zealand, and examine where more research is needed in this regard.

AGING WITH HIV/AIDS IN BRAZIL: INCREASED PSYCHOSOCIAL VULNERABILITIES

M. Costa-Couto[1], M.C. Porter[2], *1. Universidade do Estado do Rio de Janeiro, Rio de Janeiro, Rio de Janeiro, Brazil, 2. California School of Professional Psychology, Alliant International University, San DIego, California*

Past research on clinically relevant psychosocial vulnerabilities associated with aging with HIV/AIDS has largely focused on US and European contexts. Brazil, a long-time leader in HIV/AIDS policy, is unique in the rest of the world for its larger population of older people coping with concurrent effects of both long-term antiretroviral treatment and the disease itself. 128 HIV+ Brazilians aged 50 and over were compared to 430 under 50 on clinically important sociodemographic and psychosocial variables. Results indicated that, beyond a higher burden of comorbidities, older people with HIV/AIDS in Brazil may face greater deficits in objective social support, access to HIV testing and other public health services and adherence to safer sex guidelines, and a lower likelihood of adopting a "gay" identity. Functional social support, number of children and communication about HIV/AIDS were the only potential psychosocially protective factors that were not decreased in the older sample.

SESSION 1185 (SYMPOSIUM)

INFORMING NURSING HOME QUALITY & POLICY USING ASSESSMENT DATA

Chair: T.J. Roberts, *Geriatric Research Education & Clinical Center, William S. MIddleton Veteran Affairs, Madison, Wisconsin, University of Wisconsin, Madison, Wisconsin*

Co-Chair: T. McMullen, *University of Maryland, Baltimore, Maryland*

Discussant: D. Saliba, *UCLA/JH Borun Center for Gerontological Research, Los Angeles, California*

The quality of care delivered to the 1.5 million older adults in the nation's 16,000 nursing homes has been a concern for decades. A number of mechanisms have been put in place over the years to induce quality improvement including quality benchmarks and public reporting of quality measures. The Minimum Data Set (MDS), a federally mandated clinical assessment instrument, has been the primary tool used to inform and measure quality and a predominant source of data for monitoring the care and outcomes for nursing home residents. While the original intent was clinically focused, using MDS data in research can be useful for informing practice, quality, and policy beyond the local level. However, evolving notions of quality and changing resident needs can present challenges for research using the MDS. The aim of this symposium is to discuss approaches to using assessment data in research for understanding nursing home resident outcomes and informing quality and policy. The first presentation will discuss the use of validated MDS 2.0 measures for exploring relationships between therapy intensity and resident outcomes. The second presentation will discuss the development of a universal measure of cognitive function using revised MDS 3.0 items. The third presentation will discuss the use of new preference and choice items in MDS 3.0 to inform resident psychosocial well-being. The final presentation will discuss the CARE tool and the future of patient assessment data for informing quality.

CHARACTERIZING THE QUALITY OF REHABILITATION SERVICES USING THE MDS: OPPORTUNITIES AND CHALLENGES

N. Leland[1,2], P.L. Gozalo[2], V. Mor[2], T.J. Christian[3], J.M. Teno[2], *1. Division of Occupational Science and Occupational Therapy & The Davis School of Gerontology, University of Southern California, Los Angeles, California, 2. Brown University, Providence, Rhode Island, 3. ABT, Boston, Massachusetts*

The MDS provides a unique opportunity to examine the receipt of rehabilitation services among skilled nursing home residents. The MDS collects information regarding the intensity of rehabilitation for each assessment. While the original intent of quantifying therapy intensity was to inform payment through the use of resource utilization groups; researchers can use the data to evaluate care, assess quality, and inform policy. We used a national cohort of hip fracture patients discharged to a skilled nursing facility for rehabilitation between 1999 and 2007 (n=517,039) to examine the relationship between rehabilitation intensity and discharge to the community. We found a significant relationship between high intensity rehabilitation (Hazard Ratio 1.17, 95% CI 1.15-1.19) and successful discharge to the community. This presentation will discuss the methodological issues of using MDS 2.0 to examine rehabilitation and the implications of the results for growing concern over escalating skilled nursing facility spending.

DEVELOPMENT OF THE COGNITIVE FUNCTION SCALE FOR THE MINIMUM DATA SET 3.0

K.S. Thomas[2,1], A. Wysocki[1], D.M. Dosa[2,1], V. Mor[2,1], *1. Brown University, Providence, Rhode Island, 2. Providence VA Medical Center, Providence, Rhode Island*

The MDS 3.0 introduced the Brief Interview for Mental Status (BIMS) to assess nursing home residents' cognitive function. Research suggests that not all residents are able to complete the BIMS and are consequently, assessed by staff. This presentation will discuss the Cognitive Function Scale (CFS) which uses either self-report or staff-report data, depending on the mode of assessment, to categorize residents. We will present the rationale for a single cognitive function measure and our findings on the construct validity of the new scale using admission and long-stay cohorts in 2011-2012 (n=3,007,657). Specifically, we will highlight our finding that the CFS corresponded closely with performance of Activities of Daily Living, nurses' judgments of residents' function and behavior, and diagnoses of Alzheimer's disease, dementia, and stroke for both cohorts of residents. We will discuss the implication of these results for assessing cognitive function using the CFS in both practice and research.

IDENTIFYING NURSING HOME RESIDENT PREFERENCE PATTERNS USING MDS 3.0

T.J. Roberts[1,2], A.L. Gilmore-Bykovskyi[2], R. Roiland[1,2], K.A. Kennelty[1,2], B.J. Bowers[1], *1. Geriatric Research Education & Clinical Center, William S. MIddleton Veteran Affairs, Madison, Wisconsin, 2. University of Wisconsin, Madison, Wisconsin*

Providing care that is consistent with nursing home (NH) resident's preferences is believed to be related to improved care and outcomes and is the focus of nationwide quality improvement efforts. However, it is unknown whether variations in resident preferences differentially affect outcomes. The objective of this study was to identify preference patterns for care and activity and describe their relationship to mood and behavior. A latent class analysis of self-reported Minimum Data Set items on care and activity preferences from 2010 admission assessments for all NH residents >65 years old (n=18,742) identified three preference patterns. 'Autonomous' (49%) residents had strong preferences for choice and activity, 'Adapters' (35%) had weak preferences and 'Indifferent' residents (16%) were just as likely to have strong preferences as weak. Variations in mood and behavior based on preference class and implications of using self-reported MDS 3.0 preference items to inform practice and research will be discussed.

THE CONTINUITY ASSESSMENT RECORD AND EVALUATION (CARE) TOOL: STANDARDIZING QUALITY DATA

T.L. McMullen[1], S. Mandl[1], A. Deutsch[2], B. Gage[3], S. Ling[1], *1. Centers for Medicare & Medicaid Services, Baltimore, Maryland, 2. RTI International, Chicago, Illinois, 3. The Brookings Institution, Washington D.C., District of Columbia*

The Deficit Reduction Act (DRA) of 2005 directed CMS to develop a Medicare Payment Reform Demonstration (PRD) that used standardized patient information to examine the consistency of payment incentives for Medicare populations treated in various settings. As a part of this demonstration, a standardized patient assessment tool was developed for use at acute hospital discharge and at post-acute care admission and discharge. The tool, the Continuity Assessment Record and Evaluation (CARE), was designed to standardize assessment of patients' medical, functional, cognitive, and social support status across acute and post-acute settings while posing minimal administrative burden to providers. This presentation will provide an overview of the development [data collection, testing] of the CARE tool. Next, this presentation will discuss standardizing quality measures and will discuss the development of the CMS post-acute function measures that use CARE data. Finally, this presentation will discuss the future of patient assessment data for informing quality.

SESSION 1190 (SYMPOSIUM)

GRANDPARENTS AS FAMILY WATCHDOGS: AN INTERNATIONAL PERSPECTIVE

Chair: B. Ingersoll-Dayton, *School of Social Work, University of Michigan, ANN ARBOR, Michigan*
Discussant: E.A. Greenfield, *Rutgers, New Brunswick, New Jersey*

Grandparents often play a prominent role in the family and have been characterized by Troll (1993) as "family watchdogs" in times of need. As globalization accelerates, it is increasingly important to examine the changing role of grandparents from an international perspective. This symposium brings together papers focusing on grandparenting in the United States, Thailand, India, and Europe. The papers examine the spectrum of grandparent-grandchild relationships ranging from occasional contact and care to intensive, custodial care. Based on research conducted in the United States, one of the papers focuses on dynamics within the grandparent-grandchild relationship when the adult child is mentally ill. This paper investigates exchanges between the generations using a strengths-based approach. A second paper examines the impact of the adult child's migration on the grandparents who are left behind in rural Thailand to care for their grandchildren in "skipped generation" households. This research brings to light the costs and benefits of this arrangement for the grandparents. A third paper uses WHO-SAGE (Wave 1) data to examine the prevalence and well-being of grandparents in a national probability sample of households in India. Finally, in research that compares the extent of grandparent care in several European countries, the fourth paper points to how varying levels of care impact the physical and mental well-being of the grandparent. Using both qualitative and quantitative methods, these papers uncover the vital roles played by grandparents within the intergenerational family and illuminate how their caregiving roles impact the well-being of the grandparents within an international context.

SUPPORT EXCHANGED BETWEEN AMERICAN GRANDMOTHERS AND GRANDCHILDREN IN THE FACE OF MENTAL ILLNESS

R. Dunkle, B. Ingersoll-Dayton, L.A. Chadiha, *social work, university of michigan, Ann Arbor, Michigan*

When families face the serious mental illness of adult children who are, themselves, parents, the grandparent generation may need to provide assistance. Grandmothers are particularly likely to assume a caregiving role. Using a qualitative approach, this study focused on open-ended interviews obtained from a sample of 22 grandmothers aged 52-90 residing in the United States who remain in contact with their daughters who are mentally ill. Employing a strengths perspective, we examined grandmothers' support exchanges with their grandchildren. Our qualitative analyses indicated that, in the face of mental illness, grandmothers anticipated the needs of their grandchildren and attempted to enhance the relationships between their adult daughters and their grandchildren. We also found that grandchildren helped their grandmothers by providing emotional and physical aid as well as serving as a source of anticipatory support for them. These links between grandmothers and grandchildren can be vital resources for the intergenerational family.

GRANDPARENTING IN "SKIPPED GENERATION" HOUSEHOLDS IN THAILAND

B. Ingersoll-Dayton[1], S. Punpuing[2], K. Tangchonlatip[2], K. Thianlai[2], *1. School of Social Work, University of Michigan, ANN ARBOR, Michigan, 2. Mahidol University, Nakhon Pathom, Thailand*

In Thailand, a sizeable proportion of working-age adults leave their homes in search of jobs resulting in "skipped generation" households. These are living arrangements in which grandparents and grandchildren live together without the adult child. Based on in-depth interviews conducted with 42 grandparents (aged 50 +) living in three rural provinces in Thailand, this paper focuses on the effect of these living arrangements on the grandparent caregivers. Qualitative analysis of the interviews points to considerable ambivalence among grandparents. On the one hand, they are gratified that they can contribute to the extended family by caring for grandchildren which allows their adult children to find better jobs and send back remittances. On the other hand, the grandparents worry about family relationships, their own health, and their ability to care for their grandchildren as they become teenagers. This paper highlights the costs and benefits of "skipped generation" households families for caregiving grandparents.

GRANDPARENTS AS PRIMARY AND CO-CAREGIVERS IN INDIA: EVIDENCE FROM WHO-SAGE (WAVE 1)

D. Burnette, L. Kimberly, *Social Work, Columbia University, New York, New York*

This study uses data from Wave 1 of the WHO Study on Global Ageing and Adult Health to determine the prevalence of adults aged ≥ 50 years (N=7150) who are primary or co-caregivers of children aged ≤ 15 years whose parents are incapacitated or absent from the household. A second aim is to examine the health and psychosocial well-being of older adults in caregiver roles as compared to those who are not in this role. Overall 12-month prevalence of providing full-time or part-time care for children was 2.1%. This group fared consistently worse than non-caregivers on measures of health, mental health and economic measures of well-being and on overall quality of life. Findings will be discussed in the context of shifts in family structure due to contextual factors such as poverty, migration and social inequalities in developing countries, and particularly India.

THE HEALTH OF GRANDPARENTS CARING FOR THEIR GRANDCHILDREN

K.F. Glaser, G. Di Gessa, A. Tinker, *Institute of Gerontology, King's College London, London, United Kingdom*

Grandparents are an important source of childcare. However, concerns have been raised that caring for grandchildren may come at the expense of grandparents' own wellbeing. After attending this session, participants will be able to debate the evidence regarding the association between grandparental childcare and health taking into account disadvantage across the lifecourse. We employed data from the English Longitudinal Study of Ageing, and the Survey of Health, Ageing and Retirement in Europe. Both datasets include detailed retrospective life histories. Health outcomes considered were self-rated health, depressive symptoms and functional limitations. Multivariate models were used to investigate how lifecourse and socio-economic factors interact with grandparental childcare to affect health. We found little evidence to suggest that grandparental childcare has negative effects on health. Moreover, the poorer health among grandparents who coreside with their grandchildren does not appear to be a consequence of care provision per se, but rather of initial disadvantage.

SESSION 1195 (SYMPOSIUM)

BIOLOGICAL MECHANISMS AND DISEASE STATES THAT DRIVE FUNCTIONAL DECLINE

Chair: J.D. Walston, *Medicine/Geriatrics, Johns Hopkins University, Baltimore, Maryland*

Purposeful movement is a complex, multisystemic activity that requires intact sensory input and good cognitive, cardiovascular, pulmonary and motor function in order to function optimally. Age-related changes in any of these domains can result in declines in physical function. The speaker will review common age-related declines in physiology and biology that put older adults at risk for declines in physical function, including age-related changes in peripheral nerves, vision and hearing; changes in brain, cardiac, and pulmonary tissue; and the complex etiology of sarcopenia or loss of skeletal muscle mass. In addition, the speaker will review the multiple specific chronic disease states that often impacts functional decline in aging.

INTERVENTIONS TO IMPROVE THE PHYSICAL FUNCTION OF OLDER ADULTS

S.B. Kritchevsky, *Sticht Center on Aging, Wake Forest School of Medicine, Winston-Salem, North Carolina*

The maintenance of physical function is important to individuals and society. This presentation will summarize 20 years of the Wake Forest Pepper Center's clinical trials experience testing the impact of exercise and nutritional interventions to improve physical function in older adults. This experience includes community-dwelling older adults and patients with osteoarthritis, cardiovascular disease, diabetes, COPD and heart failure. In each of these populations, there are measurable functional benefits of intervention. In many cases, function improves even when clinical measures of disease severity are not affected. For example, although exercise improves function in persons with knee osteoarthritis it does not affect joint space narrowing. Our experience also shows that among overweight and obese older adults moderate intentional weight loss confers additional functional benefits beyond exercise. Our center has begun to disseminate proven interventions by making them available to older adults either through self or physician referral.

NEIGHBORHOOD SOCIAL FACTORS AND PHYSICAL FUNCTION IN OLDER MEXICAN AMERICANS OVER TIME

K.S. Markides, S. Rote, S. Al Snih, *Preventive Medicine & Community Health, University of Texas Medical Branch, Galveston, Texas*

Perhaps the most investigated outcome in the field of aging has been a variant of physical function or disability and its predictors and outcomes. While much emphasis has been given to how medical conditions influence physical function there has also been interest in how psychosocial and social environmental factors are related to physical function, disability, and mortality. In this presentation I will provide an overview of a number of analyses my colleagues and I have performed in this area using longitudinal data from the Hispanic EPESE, our ongoing longitudinal study of older Mexican Americans. We will present data on how psychological and social factors interact with medical conditions such as diabetes and obesity to influence measures of physical function including physical performance measures (balance, chair-stands and short walk) as well as Activities of Daily Living (ADL) disability. Particular focus will be given to analyses of the “barrio” or “enclave” effect of Hispanic/Latino concentration in the neighborhood and its associated psychosocial resources that may promote physical activity, lower to moderate obesity, and physical function to prevent or delay disability. The Hispanic EPESE has data on older Mexican Americans from the Southwestern United States over eight waves of observation from 1993-94 through 2012-13.

PHYSICAL FUNCTION ACROSS THE TRANSLATIONAL CONTINUUM

K.J. Mahoney, *Graduate School of Social Work, Boston College, Chestnut Hill, Massachusetts*

Fellows from the SRPP Section of the GSA have made many contributions to the body of knowledge on physical functioning and improving the lives of people with disabilities. My own work on Cash and Counseling, the self-direction option giving people with disabilities more flexibility and control over their supports and services, provides a cogent example of how such research has been disseminated and translated for policy makers and program administrators. This paper, using Glasgow’s RE-AIM model, will describe some of the mechanisms used in translating research into policy and some of the results achieved.

GSA FELLOWS SYMPOSIUM: PHYSICAL FUNCTION ACROSS THE TRANSLATIONAL CONTINUUM

H. Lach[1], E. Volpi[2], *1. Saint Louis University, St. Louis, Missouri, 2. University of Texas Medical Banch, Galveston, Texas*

The GSA Fellows Symposium focuses on interdisciplinary approaches to addressing challenges in helping older adults maintain physical function across the translational continuum. These presentations will address the biological mechanisms that control physical function in older adults through innovative interventions that can help preserve and enhance physical function. Interventions include exercise and nutritional interventions for older adults, and flexible support services for older people with disabilities. Ethnicity and social factors that influence physical function will be discussed with a focus on Hispanic older adults. Common themes that bridge the four GSA sections represented by each presenter include the importance of physical function to successful aging. Through this symposium we hope to stimulate cross-disciplinary discussion about future directions for research to address the challenging issue of physical function.

SESSION 1200 (SYMPOSIUM)

CONNECTING RESEARCHERS AND RESPONDENTS: ETHICAL DILEMMAS IN QUALITATIVE RESEARCH

Chair: C.R. Bennett, *University of Maryland, Baltimore County, Baltimore, Maryland*
Co-Chair: A.D. Peeples, *University of Maryland, Baltimore County, Baltimore, Maryland*
Discussant: P. Carder, *Portland State University, Portland, Oregon*

Qualitative researchers, and in particular ethnographers engaged in participant observation, encounter complicated ethical dilemmas when interacting with residents, family, and staff when conducting research. This symposium will examine ethical dilemmas, including: the physical safety of the researcher and resident; making advantageous or simulated friendships while conducting fieldwork; maintaining confidentiality and anonymity over time; and maintaining and validating data unique to the social reality of sites and participants. The first paper will address issues of physical safety for both the researcher and resident, and how participant observers can negotiate unsafe research situations. Next, we will discuss problems of confidentiality and anonymity that researchers encounter when disseminating ethnographic findings, including selecting pseudonyms, changing details or compiling vignettes to obscure identification, and how to maintain relationships with sites. The subsequent paper will paper address the ethical issues of short-term friendships that develop between qualitative researchers and informants, concluding with a discussion of how researchers can best navigate simulated friendships with participants. Our last paper will highlight complexities that should be considered in generating and analyzing qualitative data, such as misinterpretation, misrepresentation, contextualization, and transparency. The session will conclude with approaches to properly address the complexities of generative and analyzing quality qualitative data.

ETHICAL CONCERNS AS A PARTICIPANT OBSERVER: PHYSICAL SAFETY OF THE RESEARCHER AND RESPONDENT

C.R. Bennett, *University of Maryland, Baltimore County, Baltimore, Maryland*

Qualitative researchers find themselves in field sites enmeshed in social interaction and mat encounter ethical dilemmas with residents, family and staff while conducting ethnography. Participant observation requires a researcher to enter into the sociocultural life in a setting with limited to no background knowledge of individual residents, family, or staff. For example, a research may be alone, unknowingly, with a physically combative resident, or one that presents a significant risk for falling. This paper examines the complex contextual and narrative issues in fieldwork related to personal safety of the individual researcher and respondents, being site residents, family, or staff. This paper concludes with recommendations on how researchers can best navigate field sites and narrative exchanges while conducting ethnographic research with older adults.

“I’LL BE YOUR FRIEND FOR A MONTH.”: SIMULATED FRIENDSHIPS AND RECRUITING INFORMANTS IN ASSISTED LIVING

R. Hrybyk, C.R. Bennett, M.C. Nemec, E.G. Roth, *Center for Aging Studies, UMBC, Baltimore, Maryland*

In qualitative research among vulnerable populations, there is an asymmetrical relationship between the ethnographer and the informant. Ethnographers conducting research in an assisted living (AL) purposefully cultivate relationships with residents. During frequent visits, the researcher offers a friendly face and open ear, probing for details and carefully noting residents’ remarks. Many residents, who often spend a considerable amount of time alone, welcome this concentrated attention. Ethnographers attempt to gain the trust of an informant hoping to garner a recorded interview. After the interview, the ethnographer limits subsequent time with the resident, courting others for prospective interviews. Since the data collection period is not unlimited, ethnographers must make thoughtful choices in their allotment of time to individual informants. This paper will address the ethical issues of short-term friendships that develop between qualitative researchers and informants. We conclude with a discussion of how researchers can best navigate simulated friendships with research participants.

"I KNOW WHO THAT IS..." CONFIDENTIALITY AND ANONYMITY IN ETHNOGRAPHIC RESEARCH

A.D. Peeples, C.R. Bennett, *Gerontology, University of Maryland, Baltimore County, Baltimore, Maryland*

Ethnographers spend substantial amounts of time at research sites, getting to know both the people and places under study. A central tenet to building rapport and gaining the trust of informants involves assurances of confidentiality and anonymity - the promise that in no way, present or future, will informants or the setting be identifiable in reported findings. With this assurance, informants open their lives for examination and share varying depths of personal information with researchers. When it comes time to report findings, however, researchers may find it difficult to fully live up to these promises. This paper discusses some of the ethical issues of confidentiality and anonymity that researchers encounter when disseminating ethnographic findings, including selecting sufficiently clouding pseudonyms for people and places, changing details or compiling vignettes to obscure identification, and maintaining relationships with sites and informants, especially when less than favorable findings are reported.

ETHICALLY GENERATING AND ANALYZING DATA: QUALITATIVE CONSIDERATIONS

L. Girling, *University of Maryland, Baltimore County, Baltimore, Maryland*

A fundamental purpose of scientific investigation is the acquisition of accurate data about real phenomena. This objective places a critical responsibility on researchers to obtain good quality data. While all methodological approaches share universal ethical concerns during the process of acquiring quality data, fairly specific considerations surface within qualitative investigations as the basis for this type of research lies in the interpretative approach to social reality and the description of the lived experiences of individuals. This paper highlights several complexities that should be considered as social scientists generate and analyze qualitative data. In particular, misinterpretation, misrepresentation, contextualization, and transparency are discussed in terms of their impact on data quality. The paper will conclude with approaches to properly address the aforementioned complexities.

SESSION 1205 (SYMPOSIUM)

A COMPREHENSIVE FRAILTY PERSPECTIVE: MORE THAN PHYSICAL DISABILITIES? THEORY, MEASUREMENT AND IMPACT ON RESEARCH AND PREVENTION STRATEGIES

Chair: J. Schols, *Maastricht University, Maastricht, Netherlands*
Co-Chair: L. De Donder, *Vrije Universiteit Brussel, Brussels, Belgium*

Our symposium "A comprehensive frailty perspective: more than physical disabilities? Theory, measurement and impact on research and prevention strategies" starts from the observation that frailty in older adults is often not detected on time. Prevention and early detection of frailty in older adults would benefit the older person, his environment and be more cost-effective for society. Given the significance of the demographic projections it is of strategic importance for societies to (a) have a multi-dimensional understanding of frailty, (b) gain more insight into the processes and factors influencing frailty imbalance in older adults (c), develop effective strategies to detect frailty imbalance on time, to empower older adults and their environment to restore their frailty balance, and to guide older adults to appropriate care and support when needed. These three goals will be addressed in three presentations. Furthermore, to achieve these objectives, the symposium is approached from a multidisciplinary perspective (bio-physical, cognitive, psychological, social and environmental perspective on frailty).

MEASURING COMPREHENSIVE FRAILTY: A FOUR-DIMENSIONAL FRAMEWORK

N. De Witte[2,1], L. De Donder[1], E. Verté[1], D. Verté[1], J. Schols[3], *1. Vrije Universiteit Brussel, Brussels, Belgium, 2. University College Ghent, Ghent, Belgium, 3. Maastricht University, Maastricht, Belgium*

This contribution focuses on the multidimensionality of frailty. Using data from the Belgian Ageing Studies, the Comprehensive Frailty Assessment Instrument (CFAI) was developed. A second order confirmatory factor analysis on 33692 older adults aged 60 and older, revealed 4 domains of frailty; physical, psychological, social and environmental including 23 indicators. The instrument showed good fit indices explaining 63,5% of the variance in frailty. The CFAI was cross-validated with the Tilburg Frailty Indicator. Taken the results of the CFAI in consideration, frailty does not merely involve physical problems but also a psychosocial problem. Next to this, the environmental domain also contributes to frailty. The paper concludes that these findings create new opportunities for researchers to investigate processes leading to frailty and to prevent or delay frailty.

CARE INNOVATION: NEW STRATEGIES OF FRAILTY DETECTION AND PREVENTION

D. Verté[1], L. De Donder[1], N. De Witte[2], A. Smetcoren[1], *1. Vrije Universiteit Brussel, Brussels, Belgium, 2. University College Ghent, Ghent, Belgium*

This contribution starts from the observation that frailty-imbalance in older adults is often not detected, nor recognized, nor treated in time, leading to a threatening of their autonomy, participation in society, health and wellbeing and often leading to an admission into a residential care facility. Consequently, pro-active detection and prevention is needed. Using data from a literature review, a quantitative and qualitative study, this paper gives an overview of an extensive research project with the aim to enable an effective detection of frail community-dwelling older people (1) and to empower older adults and their environment to restore their frailty balance, and to guide older adults to appropriate care and support when needed (2) and this within the framework of prevention (primary, secondary and tertiary prevention). In doing so, it starts from the perspective of Active Ageing and an empowerment approach.

TOWARDS A FRAILTY BALANCE – FROM DEFICITS TO STRENGTHS

L. De Donder[1], N. De Witte[2,1], E. Dierckx[1], J. Schols[3], T. Kardol[1], *1. Vrije Universiteit Brussel, Brussels, Belgium, 2. University College Ghent, Ghent, Belgium, 3. Maastricht University, Maastricht, Netherlands*

This contribution focuses on the conceptualisation of frailty-imbalance. Using data from quantitative and qualitative studies the argument will be developed that frailty should be approached from a balance-perspective. To date most of the debate around frailty in older adults has (only) focused on the registration of deficits. However, within the light of active ageing, besides the registration of deficits and dependency, there needs to be a registration of strengths as well which concentrate on autonomy and the present (in)formal care or support (the frailty balance). Two individuals with the same frailty, for instance can be very different in what kinds of support they need because their balance is different. The paper concludes by highlighting the results of this approach for policy, practice and research.

SESSION 1210 (SYMPOSIUM)

LATINO FAMILY CAREGIVERS: CONSIDERATIONS IN THE CULTURAL TAILORING OF INTERVENTIONS

Chair: C.G. Soto, *University of Nevada-Reno, Reno, Nevada*
Co-Chair: L.T. Benuto, *University of Nevada-Reno, Reno, Nevada*

The aging of the U.S. population has been accompanied by a significant rise in the number of individuals diagnosed with dementia, the vast majority of who depend on family members for care. Given that there are no effective treatments for degenerative forms of dementia, supporting family caregivers to promote quality of care for persons with dementia is a national priority. Latinos are currently the fastest growing population over age 65 in the United States; the number of Latino elders with dementia is projected to increase by six-fold by 2050. To date, the majority of research on caregiver support has focused on Euro-American caregivers despite compelling evidence that there are cultural differences in beliefs, attitudes, and caregiving practices among Latino caregivers compared to Euro-Americans. Moreover, Latino caregivers are less likely to seek out or utilize formal caregiver support services than Euro-American caregivers. This program will present findings from recent research on factors impacting: Latino caregivers' utilization of support services, the quality of life of Latino elderly and caregivers, and the reduction of health disparities of Latino elderly persons with dementia and their caregiving families. Presenters will discuss: 1) how acculturation status, age, and perceived helpfulness of services impact community-dwelling Latino caregivers; 2) ways to develop new and/or tailor existing interventions to reduce caregiver worry; and 3) the service needs and barriers to accessing support services among Latino caregivers.

MEXICAN AMERICAN CAREGIVER WORRIES & THEIR IMPACT: OPPORTUNITIES FOR INTERVENTION

D.W. Coon, B.C. Evans, *College of Nursing & Health Innovation, Arizona State University, Phoenix, Arizona*

Momento Crucial is a mixed methods, multi-site, NIH-funded, interdisciplinary, descriptive study of Mexican American (MA) caregivers of older adults that uses a life course theoretical framework. This presentation focuses on the critical, yet understudied phenomena of worry through semi-structured interviews with 110 MA families across 6 home visits. Using ATLAS.ti, we identified 366 worry quotations from 639 documents, and organized findings across early, middle, and late stage caregivers. MA caregivers expressed a) cultural and contextual worries (e.g., health insurance, auxiliary caregivers and neighborhood safety); b) worries about transitions (e.g., changes in care recipient cognitive status and health, safety concerns, and increasing care responsibilities) and turning points in care (e.g., placement); and, c) impact of worry on their health (e.g., affective disruptions, sleep disturbances). While they attempted adaptive strategies to help them manage worry, their worries persisted. Findings suggest ways to develop new and/or tailor existing interventions to reduce caregiver worry.

RESILIENCE VS. STRUGGLE? CAPTURING THE EXPERIENCE OF LATINO CAREGIVING FAMILIES

C.G. Soto, L.T. Benuto, J. Fisher, *University of Nevada-Reno, Reno, Nevada*

Latino elderly experience higher rates of dementia relative to non-Latinos yet surprisingly little is known about the experiences of Latino caregiving families. Research suggests that Latinos are in more intensive caregiving situations yet are less likely to use formal support services compared to their non-Latino counterparts. We hypothesized that the collectivistic quality of Latino culture may result in caregiving experiences that are inconsistent with the pathology-oriented characterizations of dementia caregiving predominant within the majority culture. Specifically, in the marketing of support services and phrasing within caregiver assessment measures the dementia caregiving experience is typically described in terms that focus on burden, stress, and negative health outcomes. This presentation will describe findings from a survey of Latino caregivers in which questions were phrased to objectively assess their experiences and needs while avoiding any negative reference to family elders. Implications of the findings for the cultural tailoring of interventions are discussed.

DEPRESSION AND ACCULTURATION AMONG LATINO CAREGIVERS OF FAMILY MEMBERS WITH ALZHEIMER'S DISEASE

P. Alvarez[1], J. Rengifo Nevarez[1], M. Tzuang[2], D. Gallagher-Thompson[2], *1. Palo Alto University, Palo Alto, California, 2. Stanford University School of Medicine, Stanford, California*

The proportion of older Latinos suffering from Alzheimer's disease is increasing at a rapid rate, and the number of Latino family caregivers is also increasing significantly. This investigation utilized archival data from the fotonovela project, a multi-site randomized controlled study. The impact of acculturation status, age, and perceived helpfulness on depressive symptoms among a sample of community-dwelling Latino caregivers was examined. A total of 110 Latino caregivers of family members with Alzheimer's disease from four cities in California (Sacramento, Salinas, Santa Cruz, and San Diego) successfully completed depression (CES-D) and acculturation (B-ARSMA-II) measures and provided feedback on how helpful they perceived the fotonovela to be. The results of this investigation indicated that participants found the fotonovela to be more helpful than the usual care material, regardless of their levels of acculturation. At post-treatment, among the low acculturated caregivers, middle-aged adults experienced less depressive symptoms than the older adult caregivers.

SESSION 1215 (SYMPOSIUM)

FUTURE DIRECTIONS FOR SUICIDE RESEARCH AND PREVENTION AMONG OLDER ADULTS

Chair: J. Lutz, *Psychology, West Virginia University, Morgantown, West Virginia*
Co-Chair: E.C. Price, *Psychology, West Virginia University, Morgantown, West Virginia*
Discussant: Y. Conwell, *University of Rochester Medical Center, Rochester, New York*

Suicide is a significant problem among older adults. As the Baby Boomer cohort ages, suicide rates are expected to increase among older Americans. There is a critical need to expand prevention efforts among this group, which has had historically higher suicide rates than previous cohorts. This symposium will present research and policies focusing on identifying older adults at risk for suicide and implementing prevention strategies. The first presentation will focus on risk factors in older adults with physical impairments. Jay Gregg will present an examination of the relations among control strategies, depressive symptoms, hopelessness, and suicidal ideation in adults in poor health. The second presentation will present details from an intervention. Dr. Kim Van Orden will present new results from a trial aimed at reducing suicide risk in older adults by capitalizing on peer support and social connectedness. The final two presentations address policy. Dr. Mark Kaplan will present research examining the extent to which firearm policy and the work of primary care physicians may impact suicide risk among older adults. Finally, Dr. Jovier Evans will present the National Action Plan and discuss its implementation on behalf of the NIMH Suicide Prevention Research Consortium. Dr. Yeates Conwell, director of Geriatric Psychiatry and co-director of the Center for the Study and Prevention of Suicide at the University of Rochester Medical Center, will serve as discussant.

CONTROL STRATEGIES AND SUICIDE RISK IN OLDER ADULTS WITH POOR HEALTH

J.J. Gregg[1,2], A. Fiske[1], *1. Psychology, West Virginia University, Morgantown, West Virginia, 2. Durham VA Medical Center, Durham, North Carolina*

Individuals who have difficulty adapting to functional limitations in later life may be at higher risk for suicidal behavior. The current project examined control strategies in relation to depressive symptoms, hopelessness, and suicidal behavior in 186 older adults (aged 65-99) with poor health. Results demonstrated that primary control strategies (i.e., efforts to accomplish goals directly or through compensatory measures, such as help-seeking) were related to lower levels of depressive symptoms, hopelessness, and risk for suicidal behavior. Some secondary strategies (i.e., those focused on changing the self), but not all, also were associated with decreased negative affect and risk. After controlling for depression and all other control strategies, only selective primary control strategies (i.e., persistence) were associated with decreased risk for suicidal behavior. Results regarding depressive symptoms and hopelessness also will be presented, and discussion will elaborate on implications for prevention and treatment of older adults at risk for suicide.

THE SENIOR CONNECTION: DESIGN & BASELINE CHARACTERISTICS

K. Van Orden[1], H. He[1], D.M. Stone[2], J. Rowe[3], W.L. McIntosh[2], C. Podgorski[1], Y. Conwell[1], *1. Psychiatry, University of Rochester Medical Center, Rochester, New York, 2. Centers for Disease Control and Prevention, Atlanta, Georgia, 3. Lifespan of Greater Rochester, Rochester, New York*

There is a pressing public health need to find interventions that reduce suicide risk in later life. Psychiatric and physical illness, functional decline, and social factors place seniors at risk for suicide. Reflecting this body of evidence, the Centers for Disease Control and Prevention (CDC) has identified the promotion and strengthening of social connectedness, between and within the individual, family, community, and broader societal levels, as a key strategy for suicide prevention. The Senior Connection, a randomized trial of peer companionship for older adults, will be described in this talk, with an emphasis on the most novel features of the study design – grounding in a psychological theory of suicide and intervening at an early stage in the suicide risk trajectory by linking primary care patients with the Aging Services Provider Network. We will also provide information characterizing subjects at baseline, including a high prevalence of suicide ideation in the sample.

SUICIDE IN OLD AGE: A NEW TAKE ON THE GUN CONTROL DEBATE AND THE PEOPLE INVOLVED

M.S. Kaplan[1], B. Kaskie[2], *1. University of California, Los Angeles, Los Angeles, California, 2. University of Iowa, Iowa City, Iowa*

A primary target of the Surgeon General's strategy for suicide prevention is the population of persons over the age of 65. However, despite the national attention, the older adult suicide rate continues to increase. In this presentation, we consider individual risk factors for suicide in late life. We then turn toward the role of firearm policy, arguing that firearm availability plays a significant role in increasing the likelihood of suicide among older adults, older men in particular. Also, given such a large proportion of the population at risk presents in primary care settings often within two weeks of committing suicide, we contend that primary care physicians take a more active role in potentially mediating individual level factors known to increase suicide risk. Indeed, beyond supporting ongoing efforts, public policy strategies for reducing suicide among older adults should increasingly consider extra-individual factors. Firearm availability and access to physicians who uphold basic principles of geriatric care by routinely screening for affective, behavioral and cognitive disorders appear as two viable alternatives for further consideration.

PRIORITIZING SUICIDE PREVENTION RESEARCH: AN ACTION PLAN TO SAVE OLDER ADULT LIVES

J. Evans, *National Institute of Mental Health, Bethesda, Maryland*

In the recently issued A Prioritized Research Agenda for Suicide Prevention; An Action Plan to Save Lives (Agenda), the Research Prioritization Task Force of the National Action Alliance for Suicide Prevention set out research priorities as a means to guide funding towards efforts that are most likely to reduce the burden of suicide in the United States (see www.suicide-research-agenda.org). The Agenda identifies opportunities (settings accessed; means used) where subpopulations at risk would benefit from detection and/or intervention research. For older adults, this could mean a focus on improving care in multiple health care and community settings, and enhanced firearm safety. Stakeholders in older adult suicide prevention need surveillance and research-informed actions to track progress. This presentation provides an overview of the Agenda research priorities and example research directions relevant to preventing older adult suicide with this approach in mind.

SESSION 1220 (SYMPOSIUM)

INTERNATIONAL PERSPECTIVES ON URBAN SPATIAL CHANGE AND SOCIAL INEQUALITY AMONG OLDER ADULTS

Chair: J. Kelley-Moore, *Sociology, Case Western Reserve University, Cleveland, Ohio*
Co-Chair: C. Phillipson, *University of Manchester, Manchester, United Kingdom*
Discussant: T. Scharf, *National University of Ireland Galway, Galway, Ireland*

In a global context where we observe the co-occurring processes of increasing urbanization and population aging, it is imperative that we identify the implications for the well being of older adults living in these changing contexts. In this symposium, we draw from research in four countries (Ireland, England, Netherlands, and Australia) to explore how urban spatial and demographic change potentially contributes to the social exclusion of older adults. Utilizing multiple methodologies at different scales of measurement (ranging from individual-level ethnographic work to area-level census measures) this research helps to identify sub-groups of older adults who may be particularly vulnerable, types of changes in geographic contexts that may serve to exclude older adults, and potential points of intervention for increasing social participation and making urban areas more 'age friendly.' Thomas Scharf of National University of Ireland Galway will then synthesize this work, highlighting the commonalities and contrasts across national contexts and outline an agenda for studying urban spatial change and older adults.

INTERROGATING AGE-FRIENDLINESS IN AUSTERITY: MYTHS, REALITIES AND THE INFLUENCE OF PLACE CONTEXT

K. Walsh, *Irish Centre for Social Gerontology, National University of Ireland Galway, Galway, Ireland*

The potential for forces of socioeconomic change, such as the global recession, and macro-level policy, such as programs of austerity, to intensify and redirect demographic and urbanization processes in local contexts, is clear. Yet, how the economic recession and austerity-driven public policy can influence older people's relationship with place, and the capacity of cities and communities to be age-friendly settings, has rarely, if ever, been considered. To explore these questions, this paper provides an overview of age-friendly developments in Ireland, and draws on a series of Irish qualitative studies on older people's community experiences during the economic recession. Findings demonstrate how the recession and austerity combine with macro-demographic and socioeconomic patterns, and broader policy trends, to exacerbate existing aging in place issues in Ireland. Reflecting an intertwinement of local contexts with broader macroeconomic forces, there is a need to consider such linkages in a holistic and multilevel model of age-friendliness.

THREE DECADES OF OF NEIGHBORHOOD INTEGRATION: WHERE COHORTS MEET NEIGHBORHOOD CHANGE

F. Thomese, T. van Tilburg, *Sociology, VU University, Amsterdam, Netherlands*

Neighbourhood integration is pivotal to quality of later life and is considered an important condition to aging in place, as neighbours are expected to take increasing responsibility in looking after aging community members. Yet modernization theory predicts that older people lose their local connectedness due to changing life styles. Also, bifurcation in neighbourhoods may separate the "elected", with freedom to move, from the "excluded", who stay behind in low quality neighbourhoods. A unique three-cohort study in the Netherlands (Longitudinal Aging Study Amsterdam) allows an empirical test of both changes and confronting them with changes in neighbourhood integration: - did neighbourhoods of young-old diversify between 1991 and 2012? - did young-old become less bound to local and kin contexts around the turn of the century? - has neighbourhood integration become less dependent on individual and contextual opportunities? Three cohorts of people aged 55-64 in 1991, 2002, and 2002, each comprising about 1,000 respondents living across provided data on personal networks, neighbourhood characteristics, and personal characteristics. Neighbourhoods diversified economically and ethnically, but preliminary analysis indicates that changes in social behaviour predict more of changes in local and kin networks than do neighbourhood characteristics.

DEVELOPING AGE-FRIENDLY NEIGHBOURHOODS: AN ETHNOGRAPHIC PERSPECTIVE

T. Buffel[1,2], C. Phillipson[1], *1. The University of Manchester, Manchester, United Kingdom, 2. Adult Educational Sciences, Vrije Universiteit Brussel, Brussels, Belgium*

Developing environments responsive to the aspirations of older people has become a major concern for social and public policy. This paper explores conceptual and empirical aspects of the age-friendly cities debate, with a focus on experiences of place in urban settings. Exploratory findings are reported from an empirical study in two neighborhoods in Manchester, UK, which sought to examine aspects of social exclusion and inclusion among people aged 60 and over. Drawing on a mixed-method approach comprising ethnographic observations, focus groups and interviews, the paper identifies four issues in relation to the neighborhood dimension of social exclusion/inclusion in later life: experiences of community change; feelings of safety; the management of urban space; and strategies of control. The paper concludes by discussing conceptual and policy issues raised by the research, particularly in relation to developing age-friendly communities as means of achieving 'spatial justice' (Soja, 2010) and rights to urban citizenship.

POPULATION CHANGE, SPATIAL INEQUALITIES, AND POLICY RESPONSES AMONG OLDER AUSTRALIANS: EVIDENCE FROM SMALL AREA CENSUS DATA

H. Kendig[1,2], C.H. Gong[1,2], *1. Centre for Research on Ageing Health and Wellbeing, Australian National University, Canberra, Australian Capital Territory, Australia, 2. ARC Centre of Excellence in Population Ageing Research, Canberra, Australian Capital Territory, Australia*

Geographical dimensions of ageing and population change have become an increasing focus of research and policy development in Australia in recent years. The primary information source for this paper is a national analysis at the small area level of the 2006 and 2011 Censuses. Major trends identified include ageing in low density suburban areas of major cities, ageing in depopulating provincial cities with rural hinterlands, and moves to coastal areas and other leisure destinations. The analysis focuses on vulnerable populations defined in terms of socio-economic resources and functional health capacities. The impact of policy responses on access to accommodation and services will be reviewed. These include needs-based allocations for aged care and health services, infrastructure investments and land use planning by State governments, and an emergent age-friendly cities movement

SESSION 1225 (SYMPOSIUM)

INTERGENERATIONAL AMBIVALENCE: NEW CONCEPTUAL AND MEASUREMENT APPROACHES

Chair: K. Pillemer, *Cornell University, Ithaca, NY*
Discussant: A.D. Ong, *Cornell University, Ithaca, NY*

An organizing concept for studying intergenerational relations has emerged over the past decade that emphasizes mixed emotions, attitudes, and cognitions; intergenerational ambivalence. This perspective views intergenerational relations as revolving around sociological and psychological dilemmas and contradictions, seeking to better understand the quality of parent-child relations by incorporating both positive and negative elements in theoretical and empirical work. Research has confirmed that ambivalence between older parents and adult children is a common phenomenon and has identified factors that predict higher levels of ambivalence. However, as this field expands, a need for a second generation of studies has emerged. First, more sophisticated measurement strategies are needed, and in particular the development of instruments specifically designed to measure intergenerational ambivalence. Second, better-articulated conceptual frameworks are required to both inform new research designs and to integrate results from studies. Third, there is a need for international comparative research on intergenerational ambivalence. Presentations in this symposium explore these issues from an international perspective: 1) Development of a new instrument for direct measurement of ambivalence among family caregivers; 2) An analysis of existing indirect measures of intergenerational ambivalence in light of recent social psychological and attitudinal research advances; 3) An empirical test of a new conceptual approach, using a life-course framework that simultaneously considers generational position, cohort membership, and temporal dynamics; and 4) An examination of intergenerational ambivalence in the light of a new conceptual framework that highlights "intergenerational intelligence." Discussion will be provided by an expert on the psychology of positive and negative emotions.

INTERGENERATIONAL AMBIVALENCE IN FLUX: VARIATION WITHIN FAMILIES, ACROSS COHORTS, AND OVER TIME

J.P. Lendon[1], M. Silverstein[2], *1. Veterans Adminstration of Los Angeles, Los Angeles, California, 2. Aging Studies Institute, Syracuse University, Syracuse, New York*

Scholars have rarely treated ambivalence within a full life course framework that simultaneously considers generational position, cohort membership, and temporal dynamics. This research uses five waves of the Longitudinal Study of Generations to assess variation in indirectly measured ambivalence among 903 parent-child dyads between 1991 and 2005. Latent growth models revealed trajectories suggesting that ambivalence generally declines over time. Children experienced greater ambivalence than their parents, and parent-child dyads in the Babyboom cohort experienced greater ambivalence than those in the preceding cohort. Differences in trajectories showed that younger parents had the greatest ambivalence prior to launching their children and older parents tended to maintain stable levels of ambivalence. In addition, parents' ambivalence strengthened their children's ambivalence and vice versa. Findings emphasize the importance of treating intergenerational ambivalence as a dynamic property of families that is sensitive to historical contingencies, family life stage, and those to whom family members are linked.

AMBIVALENCE AND GENERATIONAL INTELLIGENCE: NEW DIRECTIONS FOR THE ANALYSIS OF SOCIAL POLICY

S. Biggs, *University of Melbourne, Parkville, Melbourne, Victoria, Australia*

Intergenerational relations are complex, including an amalgam of influences such as cohort, lineage and lifecourse position. They contain cognitive and emotional components that develop and change over time. Public debate has recently hinged on the degree to which generational groups are in competition within the public domain. And while evidence often points in the opposite direction (generational competition for jobs, willingness to pay or care) the persistence of negative attributions toward the 'age –other' persist. A key question in this context would be the degree to which ambivalence can be contained within social spaces that allow generational empathy to emerge, and are thereby likely to facilitate positive forms of interaction between generational groups. Part of this process would be to develop tools that critically examine attempts to shape policy debates on ageing as part of a task of cultural adaptation to a long life

PSYCHOMETRIC PROPERTIES OF THE CAREGIVING AMBIVALENCE SCALE (CAS)

A. Losada[1], M. Marquez-González[2], K. Pillemer[3], *1. Psychology, Universidad Rey Juan Carlos, Madrid, Spain, 2. Universidad Autónoma de Madrid, Madrid, Spain, 3. Cornell University, Ithaca, New York*

Introduction Even though ambivalent feelings (e.g., love and rejection) are usually reported by family caregivers, the association between emotional ambivalence and caregivers' health has not been studied. In addition, there are no available instruments for assessing ambivalent feelings in family caregivers. The aim of this study is to analyze the psychometric properties of a new measure: the Caregiving Ambivalence Scale (CAS). Methods Participants are 324 dementia family caregivers. Face to face interviews were conducted in which, in addition to ambivalence, caregivers' perceived health, depressive symptomatology, anxiety and guilt, and behavioural problems and cognitive and functional status of the care-recipient, were measured. Results An exploratory factor analysis showed that the six items that compose the CAS loaded in a single factor, explaining a 56.5% of the variance. The CAS showed good reliability and validity indexes, including significant ($p < .01$) positive associations with depression, anxiety, guilt and frequency and reaction to behavioural disorders, and negative with caregivers' perceived health. Discussion The CAS shows good psychometric properties, and ambivalence seems to be a relevant variable for understanding caregivers' mental and physical health. The clinical implications of this study will be discussed.

AMBIVALENCE IN OLDER PARENT - ADULT CHILD RELATIONSHIPS: ARE WE MEASURING IT THE WRONG WAY?

K. Pillemer[1], J.J. Suitor[2], *1. Cornell University, Ithaca, NY, 2. Purdue University, West Lafayette, Indiana*

Research on ambivalence has proliferated in recent years, as the field of older parent – adult child relationships has moved increasingly toward orientations and approaches that highlight contradictory emotions in later-life families. Measurement strategies, however, have greatly lagged behind the scientific interest. This presentation reviews the most prominent measurement strategy: indirect measures that separately assess positive and negative dimensions and use a formula to calculate an ambivalence score. We critique the predominant approach, noting that existing measures are inconsistent across studies, are largely reliant on items drawn from scales not designed to assess ambivalence, and do not have established reliability and validity. We then review more sophisticated ambivalence measurement techniques developed in the social psychology of attitudes and suggest how these techniques can be applied to intergenerational ambivalence. Findings from a pilot study contrasting these two types of measures are presented, and implications for improved assessment of ambivalence are discussed.

SESSION 1230 (SYMPOSIUM)

QUALITATIVE INSIGHTS ON HEALTH LITERACY, NUTRITION, SOCIAL RELATIONSHIPS AND RESILIENCE FROM THE COGNITIVE FUNCTION AND AGEING STUDIES WALES (CFAS-WALES)

Chair: G. Windle, *Dementia Services Development Centre, Bangor University, Bangor, United Kingdom*
Co-Chair: V. Burholt, *Dementia Services Development Centre, Bangor University, Bangor, United Kingdom*

This symposium presents four papers which qualitatively explore the connections between, and changes within a range of health, lifestyle and environmental factors in people age 65 and over in Wales, UK. The qualitative work adopts innovative methodology, drawing on wave 1 of the CFAS Wales quantitative data to identify unique samples of participants for each theme presented. The first presentation is based on people who despite having ill-health and associated functional impairment have high levels of well-being, and explores how life experiences may shape the development of this resilience. The second presentation is based on people who have depression or diabetes, and explores how they might receive health literacy support with managing their health and accessing health services from members of their social network. The third paper looks at the role the support network in relation to the normative expectations for emotional and functional/practical care in relation to where people live. The final paper is based on people who, through a blood sample were identified to have high and low levels of homocysteine (which is elevated in vitamin B12 deficiency) and explores their shopping and eating habits and preferences. The qualitative work aims to contribute to theoretical understandings and debates around the overarching theme of CFAS Wales – understanding how people can maintain function and well-being as they age, and the role of protective factors in this process.

WHY I EAT WHAT I EAT: OLDER ADULTS KNOWLEDGE AND ATTITUDES TOWARDS NUTRITION

K.M. Bennett, C. McCracken, *Psychology, University of Liverpool, Liverpool, United Kingdom*

Good nutrition is an important contributing factor to health in later life. As part of the large-scale CFAS Wales longitudinal study of health, well-being and cognitive function we interviewed 30 older adults: 5 men, 5 women who lived alone; 10 men, 10 women who did not. We explored older adults attitudes towards, and knowledge of, nutrition. We asked how their food choices had been shaped by changes such as retirement and poor health. Five main themes emerged. Participants reported the importance of tradition. We found that eating habits formed during the working life were carried on into life post-retirement. Breakfast was an important meal for participants and provided a means of increasing fruit intake. Participants were aware of healthy eating messages but often subverted them. Participants needed to modify their food choices to comply with medication advice. We discuss the implications for older people and for health professionals.

EXPLORING LIFE EXPERIENCES, USE OF RESOURCES AND THEIR RELATION TO RESILIENCE IN OLDER PEOPLE WITH ILL-HEALTH AND MOBILITY RESTRICTIONS

G. Windle[1], K.M. Bennett[2], C.A. MacLeod[1], *1. Dementia Services Development Centre, Bangor University, Bangor, United Kingdom, 2. Liverpool University, Liverpool, United Kingdom*

This presentation explores the development of resilience. Twenty participants aged 65+ who had high levels of well-being despite ill-health and associated functional impairment, were selected from the CFAS Wales longitudinal cohort study. Taking a life-course perspective, the interviews sought to understand the meaning and impact of significant life experiences, the resources utilised in this process, and how this may lead to positive functioning despite adversity in later life. The method of IPA was used to understand the narratives. Key themes to emerge in terms of experiences include the importance of childhood attachment, early family experiences as formative and early experiences of challenge and disadvantage. Many had a significant experience of loss, often occurring outside the normative trajectory. A sense of acceptance, determination to carry on, tolerate and compromise underpinned successful psychological adjustment, and family relationships were important resources. The implications for further research on resilience in later life are discussed.

THE DISTRIBUTION OF HEALTH LITERACY IN THE SOCIAL NETWORKS OF OLDER PEOPLE LIVING WITH A LONG-TERM CONDITION

M. Edwards, A. Williams, *Centre for Innovative Ageing, Swansea University, Swansea, United Kingdom*

Health literacy can be considered as an outcome of learning about health from formal and/or informal sources. People can draw on the health literacy of people within their social network to support them with managing their health. The study looked at how health literacy might be distributed within older people's social networks and how friends and family may act as health literacy mediators. We interviewed 67 older people with a long-term condition (diabetes or depression). Our framework analysis enabled us to identify similarities and differences in how health literacy was distributed within different social network types and also how individuals from these different types of social networks accessed support with accessing and using health information and services. Our findings can inform the development of targeted community-based interventions to support older people with health literacy based on the type of social network they have.

NEIGHBOURHOOD DIFFERENCES IN PERCEPTIONS ABOUT THE AVAILABILITY AND EXPECTATIONS FOR HELP FOR OLDER PEOPLE WITH FUNCTIONAL OR COGNITIVE IMPAIRMENT, FROM THE COGNITIVE FUNCTION AND AGEING STUDIES WALES (CFAS-WALES)

V. Burholt, C. Philippart, E.V. Richards, B. Winter, S. Miles, *Centre for Innovative Ageing, Swansea University, Swansea, United Kingdom*

Objectives: This paper addresses the questions: Are there shared 'understandings' of social support in a given location? Do these differ for functional versus cognitive impairment? Method: A purposive sample four groups of older people (n=180 in total) were selected from the CFAS quantitative sample. These were based on network type, location and health status (MMSE score, presence or absence of diabetes and depression). Thematic analysis was undertaken with responses to two open-ended questions: In this neighbourhood, in general what sort of help, if any, would you expect friends and neighbours to provide to an older person who was unable to leave house because of a physical problem? The question was repeated for perceptions about the support for people with dementia. Results: Responses were compared by location and demonstrated that traditional images of 'rural solidarity' or 'working class solidarity' impact on the preferred family forms in these locations.

SESSION 1235 (SYMPOSIUM)

LIFE EXPECTANCY WITH COGNITIVE IMPAIRMENT: IS IT WHERE YOU LIVE OR HOW YOU LIVE?

Chair: C. Jagger, *Institute for Ageing and Health, Newcastle University, Newcastle upon Tyne, United Kingdom*
Co-Chair: S.B. Laditka, *University of North Carolina at Charlotte, Charlotte, North Carolina*
Discussant: E. Crimmins, *University of Southern California, Los Angeles, California*

As life expectancy continues to increase globally, there is an urgent need to establish that extra years of life are healthy ones. Health expectancies (HE) are population health indicators combining morbidity and mortality, developed to address this issue of compression or expansion of morbidity. HE are mostly based on disability but cognitive impairment, with its strong relationship with age, is now a major public health concern. This symposium focuses on cognitive impairment-free life expectancy (CIFLE) and the factors that influence it, using data from different countries. In the first presentation we explore how education affects life expectancy and disability-free life expectancy for people with cognitive impairment in the US. Smoking, sedentary lifestyle and obesity are three modifiable risk factors for mortality and dementia and the second presentation investigates their impact on CIFLE in Australian men and women. The third presentation reports regional differences in cognitive impairment free life expectancy and the role of education across seven Caribbean countries. The final presentation describes results from the UK Medical Research Council Cognitive Function and Ageing Studies on the changes between 1991 and 2011 in four HEs: CIFLE, healthy life expectancy (based on self-perceived health), disability-free life expectancy (DFLE - based on IADL and ADL disability) and severe DFLE (ADL disability only). Together these presentations increase our understanding of whether there is a compression or expansion of cognitive impairment, as well as how socio-economic status and modifiable health behaviours may affect years with and without cognitive impairment.

FOR PEOPLE WITH COGNITIVE DECLINE: EDUCATION EXTENDS ACTIVE LIFE EXPECTANCY, LIMITS COGNITIVE LOSS

S.B. Laditka, J.N. Laditka, *Public Health Sciences, University of North Carolina at Charlotte, Charlotte, North Carolina*

Cognitive impairment risk increases with age. Education is generally associated with less disability and longer life. Using the Panel Study of Income Dynamics (1992-1999; ages 55+; n=2,165; 23,063 person-years), we studied associations among education, disability in activities of daily living (ADLs), and life expectancy for people with cognitive impairment. We estimated monthly probabilities of death and disability with multinomial logistic Markov models: seven education levels adjusted for age, gender, ethnicity, and cognitive status. Microsimulation created large populations, used for outcome measures. Among people with cognitive impairment, those with more education lived longer with less disability. Illustrating results, college educated African American women lived 2.8 more years than those with <8 years education, disabled 30.5% of remaining life compared with 44.6% ($p<0.0001$). Education may lengthen active life expectancy for people with cognitive impairment. Advanced dementia is defined in part by ADL disability; thus, more education may also limit dementia progression.

THE INFLUENCE OF SMOKING, SEDENTARY LIFESTYLE, AND OBESITY ON COGNITIVE IMPAIRMENT FREE LIFE EXPECTANCY

K.J. Anstey[2], A. Kingston[1], K.M. Kiely[2], M.A. Luszcz[3], P. Mitchell[4], C. Jagger[1], *1. Institute for Ageing and Health, Newcastle University, Newcastle upon Tyne, United Kingdom, 2. Australian National University, Canberra, Australian Capital Territory, Australia, 3. Flinders University, Adelaide, South Australia, Australia, 4. University of Sydney, Sydney, New South Wales, Australia*

To examine the impact of smoking, sedentary lifestyle and obesity on cognitive impairment free life expectancy (CIFLE) we used the DYNOPTA dataset (five longitudinal ageing studies pooled), including 8111 participants with complete MMSE score. For each risk factor (and total burden of risk factors) transitions to CI and from both cognition states to death were calculated using multistate modelling and combined with microsimulation to produce mean values of LE, CIFLE and years with cognitive impairment (CILE). CILE was approximately 2 years (men) and 3 years (women) regardless of age. Absence of each risk factor was associated with longer LE and CIFLE but also significantly longer CILE for women who did not smoke (1.29 years, SE=0.57, p=0.02) and physically active men (0.95 years, SE=0.42, p=0.02) and women (1.73 years, SE=0.58, p=0.002). Reductions in smoking, inactivity and obesity increase longevity and CIFLE, but not all extra years are free of CI.

MENTAL HEALTH EXPECTANCIES IN LATIN AMERICA AND THE CARIBBEAN

K. Ashby-Mitchell[1], C. Jagger[2], K.J. Anstey[3], *1. Centre for Research on Ageing, Health and Wellbeing, The Australian National University, Canberra, Australian Capital Territory, Australia, 2. Newcastle University, Newcastle Upon Tyne, United Kingdom, 3. The Australian National University, Canberra, Australian Capital Territory, Australia*

It is well documented that our populations are ageing and that the prevalence of moderate or severe cognitive impairment rises steeply with age. This study compared the effect of education on estimates of cognitive impairment-free life expectancy (CIFLE) in seven developing Latin American and Caribbean countries. The Sullivan Method was used to estimate mental health expectancies and regression analyses used to determine the effect of age, gender and education on cognitive outcome and CIFLE. In Brazil, Chile, Cuba and Mexico the odds of cognitive impairment (CI) are increased for persons with a low education level when compared to persons with a high education level. A significant gender effect was observed in Mexico with males having lower odds of CI compared to females. Across age groups, CIFLE was generally highest in Brazil and Mexico and lowest in Uruguay. Meta-regression analysis was performed to determine the effect of education on CIFLE.

CHANGES IN HEALTH EXPECTANCIES AT AGE 65 OVER TWO DECADES: RESULTS OF THE COGNITIVE FUNCTION AND AGEING STUDY I AND II

C. Jagger[1], F. Matthews[4], P. Wohland[1], T. Fouweather[1], B.C. Stephan[1], L. Robinson[1], A. Arthur[2], C. Brayne[3], *1. Institute for Ageing and Health, Newcastle University, Newcastle upon Tyne, United Kingdom, 2. University of East Anglia, Norwich, United Kingdom, 3. Cambridge University, Cambridge, United Kingdom, 4. MRC Biostatistics Unit, Cambridge, United Kingdom*

We use two identical studies, the Medical Research Council Cognitive Function and Ageing Studies to compared cohort effects in four health expectancies calculate using Sullivan's method including: healthy life expectancy (HLE: good/excellent self-perceived health); cognitive impairment-free life expectancy (CIFLE: MMSE score 18-30); disability-free life expectancy (DFLE: no difficulty in IADL or ADLs); and, severe disability free expectancy (sevDFLE: no difficulty in ADLs only). Between 1991 and 2011 men and women at age 65 saw rises in life expectancy (LE) (men: 4.5yrs, women: 3.6yrs) and gains in HLE (men: 3.8yrs, women: 3.0yrs), CIFLE (men: 4.4yrs, women: 3.8yrs), DFLE (men: 1.8yrs, women: 3.1yrs) and sevDFLE (men: 4.0yrs, women: 3.1yrs). For women CIFLE gains were at least those in LE, with a reduction in years with cognitive impairment. However gains in the other health expectancies were less than increases in LE suggesting an expansion of ill-health and disability, particularly milder disability.

SESSION 1240 (SYMPOSIUM)

NEW VIEWS ON INTERGENERATIONAL SUPPORT

Chair: A.R. Heid, *The Polisher Research Institute, The Madlyn and Leonard Abramson Center for Jewish Life, Merion Station, Pennsylvania*
Co-Chair: K. Fingerman, *The University of Texas at Austin, Austin, Texas*

Parents continue to engage in support exchanges with their children throughout life. In late life, adult children often step in to provide support and changes in support patterns may present challenges for both parties. This symposium will examine four perspectives on support exchanges in late life within multi-generational families, highlighting some of the challenges and benefits of support provided. Drawing on daily diary data, Kim will examine how often older parents have different types of contact and interactions with their adult offspring across 7-days and how the daily interactions are associated with daily health and mood. Cheng will present middle aged children's appraisals of the support they give to their parents including their feelings of stress and rewards as well as how these appraisals of support are associated with parents' views on that support and their psychological wellbeing. Bangerter will discuss associations between adult children's depressive symptoms and the life problems of their aging mothers. And, Heid will explore unique data regarding offspring's responses to aging parents' behaviors that involve insistence, persistence, or resistance when there is conflict in relationship goals. Each presentation will capture a differing perspective of adult child and aging parent relationships, shedding light on intergenerational support in late life.

DAILY INTERACTIONS OF OLDER PARENTS WITH THEIR ADULT CHILDREN AND IMPLICATIONS FOR DAILY WELL-BEING

K. Kim[1], K. Fingerman[1], S.H. Zarit[2], K.S. Birditt[3], *1. Human Development and Family Sciences, The University of Texas at Austin, Austin, Texas, 2. The Pennsylvania State University, University Park, Pennsylvania, 3. University of Michigan, Ann Arbor, Michigan*

Research on intergenerational relations has mainly relied on one-time/retrospective measures on the types and amount of interactions between generations. Drawing on a 7-day diary data from 207 older parents (Mean age = 79.9), this study examined how often older parents have different types of contact and interactions with their adult offspring on a daily basis and how the daily interactions are associated with parental well-being. On average, older parents reported 5.3 contact days with their offspring during the 7-day period (by telephone = 3.9; in-person = 3.0; text/on-line = 0.4). On 67.5% of those contact days, parents indicated having enjoyable/positive interactions with adult offspring, whereas on 8.7% of days, parents reported having irritating/negative interactions. Multilevel models showed that physical symptoms and negative mood of parents were significantly higher on days with negative interactions with children. Also, positive mood was higher on days with positive interactions with children.

SUPPORT OUT OF AFFECTION VERSUS OBLIGATION: OFFSPRING'S SUPPORT APPRAISALS AND PARENTS' PSYCHOLOGICAL WELLBEING

Y. Cheng, K. Fingerman, *University of Texas at Austin, Austin, Texas*

Middle-aged adults often help aging parents. However, how offspring feel when helping older parents and how parents react to the offspring's appraisals are usually overlooked. This study examined (a) whether relationship quality with parents and filial obligation were associated with rewards and stress of helping parents; and (b) whether offspring's feelings of reward and stress were associated with parents' psychological wellbeing. Middle-aged adults (n = 383, mean age = 55.13) and their aging parents (n = 222, mean age = 80.07) participated. Multilevel models revealed that adult offspring with better quality relationships with their parents experienced greater rewards and less stress in supporting parents. Filial obligation was associated with offspring's sense of rewards from helping. Offspring's stress was associated with greater parental depression. The findings suggest offspring with higher filial obligation find it more rewarding to help parents. However, in terms of parental wellbeing, adult offspring's relationships with parents are more crucial.

MOTHER'S LIFE PROBLEMS: DIFFERENTIAL IMPACT AND RESOURCES FOR OFFSPRING DEPRESSIVE SYMPTOMS

L.R. Bangerter[1], S.H. Zarit[1], K. Fingerman[2], *1. Penn State University, State College, Pennsylvania, 2. The University of Texas at Austin, Austin, Texas*

Middle-aged adults are affected by aging parents who suffer from disabilities, cognitive impairment and functional limitations. Less attention is paid to other life problems of aging parents that contribute to the mental health of their offspring. We use a sample (N=308) of middle-aged adults (mean age = 51) whose only living parent was their mother to examine associations between participant depressive symptoms and the life problems of their aging mothers. We examine resources that may mitigate the psychological implications of having a sole-surviving mother with many life problems. Regression analyses are used to examine the personal and family resources that moderate the relationship between mother's life problems and offspring depressive symptoms. For depressive symptoms, significant interactions were found for: a) participant self-reported physical health and mother's problems, b) number of siblings living geographically close to the mother and mother's problems, and c) support provided by the mother and mother's problems.

"HE'S SO STUBBORN!"—PERCEPTIONS OF AGING PARENTS' PERSISTENCE, INSISTENCE, AND RESISTANCE

A.R. Heid[1], S.H. Zarit[2], K. Fingerman[3], *1. The Polisher Research Institute, The Madlyn and Leonard Abramson Center for Jewish Life, Merion Station, Pennsylvania, 2. The Pennsylvania State University, State College, Pennsylvania, 3. The University of Texas at Austin, Austin, Texas*

Goal conflict between adult children and aging parents is hypothesized to result in older adults insisting, resisting, or persisting in their ways or opinions at times—acting in a way commonly attributed to stubbornness. However, research has yet to examine this phenomenon in families. With 189 dyads of middle-aged adults and their parents, we examined the prevalence of reports of parents' behaviors commonly attributed to stubbornness. Utilizing multi-level modeling we further explored the association of perceptions of children and parents with individual and relationship-based characteristics and concordance across reporters. Over 92% of dyads report parents acting in ways commonly attributed to stubbornness. Children's perceptions of occurrence are related to both child and parent characteristics, while parents' self-reports are related to only their own characteristics. Furthermore, children report higher levels of parent stubbornness than aging parents self-report. This novel exploration supports intervention work that increases understanding of goals within families.

SESSION 1245 (SYMPOSIUM)

FUNCTION FOCUSED CARE IN COMMUNITY-DWELLING OLDER ADULTS: CONNECTING INTERNATIONAL EVIDENCE

Chair: G. Zijlstra, *Maastricht University, Department of Health Services Research, CAPHRI School for Public Health and Primary Care, Maastricht, Netherlands*
Co-Chair: S. Metzelthin, *Maastricht University, Department of Health Services Research, CAPHRI School for Public Health and Primary Care, Maastricht, Netherlands*
Discussant: M. Boltz, *New York University, College of Nursing, New York, New York*

Our aging society asks for the development of sustainable long-term care services for older adults. Evidence suggests that community-based care in comparison with institutionalization may achieve better outcomes at lower costs. Community-based care also meets the preferences of the older adults, as they favor living in their homes and familiar surroundings for as long as possible. Functional impairment is a major reason for institutional care. Thus innovative approaches are needed to prevent unnecessary functional decline among older adults. In the US, a promising approach, called Function Focused Care (FFC), also known as restorative care, was developed and tested over the past decade. The goal of this approach is to maintain or increase the individual's involvement in his or her daily activities and increase physical activity. This symposium focuses on the results of and experiences with FFC in various countries. The first presentation gives a brief introduction on how the philosophy of FFC is implemented in the US. The effects of FFC in American older adults with Parkinson's are described in the second presentation. The third and fourth presentations report on experiences with and effects of a restorative care approach in New Zealand and Australia. Finally, the fifth presentation describes the systematic development of an approach for Dutch homecare agencies based on a philosophy of FFC. Our discussant Marie Boltz will reflect on the individual presentations and will facilitate a discussion on-site.

FUNCTION FOCUSED CARE: MAKING IT HAPPEN IN THE COMMUNITY

B. Resnick, *University of Maryland, Baltimore, Maryland*

Function Focused Care, defined as optimizing function and physical activity among older adults during all care interactions, is logically simple. Unfortunately, there are many barriers to this approach including: new acute events (e.g., cerebral vascular events), sociodemographic characteristics, comorbidities, cognitive decline, delirium, depressed mood, lack of motivation, cultural expectations, pain, fear of falling, body mass index, and polypharmacotherapy. Caregivers do not have the skills to motivate and engage their care recipients during specific care interactions and simply may want to get the task done. To address these barriers, Function Focused Care was developed using a social ecological model and the theory of self-efficacy. A description of how to implement Function Focused Care will be provided based on our well established four step process: (I) Environment and Policy/Culture Assessments; (II) Education of Caregivers; (III) Developing Function Focused Goals of Care Recipients; and (IV) Mentoring and Motivating the Caregivers and Care Recipients.

FUNCTION FOCUSED CARE FOR PEOPLE LIVING WITH PARKINSON'S DISEASE

I.A. Pretzer-Aboff[1], E. Galik[2], B. Resnick[2], *1. School of Nursing, University of Delaware, Newark, Delaware, 2. University of Maryland, Baltimore, Maryland*

Parkinson's disease (PD) results in a progressive loss of function such that family caregivers provide a large percentage of the personal care to PD patients in their home. We tested the impact of a function focused care intervention designed for people with PD (FFC-PD) and their family caregivers in the community setting. The impact of FFC-PD on the PD person showed improved outcome expectations for exercise, F = 3.1, p = .03; hours exercised, F = 5.0, p = .004; hours spent in activities, F = 6.1, p = .001; decreased disability (Unified Parkinson's Disease Rating Scale), F = 9.5, p = .001; and improved quality of life (PDQ-39), F = 3.8, p = .01. There were no significant changes noted in caregiver burden or depressive symptoms. FFC-PD was both feasible and effective in improving function and increasing activity of the person with PD, and did not increase caregiver burden.

RESTORATIVE HOME CARE IN AUSTRALIA

G. Lewin, *1. Silver Chain, Osborne Park, Western Australia, Australia, 2. Curtin University of Technology, Perth, Western Australia, Australia*

Since 1999 Silver Chain, a large Australian community health and aged care provider, has conducted research on restorative home care and found these services to be more cost effective than traditional home care. E.g., a large RCT found that, over two years, restorative clients used fewer home care hours (mean [SD], 117.3 [129.4] vs. 191.2 [230.4]), were less likely to be approved for a higher level of aged care (N [%], 171 [55.2] vs. 249 [63.0]),have presented at an Emergency Department (OR = 0.69, 95% CI = 0.50-0.94) or had an unplanned hospital admission (OR = 0.69, 95% CI = 0.50-0.95) than traditional home care clients. Consequentially, their aggregated health and home care costs were lower by a factor of 0.83 (95% CI 0.72-0.96) (AU$19,090 vs AU$23,428). As a result of this and other evidence, Australia's reformed aged care system is to include a greater focus on restorative home care.

A NEW MODEL OF COMMUNITY CARE IN NEW ZEALAND

M. Parsons, *Faculty of Medical and Health Sciences, University of Auckland, Auckland, New Zealand*

'Ageing in Place' or providing services that allow older people to remain living in their own homes has been an active policy direction in New Zealand (NZ) since 2002. ASPIRE was a prospective meta analysis of three initiatives that aimed to reduce the risk of institutionalization for 567 frail older people in NZ. The initiatives, evaluated by randomized controlled trial were a case management initiative, a residential slow stream rehabilitation programme and a new method of home care, termed restorative home support. The pooled results indicated a statistically significant 31% reduction in Adjusted Hazard Ratio for the combined primary outcome of death or institutionalization (95% confidence interval: 9%, 47%) for the initiatives compared to usual care. The results, along with other evaluations have informed the model of care now widely delivered across NZ. This presentation will explore the current model and research underpinning it.

IMPROVING DUTCH HOMECARE SERVICES BASED ON A PHILOSOPHY OF FUNCTION FOCUSED CARE

S. Metzelthin[1], G. Zijlstra[1], E. van Rossum[2,1], G.I. Kempen[1], *1. CAPHRI School for Public Health and Primary Care, Maastricht University, Maastricht, Netherlands, 2. Zuyd University of Applied Sciences, Heerlen, Netherlands*

In the Netherlands, home care services are increasingly under pressure to deliver cost-effective care that enables older people to stay in their homes as long as possible. With regard to daily functioning of older adults Function Focused Care (FFC) has proven its effectiveness in a substantial amount of studies abroad. However, to prevent a decrease in effectiveness interventions have to be adapted systematically before they can be implemented among another target group in another context. This presentation describes the systematic development of an approach for Dutch home care services based on a philosophy of FFC. After some meetings with experts in the field of FFC (n=6) and studying their intervention materials, observations in the field were conducted to get insight into the implementation of FFC. As a result of these activities appropriate intervention components were selected and adapted leading to an innovative Dutch approach for home care services.

SESSION 1250 (PAPER)

DEATH, DYING & BEREAVEMENT

CHILDREN'S PERCEPTIONS OF WIDOW'S BEREAVEMENT

M.S. Moss, S. Moss, *Arcadia University, Glenside, Pennsylvania*

Children's Perceptions of Widow's Bereavement How do adult children perceive the widowhood experience of their elderly mother? And how do their perceptions reflect the widow's descriptions of her bereavement? In a study of family bereavement where an elderly husband/father had died within the previous 6 months to a year, in each family we held 2 separate lengthy qualitative interviews with the widow and with each of two of their adult children. In the first interview we explored the respondent's experience of loss, and in the second interview we explored his or her perceptions and understandings of other family members. The data includes 6 interviews in each of 10 families: 10 widows (mean age 80) and 20 adult children—ACs (mean age 53). With the widow's loss of couplehood, her role in the family has shifted. Three inter-related themes emerged : (1) Recognition of the widow's strength and resilience within the context of potential future vulnerability and dependency. (2) Widows and ACs recognition that each carries a protective role toward the other, often monitoring expression of their upsetting feelings about their loss. (3) Family members perceive mutual caring and concerns between widow and ACs, with primary focus on the ACs, rather than the widow, as providers of resources within the family. The findings reflect the richness of a family perspective in understanding bereavement. (Funded by NIA R01AG031806)

PATTERNS OF RESPONSE OF AFRICAN AMERICAN CAREGIVERS TO POST-CAREGIVING TRANSITIONS

E. Ume[1], B.C. Evans[2], L.R. Phillips[3], *1. School of Nursing, Charles R. Drew University of Medicine and Science, Los Angeles, California, 2. Arizona State University, Phoenix, Arizona, 3. UCLA, Los Angeles, California*

Majority of the caregiving studies and literature focus on the active caregiving experiences of Caucasian family caregivers while fewer publications deal with the experiences of African American post-caregivers (AAPCGs). This mixed-methods study focused on the patterns of response of AAPCGs after the death of the loved one and the termination of their caregiving roles. The sample for this study included 40 AAPCGs, whose caregiving roles terminated within a period of 10 years prior to this study. Using the Transition Theory as a theoretical framework, this study present findings related to process indicators of healthy post-caregiving transitions (PCT) for these AAPCGs including connectedness such as reconnecting to friends and family, returning to work, connecting to the deceased loved one, and connecting to a spiritual higher power; interactions with family and friends, locating and being situated, social support, social networks and various strategies manifesting confidence and coping. These strategies manifest the post-caregivers' progress through healthy PCT. These findings also describe outcome indicators that AAPCGs demonstrate to show that they have truly adjusted to PCT. This study has implications for policy, practice, education and research that will improve care for older African American caregiver population.

THE EFFECTS OF INCIDENT CLINICAL DISEASE AND DEPRESSION ON THE MORTALITY OF BEREAVEMENT

S. Stahl, J. Chen, S. Anderson, R. Schulz, *University of Pittsburgh, Pittsburgh, Pennsylvania*

Late-life bereavement is associated with an increased risk of mortality. Declines in physical and mental health accompany spousal loss, yet their role as possible mediators of mortality has not been studied. This study examined the effects of bereavement, incident clinical disease, and depressive symptoms on 3-year mortality in older adults. Participants included 1150 widow(er)s and married controls aged 65 to 93 years (Mean age = 72.57 years, SD=5.19 years) who participated in a longitudinal, epidemiological study. Results show that older adults who became bereaved had elevated adjusted mortality rates relative to married controls, but only among those who experienced incident clinical disease after the death of their spouse. High levels of depressive symptoms post-bereavement were not significantly associated with mortality. However, post-hoc analyses indicate that one post-bereavement CES-D item, 'I felt that everything I did was an effort,' was an independent risk factor for mortality. These findings highlight the potential value in treating clinical disease and depression after bereavement as a preventive measure to reduce the risk for mortality.

FILIAL PIETY AND DIGNITY IN END OF LIFE CAREGIVING: LIVED EXPERIENCE OF CHINESE FAMILIES FACING TERMINAL ILLNESS

A. Ho[1,2], C. Chan[2], A.Y. Chow[2], T.Y. Lum[1,2], *1. Sau Po Centre on Ageing - The University of Hong Kong, Pokfulam, Hong Kong, 2. Department of Social Work and Social Administration - The University of Hong Kong, Pokfulam, Hong Kong*

Background: This presentation critically examines and compares the traditional and evolving nature of filial piety, as well as the role that it plays on the contemporary experience of 'living and dying with dignity' among Chinese families facing terminal illness. Methods: Meaning-oriented interviews were conducted with a purposive sample of 15 adult-children caregivers in Hong Kong, aged 30 to 62, to elicit their narratives and stories in caring for a dying elderly parent. All interviews were transcribed verbatim and analyzed using grounded theory methodology. Results: Our findings reveal that although traditional filial beliefs provided motivation for family caregiving at the end-of-life, the contemporary experience of filial piety has evolved to reflect more equalitarian attitudes and behaviours. However, the shame and regrets of unfulfilled filial responsibilities still create vast emotional dissonance between elderly parents and adult-children, which can act as a cultural barrier for reconciliation and contentment at life's final margin. Conclusion: These findings underscore the importance of intergenerational dynamics and interactions in the transformation of filial values and practices, highlighting the importance of reciprocal relationships (vs. authority relationship), mutual support (vs. complete obedience), compassionate duty (vs. obligatory duty), emotional connection (vs. task fulfillment), as well as appreciation and forgiveness (vs. guilt and shame) in the promotion of dignity at the end-of-life. They further pinpoint the imperative of developing a family-driven dignity-enhancing intervention in palliative social work for empowering and sustaining family caregiving at life's more vulnerable yet precious moments. Clinical and policy implications will be discussed from a multicultural perspective.

SESSION 1255 (PAPER)

AGING AND EXERCISE

ASSOCIATION OF ACCELEROMETER AND QUESTIONNAIRE-ASSESSED PHYSICAL ACTIVITY WITH ADIPOSITY MARKERS

S. Sabia[1], A. Elbaz[2], V.T. van Hees[3], A. Dugravot[2], M. Shipley[1], M. Kivimaki[1], A. Singh-Manoux[2], *1. Dpt of Epidemiology/Public Health, UCL, London, United Kingdom, 2. Inserm U1018, Villejuif, France, 3. University of Newcastle, Newcastle, United Kingdom*

Background: There is a well-documented association between physical activity and adiposity markers but the strength of the association remains unclear. We compared the associations of questionnaire-assessed and objective accelerometer-assessed physical activity with adiposity markers in older adults. Methods: Data are from 3634 Whitehall II study participants (901 women, age range= 60-82) who completed a 20-item physical activity questionnaire and wore a wrist-mounted accelerometer for 9 days in 2012/13. Total physical activity level was estimated using metabolic equivalent hours per week for the questionnaire and acceleration per week for the accelerometer. Body-mass index, waist circumference, and waist-hip ratio were calculated using anthropometric measures assessed at a clinic. Body fat percentage was estimated using bio-impedance. Results: Adiposity markers one standard deviation (SD) higher were associated with approximately one tenth SD lower self-reported physical activity (β range=-0.07 (95% confidence interval (CI): -0.11, -0.03) for waist-hip ratio to -0.13 (95% CI: -0.18, -0.09) for body fat percentage) and with one quarter to one third SD lower accelerometer-assessed physical activity (β range=-0.24 (95% CI: -0.28, -0.21) for waist-hip ratio to -0.34 (95% CI: -0.38, -0.30) for body fat percentage). The associations with accelerometer-assessed physical activity were 2.5 (95% CI: 1.9, 3.6) to 3.3 (95% CI: 2.2, 7.8) times stronger than the ones observed with self-reported physical activity. Conclusions: This study suggests that the impact of physical activity on adiposity might have been underestimated in previous studies using self-reported physical activity measures.

AN INTERVENTION TO INCREASE LIFESTYLE PHYSICAL ACTIVITY IN SEDENTARY OLDER WOMEN: BASELINE RESULTS FROM A RANDOMIZED CLINICAL TRIAL

L.L. Lefler[1,2], J. McSweeney[1,2], S.Y. Lensing[3,2], K.K. Garner[2,1], P.M. Dubbert[2], K.A. Packard[3], K.A. Hayman[1], *1. College of Nursing, University of Arkansas for Medical Sciences, Little Rock, Arkansas, 2. Central Arkansas Veterans Healthcare, North Little Rock, Arkansas, 3. University of Arkansas for Medical Sciences-College of Medicine, Little Rock, Arkansas*

Purpose: Making physical activity (PA) an integral part of daily life is imperative for health and well-being of older adults. Older women are the most sedentary; yet interventions to combat a sedentary lifestyle are lacking. We present baseline values of objective measures for usual free-living PA and discuss a theoretically derived intervention developed to improve lifestyle physical activity in older women. Methods: Women ≥60 that were not regular exercisers participated in a randomized clinical trial of a tailored motivational intervention. Objective GT3X+ tri-axial actigraphy monitors were used to measure free-living energy expenditure, activity minutes, counts, and intensity levels; self-reported measures included Exercise Stage of Change and Exercise Benefits and Barriers. Results: Of the 85 women, 36% were Black, 62% White, with mean age of 69. They were high-risk, with multiple risk factors: hypertension (74%), smoking (31%), and diabetes (18%). Compared with resting metabolic rate (MET of 1.0), mean activity for 5 days (omitting sleep) was 1.57 (SD 0.21) METs. Mean kilocalories expended/day were 396, a value lower than 521 kcal/d recommended. Mean minutes/day in sedentary behavior was 758 (SD 190); light 138 (SD 42); with little of recommended moderate intensity

14 (SD 12); and almost no vigorous activity. PA bouts/d were less than 1, indicating no defined exercise. Conclusions: These older women are extremely sedentary and are far below national recommendations. A critical need exists for interventions to improve health and function associated with aging. Our 3-year ongoing trial will test an intervention to improve habitual PA in older women.

SELF-REPORTED BENEFITS OF TAIJI AND QIGONG

M.F. Komelski[1], A.L. Nguyen[2], *1. Virginia Tech, Department of Human Development, Blacksburg, Virginia, 2. UC, Irvine School of Medicine, Irvine, California*

Taiji and qigong (TQG) are mind-body exercises of Chinese origin. Using data from the Taiji Symposium Research Survey (TSRS), our previous research on a convenience sample of 120 US TQG practitioners (mean age 54.77) showed that their health status profile was above the national average and held steady across ages, differing markedly from the negative slope in the US average population. The current study explored written open-ended questions about the perceived benefits of TQG practice from the same sample (n=120) to better understand participants' unusual health trajectory. Methods: TSRS data was collected via online survey of a convenience sample of US TQG practitioners. Thematic content analysis was employed by two coders using open and axial coding and consensus decision-making to construct a codebook of emergent themes. Results: Emergent categories included general cognitive benefits (e.g., memory, acuity), as well as, enhanced mood, greater focus/sense of awareness, meditative or stress-reducing effects, and promotion of social engagement. General health benefits included musculoskeletal (e.g. flexibility, strength) while some used TQG as complementary or alternative treatment for specific conditions (e.g., injury, back pain, high blood pressure). An overarching narrative across the data was a sense of mind/body/spirit unity created through practice. Conclusion: Emergent categories resonate with general models of well-being, health, and optimal aging, providing a potential explanation for the sample's unusual health profile across ages. Categories can be used to form a testable model that can be further validated in community based research on TQG practitioners.

STAYING PHYSICALLY ACTIVE IN OLD AGE: CAN PROSPECTIVE MEMORY DEFICITS BE BUFFERED BY PLANNING EFFORTS?

J.K. Wolff[1], M. Kliegel[2], J.P. Ziegelmann[1], S. Wurm[3], C. Tesch-Roemer[1], *1. German Centre of Gerontology, Berlin, Germany, 2. University Geneva, Geneva, Switzerland, 3. Friedrich Alexander University, Nuremberg, Germany*

Physical activity (PA) is an important key for healthy aging. Regular PA is, however, a difficult task for older adults facing health and cognitive decline. Planning competencies and prospective memory (PM) as a cognitive resource may help translating intentions for PA into behavior. Therefore, in particular older adults with deficits in PM may profit from planning competencies to stay physically active. A mediated moderation model was estimated with longitudinal data covering three measurement points across 12 weeks from the PREFER II study including 310 older adults (64+). Planning significantly mediated the intentions-PA link. The moderation was also significant: Older adults with worse PM could buffer their deficits by increased planning efforts. Findings suggest that particularly in old age with decreasing cognitive capacities planning strategies are central to stay active and healthy. Results are discussed integrating research and theory of cognitive aging and health in old age.

FIT AND STRONG! PLUS PHYSICAL ACTIVITY/WEIGHT MANAGEMENT TRIAL: EARLY FINDINGS

S.L. Hughes, M. Fitzgibbon, L. Tussing-Humphreys, R. Smith-Ray, L. Schiffer, A. Shah, *University of Illinois at Chicago, Chicago, Illinois*

Overweight older adults with osteoarthritis (OA) have heightened risk of disability; however few evidence-based programs currently target weight loss. The Fit and Strong! (F&S!) physical activity (PA) program improves lower extremity (LE) strength and mobility out to 18 months for persons with OA. This session presents early findings from the new F&S! Plus program, that addresses both PA and weight loss. We are currently using a randomized trial to compare customary F&S! outcomes to those achieved by F&S! Plus. The first three cohorts of study participants (n=93) had a mean age of 68.9 at baseline, 74% were female and 89% were African American. In addition to arthritis, 79% had high blood pressure, 36% had vision problems and 22% had diabetes. Baseline mean BMI was 34.3 kg/m3 (obese), mean LE pain score was 6.2 (mild) and mean LE stiffness score was 3.3 (moderate). Overall sit-stand rate was 8.2 and mean 6-minute distance walk score was 362.4 meters. Significant differences were seen by group in baseline to 2-month outcomes with respect to BMI (p=0.02) and PA (p=0.05) with a marginally significant difference in 6-minute distance walk (p=0.07), favoring the new diet program. Dietary changes were also seen by group in fiber (p=.04), increased consumption of vegetables (p=.03) and orange vegetables (p=.001) for the first two cohorts. Enrollment will continue to reach our targeted enrollment N of 400. This presentation will review the trial design, intervention components, recruitment procedures and baseline, 2, and new 6-month outcomes that will be available this fall.

SESSION 1260 (PAPER)

COUPLES AND CAREGIVING

AMBIVALENCE AND PHYSICAL HEALTH IN THE CONTEXT OF SPOUSE CARE

H. Choi, *Pennsylvania State University Altoona, Altoona, Pennsylvania*

This study examined the link between ambivalence and physical health in the context of spouse care. Ambivalence associated with caregiving and care receiving has been explored primarily in relation to adult child caregivers and their older parents. Guided by literature on intergenerational ambivalence, as well as marital quality and health, this study evaluated whether ambivalent feelings towards a partner have cross-partner effects on functional impairment among midlife and older married dyads. Data came from a nationally representative sample of continuously married heterosexual couples from the Health and Retirement Study, 2006-2010. Some of the dyads included in the study transitioned into the roles of spouse caregiver and care receiver to each other. For analyses, Actor-Partner Interdependence Models were estimated with multilevel modeling using the SAS Proc Mixed procedure. Results revealed that a new caregiver's elevated level of ambivalence towards the care receiver was linked to a significant increase in the care receiver's functional impairment over the 4-year period, in contrast to the no care contrast group. The new care receiver's ambivalent feelings towards the new caregiver were not associated with his (or her) own functional health. Functional health of a new spouse caregiver was not associated with ambivalence, either reported by him (or her) or the partner who is the care recipient. Our findings suggest that caregiver ambivalence could be a significant health risk factor for care receivers who are already in poor health. Psychosocial education programs for married couples dealing with a spouse' declining health should target reducing caregiver ambivalence.

INTERDEPENDENCE BETWEEN AGING COUPLES: DEPRESSIVE SYMPTOMS, HEALTH AND SPOUSAL SUPPORT

M. Ye[1], J. Lee[1], E. Kahana[1], B. Kahana[2], *1. Sociology, Case Western Reserve University, Cleveland, Ohio, 2. Cleveland State University, Cleveland, Ohio*

Prior studies have indicated that marital partners often face physical and mental health challenges together and provide support for one another in late adulthood. Our earlier work has highlighted the bidirectional nature of spousal care giving support (Kahana & Young`, 1990) . Yet, studies often emphasize the health and well-being of one spouse without considering the experience of the other spouse. In this study we used the Actor-Partner Interdependence Model (Kashy & Kenny, 2003) to examine how one's own health and spousal support impact the well-being of both spouses. We used a sample of 125 couples (N=250) who were participants in the Successful Aging Study (Kahana, Kelley-Moore and Kahana, 2012).Our findings indicate a significant association between one's health and marital satisfaction (actor effect). Physical health was negatively related to depressive symptoms (actor effect). Surprisingly, there were no significant associations between spousal support and depressive symptoms reported by either spouse. We found that higher levels of spouses' depressive symptoms related to less marital satisfaction reported by the spouse (actor effect). Depressed spouses had an adverse effect not only on their own marital satisfaction, but also on that of their spouse (partner effect). Contrary to expectations we found that both male and female spouses who had greater satisfaction with spousal support, reported lower levels of marital satisfaction. This study underscores the dyadic nature of couples dealing with health challenges. Spousal support in late life has an important impact on well -being of both spouses.

'TIL DIVORCE DO US PART: LATE LIFE DIVORCE FOLLOWING LONG-TERM MARRIAGE

S.L. Canham[1,3], A. Mahmood[2], S. Stott[2], N. O'Rourke[3], *1. Johns Hopkins Bloomberg School of Public Health, Annapolis, Maryland, 2. Simon Fraser University, Vancouver, British Columbia, Canada, 3. IRMACS Centre, Simon Fraser University, Burnaby, British Columbia, Canada*

Late life divorce—commonly referred to as "grey divorce"—is a rising trend and parallels the growth of the older adult population. In 2010, 1 in 4 divorces were among adults age 50 and over. The purpose of our study was to get an in-depth understanding of the experiences of marriages that lead to divorce, the divorce process, and life following divorce in a sample of older adults aged 50+ who were formerly married for 20+ years. Qualitative data were collected and analyzed to understand the grey divorce experience—factors that determined or delayed the decision to divorce and divorcees' coping after divorce. Ten adults (7 women and 3 men; mean age 63.5) completed in-depth semi-structured interviews. Findings reveal that issues pre-marriage and during marriage contribute to decisions to divorce. Participants' stories demonstrate that marriages can last 20+ years despite problems because relationship issues are complex, and good experiences are mixed with bad ones. Though the marital histories of participants were affected by physical and emotional abuse, infidelity, poor communication, imbalanced household responsibilities, and undesired changes in partners, they also included periods of support and positive shared memories. These results provide us with a holistic and in-depth picture of the growing phenomenon of grey divorce. Outcomes of late life divorce have significant health and financial implications for both individuals and society. Thus, future research should continue to explore grey divorce as baby boomers age and attitudes regarding marital relationships evolve.

LONGITUDINAL ASSOCIATIONS BETWEEN ILLNESS SEVERITY IN OSTEOARTHRITIS PATIENTS AND SPOUSE WELL-BEING

C.A. Polenick, L.M. Martire, R.C. Hemphill, *Human Development and Family Studies, The Pennsylvania State University, University Park, Pennsylvania*

Chronic illness severity may have negative implications for psychological well-being in family caregivers. However, little is known about the relationship between these measures over time. We examined longitudinal associations between changes in osteoarthritis patients' illness severity and changes in their spouses' depressive symptoms, negative affect, positive affect, and life satisfaction. Participants were 152 knee osteoarthritis patients and their spouses who were assessed at three time points across an 18-month period. Greater increases in illness severity were associated with greater decreases in life satisfaction at 6 months and at 18 months as well as greater decreases in positive affect at 18 months. The role of spouse-reported couple closeness (the extent to which the partner is included in one's concept of self) will be discussed as a moderator of these relationships. Our findings highlight the importance of assessing long-term changes in health-related outcomes for chronically ill patients and their close family members.

DOES FAMILY AGREEMENT ON MILD COGNITIVE IMPAIRMENT AFFECT CARE PARTNERS' COPING?

S. Kim, R. Blieszner, K.A. Roberto, K.A. Arsenault, *Virginia Tech, Blacksburg, Virginia*

Family members with a relative with mild cognitive impairment (MCI) encounter potentially stressful changes in their daily lives, including the possibility that relatives disagree about the extent of memory loss. This study explored the relationship between family agreement about MCI-related cognitive changes and ways care partners managed associated stress. Semi-structured interviews with 56 family triads (the elder with MCI and two care partners) identified family members' acknowledgement of MCI, stressors, and coping. Coping strategies varied by the extent to which the family acknowledged changes in the elder's memory (completely, passively, partially, not at all). Care partners in families that completely acknowledged MCI were more likely than others to utilize behavioral coping strategies (e.g., exercise, leisure, private time) that often included accepting informal and formal support (e.g., help from other relatives, friends, adult care services). They also tended to accept the elder's memory problems better and reported more positive emotions (e.g., contentment) from their caregiving experiences than did care partners in other families. Collectively, the care partners within families that did not so readily acknowledge the early memory loss were more likely to minimize or ignore memory-related problems and to use resignation ("MCI is a normal part of aging") and groundless hopefulness ("MCI will get better") as coping strategies. This new finding – that care partner coping strategies are associated with family-level perception of MCI – has important implications for coping theory, suggesting that focusing only on individual-level appraisal, dispositions, and resources ignores the effects of the family context which can influence coping.

SESSION 1265 (PAPER)

CAREGIVERS AND END OF LIFE CARE

BIO-PSYCHOSOCIAL FACTORS ASSOCIATED WITH QUALITY OF LIFE AMONG RESIDENTS OF HOMES FOR THE AGED

E. Adler[1], E. Marcus[1,2], *1. School of Nursing, Hadassah Hebrew University Medical Center, Jerusalem, Israel, 2. Herzog Hospital, Jerusalem, Israel*

Background: Maintaining quality of life is a main goal in the care of residents in homes for the aged. Aim of study: To assess the correlation between variables of the bio-psychosocial model and life quality in residents of homes for the aged in Israel, a multicultural society. Subjects and Methods: Residents in homes for the aged, MMSE score ≥ 24, were included. Life quality was assessed by the WHOQOL-Bref including physical health, psychological, social relationship and environmental domains; pain by the Short Form McGill Pain Questionnaire; function by the Barthel Index; hope by the Herth Hope Index; and social support by the Social Support Questionnaire for Transaction and the Social Support Questionnaire for Satisfaction. Results: 100 participants, 63 females and 37 males, mean age 80.9 years. 60% reported pain. Correlation was found between: level of pain and physical health life quality ($r= -0.487$, $p<0.01$); function and physical health, psychological and environmental life quality ($r=0.523$, $r=0.260$, $r=0.255$, respectively, $p<0.01$); hope and physical health, psychological, social relationships and environmental life quality ($r=0.479$, $r=0.759$, $r=0.567$, $r=0.532$, respectively, $p<0.01$). A moderate to strong correlation was found between social support and all domains of life quality. In multivariate analysis, factors predictive of physical health life quality were: pain, function, social support, and hope, and for other domains, social support and hope. Conclusions: More than half of the residents reported pain that affected their physical health. The association between social support, hope and quality of life supports the need for interventions to increase social support and maintain hope.

HOSPICE WORKER BURNOUT AND COMPASSION FATIGUE: DOES SELF-CARE MAKE A DIFFERENCE?

S.H. Jones, *Social Work, Texas State University, San Marcos, Texas*

An estimated 1.5 million people received hospice services in the U.S.in 2012, with 83.4% of these being over age 65. The team members who provide these services often describe their work as a deeply rewarding privilege. Yet, the negative impact of the work has long been acknowledged, and the estimated 30% turnover of hospice clinical staff has been connected with job satisfaction and ultimately patient satisfaction. Although hospice services have been shown to provide high quality and cost-effective end-of-life care, recent regulatory changes are requiring hospices to do more with less, leading to increasing caseloads, documentation, and restrictions that hinder hospice workers from providing the quality care that they find rewarding. As the risk for burnout and compassion fatigue becomes a growing concern, the literature calls for a variety of self-care methods, which organizations encourage their employees to utilize. However, little research has been done on their effectiveness. This presentation will describe the results of a longitudinal research study that examined the effects of individualized self-care plans on burnout, compassion fatigue, and job satisfaction in 85 workers from 14 hospices in 15 U. S. states. Findings showed significant improvement in compassion fatigue but not burnout for post-test participants. Intent to leave was rated significantly higher and organizational support ratings were significantly lower. The role of personal, professional, and hospice demographics will be described, as well as possible explanatory factors revealed in qualitative data. Implications regarding the role of self-care for individual workers, hospice organizations, and policy-makers will be discussed.

WHAT ARE THE KEY SOURCES OF CAREGIVER BURDEN FOR HOSPICE FAMILY CAREGIVERS? A SYSTEMATIC LITERATURE REVIEW

E. Sikorska-Simmons, C. Kursewicz, H. Pletcher, *UCF, Orlando, Florida*

Hospice family caregivers play a critical role in the provision of end-of-life care and are essential in enabling patients to die at home. Without adequate caregiver support, hospice patients are more likely to be transferred to an institutional setting, which could lead to poorer quality and more expensive care. Hospice caregiving can be demanding, stressful (especially considering the impending death of a loved one), and challenging when dealing with limited access to medical care. Despite this recognition, little is known about hospice family caregivers. This systematic literature review addresses key challenges faced by family caregivers in managing daily care of patients receiving hospice care. The major databases (e.g., Medline, PsychINFO) were searched from 2000 to 2014 using the keywords: caregiving, caregiver burden, hospice, and end-of-life care. All studies that focused on informal caregivers for hospice patients in the US were included. In total 77 studies, the majority of which focused on morbidity and/or psychosocial aspects of caregiving and caregiver burden, were examined. Few addressed a broader context of hospice caregiving, such as economic costs, access to medical care, or availability of formal and informal support systems. More research is needed to indentify the key sources of burden for hospice caregivers. Such research could guide efforts to help patients die at home, develop better support systems for caregivers, and improve the quality of end-of-life care.

EXPERIENCES OF CAREGIVERS SERVING AS STUDY PARTNERS IN DEMENTIA RESEARCH

B.S. Black[1,2], H. Taylor[2], P. Rabins[1,2], J. Karlawish[3], *1. Psychiatry & Behavioral Sciences, Johns Hopkins University, Baltimore, Maryland, 2. Johns Hopkins Berman Institute of Bioethics, Baltimore, Maryland, 3. University of Pennsylvania, Philadelphia, Pennsylvania*

Research on Alzheimer disease and other dementias usually requires a study partner for each participant. Typically, study partners are family members who are often the patient's informal caregiver. While study partners are vital to dementia research, little is known about their experiences. This qualitative study examined responsibilities and experiences of caregivers serving as dementia research study partners. Semi-structured interviews with 60 study partners involved in 11 dementia studies at two research sites were recorded. Interview transcripts were content analyzed by summarizing, coding the text and identifying themes and sub-themes in the data. Most caregivers were white (91.7%), the subject's spouse/partner (80.0%), female (61.7%) and retired (51.7%). On average, they were age 64.6 (±11.6), with 16.6 (±3.3) years of education. Study partners' tasks included participating in enrollment and post-enrollment decision-making, facilitating study visits (e.g., scheduling, transporting, accompanying the patient), serving as an informant (e.g., reporting changes in function/behaviors, adverse events), and ensuring protocol adherence (e.g., monitoring pill-taking, fasting for blood draws). They provided emotional support and encouragement to enable subjects to participate in procedures (e.g., cognitive testing, MRIs, LPs, infusions) and to complete studies. Aspects of attending study visits (e.g., travel/traffic, long visits/waiting) were burdensome to the majority of study partners, but most viewed studies' potential benefits (e.g., information on patients' status, hope for positive outcomes, contributing to scientific advancement) as outweighing study burdens. Study partners are critical to conducting dementia research. Their responsibilities should be made explicit during recruitment, and their interests as caregivers should be considered during research involvement.

FACILITATORS AND CHALLENGES IN PROXY DECISION-MAKING FOR PERSONS WITH DEMENTIA AT THE END OF LIFE

H. Noh[2], J. Kwak[1], *1. University of Wisconsin-Milwaukee, Milwaukee, Wisconsin, 2. The University of Alabama, Tuscaloosa, Alaska*

For persons with advanced Alzheimer's disease or other dementia, their family members, or designated healthcare proxies, make important end-of-life (EOL) care decisions. However, existing literature suggests that many proxies are uninformed about their role and experience challenges in EOL decision making. To better understand challenges and facilitators in informed decision-making by proxies of persons with advanced dementia, semi-structured in-depth interviews with 22 family healthcare proxies of persons with advanced dementia or Parkinson.

Open-ended questions were asked to the participants about the most important things influencing their decisions and challenges experienced in their decision-making for their family members. Data from the interview transcripts were analyzed using qualitative content analysis to search for themes across the interviews. Sixty-eight percent of proxies were caring for spouse/partner while 32% of proxies were caring for a parent. Themes on facilitators for informed decision-making included: knowledge of care receiver's preference; advance care planning; supportive healthcare providers and family; past experience with caregiving and decision-making; and spiritual or religious beliefs. Primary themes on challenges included: uncertainty about life sustaining treatments' benefits; uncertainty about care receiver's EOL wishes; lack of family support for proxy; conflicts between proxy's religious beliefs and care receiver's wishes; and anticipated grief and guilt from withholding life sustaining treatments. These findings suggest a need for providing systematic, decision support to provide education, clarify patient values, and facilitate family meetings for families of persons with dementia at the EOL.

SESSION 1270 (SYMPOSIUM)

THE RICHMOND HEALTH AND WELLNESS PROGRAM (RHWP) FOR OLDER ADULTS

Chair: P. Parsons, *Virginia Commonwealth University, Richmond, Virginia*

The Richmond Health and Wellness Program (RHWP) for Older Adults provides services targeting healthcare hotspots in Richmond, Virginia, with the goal of improving health outcomes and healthcare utilization within the community. The initial site, which opened in September 2012, is a Section 8 building for older adults with 247 residents. The population is 55% female, 62% Black, and 15% disabled with 53% receiving less than $9,999 annual income. The majority are dual eligibles. Emergency room transport in 2012, before RHWP was established, totaled 153 transports of which 151 were classified as non-emergent. The program utilizes an interprofessional team of faculty and students to provide care coordination and health promotion. Through rigorous evaluation and a reflective adaptive process the program evolves to meet the needs of the community. The program is expanding to additional sites. It is funded through HRSA's Nurse Education Practice Quality and Retention (NEPQR) program.

COOLING THE HOTSPOT: COMMUNITY-BASED INTERVENTIONS TARGETING HIGH UTILIZATION INDIVIDUALS

A. Dow, P. Parsons, P.W. Slattum, *Internal Medicine, Virginia Commonwealth University, Richmond, Virginia*

Health care hotspots are described as population clusters where the burden of chronic disease, the utilization of health care services, and the costs associated with care are high. Most hotspots are located in poor and underserved urban areas. Targeting hotspots provides a focused strategy to improve the health status of these individuals and communities. Several academic institutions are working within these communities to develop and implement community-based interventions. This symposium describes three programs in different urban localities, the facilitating factors and barriers to success, and the approach to demonstrating value through measurement of changes in health outcomes and overall cost. The Richmond Health and Wellness Program, from Virginia Commonwealth University, runs a weekly, interprofessional care coordination clinic within a Section 8 apartment building. The second program, Bridges to Health of the Fair Share Northgate II organization located in Camden, New Jersey, builds on existing care delivery processes to provide enhanced education, counselling, and care coordination services to low income seniors. The third program, based in the Fuqua Center for Late Life Depression at Emory University, works with the Atlanta Housing Authority to provide mental health services to low-income seniors. Using these programs as a foundation, attendees will be able to consider the issues around creating a similar program and develop plans for future interventions of impact.

FAIR SHARE NORTHGATE II BRIDGES TO HEALTH PROGRAM

M. Mock, *Fair Share Northgate II, Camden, New Jersey*

Fair Share Northgate II (FSNGII), a non-profit organization in NJ, provides affordable housing and social services for low-income seniors, disabled individuals and families. Fair Share Northgate II partnered with Dr. Jeff Brenner and the Camden Coalition of Healthcare Providers (CCHP) as part of a nationally recognized program that aims to transform how healthcare is delivered in urban settings across the country. The partnership marries healthcare provision with social service provision to create an innovative holistic approach to meeting the high medical risk/high medical cost needs of our urban low-income minority elderly population. Our Bridges to Health program expands the scope of social services to imbed care coordination and health programming. Our program includes evidenced-based health education, clinical counseling services, post-hospital care coordination, assisted living and other health/wellness programs. The goal of these programs is to improve health and functional ability in order to avoid, minimize or forestall institutional placement.

FUQUA CENTER GERIATRIC PSYCHIATRY SERVICES IN LOW-INCOME HOUSING

E.H. Byrd, J.T. Wise, *Division of Geriatric Psychiatry, Fuqua Center for Late-Life Depression, Emory University, Atlanta, Georgia*

Since 2008, the Fuqua Center for Late-Life Depression at Emory University has provided psychiatric services in low-income housing with a team of three advanced-practice nurses and a social worker. Similar to the Psychogeriatric Assessment and Treatment/Teaching in City Housing program, our team focuses on comprehensive psychiatric assessment, education, and medication management and uses the Gatekeeper model to emphasize referral and care coordination among various service providers, such as primary care, in-home counselors, and public mental health and aging services. Approximately 80 patients are seen annually (46% Black, 51% Caucasian, 70% female) in 15 metro-Atlanta high rises where about 75% of residents are age 62+. Medical, nursing, and social work students shadow during these home visits as part of their psychiatry education. A goal of this project is to develop a sustainable care model; drawing together existing healthcare and housing agencies in a collaborative network serving older and financially disadvantaged adults.

SESSION 1275 (SYMPOSIUM)

COGNITIVE IMPAIRMENT, DEPRESSIVE SYMPTOMS, AND ORAL HEALTH IN CROSS-CULTURAL SETTINGS

Chair: B. Wu, *Duke University, Durham, North Carolina*
Discussant: R. Jablonski, *The University of Alabama at Birmingham, Birmingham, Alabama*

Increasing evidence suggests that cognitive impairment and depressive symptoms are associated with oral health. This symposium aims to enhance knowledge in this area, by including trajectory analysis on intra-personal changes of depressive symptoms on oral health, from the study of another country; disentangle the relationship between cognitive impairment and oral health; and developing intervention strategies to improve oral health in individuals with dementia. Using a subsample of the Health and Retirement Study, the first paper analyzed the trajectories of depressive symptoms from 1998-2008 and examined how they predicted oral health in 2008. This paper shows that persistent clinically significant depressive symptoms over time are linked with poorer oral health. The second paper included a sample of community-dwelling older adults aged 70+. The results showed that cognitive impairment on oral health outcomes was mediated by oral hygiene behaviors: brush and flossing. This study demonstrates the importance of oral hygiene for individuals with cognitive impairment. The third paper was a quality improvement evaluation pilot study that evaluated the feasibility and preliminary outcomes of a multi-pronged, interprofessional approach to improving oral hygiene among Veterans with dementia in a long-term care setting. The study suggests that dementia-specific oral hygiene care is feasible, but requires investment in staff training and administrative commitment. Using a large community survey from China, the fourth paper found that significant tooth loss was associated with dementia. It adds more evidences to the body of knowledge on the association between tooth loss and cognitive impairment in developing countries.

PILOT EVALUATION OF A DEMENTIA-SPECIFIC ORAL HYGIENE PROGRAM IN A VA LONG-TERM CARE UNIT

E. McConnell[1,2], K. Lee[1,2], C. Downey[1,2], M.V. Spainhour[2], L. Galkowski[2], D. Drafts[2], R. Horwitz[2], *1. Duke University, Durham, North Carolina, 2. GRECC-VAMC, Durham, North Carolina*

Gaps in oral care among long-term care (LTC) residents with dementia are well-documented and are attributable to patient-level, staff-level, and system-level barriers. To evaluate a dementia-specific oral hygiene (DOHP) program, nursing staff on two VA-LTC units (n = 88) completed self-instructional modules followed by hands-on training in both dementia skills and oral care skills, demonstrating improvements in knowledge, attitudes and skills. Weekly inter-professional rounds supported staff as they implemented the DOHP. Eleven long-stay Veterans with diverse patterns of oral health, functional and cognitive status participated in the pilot evaluation. Preliminary results show improvement in oral plaque, and in psychological well-being measures. Evidence of adoption and implementation was demonstrated through integration of new care practices into existing staff roles, and implementation of new oral hygiene indicators in the electronic record. Outcomes from the pilot evaluation suggest that barriers to oral care can be isolated and successfully addressed.

TOOTH LOSS AND COGNITIVE FUNCTION AMONG CHINESE OLDER ADULTS: A COMMUNITY-BASED STUDY

J. Luo[1,2], B. Wu[3], Q. Zhao[4], Q. Guo[4], H. Meng[4], Z. Hong[4], D. Ding[4], *1. Public Health School, Fudan University, Shanghai, China, 2. The Key Laboratory of Public Health Safety of Ministry of Education, Shanghai, China, 3. School of Nursing and Global Health Institute, Duke University, Durham, North Carolina, 4. Institute of Neurology, Huashan Hospital, Fudan University, WHO Collaborating Center for Research and Training in Neurosciences, Shanghai, China*

Previous studies have shown an association between cognitive function and oral health. However, most of these studies had no comprehensive clinical diagnosis of cognitive impairment. Furthermore, no study has examined the association among the Chinese population. This study, conducted from 2009 to 2011, included 3,063 community-dwelling older adults age 60+ in Shanghai, China. Oral health was assessed using a self-administered questionnaire. Cognitive function was assessed by neurologists using DSM-IV and Petersen criteria. Individuals with dementia lost an average of 18.7 teeth, much higher than those with MCI (11.8) and cognitive normal (9.3) ($p<0.001$). After controlling for socio-economic factors, lifestyle, health status and ApoE-ε4, loss of 16 teeth or more was significantly associated with dementia (OR=1.57, 95%CI: 1.12, 2.21). This study added more evidence to the body of knowledge on the association between tooth loss and cognitive impairment. It further illustrates the importance of oral health in improving systemic health.

TRAJECTORIES OF DEPRESSIVE SYMPTOMS AND ORAL HEALTH IN OLDER ADULTS

C. Hybels[1], J.M. Bennett[2], L.R. Landerman[1], J. Liang[2], B.L. Plassman[1], B. Wu[1], *1. Dept of Psychiatry, Duke University Medical Ctr, Durham, North Carolina, 2. University of Michigan, Ann Arbor, Michigan*

Using a sample of 944 adults aged 60 or older who completed the oral health module of the Health and Retirement Survey (HRS) in 2008, we analyzed the trajectories of depressive symptoms from 1998-2008 and examined how they predicted oral health in 2008. Depressive symptoms were measured with a modified version of the CES-D. Three distinct subgroups of older adults were identified. Group 1 (43%) had little or no depressive symptoms over the study period, while Group 2 (41%) remained at a subthreshold level. Group 3 (16%) maintained higher CES-D scores. Being in Group 3 was associated with poorer mouth condition (bleeding gums, gum sensitivity, and food avoidance) ($p<0.0001$) and poorer self-rated oral health ($p=0.0003$). Membership in Group 1 or 2 was not significantly associated with the outcomes. Clinically significant depressive symptoms persistent over time are linked with poorer oral health. (NIH R01DE019110)

ORAL HYGIENE BEHAVIORS AS A MEDIATOR BETWEEN COGNITIVE IMPAIRMENT AND ORAL HEALTH AMONG COMMUNITY-DWELLING OLDER ADULTS

K. Lee[1], B. Wu[1], B.L. Plassman[2], *1. Duke University School of Nursing, Durham, North Carolina, 2. Duke Univeristy School of Medicine, Durham, North Carolina*

It is a common problem that cognitively impaired elders have poor oral health. This study was conducted to elucidate the mediating effect of oral hygiene (i.e., brushing and flossing) on the relationship between cognitive impairment and oral health. The study sample included 327 older adults age 70+ in West Virginia. Structure equation modeling was used to test for mediation. The results showed that a higher level of cognitive impairment was directly associated with more plaque and decayed coronal surfaces. Brushing mediated the relationship between cognitive impairment and plaque index and marginally mediated the relationship between cognitive impairment and the number of decayed coronal surfaces. Flossing was a significant mediator between cognitive impairment and the number of decayed coronal surfaces. This study demonstrates the importance of oral hygiene among individuals with cognitive impairment. It is important to develop interventions to improve oral hygiene for this population.

SESSION 1280 (SYMPOSIUM)

BEHIND CLOSED DOORS: PHYSICAL RESTRAINT USE IN HOME CARE

Chair: M.H. Bleijlevens, *Health Services Research, Maastricht University/CAPHRI, Maastricht, Netherlands*
Co-Chair: E.E. Capezuti, *Hunter-Bellevue School of Nursing; Hunter College of the City University of New York, New York, New York*
Discussant: L.K. Evans, *University of Pennsylvania School of Nursing, Philadelphia, Pennsylvania*

The use and reduction of physical restraints in persons with dementia has been studied extensively in both nursing homes and hospitals. Their use in home care has not been thoroughly investigated. The use of physical restraints in home care is undesirable and has already been reported anecdotally by nursing staff. However, reliable figures about restraint use in this setting are lacking, and the prevention of their use needs our attention. Home care is a growing arena for care of older adults due to shifting demographic and technological trends in combination with an active aging-in-place agenda that supports elders living in their own homes as long as possible. These trends are resulting in increasing numbers of frail older persons living in the community despite major cognitive and functional disabilities: conditions that are associated with an increased use of restraints. Therefore, this symposium will focus on the state of knowledge to date on the practice and prevalence of physical restraint use in home care. First, presenters from the Netherlands and Belgium will discuss the prevalence of physical restraint use at home in their countries. The third speaker will present the results from a study on physical restraint usage in both home care and institutional long-term care in 8 European countries (England, Estonia, France, Finland, Germany, the Netherlands, Spain, and Sweden). The discussant will reflect on the prevalence of physical restraint use in home care, discuss the sense of urgency in describing and confronting the practice in the future, and facilitate on-site discussion.

THE USE OF RESTRAINTS IN PERSONS RECEIVING HOME CARE

J. Hamers[1], M. Gulpers[2,1], B. Brock[2], L. van Eijsden[2], J. Grouls[2], M.H. Bleijlevens[1], H. Verbeek[1,2], *1. HSR, Maastricht University, Maastricht, Netherlands, 2. MeanderGroep Zuid-Limburg, Landgraaf, Netherlands*

Introduction The use of restraints in persons with dementia in their homes is unknown. This study aimed to get insight into the prevalence of restraints at home. Methods Using a cross-sectional design, the use of restraints (e.g., belt restraints, bed rails, locking doors) in persons receiving professional home care was rated by nursing staff. Results The convenience sample consisted of 3154 persons receiving professional home care; 272 persons had a formal indication for receiving psychogeriatric home care. Restraints were used in 21% of the persons in this group. Bedrails were used most often (4%), belt restraints were not used at all. Conclusion The prevalence of restraint use at home is rather low. However, knowing that number of persons with dementia will increase in the next decade, and will stay in their homes as long as possible, prevention of the use of restraints is needed.

RESTRAINT USE IN THE HOME CARE SETTING: A CROSS NATIONAL PREVALENCE STUDY IN FLANDERS

K. Scheepmans[1,2], B. Dierckx de Casterlé[1], L. Paquay[2], H. Van Gansbeke[2], K. Milisen[1], *1. Department of Public Health and Primary Care, Centre for Health Services and Nursing Research, KU Leuven, Leuven, Belgium, 2. Wit-Gele Kruis van Vlaanderen, Brussels, Belgium*

Introduction: Despite the growing demand for home care, research about restraint use in this setting is scarce. Methodology: To gain insight in the use of restraints in home care, we conducted a cross national prevalence study. A random sample of 8000 older patients cared by the Wit-Gele Kruis, a home care organization of nursing in Flanders, were selected. Results: 6397 patients (mean age 80.6 years) could be included, of which 24.7% were restrained. Bedrails (24.1%), geriatric chair (16.2%), breaks on the wheelchair (14%) and locking the house (13.2%) were the most used types of restraints. The family (55.3%) most often initiated restraints, followed by the nurse (37.2%), patient (24.9%) and GP (11.7%). Conclusions: Restraint use in home care is common and seems to be even more complex than in other settings. Multidisciplinary interventions and guidelines (including risk assessment procedures and appropriate education) to decrease its use are urgently needed.

RESTRAINTS PREVALENCE IN HOME CARE AND NURSING HOMES: RESULTS FROM THE EUROPEAN RIGHTTIMEPLACECARE STUDY

M.H. Bleijlevens[1], G. Meyer[2], J.P. Hamers[1], R. Consortium[1,2], *1. Health Services Research, Maastricht University/CAPHRI, Maastricht, Netherlands, 2. Institute of Health and Nursing Science, Medical Faculty, Martin-Luther-University Halle-Wittenberg, Halle, Germany*

Prevalence figures of physical restraint use in home care are scarce. The prevalence of physical restraint use in nursing homes has been reported frequently and ranges between 4% and 85%. This variety can be explained by differences in definitions, data collection techniques, and sample sizes used. The current studies aims to assess the prevalence of physical restraint use among people with dementia in home care and nursing homes in 8 European countries, using a cross sectional survey. In the nursing home setting 31% of the people with dementia were restrained (ranging from 7% in France to 83% in Spain). The use of physical restraints in home care turned out to be considerably lower (10%; ranging from 3% in the Netherlands to 19% in Germany). There is great variation in physical restraint usage among European countries and settings, possibly caused by differences in culture and nursing traditions.

SESSION 1285 (SYMPOSIUM)

NATIONAL EVALUATION OF A QUALITY IMPROVEMENT PROGRAM DESIGNED TO REDUCE UNNECESSARY HOSPITALIZATIONS OF NURSING HOME RESIDENTS

Chair: J. Ouslander, *Florida Atlantic University, Boca Raton, Florida*
Co-Chair: R.M. Tappen, *Florida Atlantic University, Boca Raton, Florida*
Discussant: R. Kane, *University of Minnesota, minneapolis, Minnesota*

Hospitalizations of nursing home (NH) residents are frequent and associated with numerous complications that cause morbidity and increase health care costs. Prior research has demonstrated that a substantial number of these hospitalizations may be preventable. This symposium will review the background, design, implementation, and preliminary findings from a national evaluation of the INTERACT (Interventions to Reduce Acute Care Transfers) quality improvement program supported by the National Institute for Nursing Research of the National Institutes of Health. The evaluation is a randomized trial with three groups:1) NHs implementing INTERACT over a 12-month period; 2) a control group of NHs; 3) and a group of NHs contacted quarterly to review any programs they have in place to reduce hospitalizations (included to examine a potential Hawthorne effect). A total of 264 NHs met eligibility criteria and were block randomized based on their self-reported number of activities designed to reduce hospitalizations, and their 30-day hospital readmission rates. The intervention includes the involvement of a facility-based champion leading program implementation; provision of INTERACT program materials; an online training curriculum supported by webinars with project staff; monthly calls with individual NHs; and feedback to NHs on selected self-reported process and outcome measures. Numerous challenges have been encountered in the design of the trial, planned analyses, and implementation of the INTERACT program. Strategies employed to address these challenges, and implications for interpretation of the outcomes of the trial and for future NH research will be discussed.

BACKGROUND AND RATIONALE FOR THE TRIAL

A. Bonner[2], R.M. Tappen[1], J. Ouslander[1], *1. Florida Atlantic University, Boca Raton, Florida, 2. Northeastern University, Boston, Massachusetts*

About one in five nursing home (NH) residents are hospitalized each year, and many of these hospitalizations may be avoidable. Hospitalizations are driven by misaligned incentives: lack of compensation for more acutely ill residents without a 3-day hospitalization; higher payment and convenience for physicians in the acute care setting; lack of skilled staff or availability of primary care providers in many NHs; and lack of timely diagnostic services. In addition, early studies on INTERACT (Interventions to Reduce Acute Care Transfers) suggested that inadequate advance care planning and family pressure to hospitalize also played a role. While some NHs may be capable of caring for sicker residents, regulations and legal liability issues have not supported such a care delivery system. INTERACT, a quality improvement program to improve management of acute changes in condition and prevent hospital transfers when safe and feasible, is currently being tested in an NIH-funded randomized clinical trial.

DESIGN OF THE TRIAL

J. Ouslander, R.M. Tappen, *Florida Atlantic University, Boca Raton, Florida*

This evaluation is being conducted as a randomized, controlled trial of a quality improvement program. The Florida Atlantic University Institutional Review Board approved the trial as minimal risk and meeting federal criteria for waiver of informed consent. A Safety Monitoring Committee is reviewing trial progress and changes in quality indicators that might be related to INTERACT implementation. The design employs three groups: intervention, control, and a group of NHs contacted quarterly in order to partially address the potential for a Hawthorne effect created by focusing attention on reducing hospitalization rates. A critical challenge has been the rapidly changing health care environment, in which hospitals are financially penalized for high readmission rates. In many areas of the country this is putting enormous pressure on NHs to manage sicker patients without transfer to the hospital, which may result in contamination of the control NHs and challenges in the interpretation of trial outcomes.

CHALLENGES IN IMPLEMENTING THE INTERACT PROGRAM

M. Rojido, D.G. Wolf, R.M. Tappen, J. Ouslander, *Florida Atlantic University, Boca Raton, Florida*

A total of 88 nursing homes were identified as the initial intervention group. They received training via an online curriculum and a series of webinars, were provided kits containing INTERACT tools, and participated in monthly support calls. Throughout implementation, intervention fidelity was tracked through training attendance, INTERACT tool use, and participation on monthly calls. Levels at which nursing homes were able to implement INTERACT were categorized for 71 of the homes as low (24 homes; average number of tools used 5.4), medium (26 homes; average number of tools used 7.8), and high (21 homes; average number of tools used 9.6). Qualitative data from the monthly interviews revealed several major barriers to successful implementation. Some of these barriers included staff, family and physician resistance, perceived time constraints, and staff turnover. The implications of these data for the success of this quality improvement intervention in nursing homes will be discussed.

PRELIMINARY DATA ON THE EFFECT OF INTERACT IMPLEMENTATION ON 30-DAY RE-HOSPITALIZATION RATES

R.M. Tappen, D. Newman, G. Engstrom, J. Ouslander, *Florida Atlantic University, Boca Raton, Florida*

Participants in the initial intervention group entered all nursing home admissions and hospital transfers into an Excel-based electronic tracking tool. Data were de-identified by the nursing home and transmitted monthly. Fifty-two nursing homes submitted complete data for the first eight months of implementation of the INTERACT program. Thirty-day readmission rates were calculated for the patient population as a whole across the 52 reporting nursing homes. Observation stays and emergency department visits are not included in this rate. The re-hospitalization rate decreased steadily over the eight months of implementation. These preliminary data suggest that implementation of the INTERACT program resulted in a greater decrease in 30-day readmission rates than the reported modest decrease in national rates over a comparable time period.

SESSION 1290 (PAPER)

COGNITION

THE SMART STUDY OF RESISTANCE TRAINING AND/OR COGNITIVE TRAINING FOR MILD COGNITIVE IMPAIRMENT: A RANDOMIZED, DOUBLE-BLIND, DOUBLE-SHAM CONTROLLED CLINICAL TRIAL

M.A. Fiatarone Singh[1], N. Gates[2], N. Saigal[1], G.C. Wilson[1], H. Brodaty[2], N.A. Singh[3], P.S. Sachdev[2], M. Valenzuela[1], *1. University of Sydney, Lidcombe, New South Wales, Australia, 2. UNSW, Randwick, New South Wales, Australia, 3. Balmain Hospital, Balmain, New South Wales, Australia*

Background: Mild cognitive impairment (MCI) increases dementia risk; however the efficacy of physical or cognitive training is uncertain. The Study of Mental and Regular Training (SMART) was the first randomized, double-blind, sham-controlled trial investigating effects of cognitive training (CT) and high intensity progressive resistance training (PRT) in MCI. Methods: PRT and computerized CT were supervised 2-3 d/wk for 6 months with 18-month follow-up. Primary outcomes were Alzheimer's Disease Assessment Scale (ADAS-Cog), and Bayer Activities of Daily Living. Results: 100 adults [70.1 (6.7) years; 68% women] enrolled. Resistance Training significantly improved primary outcome ADAS-Cog; [relative effect size ES (CI): -0.33 (-0.73, 0.06); $p<0.05$] at 6 months, and executive function (WAIS Matrices; $p=0.016$) across 18 months. Normal ADAS-Cog scores occurred in 48% after PRT vs. 27% without PRT [$p<0.03$; Odds Ratio (95% CIs) 3.50 (1.18, 10.48)]. Resistance Training improved visual/constructional memory [ES (CI): 0.45 (0.05, 0.85); $p=0.04$] but worsened auditory memory ($p<0.03$). Cognitive Training only attenuated decline in Memory Domain at 6 months ($p<0.02$). Resistance Training 18-month benefit was 74% lower ($p=0.02$) for Executive Domain when combined with Cognitive Training [z-score change=0.11 (-0.60, 0.28) Combined vs. 0.42 (0.22, 0.63) PRT] and 48% lower ($p<0.04$) for Global Domain [z-score change=0.23 (0.10, 0.36) Combined vs. 0.45 (0.29, 0.61) PRT]. Conclusions: Resistance Training significantly improved the primary outcome: global cognitive function, with maintenance of executive and global benefit 12 months later. Combining Resistance with Cognitive Training diminished these benefits. Further trials of high intensity Resistance Training in MCI for prevention of incident dementia are warranted.

EFFECTS OF AGING AND DISEASE ON FRONTAL BRAIN ACTIVATION WHILE WALKING AND DUAL TASKING

A. Mirelman[1], I. Maidan[1], H. Bernad-Elazari[1], F. Nieuwhof[2], M. Reelick[2], N. Giladi[1,5,6], J. Hausdorff[1,3,4], *1. Tel Aviv Sourasky Medical Center, Tel Aviv, Israel, 2. Radboud University Medical Center, Nijmegen, Netherlands, 3. Department of Medicine, Harvard Medical School, Boston, Massachusetts, 4. Department of Physical Therapy, Sackler Faculty of Medicine, Tel Aviv, Israel, 5. Sagol School of Neuroscience, Tel-Aviv University, Tel Aviv, Israel, 6. Department of Neurology, Sackler Faculty of Medicine, Tel-Aviv University, Tel Aviv, Israel*

Background: The performance of cognitive tasks while walking increases oxygenated hemoglobin (HbO2) levels within the prefrontal cortex, a brain region linked to cognition and locomotor control. Aging apparently reduces this response. We aimed to assess the effects of aging and Parkinson's disease (PD) on hemodynamic-activation during walking and dual-tasking using functional near-infrared spectroscopy (fNIRS). Methods: Subjects walked at a comfortable speed, with and without dual-tasking (serial-subtractions). fNIRS, with probes at Brodman's Area 10, determined HbO2 levels for each condition, relative to quiet standing values. RM-ANOVA determined differences among groups and conditions. Results: Subjects included: 23 young adults (30.9±3.7yrs), 16 older adults (71.1±1.6yrs), and 24 PD patients

(77.7±1.3yrs). HbO2 levels differed between the conditions in all groups (p=0.02). Compared to quiet standing, the PD group had the largest HbO2 increase during usual-walking (PD: 0.44±0.11μM; older adults:0.09±0.12μM; young adults: 0.02±0.08μM). Conversely, the difference between dual-task walking and usual-walking was largest in the young adults and lowest in the patients with PD (PD: 0.05±0.12μM; older adults: 0.10±0.07μM; young adults: 0.26±0.09μM). PD disease duration was negatively associated with the change in HbO2 between conditions (r=-0.51, p=0.082). Conclusions: The present findings are consistent with the idea that cognitive compensation is relied upon during usual-walking in aging and to a greater extent in PD, as manifest in frontal lobe hemodynamic-activation. During dual-tasking, already taxed cognitive resources limit further activation in PD and aging, while hemodynamic activation is observed in healthy young adults. This may partially explain the decreased dual-task walking abilities in aging and PD.

GENETICS AND COGNITIVE AGEING IN RELATIVELY YOUNG HEALTHY PERSONS – THE DOETINCHEM COHORT STUDY

A.C. Nooyens[1], M. Verschuren[1], M. van Boxtel[2], *1. National Institute for Public Health and the Environment, Bilthoven, Netherlands, 2. Maastricht University, Maastricht, Netherlands*

Background Several genetic variations have been associated with Alzheimer's disease, but it is unclear whether these genes are also associated with non-pathological cognitive ageing. Methods In the present study, APOE e2/3/4, BIN1, CLU, ABCA7, CR1, and PICALM are studied in relation to 10-year cognitive decline in 2200 men and women of the Doetinchem Cohort Study, aged 43-70 years at baseline. DNA was extracted from buffy coat samples and genotyped using KASP™. Cognitive functioning was assessed 3 times: at baseline, and at 5 and 10 years of follow-up using a cognitive test battery including a verbal learning test, Colour Word Stroop test, Letter Digit Substitution Test, and a fluency test. Based on the results of these tests, a global cognitive score and three cognitive domain scores (memory, speed, and flexibility) were calculated. Associations between genes and cognitive decline were analysed using random intercept models. Results Persons with APOE E3/E4 (p<0.05) or APOE E4/E4 (p<0.0001) declined more rapidly in global cognitive function and especially memory function, while persons with APOE E2/E2 (p=0.04) declined slower in global cognitive function than persons with APOE E3/E3. At adult age, average cognitive function was higher for persons with APOE E3/E4 (p=0.02) and APOE E4/E4 (p<0.0001) in contrast to persons with APOE E3/E3. For the other polymorphisms, no significant associations were observed with cognitive decline in our healthy population. Conclusions In our relatively young and healthy population, having at least one APOE e4 allele was associated with more rapid (non-pathological) cognitive decline.

GENETIC VARIANTS ASSOCIATED WITH LONGITUDINAL DECLINE IN EPISODIC MEMORY AFTER AGE 60 IN HRS

T.E. Arpawong[1], J. McArdle[1,2], C. Prescott[1,2], *1. Department of Psychology, University of Southern California, Los Angeles, California, 2. Davis School of Gerontology, University of Southern California, Los Angeles, California*

Background: Decline in memory ability is a common aspect of aging but individuals vary greatly in slope and decline. There is strong evidence that genetics explains the level of ability, yet not as much examination has been done with regard to decline. Thus, determining possible genetic variants that contribute to changes in memory over time may help identify contributors to cognitive decline in older age. We used a summed index of delayed and immediate recall measures to assess episodic memory (EM). The study included participants in the Health and Retirement Study, assessed for EM between 1996 and 2012, with genetic data. Genetic data comprised 2.4 million single nucleotide polymorphisms (SNPs) per individual. Methods: First, we used a two-slope mixed effects model to estimate individual change in EM over time and parameters for rate of change. Using parameters for those age 60 and over, we conducted a genomewide association scan (GWAS) for change in EM, including covariates for sex and ancestral informative markers (N=11,209; mean age=71.0±8.0, range 60-107; 58% female). Third, we examined whether the same genetic variants influenced levels of EM at age 60. Results: Age of the sample was related to decline in EM scores (β=-0.30, p<.0001). One SNP was strongly associated with rate of decline in EM (P<5.0x10-08), two were associated at P<1.5x10-07, and seven others were suggestive of association (p<2.0x10-06). Further findings related to level of EM will be presented. Conclusions: Findings have important implications for determining the genetic architecture of memory level and decline in older age.

EFFECTS OF PROCESSING SPEED TRAINING ON AGE-RELATED COUPLING OF SENSORIMOTOR AND COGNITIVE FUNCTIONS

L.M. Decker[1], J. Bulla[2], L. Mari[3], F. Retornaz[3,4], J.J. Temprado[5], *1. UMR 1075, COMETE, INSERM & Université Caen Basse-Normandie, Caen, France, 2. UMR 6139, LMNO, CNRS & Université Caen Basse-Normandie, Caen, France, 3. Centre Gérontologique Départemental, Marseille, France, 4. EA 3279, SPMC, Aix-Marseille Université, Marseille, France, 5. UMR 7287, ISM, CNRS & Aix-Marseille Université, Marseille, France*

Aging is characterized by increasing interdependencies between sensorimotor and cognitive functioning. Slowed speed of information processing may account for a substantial proportion of age-associated decline in these two functional domains. The present study aimed to determine whether (i) processing speed acts as a common cause to behavioral slowing in sensorimotor (Fitts' law) and cognitive (Hick's and Sternberg's law) tasks, and (ii) processing speed training in one domain (sensorimotor) transfers to another domain (cognitive). Thirteen cognitively normal older adults and ten patients with dysexecutive syndrome performed a discrete aiming task (Fitts' law), a choice reaction time task (Hick's law), and a short-term memory scanning task (Sternberg's law). Task difficulty was parametrically manipulated to estimate group-related differences in information processing speed (i.e., slope of the law in each task). Then, the patients practiced the Fitts' task over a four-week period, 3 times per week and 30 minutes per session. Processing speed was assessed before and after practice in both trained and untrained tasks. The slopes of Hick's, Sternberg's and Fitts' laws were steeper but also closer to each other in patients than in healthy controls. Moreover, training improved performance on the trained task (Fitts) so that, after practicing, patients outperformed healthy controls. More importantly, the increased processing speed transferred to other untrained cognitive tasks. Collectively, these findings suggest that functional capacities tend to be more and more undifferentiated, and that behavioral intervention for processing speed may open a new avenue for the prevention of the widespread age-related changes in function across domains.

SESSION 1295 (PAPER)

END OF LIFE

PREVALENCE OF ADVERSE END-OF-LIFE NURSING CARE QUALITY OUTCOMES AMONG CRITICALLY-ILL OLDER ADULTS

J.B. Seaman[1], A.E. Barnato[3], S.M. Sereika[1], J.A. Erlen[1], M. Happ[2], *1. Health & Community Systems, University of Pittsburgh, School of Nursing, Pittsburgh, Pennsylvania, 2. The Ohio State University, College of Nursing, Columbus, Ohio, 3. University of Pittsburgh, School of Medicine, Pittsburgh, Pennsylvania*

BACKGROUND: Critically-ill older adults, particularly those receiving mechanical ventilation (MV), are at risk for poor nursing care quality outcomes at end-of-life (EOL). The existential implications of these outcomes may be greatest among patients who experience periods of sustained wakefulness. The purpose of the current study was to describe prevalence of nurse-sensitive care outcomes for this population. METHODS: We conducted a secondary analysis of a retrospective cohort of 1440 randomly selected ICU admissions to 6 ICUs in 2 academically-affiliated hospitals in 2009-2011 among adults requiring MV with >12 hours of sustained wakefulness. We abstracted electronic medical records for up to 28 days for outcome data on physical restraint, unrelieved pain, and heavy sedation. We defined patients at EOL as those at high risk of dying (APACHE III>63) and/or those who died during hospitalization. RESULTS: 652/1400 (45.3%) patients were ≥65, and 440/773 (56%) were at EOL. Older adults at EOL spent on average 39.4% of ICU days in restraint (95%CI=36.6,42.2), 47.8% of ICU days with unrelieved pain (95%CI=45.1,50.5), and 38.8% of ICU days with heavy sedation (95%CI=36.3,41.4). IMPLICATIONS: The prevalence of adverse nursing care quality outcomes among critically-ill older adults at EOL with sustained wakefulness is high. Our findings on pain prevalence (47.8%) are not unlike those cited in the Study to Understand Prognoses and Preferences for Outcomes and Risks of Treatments (SUPPORT), where a similarly-aged cohort experienced comparable levels of pain. This lack of progress over nearly 20 years is disappointing, highlighting the persistent difficulty improving EOL care for this population.

INFLUENCE OF ANTIPSYCHOTIC DOSE AND DURATION ON MORTALITY AMONG NURSING HOME RESIDENTS WITH APPROPRIATE INDICATIONS FOR USE

L. Simoni-Wastila[1], Y. Wei[1], I.H. Zuckerman[1,3], T. Huang[1], P. Moyo[1], N. Brandt[1], J. Lucas[2], *1. University of Maryland, Baltimore, Maryland, 2. Seton Hall University, South Orange, New Jersey, 3. Impaq International, Columbia, Maryland*

Although growing evidence suggests antipsychotic use is linked to increased mortality among nursing home residents, it remains unclear whether risk varies by indications for use, since dose and duration regimens vary by treated condition. Using 2007-2009 Medicare administrative data linked to Minimum Data Set 2.0 files, this study estimated mortality among three mutually-exclusive cohorts of new antipsychotic users living in nursing homes with serious mental illness (SMI; n=7020), dementia with behavioral symptoms (dementia+behavior; n=902), or delirium (n=1807). Antipsychotic dose and duration of therapy were assessed monthly. Dose was measured as modified standardized daily dose (mSDD), with mSDD>1.0 above recommended geriatric dose. Duration was categorized as ≤30, 31-60, 61-90, and 91-184 days (SMI and dementia+behavior) and ≤7, 8-30, 31-90, and 91-184 days (delirium). Discrete time models were used to estimate hazard of death, with mSDD and duration as time-dependent exposures. Antipsychotic dose varied by indication, with mSDD>1.0 ranging from 10.6% (delirium) to 17.1% (SMI). Duration ranged from 89 days (delirium) to 97 days (dementia+behavior). In all three cohorts, antipsychotic users with mSDD≤1.0 had significantly lower mortality than users with mSDD>1.0 (HRSMI=0.77, 95%CI=0.68-0.89; HRdementia+behavior=0.55, 95%CI=0.38-0.80; HRdelirium=0.62, 95%CI-0.45-0.86). Among all three cohorts, the highest risk of mortality occurred during the first month of antipsychotic use. Regardless of indication, lower mortality was observed when new antipsychotic use was limited to within-recommended geriatric dose and duration guidelines. Prescribers should closely monitor antipsychotic dosage during the first month of initiation, and tailor dose and duration regimens to individuals' indications.

THE QUALITY OF END-OF-LIFE CARE IN VA NURSING HOMES

M. Ersek[1,2], J.M. Thorpe[3,4], H. Kim[1], A. Thomasson[2], D. Smith[1,2], *1. University of Pennsylvania School of Nursing, Philadelphia, Pennsylvania, 2. Center for Health Equity Research and Promotion, Department of Veterans Affairs Medical Center, Philadelphia, Pennsylvania, 3. Center for Health Equity Research and Promotion, Department of Veterans Affairs Medical Center, Pittsburgh, Pennsylvania, 4. Department of Pharmacy and Therapeutics, University of Pittsburgh School of Pharmacy, Pittsburgh, Pennsylvania*

BACKGROUND: The quality of end-of-life (EOL) care in nursing homes, where over 25% of older Americans receive care near death, is often inadequate. Most of the VA facilities including 132 Community Living Centers (CLCs = nursing homes) have palliative care teams; however, there is little evidence about the quality of EOL care in CLCs compared with that of other inpatient VA settings. The objective of this study is to compare quality of EOL care indicators and family evaluation of EOL care in CLCs with those of acute, intensive, and hospice/palliative care units. METHODS: Retrospective medical chart review of all deceased Veterans (n=57, 397) and telephone survey with next-of-kin of deceased Veterans using the Bereaved Family Survey (n=33,497), in 145 inpatient VA Medical Centers including 132 CLCs, across the U.S. Measurements included four indicators (e.g., palliative consult, patient and family contact with a chaplain, and emotional support provided to family members post-Veteran death) of optimal EOL care extracted from chart review and families' global evaluation of the quality of EOL care (Excellent/Very Good, Good, Fair/Poor) from the survey. RESULTS: Quality of EOL care indicators and family evaluation of EOL care for Veterans who died in CLCs were worse than those of Veterans dying in hospice/palliative care units, but were better than those in acute and intensive care units. CONCLUSION: Findings indicate that the integration of palliative care practice can promote the quality of EOL care in CLCs. Future research should examine additional factors associated with better EOL care in nursing homes.

LIFE-SPACE PREDICTS END-OF-LIFE HEALTHCARE UTILIZATION AMONG COMMUNITY-DWELLING OLDER ADULTS

A. Lo[1], R.E. Kennedy[3,4], C. Williams[3], P. Sawyer[4,3], R.M. Allman[5], C.J. Brown[4,2,3], *1. UAB Dept. Emergency Medicine, Birmingham, Alabama, 2. UAB Div Gerontology/Geriatrics/Palliative Care, Dept. Medicine, Birmingham, Alabama, 3. Comprehensive Center for Aging at UAB, Birmingham, Alabama, 4. VA GRECC (Birmingham/Atlanta), Birmingham, Alabama, 5. VA Office of Patient Care Services, Washington, District of Columbia*

Background: Functional decline predicts hospitalization and expenditure at the end-of-life, but there is little data on the role of mobility, as measured by life-space, on healthcare utilization. Methods: The UAB Study of Aging is a prospective cohort study of community-dwelling older adults >65 years. Data on patient and clinical characteristics were collected at baseline by in-home assessment. Life-space, emergency department (ED) utilization and hospitalizations were assessed by telephone follow-up every 6 months for up to 8.5 years or until death. The impact of life-space on ED utilization and hospitalization in the final 12 months prior to death was examined using multivariate logistic regression models. Results: At the end of the study period, 433 (43.3%) of the original 1,000 participants had died. There were 49 ED visits and 90 hospitalizations in the final 12 months for the 433 participants. Every one point decline in life-space was independently associated with ED utilization (Odds Ratio 1.016, 95% CI 1.001-1.031; p=0.03) and with hospitalization (OR 1.013, 95% CI 1.001-1.025; p=0.03), adjusting for age, sex, race, marital status, education, income, number of comorbid conditions, number of medications and access to a primary care physician. There was no difference between the last 6 months of life, and 7 to 12 months before death, in terms of the associations with ED utilization (p=0.88) or hospitalizations (p=0.80). Conclusion: Life-space change can identify those at higher risk of ED utilization or hospitalization for up to 12 months at the end-of-life.

DOES ENROLLMENT IN CAPITATED HEALTH PLANS PREDICT LOCATION OF DEATH?

E. Chen, F.W. Porell, E. Dugan, E.A. Miller, *UMass Boston, Boston, Massachusetts*

Most individuals prefer to die at home, yet large numbers die in a hospital. This study examines the relationship between enrollment in a capitated plan (Medicare Advantage) on the odds of dying in a hospital setting. Data from the 2008 and 2010 waves of the Health and Retirement Study (HRS), including enrollment in Medicaid, health status, social, and advance planning variables, were analyzed. We hypothesize that enrollees in capitated plans are more likely to die outside a hospital setting because Medicare Advantage contracts incentivize insurers to move eligible patients to the Medicare Hospice Benefit. We examine a broader set of variables than previous studies that rely on Medicare Administrative data. The analytic sample (N=1047) comprised individuals in the HRS, who died from 2008-2010, and were enrolled in Medicare at the time of death. Logistic regression analyses estimated the impact of enrollment in capitated vs. fee-for-service Medicare and the likelihood of dying in a hospital, controlling for other characteristics. Enrollees in capitated plans were less likely to die in a hospital (OR=.64) than those in fee-for-service plans. The same was true when death was expected (OR=.54) or if decedents lived in a nursing home (OR=.40). Males were more likely to die in a hospital (OR=1.44) than females. Deaths due to respiratory (OR=1.98) or digestive (OR=1.92) diseases had higher odds of occurring in a hospital than deaths from cancer. Findings suggest that financial incentives in capitated contracts are more likely to spur alternatives to hospitals as the site of death than fee-for-service.

SESSION 1300 (SYMPOSIUM)

WORKING WITH STATE AND LOCAL GOVERNMENTS: OPPORTUNITIES AND CHALLENGES FOR AGING RESEARCH

Chair: A. Glicksman, *Planning, Philadelphia Corporation for Aging, Philadelphia, Pennsylvania*
Co-Chair: L.N. Ring, *Planning, Philadelphia Corporation for Aging, Philadelphia, Pennsylvania*
Discussant: K.J. Mahoney, *Boston College, Boston, Massachusetts*

Most programs and services for older adults are funded or administered at the state or local level. This panel will explore the opportunities and challenges that exist for collaboration between researchers and government agencies. Each of the papers on the panel examines some aspect of the scientific, political, and ethical issues that arise when such collaborations are attempted. Each paper will also address the issue of how to develop collaborations with local and state government. The first paper by Iris and Conrad examines their experience working with the development of an Adult Protective Service decision support system in Illinois. The next paper, by Graham, looks at the role of researchers in the state evaluation of a program to transition seniors and people with disabilities Medicaid managed care plans in California. The third presentation, by Simon-Rusinowitz, looks at initial steps in developing age-friendly communities at the state, county and city level in Maryland, and the way in which a researcher participated in this process. Finally, Ring et. al. take a slightly different approach – rather than the role of research supporting or evaluating government programs, this group looks at the impact of using planning districts established by the City of Philadelphia as a base for research on the experience of aging in the urban environment. Kevin Mahoney, who has extensive experience working for local government and as a researcher, will place these four papers into a wider perspective on the opportunities and challenges of working with local government in aging research.

ACADEMICS, STAKEHOLDERS, AND POLICYMAKERS: WORKING TOGETHER TO PROMOTE POSITIVE POLICY CHANGE

C. Graham, *University of California, Berkeley, California*

In this presentation, Dr. Carrie Graham from University of California will discuss her experience collaborating with the California Department of Health Care Services to conduct a highly sensitive evaluation of the state’s transition of beneficiaries with disabilities and complex care needs to Medicaid managed care plans. She will discuss several factors that improve the ability of academic researchers to work productively with state agencies and strategies to improve the chances that results will translate into positive policy changes, including: engaging the state in early priority setting and planning, engagement of stakeholders, and ongoing “member checks” with preliminary findings. She will review tips for obtaining actionable and timely results. She will also discuss some challenges in working with state agencies such as contracting issues, state leadership turnover, academic freedom, budgeting and obtaining state datasets. Finally, strategies for communicating results and policy recommendations will be discussed.

STUDYING ADULT PROTECTIVE SERVICES: ENGAGING RESEARCHERS AND PRACTITIONERS IN COLLABORATIVE PARTNERSHIPS

M. Iris[1], K.J. Conrad[2], *1. Leonard Schanfield Research Institute, CJE SeniorLife, Chicago, Illinois, 2. Chestnut Health Systems, Normal, Illinois*

Research regarding Adult Protective Services (APS) requires collaboration between researchers, program managers and services providers. Because adult protective services are administered by or directly based in governmental organizations, at the local, county, or state level, access to APS service and outcomes data often involves negotiations with program managers, supervisors, and case workers across all levels of the APS system. This presentation describes the opportunities and challenges encountered during the conceptualization, development and implementation of the Elder Abuse Decision Support System (EADSS) project in Illinois. Using a participatory research approach, the researchers worked closely with the Illinois Department on Aging and service providing organizations throughout the conceptualization, assessment development, and field testing phases, culminating in the implementation of the EADSS in Illinois. In our discussion we will highlight the scientific, political, and ethical issues that arose during this multi-year collaboration and describe methods to ensure mutual benefits to practitioners and researchers.

INITIAL STEPS IN DEVELOPING AGE-FRIENDLY COMMUNITIES IN MARYLAND: STATE AND LOCAL LEVEL EXPERIENCES

L. Simon-Rusinowitz[1], J.K. Davitt[2], J. Wallen[3], *1. Health Services Administration, University of Maryland, College Park, Maryland, 2. University of Maryland Baltimore, Baltimore, Maryland, 3. University of Maryland School of Public Health, College Park, Maryland*

Maryland has lagged behind many states in shifting long-term services and supports (LTSS) spending to community options. Thus, Maryland legislators passed the 2011 (unfunded) Maryland Communities for a Lifetime Act, which focuses on community services such as LTSS, housing, transportation, health care, and civic engagement. We know little about the feasibility of implementing age-friendly services in a racially and economically diverse community. This paper discusses initial steps in implementing the legislation via a pilot project investigating community needs and preferences for an age-friendly community in one such Maryland county. The authors focus on the opportunities and challenges working with state and local government to conduct the project, which comprised focus groups with key stakeholders, elderly residents of two low-income senior buildings, and family members of building residents, as well as review of existing state and county data. We will present lessons learned and recommendations for applied research.

FROM POLICY TO RESEARCH: CAN POLICY INITIATIVES SERVE AS A SOURCE FOR DEFINING COMMUNITY?

L.N. Ring[1], A. Glicksman[1], C. Hoffman[1], M.H. Kleban[2], *1. Planning, Philadelphia Corporation for Aging, Philadelphia, Pennsylvania, 2. Polisher Research Institute, North Wales, Pennsylvania*

Various methods have been used by researchers to define the geographic boundaries of "community", generally defined as a group of people who live in the same area who share a feeling of connection to ones neighbors. It is hoped that the definition of community can be used in policy development. We reversed the process by asking whether community boundaries created for a policy effort can be used for research. In 2011 the Philadelphia Planning Commission divided the city into 18 Planning Districts. We wished to know if these PDs would be useful to determine if level of interaction with neighbors differed by community. We found a significant relation between PD and measures of interaction with neighbors. By using the PDs as base for analyses we are able to support city efforts to improve the lives of the elderly using the PD to divide the city into separate communities.

SESSION 1305 (SYMPOSIUM)

POLICY SERIES: GERONTOLOGY 2.0: ADVANCING INNOVATION IN AGING

Chair: G. O'Neill, *The Gerontological Society of America, Washington, District of Columbia*

SESSION 1310 (SYMPOSIUM)

BEYOND ACTIVE AGING. EXPLORING PHILOSOPHICAL ALTERNATIVES

Chair: R. Edmondson, *National University of Ireland, Galway, Ireland*

Stimulating 'active aging' is often presented as the best strategy to address current societal issues related to the growing aging population. Implicitly, most views of successful, active aging apply a one-sided identification of success with health and active participation. The underlying presumption seems to be that behavior and attitudes enhancing our control over life should be stimulated. But what about the physical, social and existential vulnerabilities people will inevitably confront at some point in the aging process? Existential, moral and spiritual aspects of 'aging well' tend to be undervalued in these views of successful aging. This neglect of 'uncontrollable' aspects raises problems. Not only does it suggest that some people's aging process is a failure, it also blocks our possibilities to ascribe meaning to experiences of later life connected to our existential vulnerability as finite human beings. In this symposium, we will critically consider certain dominant conceptions of activity in current perceptions of aging well, primarily from a philosophical point of view. We will discuss the virtues of some alternative attitudes towards aging well, complementing the one-sided focus on certain conceptions of activity with reflections on the value of notions like transcendence, contemplation, serenity and practical wisdom.

WISDOM: THE CONTRIBUTION OF PHILOSOPHICAL ACCOUNTS

R. Edmondson, *National University of Ireland, Galway, Ireland*

While the concept of wisdom has been perennially linked with that of older age, it demands renewed investigation in order to play a viable part in making sense of the life course. This paper will explore respects in which psychologists such as Ardelt, Baltes and Staudinger, or Sternberg regard wisdom as a trait or as a capacity, possessed by individuals. Edmondson contends that the history of philosophical conceptions of wisdom can add to this debate by casting light on a range of actions and processes capable of being considered wise; these can in turn be connected with specific understandings of ageing and the life course. These conceptions can be complemented by philosophically-informed ethnographic analyses of what happens in interactions deemed to be wise. This leads to an account of wisdom with the potential to mitigate some of the harsher implications of 'active ageing'.

GEROTRANSCENDENCE: A CORRECTIVE VIEW OF ACTIVE AGING

P. Derkx, *University of Humanistic Studies, Utrecht, Netherlands*

Since 1989 it has become clear that the cosmic dimension of gerotranscendence is the only one with a satisfactory reliability (Braam et al 2006). Cosmic transcendence (CosT) involves an increased feeling of unity with the universe, a changed perception of time, space, life and death, and a growing affinity with past and future generations. Derkx will present five claims with arguments supporting them. Here two of these claims: (1) A high level of CosT appears to be a cohort phenomenon rather than to be associated with the process of aging. (2) The theory of gerotranscendence remains important, not as a naturalistic position about 'normal' aging but as a normative and spiritual position in the debate about aging optimally, i.e. as a corrective to a one-sided emphasis on (or rather interpretation of) active aging and as a corrective to a view of aging as only decline.

LABYRINTHINE LIVING AND AGING

F. De Lange, *Protestant Theological University, Amsterdam, Netherlands*

In modern master narratives of aging, the eudaimonist concepts of 'agency' and 'telos' are often understood as means to an end, and going through the stages of life as a straightforward activity. Eudaimonism presents itself as a good candidate for an ethical theory of aging. A happy life is a life that strives to flourish, it says. Human flourishing is a life-long, deliberate, controlled, and goal oriented (teleological) activity. De Lange however argues that aging metaphors that draw on this vision (life plan, project, development tasks, journey, etc.) are at odds with the experience of time and space in old age (slowing down, erring). He proposes the labyrinth as an alternative symbol for aging. 'Labyrinthine living' still implies a normative understanding of life as a teleological activity, but better fits old age in its nomadic implications.

VIRTUOUS AGING: MORAL LUCK AND THE IMPORTANCE OF CHARACTER

H. Laceulle, J. Dohmen, *University of Humanistic Studies, Utrecht, Netherlands*

Perspectives on ‘aging well’ in late modernity, in order to be able to integrate questions related to what Nussbaum calls the ‘tragic’ experiences of life, should not totally disregard the notion of activity, but enrich it with alternative values. They investigate the merits of virtue ethical perspectives in moral philosophy for the study of the existential experience of aging. A central virtue ethical idea is that human beings should acquire an optimal attitude and moral excellence of character, helped by the development of phronesis, or practical wisdom. Laceulle and Dohmen explore the relevance of these virtue ethical ideas, when applied to questions about how aging people should relate to the demands posed by their existence as vulnerable, finite agents, in a world partially determined by what Williams and Nussbaum call ‘moral luck’.

SESSION 1315 (SYMPOSIUM)

UNIQUE TRAINING NEEDS OF REPRESENTATIVES FOR PEOPLE WITH DEMENTIA IN A PARTICIPANT-DIRECTED PROGRAM

Chair: L. Simon-Rusinowitz, *Health Services Administration, University of Maryland, College Park, Maryland*
Discussant: L. Feinberg, *AARP, Washington, District of Columbia***Discussant:** J. Tilly, *U.S. Administration for Community Living/Administraton on Aging, Washington, DC, District of Columbia*

Participant-directed (PD) models, in which health service users acquire and direct their own services, have been shown to increase satisfaction for participants and caregivers, with equal or better health outcomes, including for elders with diverse disabilities. A critical feature making PD adaptable to participants with all types of disabilities, including dementia, is the representative. Representatives – often relatives or friends – are responsible for gauging the wishes and best interests of the participant, while performing numerous tasks, including assistance with hiring and managing caregivers, developing a spending plan (with program counselors), and evaluating overall care. There is keen interest in developing PD services for the growing number of persons with dementia. Representatives play a key role at the unique intersection of dementia and PD, with expanding responsibilities for participants’ health and well-being along the progressive trajectory of dementia. We need to find ways to support those who are in this critical role. This symposium presents findings from three studies that address this important issue. The first presentation focuses on representative preparedness, specifically role dimensions that are aligned with preparedness and perceived stress. Next, although the primary focus of PD is on the needs and preferences of participants, the second presentation reports research about the importance of respecting the needs and wishes of care team members when negotiating and resolving conflicts. The last presentation addresses the importance of communication skills, which are critical for success in the representative role. Each report identifies areas that evidence-based training interventions should address.

PREPAREDNESS OF REPRESENTATIVES OF PERSONS WITH DEMENTIA IN PARTICIPANT-DIRECTED CARE

E.K. Mahoney[1], L. Simon-Rusinowitz[2], D.M. Loughlin[2], K. Ruben[2], C. Braun[1], M. Dillon[1], *1. Connell School of Nursing, Boston College, Chestnut Hill, Massachusetts, 2. University of Maryland, Baltimore, Maryland*

Representatives enact their role across the intersection of participant direction and dementia care. Self-rated preparedness for key dimensions of the role endorsed by a panel of experts in PD and dementia was assessed by telephone interview of a diverse sample of representatives (N=30) of participants with moderate to advanced dementia. Overall preparedness scores were in the pretty well to very well prepared range, with variation across dimensions and between individuals. Role dimensions correlated with overall preparedness and stress were relatively discrete. Preparedness was related to what has to be done day-to-day in dynamic or unpredictable situations, gauging decisional capacity, anticipating changing needs, ensuring safety, supporting a dementia-capable care team and negotiation. Conversely, stress was related to having a safety net of capable back-up supports. Areas of strength, individual variation and particular challenges along the trajectory of representing can guide development of interventions to provide representatives with tailored training and support.

REPRESENTATIVES’ COMMUNICATION SKILLS AND PREPAREDNESS TO CARE FOR INDIVIDUALS WITH DEMENTIA

K. Ruben, *Health Services Administration, University of Maryland, College Park, Maryland*

Good communication skills help representatives for elders with dementia feel “very well prepared” to care for recipients in a participant-directed program, and to perform optimally in their role. We evaluated the impact of communication skills on representative self-reported “preparedness” for representing care recipients, and for the stress of their role. Using a mixed-methods approach, we completed a secondary analysis of preparedness data obtained from a telephone survey of thirty representatives for individuals with dementia in the Arkansas “IndependentChoices” program. Mean preparedness scores indicate that less than half of the representatives feel “very well prepared” for 7 measures of communication skills. Representatives gave examples of situations where poor communication impacts their ability to access information about dementia, communicate about this information, and perform optimally in their role. To enhance participant-directed services for individuals with dementia, representative training should include a health literacy component that includes communication skills. Key Words: Health Literacy, Representatives, Dementia, Participant-Direction

HEARING ALL VOICES: NEGOTIATING THE NEEDS OF PARTICIPANTS WITH DEMENTIA AND THEIR CARE TEAM MEMBERS

L. Simon-Rusinowitz[1], E.K. Mahoney[2], K. Ruben[1], D.M. Loughlin[1], K.J. Mahoney[2], *1. Health Services Administration, University of Maryland, College Park, Maryland, 2. boston college, chestnut hill, Massachusetts*

Participant direction focuses on the needs and preferences of the participant. It is also important to respect the needs and wishes of care team members, as at times the participants’ needs and preferences may differ from those of care team members. To honor all team members’ needs, and prevent caregiver burnout, it is important to hear all of their voices. Representatives — the team coordinator — need to know how to identify participant requests, including those that extend beyond care team members’ abilities and boundaries. They need skills to negotiate such differences when caring for participants with dementia, whose requests, understanding of appropriate boundaries and ability to negotiate will change over time. This paper reports on qualitative and quantitative telephone interview data collected from 30 representatives in Arkansas’ Cash and Counseling program. We identified training areas needed to help them negotiate differing views, needs, and preferences among care team members.

SESSION 1320 (SYMPOSIUM)

THE EROSION OF RETIREMENT SECURITY: SOURCES AND REMEDIES

Chair: L. Polivka, *Claude Pepper Center, Florida State University, Tallahassee, Florida*
Discussant: L. Polivka, *Claude Pepper Center, Florida State University, Tallahassee, Florida*

The gap between the reality and perception of a growing crisis in the U.S. retirement security system has finally begun to close over the last few years. It is now widely recognized that many retirees from the boomer cohorts and those that follow will not be as economically secure as their parents after they retired. The Center for Retirement Research now estimates that over 50% of today's workers will not have enough financial resources to maintain a good standard of living in retirement. An emerging consensus recognizes that a U.S. retirement security crisis is imminent, but there is no consensus regarding either the sources of the crisis or possible remedies for cushioning its impact on retirees and their families. Explanations for the crisis range from those that focus on individuals and families—e.g., they have failed to save enough or invest well, unstable families are economically unstable—to perspectives that focus on structural changes in the U.S. and global economies since the 1970s, including changes in retirement programs in the private sector, are mainly responsible for the crisis. The three presentations in this symposium will describe the dimensions of the emerging crisis, assess the relative strengths of the alternative perspectives on its origins, identify the kinds of policy remedies that are most consistent with each perspective, and then discuss the mix of policy options that may be most politically feasible and most effective in responding to the crisis.

RETIREMENT SECURITY IN A NEOLIBERAL ECONOMY

L. Polivka, *Claude Pepper Center, Florida State University, Tallahassee, Florida*

The origins and trajectory of the crisis in the U.S. retirement security system have slowly become part of the expanding discussion about the social, political and economic impact of population aging. This presentation will focus on an analysis of changes in the private sector retirement system since the 1970s and their connection to changes in the U.S. political economy as neoliberal ideology and practices have become dominant in the private and public sectors. The neoliberal priority on reducing labor costs and achieving maximum shareholder value has created an environment inimical to maintaining traditional defined benefits pension and health care benefits which have declined precipitously since 1980 and replaced by employee risk bearing defined contribution plans. The presentation will explore the implication of these neoliberal trends in the U.S. economy for the future of retirement security and for the role of the publically funded programs.

GERONTOLOGICAL CONTRIBUTIONS TO UNDERSTANDING MIDDLE CLASS SECURITY

D.L. Redfoot, *Public Policy Institute, AARP, Washington, District of Columbia*

Gerontologists can add a unique perspective to discussions related to the declining security of the middle class in America. Drawing on data from the AARP Public Policy Institute Middle Class Security Project and subsequent research, this presentation will focus on what gerontologists can contribute to projecting security for future generations. Specifically, the presentation will look three important dimensions from a gerontological perspective: 1) going beyond a simple focus on income and savings to look at the multi-dimensional assaults on middle class security that come from rising costs for health, housing, education, and long-term care; 2) looking at the entire life span and how changing life events are affecting economic security; and 3) focusing on the social and intergenerational dimensions of middle class security as families change. The widening gulf between haves and have-nots is likely to continue and intensify for future generations of retirees.

CHANGING THE SOCIAL SECURITY NARRATIVE: WHY EXPANSION IS A REALISTIC, AS WELL AS THE BEST, POLICY SOLUTION

N. Altman[1], E. Kingson[2,1], *1. Social Security Works, Washington, District of Columbia, 2. Syracuse University, Syracuse, New York*

With two-thirds of working Americans estimated to be unable to maintain their standard of living in retirement, a substantial expansion of Social Security is, the presenters assert, the most viable means for addressing this crisis, especially for middle- and late-middle-aged workers. The presenters illuminate the changing Social Security policy narrative; examine why a window of opportunity for benefit improvements has opened; and identify benefit expansion and financing options for addressing the looming retirement income crisis. Further discussing major expansion proposals advanced by congressional champions, the presentation concludes by describing and recommending strategies – organizational, electoral, communications, lobbying and organizing – for expanding benefit protections.

SESSION 1325 (SYMPOSIUM)

VULNERABLE POPULATIONS AND THE IRB IN QUALITATIVE WORK

Chair: J. Weil, *University of Northern Colorado, Greeley, Colorado*

Qualitative work by its very nature often explores topics with elders who may be seen as vulnerable. Older persons can be placed at risk due to data provided in great levels of detail or some aspect of their statuses revealed in the data-collection process. When using open-ended interviews, interview scripts, or focus groups, for example, a researcher may collect information which is sensitive. Working in intergenerational family settings, one may also uncover family dynamics involved with the process of providing informed consent to elders or learn that verbal informed consent offers some protection to participants. Presenters in this symposium will discuss ethical issues raised by work with elders deemed vulnerable and ways to safeguard the information provided thorough Institutional Review Board (IRB) and Certificate of Confidentiality practices. Topics include the use of National Institute of Health's Certificates of Confidentiality with an older and vulnerable population at the Veterans Administration, in-depth interviews with refugee populations which include adult children's consent, focus groups with elders from four ethnic groups from NIA-funded Alzheimer's research Centers, the experience of a 4-year ethnographic study using a Certificate of Confidentiality, and verbal consent and Certificate of Confidentiality use in creating grounded theory with potentially undocumented persons.

IRB AND OLDER VULNERABLE POPULATION AT THE DEPARTMENT OF VETERANS AFFAIRS (VA), VETERANS HEALTH ADMINISTRATION (VHA)

A. Tesfa, *Department of Veterans Affaris, Northport, New York*

The VA is an ideal setting for conducting research studies on older veteran population. All human subjects research is governed by the principles of the Belmont Report - respect for persons, beneficence and justice. In the VA, these principles are codified in the federal regulations 38 CFR 16 or the Common Rule which governs the Institutional Review Board (IRB). IRB reviews and approves research protocols involving human subjects; HIPAA's implementation in 2003 has changed the impact these regulations have on the protection of confidential information. Participation in qualitative research may result in feelings of guilt or embarrassment that may arise from talking or thinking about one's own behavior, attitutides or lived experiences on sensitive topics. Risks associated with these studies are primarily of disclosure of potentaily sensitive information. IRBs weigh the risks and benefits to qualitative research participants during review of protocols to protect vulnerable research subjects, including older adults.

IN-DEPTH INTERVIEWS WITH OLDER REFUGEE ADULTS: INDIVIDUALISTIC AND FAMILY-CENTERED APPROACH OF INFORMED CONSENT

R. Gautam[1], B.E. Mawn[1], S. Beehler[2], *1. Nursing, University of Massachusetts Lowell, Lowell, Massachusetts, 2. University of Minnesota, Duluth, Minnesota*

A qualitative study was conducted to describe the experiences of nine older Bhutanese refugees after resettlement in a U.S. city. The purpose of this paper is to explore the challenges that arose during the conduction of this study related to informed consent. This study was approved by a university IRB. Verbal consent was allowed since many respondents are known to be illiterate. An unanticipated finding documented in the study's field notes was that the notion of individual consent was culturally irrelevant to many in this sample. The majority of study participants sought approval and consent from their adult children to participate in the study. This paper examines a family-centered approach to research consent vs. the traditional individualistic approach. In this elderly refugee population a family-centered approach best fit the need to ensure participants were fully informed. Documentation of verbal consent included the decision-making process among family members in order to fully conform to the ethical principle of respects of persons while acknowledging cultural differences.

CONDUCTING FOCUS GROUPS ON DONATING ONE'S BRAIN FOR ALZHEIMER'S RESEARCH

L. Boise[1], L. Hinton[2], H. Rosen[3], M. Ruhl[1], *1. Layton Aging & Alzheimer's Disease Center, Oregon Health & Science Univ, Portland, Oregon, 2. UC Davis School of Medicine, Davis, California, 3. UCSF Memory and Aging Center, San Francisco, California*

The multi-layered issues related to the conduct of focus groups at four Alzheimer's research centers with four ethnic groups will be presented. The topic of interest was the beliefs and concerns of African American, Caucasian, Chinese and Latino research subjects and their family members about brain donation. The focus groups illuminated a broad range of attitudes and perspectives on brain donation, including the role of family dynamics and culture in making a decision about brain donation. A pervasive lack of understanding about the importance of brain autopsy for research and the procedures used for brain removal was evident among the participants. Presentation will address methodological issues related to the conduct of focus groups and data analysis on a sensitive topic and consenting issues around brain donation from the perspective of researchers, focus group participants, the institutional review board, and state laws.

LEVELS OF RISK IN ETHNOGRAPHIC RESEARCH FOR MEXICAN AMERICAN WOMEN WITH DISABILITIES

T. Harrison, *The University of TX at Austin, Austin, Texas*

In the process of deciding whether or not to enroll in a research study, participants routinely weigh the potential for benefit against the potential for harm. The worst possible perceived harm occurs when damage is irreversible. In the context of qualitative research, the public disclosure of illegal or stigmatizing events may be perceived as irreversible damage. The purpose of this work is to highlight how a certificate of confidentiality was perceived to protect the confidentiality of older Hispanic and non-Hispanic White women with disabilities enrolled in a study of health disparities in disability outcomes. In this process, the types of disclosures made by 122 women over the course of 444 interviews were categorized into levels of potential harm and used to create a framework for understanding types of protection that might be most useful in the qualitative research process. Acknowledgement: Support provided by NIH/NINR 1 R01 NR010360

PROTECTING THE CONFIDENTIALITY OF POTENTIALLY UNDOCUMENTED LATINO GRANDPARENTS RAISING GRANDCHILDREN

A.N. Mendoza[1], J. Weil[2], C.A. Fruhauf[1], *1. Colorado State University, Fort Collins, Colorado, 2. University of Northern Colorado, Greeley, Colorado*

For nearly three decades, scholars have been interested in researching grandparents raising grandchildren. Currently, closer attention is given to empirical samples of ethnically diverse grandparent caregivers. Due to increased awareness in both international and local climates where participants' privacy and confidentiality are at risk, researchers must consider additional safeguards to protect participants. This presentation will highlight best practices from previous research sampling potentially undocumented Latino grandparents raising grandchildren from a region that has a history of difficulty in obtaining Latino participants attributed to fear and distrust associated with past Immigration and Customs Enforcement raids. Recommendations will address the importance of witnessed consent and Certificate of Confidentiality in providing reassurance to participants that their legal status has no bearing on their participation and their information will not be divulged to governmental institutions.

SESSION 1330 (PAPER)

LONG TERM SERVICES AND SUPPORTS: FINANCING AND POLICY ISSUES

MEDICAID COST COMPARISONS ACROSS THE PROGRAM OF ALL-INCLUSIVE CARE FOR THE ELDERLY, HOME AND COMMUNITY BASED SERVICES/FRAIL ELDERLY, AND NURSING FACILITIES

C.L. Wendel, R.K. Chapin, A. Sellon, *School of Social Welfare, University of Kansas, Lawrence, Kansas*

The Program of All-Inclusive Care for the Elderly (PACE) provides coordinated healthcare and long term services and supports (LTSS) for Medicaid/Medicare dual eligibles through a single capitated payment. While there is some research to support the benefits of PACE, there is wide variation in cost/benefit outcomes across PACE sites and states. The state contracted with our research office at the University of Kansas to conduct a Medicaid cost-benefit analysis of PACE compared to Home and Community Based Services/Frail Elderly (HCBS/FE) and nursing facility (NF) services for Kansas Medicaid customers. We matched 136 PACE customers to 272 HCBS/FE and 272 NF customers by demographic and functional capacity characteristics using propensity score matching. In this presentation, we focus on how health and long term care Medicaid expenditures for PACE compare to costs for similar adults served by HCBS/FE and NFs, drawing on Medicaid Management Information Systems (MMIS) cost data from 2006-2011. Results demonstrated that PACE saves state Medicaid funds compared to NFs, but not compared to HCBS/FE. Medicaid costs for HCBS/FE study participants were 17% lower than PACE costs, with an average difference of $320, per participant per month ($p<.01$). However, costs differentials vary over time and by subgroup. For example, analysis of aggregate costs for the three months before death demonstrated that HCBS/FE costs were $3,907 higher ($p<.10$) and NF costs were $2,594 higher ($p<.01$), compared to PACE study participants. The need for further research into costs by subgroup will be discussed.

THE IMPACT OF THE 2013 FAIR LABOR STANDARDS ACT (FLSA) REGULATIONS ON PARTICIPANT-DIRECTED PROGRAMS

P. Nadash, *Gerontology, University of Massachusetts, Boston, Boston, Massachusetts*

This paper examines the impact of recent regulatory changes on direct care workers providing services under Medicaid-funded participated-directed programs providing long term services and supports (LTSS) in home and community-based settings. It describes the context and background of the Fair Labor Standards Act [FLSA] of 1938 and the way in which its provisions – in particular, the "companionship exemption" (introduced in 1974) exempted employers of domestic workers — such as nannies, housekeepers, and the like, as well as home care workers — from paying minimum wage or overtime. In September 2013, new Department of Labor regulations tightened this exemption, effective January, 2015, extending fair employment standards to these workers. The paper explores the implications of this regulatory change in states where the impact is likely to be highest: California, New York, Oregon, and Washington, where the structure of participant-directed programs may mean that the much-needed regulatory changes, which were designed to protect workers, may, in fact, result in increased burdens on the family caregivers who provide LTSS to loved ones through participant-directed programs.

ACCESS TO INSURANCE AND HEALTHCARE EXPENDITURES AND USE AMONG MIDDLE-AGED AND NEAR-OLD US IMMIGRANTS

W. Tarraf, *Wayne State University, Detroit, Michigan*

Middle-aged and near-old individuals have seen worsening health and disability profiles. This regression in health profile is partly due to limited access to and inefficient use of healthcare. Near-old uninsured immigrants are especially vulnerable given their substantially restricted access to healthcare. The Affordable Care Act aims to alleviate some of these differentials by increasing access to insurance. We used causal inference techniques for observational data to provide preliminary evidence on whether and how access to insurance would affect health services spending (yearly total, out-of-pocket, and Medicaid) and use (appointments for routine care, emergency department (ED) use, and inpatient hospitalizations) among uninsured immigrants. We analyzed data on middle-aged and near-old immigrants (50-64 years) from the 2010 Medical Expenditures Panel Survey (n=967). To determine the effect of insurance on our outcomes of interest we used propensity score weighting and matching techniques to account for selection bias and match insured (treatment group) and non-insured (control group) immigrants on healthcare predisposing, enabling, and need characteristics. Our results indicate that insurance increased routine care (OR=4.4; 95% CI=2.69-7.20), but did not significantly affect ED services use or inpatient hospitalizations. Insurance also significantly increased total spending by $2,853 (SE=$722; p<0.001) and Medicaid spending by $965 (SE=326; p<0.001) but had no significant effect on out-of-pocket expenditures. Higher access to insurance can potentially increase preventive routine primary care among middle-aged and near-old immigrants. Increased access, however, will come at a cost, and a substantial portion of this cost may need to be publicly financed through Medicaid.

THE PROMISE OF CARE COORDINATION FOR OLDER ADULT DUAL ELIGIBLES: LESSONS FROM CAL MEDICONNECT

K.G. Kietzman[1,2], J. Torres[1,2], C. Chang[1,2], T. Tran[1,2], A. Choi[3], S. Wallace[1,2], *1. UCLA Center for Health Policy Research, Los Angeles, California, 2. UCLA Fielding School of Public Health, Department of Community Health Sciences, Los Angeles, California, 3. California State University Dominguez Hills, Los Angeles, California*

The Helping Older-adults Maintain independencE (HOME) project has been documenting the experiences of low income older adults with multiple chronic conditions and disability in California since 2010. In recent months, these "dual eligible" seniors (who are insured through both Medicare and Medicaid) have been faced with important decisions about the delivery of their medical care and long term services and supports. As part of California's Coordinated Care Initiative (CCI), starting on April 1, 2014, an estimated 400,000 dual eligible beneficiaries in eight counties will begin to be enrolled in a MediCal managed care program called Cal MediConnect unless they actively opt out of the program. Recent data from the HOME project reveal that those who will be directly affected by the transition are often confused or concerned about its potential effects on their health care. This vulnerable group of consumers is unevenly responsive to the program information received, depending in large part on the older adult's physical or mental state and on the availability of family or other supportive resources. In-depth and repeated interviews conducted with these older adults and their primary caregivers also reveal what "continuity of care" actually means in the day-to-day lives of these individuals, who have been grappling in recent years with ongoing changes to the services, supports and providers they have come to rely on to continue to live safely at home. Finally, these data assess in "real time" whether any current gaps in care might be successfully addressed by the new managed care program.

THE SEARCH FOR A PLAN FOR RATIONAL FINANCING OF LONG TERM CARE

A.M. Tripp, *1. University of Maryland Baltimore County, Baltimore, Maryland, 2. The Hilltop Institute, Baltimore, Maryland*

With the repeal of the CLASS Act and the subsequent lack of recommendations around financing by the Long Term Care Commission, it is important to review the state of long term care financing policy in the United States. This paper provides a research synthesis of the current state of long term care financing in the United States, a comparison of cross national models with a focus on European social insurance models, and the attempts to address the question of should the cost of care be shared within and across generations, or between the public and private sectors. Care provided by family and friends, when monetized, accounts for the vast majority of long-term services and supports. Following reliance on informal and unpaid care, the next largest source of services is the Medicaid program, which requires individuals and families to impoverish themselves to attain necessary care. The current system demonstrates a market failure for private long-term care insurance and the lack of a true market for affordable, efficient, and quality supports for those with functional limitations. Policy alternatives will be presented which seek to spread the risk for the costs of care as broadly as possible that could support both a private market for long term care insurance as well as making family caregiving more manageable.

SESSION 1335 (SYMPOSIUM)

PRIMARY AND SECONDARY OUTCOMES OF THE PRISM FIELD TRIAL: A TECHNOLOGY-BASED INTERVENTION TO REDUCE ISOLATION, IMPROVE WELL-BEING AND PROMOTE INDEPENDENCE

Chair: S.J. Czaja, *University of Miami Miller School of Medicine, Miami, Florida*

Discussant: J.W. King, *National Institute on Aging, Washington DC, District of Columbia*

The Center for Research and Education on Aging and Technology Enhancement (CREATE) completed a randomized clinical trial that evaluated the effect of a specially designed computer software application for older adults that was intended to enhance prospective memory, knowledge, resource access, information gathering, and social support. Three hundred older adult participants at risk for social isolation were randomly assigned to receive the Personal Reminder, Information, and Social Management (PRISM) system or a similarly structured binder system (control). The trial duration was one year. Primary outcomes included changes in degree of isolation, social support, and well-being. Secondary outcomes included changes in computer and technology attitudes, proficiency, and technology adoption. This symposium will highlight findings of the trial. S. Czaja will provide an overview of the trial, participant demographics and present findings regarding the primary outcome measures. W. Boot will discuss findings regarding use of system features and how they vary with participant characteristics. N. Charness will examine how cognitive abilities changed in response to PRISM interventions and J. Sharit will present data on predictors of PRISM usage and changes in the secondary outcomes of attitudes and proficiency. Finally, W. Rogers will present how the PRISM trial informs theories and models of technology acceptance, and uptake. Overall, the PRISM trial succeeded in its aims and provides valuable insight into how well-being can be promoted in an at-risk older adult population. J. King will lead a discussion of these topics and highlight some of the challenges and opportunities associated with the PRISM trial.

THE PRISM TRIAL: AN INTERVENTION TO ENHANCE THE WELL-BEING OF OLDER ADUTLS

S.J. Czaja[1], J. Sharit[2], N. Charness[3], W.R. Boot[3], W.A. Rogers[4], *1. Psychiatry and Behavioral Sciences, University of Miami Miller School of Medicine, Miami, Florida, 2. University of Miami, Miami, Florida, 3. Florida State University, Tallahassee, Florida, 4. Georgia Institute of Technology, Atlanta, Georgia*

This multi-site randomized trial gathered rigorous evidence about the value of the Personal Reminder Information and Social Management System (PRISM), a tech-nology application designed for older adults at “risk for social isolation.” PRISM was designed to support social connectivity, memory, knowledge, leisure activi-ties and resource access, and compared to a Binder condition. Participants com-pleted baseline, 6 and 12-month follow-up assessments. Three hundred diverse adults aged 65+ were randomized into the trial. This presentation will present da-ta from the 12-month assessment regarding social isolation, connectivity, social support, and the perceptions of the PRISM system. The data are encouraging and indicate that the participants assigned to the PRISM condition perceived PRISM as valuable, and that use of PRISM facilitated their ability to connect with family and friends, access community resources, and find information. The data also in-dicate that the use of PRISM was beneficial in terms of enhancing social connec-tivity and support.

COGNITIVE CHANGES FOR PRISM USERS

N. Charness[1], W.R. Boot[1], S. Czaja[2], J. Sharit[2], W.A. Rogers[3], T.L. Mitzner[3], *1. Psychology, Florida State University, Tallahassee, Florida, 2. University of Miami, Miami, Florida, 3. Georgia Institute of Technology, Atlanta, Georgia*

Cross-sectional studies show positive relationships between computer use and cognition (Tun & Lachman, 2010; Elliot, Mooney, Douthit, & Lynch, 2013). Freese, Rivas and Hargittai (2006) showed that high school cognition predicted computer use at age 65. However, Slegers, van Boxtel and Jolles (2009) found no effect for computer training on cognition in a one-year RCT. PRISM allows comparisons of cognitive performance at baseline and 12 months for lower SES older adults at risk for social isolation who were randomly assigned to computer and binder conditions. Using measures such as digit symbol, Trails A&B, Fuld, Animal Fluency, STOFHLA, Stroop, Shipley vocabulary, Letter sets, we assess how tests cohere and how they relate to treatment, time, and their interactions. Preliminary results indicate that the cognitive measures show no retest effects and that neither the computer condition nor the binder condition leads to improvements in cognition, consistent with Slegers et al.

A DETAILED EXAMINATION OF PRISM FEATURE USE OVER TIME

W.R. Boot[1], N. Charness[1], S.J. Czaja[2], J. Sharit[2], W.A. Rogers[3], T.L. Mitzner[3], *1. Psychology, Florida State University, Tallahassee, Florida, 2. University of Miami, Miami, Florida, 3. Georgia Institute of Technology, Atlanta, Georgia*

PRISM was designed to support prospective memory, communication, information gathering, and knowledge about important topics related to health and independence. The trial represents a unique opportunity to understand what computer features older adults find most useful by examining the features they use, and the features they use most frequently. Feature access and specific actions (e.g., reading/sending email, accessing the help function) were recorded and sent to a central server for each of the 150 participants assigned to the PRISM computer condition. We present a detailed analysis of feature use over time and individual differences in patterns of use. Consistent with the intent of the trial to facilitate communication and information gathering, email and Internet were among the most used features of the PRISM system. System games were also popular. Data provide insight into how older adults incorporate new technology into their lives and what they use this technology to accomplish.

EXAMINING CORRELATES OF OVERALL USAGE OF THE PRISM SYSTEM

J. Sharit[1], S. Czaja[2], W.R. Boot[3], N. Charness[3], W.A. Rogers[4], T.L. Mitzner[4], *1. Univ Miami, Coral Gables, Florida, 2. University of Miami Medical School, Miami, Florida, 3. Florida State University, Tallahassee, Florida, 4. Georgia Institute of Technology, Atlanta, Georgia*

The PRISM field trial assessed outcomes associated with use of a computer system specifically designed for older adults at risk for social isolation. As part of this trial we developed: (1) the Computer Proficiency Questionnaire (CPQ), which measures computer proficiency across six different subscales, and which was administered at baseline, six, and 12 months, and (2) the PRISM System Evaluation Questionnaire (PSEQ), which was administered at six and 12 months. Data on overall use of PRISM enables the variability in PRISM usage to be examined over the 12-month trial and related to individual variables such as health status and cognitive abilities, and to changes in ratings of computer proficiency (CPQ) and of satisfaction with and usefulness (PSEQ) of the PRISM system. These data can help us better understand barriers to use and benefits that accompany increased use of such systems for these older, primarily lower SES adult populations.

TESTING TECHNOLOGY ACCEPTANCE MODELS FOR PRISM USERS

W.A. Rogers[1], T.L. Mitzner[1], S.J. Czaja[2], N. Charness[3], W.R. Boot[3], J. Sharit[2], *1. School of Psychology, Georgia Institute of Technolog, Atlanta, Georgia, 2. University of Miami, Miami, Florida, 3. Florida State University, Tallahassee, Florida*

Extant theoretical models of technology acceptance are extremely limited – they do not account for specific characteristics of older adults, have not been empirically tested with senior-focused technologies, and frequently only measure intention to use a technology rather than behavioral integration of a technology into everyday life. The PRISM field trial assessed usage patterns of a computer system specifically designed for older adults. Prior to, and following experience with PRISM, 150 participants completed a technology acceptance scale regarding perceptions of ease of use and usefulness of the system. Our analyses identify individual difference variables that predict perceptions both before and after use, as well as usage rates. These data provide insights for broader-based models of technology acceptance to guide design, instruction, and deployment of products for older adults. The 6 month usage data enable us to differentially identify predictors of behavior integration of a computer technology into everyday activities.

SESSION 1340 (SYMPOSIUM)

RE-ENGAGING THE SOCIAL IN A GLOBAL CONTEXT: NEW CHALLENGES FOR THE SOCIOLOGICAL IMAGINATION

Chair: C. Phillipson, *Sociology, The University of Manchester, Manchester, Lancashire, United Kingdom*

The weakening of institutions supporting old age – notably retirement and the welfare state – has been a central narrative within critical gerontology. Here, globalisation is viewed as playing a key role re-defining ageing, generating new forms of risk and insecurity. But research in this area remains disconnected from analyses of the interplay between cellular, individual and social processes of aging. Drawing on the theme of linking 'personal troubles with public issues' this paper examines the relevance of globalization to this wider debate. This will done by examining, first, its contribution to the 'crisis construction of aging'; second, promoting economic inequalities; third, emphasizing aging as an individual rather than collective responsibility. The paper will explore the way in which these developments are reconstructing later life transitions. The discussion will review these changes to the structural contexts of ageing and the implications which might follow for movement through the life course.

AGING – FROM CELLS TO SOCIETIES?

J. Baars, *University of Humanistic Studies, Haarlem, Netherlands*

The idea of bringing research on cells and societies in a continuum can be seen as a contemporary version of the 'organism analogy' in sociological functionalism (Luhmann 1996). Outdated as this idea may seem, it is still vivid in many aging studies that take the nation state as the context of research, focusing on the functioning of 'national subsystems' such as the labor market or health care. However, the sum of the systemic 'parts' is increasingly more complex than the national 'whole'. This has major implications for aging: although age still functions as a marker in (national) bureaucracies, aging processes are constituted by a multitude of systemic formations that try to regulate their specific cohorts. The de-standardization of the life course may imply a decreasing relevance of age, but this is matched by more intense regulation of the times that are spent in specific systemic contexts (cf. Baars 2012).

FROM CELLS TO SOCIETY: THE SOCIOLOGICAL IMAGINATION IN THEORY, RESEARCH AND POLICY

D. Dannefer[1], C.L. Estes[2], L. Burton[3], *1. Department of Sociology, Case Western Reserve University, Cleveland, Ohio, 2. University of California San Francisco, San Francisco, California, 3. Duke University, Durham, North Carolina*

This session takes as a point of departure appreciation for what C.W. Mills termed the "sociological imagination", the work of tracing connections between the lives of individuals and the historical and social forces in which they are enmeshed. A key element here concerns examining links between private troubles and public issues (and policy). Such a theme is especially resonant given the individual and societal challenge of longevity and its interaction within a climate of economic austerity and crisis. To this end, session presenters move through the various levels – from micro, meso and macro – through which age and the life course unfold. In doing so, they explore competing narratives around themes of resilience and plasticity one the one side and socially constructed inequalities on the other. Each presenter will apply this framework to major themes within critical perspectives on ageing, including institutionalized ageism and its effects, biosocial interactions, cumulative dis/advantage, and autonomy and justice. Presenters will be encouraged to follow the perspective developed by Mills by demonstrating how particular research findings and observations about the lives of older people can be drawn together to develop generalizations concerning society as a whole. In line with this, the papers will examine the interdependence and interplay of social institutions and processes (cellular, individual and social), with attention to wider cultural, political and economic processes. The discussant will review the papers, highlighting connections for theory, research and policy, drawing on the spirit of the "sociological imagination" as applied to work in the field of aging.

THEORIZING CUMULATIVE DISADVANTAGE THROUGH THE LENS OF LATE LIFE PHENOTYPIC MALADAPTATION

K.Z. Douthit[1], D. Dannefer[2], A.J. Elliot[1], *1. Education & Human Development, University of Rochester, Rochester, New York, 2. Case Western Reserve University, Cleveland, Ohio*

Although cumulative disadvantage is rooted primarily in social theory, it provides a fruitful medium for interdisciplinary, multilevel analysis of mechanisms relating to late-life, physiological and psychological embodiment of contextual challenge over the life course. This paper proposes a biosocial model of cumulative disadvantage that views social settings in terms of their potential for inducing phenotypic maladaptation in old age. Highlighting sources of phenotypic plasticity, including intra-generational and intergenerational epigenetic mechanisms, as well as other sources of human and animal phenotypic plasticity, a model of compromised, late-life health and mental health outcome is described. Using late life cognition as an exemplar, the model highlights the potential for reversing socially and psychosocially mediated and moderated injurious gene activity.

DOMINANCE AND RESISTANCE: SOCIAL MOVEMENTS AND SOCIAL SECURITY

C.L. Estes, *University of California San Francisco, San Francisco, California*

Since President Reagan, a war over Social Security is engaged. Socially constructed by forces opposed to social insurance, underwritten by big money, think tanks and politicians systematically sell the media and public on Social Security's inevitable demise. Breaching the Third Rail of US policy is attempted with crisis, austerity and deficit discourses. Social Security Defenders voice human needs, vulnerable peoples, and earned benefits, with their mobilization and coalesce across disparate rainbow causes. Social Inequality claims the debate stage. The Resistance movement of Social Security Defenders is identified, its composition, strategy and tactics in conflicts over eroding democracy and the ascendant Market (class) State vs Citizen State.

SESSION 1345 (SYMPOSIUM)

THE IMPACT OF CREATIVE AND MEANINGFUL ACTIVITIES ON NEUROPSYCHIATRIC SYMPTOMS IN PERSONS WITH DEMENTIA

Chair: N. Hodgson, *Johns Hopkins University, Baltimore, Maryland*
Co-Chair: L.N. Gitlin, *Johns Hopkins University, Baltimore, Maryland*
Discussant: N. Hodgson, *Johns Hopkins University, Baltimore, Maryland*

Person centered approaches to engaging persons with moderate stage dementia (PwD) in creative and meaningful activity can facilitate well- being and quality of life. Yet most PwD spend their days doing nothing and without any participation in activities that hold meaning. A burgeoning area of research suggests that active engagement in creative activities is associated with a decline in burdensome neuropsychiatric symptoms such as agitation. There is a need to examine the evidence base on the specific symptoms most affected by activity engagement and the specific types of creative activities perceived as meaningful that have the largest effects on symptom burden. This symposium will present 4 papers reporting on evidence based outcomes and practical application of selected activities to reduce neuropsychiatric symptoms in persons with moderate stage disease. Marx reports on data from two activity trials on the types of activities prescribed by cognitive level, time of day recommended and frequency. Maguire presents findings from a systematic review of targeted prescriptive music activities on symptoms of agitation and physiologic measures of stress for persons with dementia. Hodgson reports on a pilot study that examined the relationship between of timing of activities and symptoms of circadian disruption. Hansen presents results of a qualitative analysis of on online caregiver discussion board focused on activities described as meaningful. Together these studies affirm the benefits of a variety of creative activities that are meaningful and engaging. We will conclude with a discussion of potential mechanisms through which activity engagement reduces neuropsychiatric symptoms.

ACTIVITY DEVELOPMENT FOR DEMENTIA PATIENTS ON GERIATRIC MENTAL HEALTH UNIT

K.A. Marx[1], L.N. Gitlin[1], K. VanHaitsma[2], D. Alonzi[3], T. Gentile[3], *1. Center for Innovative Care in Aging, Johns Hopkins University, Baltimore, Maryland, 2. Polisher Research Institute, North Wales, Pennsylvania, 3. Johns Hopkins Bayview, Baltimoer, Maryland*

Neuropsychiatric behaviors are almost universal in dementia patients. Non-pharmacologic interventions, such as activities, have been endorsed by major medical organizations as the first line of management. This study examines the type of activities developed by occupational therapists as an intervention on a hospital unit specializing in geriatric mental health. 20 participants (average age 77.5, sd=7.9, 60% female) were enrolled in the study. Cognitive functioning testing indicated that the average abilities reflected manual type activities that were not goal directed. Overall, 62 different activity prescriptions were developed and six categories emerged, physical, cognitive, prior role, reminiscing, arts and crafts, and passive activities. Physical activities, such as walking or chair exercises, represented 24.2% (n=15). The second largest category was cognitive activities (e.g. sorting cards or puzzles) with 21.0% (n=13). Development of activities that are meaningful to the person and appropriate for the disease stage have the potential to decrease neuropsychiatric behaviors.

"THE WORK OF OUR HANDS": QUALITATIVE ANALYSIS OF A CAREGIVER DISCUSSION BOARD

B.R. Hansen, N.A. Hodgson, L.N. Gitlin, *The Johns Hopkins University, Baltimore, Maryland*

Despite the potential benefits of creative activities for persons with dementia, caregivers are given little information on the types of activities that are most useful for maximizing quality of life and preserving capabilities. Discussion board comments were abstracted from a Massive Open Online Course (MOOC) delivered to 25,000+ students from 131 countries on the Care of Individuals with Major Neurocognitive Disorders. Qualitative methods were used to analyze the comments of over 75 caregivers posted to a discussion board thread on the use of activities in persons with dementia. Analysis indicated the leading activities included (1) reminiscence activities (sorting photos or creating scrapbooks), (2) physical activities (balloon toss), (3) sensory experiences (clapping to music or touching familiar objects), or (4) interactive experiences (holding pets). Caregivers emphasized the observed benefits of engaging the hands of patients in activities to maximize the sensory experience, eye-hand coordination, and preserved memories through familiar hand work.

SESSION 1350 (SYMPOSIUM)

EMERGING INTERVENTIONS FROM THE VA/HARTFORD GERIATRIC SOCIAL WORK SCHOLARS

Chair: L. Daniels, *Vet Center, Readjustment Counseling Service, Portland, Oregon*

This symposium unites 5 scholars from the Department of Veterans Affairs (VA)/Hartford Geriatric Social Work Initiative as they present current research emphasizing interventions to improve health and behavioral health of older adults. Since 1999, the John A. Hartford Foundation and Gerontological Society of America (GSA) have collaboratively educated Social Work academics about research, policy, and expanded pedagogy focused on aging issues through the Hartford Gerontological Social Work Faculty Scholars program. Since that time, cohorts of social work professors have gained knowledge about how to integrate gerontology into their curriculum. In 2010, the Hartford Foundation included PhD-level VA social workers within the geriatric social work scholars program. Subsequently, 5 VA social workers have been heavily involved in research studies to improve services for the nation's veterans receiving care through the Department of Veterans Affairs. This symposium is the first time that the VA/Hartford Geriatric Social Work Scholars will share their insights gained from their respective research studies as a result of their participation in the prestigious Hartford program. Epitomizing GSA's theme of "making connections from cells to societies", each scholar's study describes interventions which can pertain not only toward improved services in the VA's healthcare system, but potentially to non-federal community-based aging issues of suicide prevention, PTSD treatment, vocational rehabilitation, care-givers, and elderly cancer patients.

EMERGING INTERVENTIONS AT THE VA- CARE TRANSITIONS WITH OLDER VETERANS AND THEIR CAREGIVERS

B. Ford, *1. GRECC, Birmingham VA Medical Center, Birmingham, Alabama, 2. University of Alabama at Birmingham, Birmingham, Alabama*

Older adults are particularly vulnerable to the consequences of fragmented care as they transition between health care settings. Research indicates that almost half of older adults experience a medical error, and 1 in 5 suffer an adverse event associated with discharge. This study examined care transition experiences of older veterans and their caregivers. Fifty patients age 65 years and older, discharged from a Veterans Administration (VA) Medical Center hospital completed the Care Transitions Measure-15TM survey 3-4 weeks post-discharge. Seven patients and 6 caregivers participated in semi-structured interviews. Overall the quality of care transitions was rated as good; however, some items were indicated as problematic for veterans. Themes that emerged included agreeableness, frustration with complex information, caregiver education, and the timing and methods of information delivery. These findings have implications for emerging care transition interventions for veterans and their caregivers.

INDIVIDUALIZING PSYCHOSOCIAL DISTRESS MANAGEMENT IN OLDER VETERANS WITH ADVANCED STAGE CANCERS NEAR THE END OF LIFE

F.R. Nedjat-Haiem, *1. Department of Veterans Affairs, Los Angeles, California, 2. University of Southern California, Los Angeles, California*

Patients with life-limiting cancers have complex psychosocial needs that go unnoticed, thus leading to intense suffering and complicated care. Psychosocial distress is a significant problem influencing approximately 30% to 45% of cancer patients, and up to 70% of those with life-limiting cancers. Research suggests that vulnerable individuals with complex terminal conditions encounter problems such as distress, associated with unmet needs in symptom management, emotional support, and communication. Distress that is overlooked or mismanaged can further intensify patients' anxiety, complicating end-of-life decision-making, and triggering the over- or under-use of treatment. Consequently, patients are likely to experience poor quality of life and express desire to hasten death. This study examined factors that influence individualizing psychosocial distress management among Veterans and clinical providers; aimed to describe older Veterans' experiences with distress in advanced cancer care and providers' practices with managing distress.

By describing patients' and providers' experiences, we identify ways to improve care.

VOCATIONAL REHABILITATION AND OLDER VETERANS: DOES WORK THERAPY "WORK"?

E. Naito-Chan, *Compensated Work Therapy Transitional Residence Program, Department of Veterans Affairs, Los Angeles, California*

Employment is generally accepted as an important component of treatment and recovery for patients with mental disorders. Consequently, the role of vocational rehabilitation (VR) is playing an increasingly critical role in mental health treatment. This is particularly true for veterans in mental health programs under the Veterans Health Administration (VHA). An area that has not received much examination concerns the participation and outcomes of an increasing number of older adults entering VR programs. More studies focusing on older VR participants may result in the design and implementation of age-specific vocational rehabilitation services. This study compares older veterans (55 years and older) with younger veterans (18-54 years) in VR programs for the purpose of exploring differences and identifying variables associated with successful outcomes. A secondary analysis of data collected on veterans participating in a VHA Compensated Work Therapy (CWT) program was conducted. Data analysis and findings will be presented.

SIMPLE INTERVENTION FOR SUICIDAL VETERANS

J. Hunter, *Stratton VA Medical Center, Albany, New York*

The "Building on Strengths and Interests to reinforce Meaning and Purpose in Life Experiences (SIMPLE) intervention targets veterans who have been admitted to inpatient psychiatry as a result of thoughts or acts of self-directed violence with intent to die. SIMPLE is a short term cognitive-behavioral suicide prevention ("indicated") intervention designed to successfully transition veterans at considerable risk for suicide from inpatient to outpatient settings, reduce likelihood of acts of self-directed violence, and decrease level of suicide risk. The goals are to decrease hopelessness, increase sense of meaning and purpose in life, decrease levels of depression, decrease subsequent episodes of suicide crises, and increase social connectedness for veterans admitted to inpatient psychiatry with suicide ideation. An experimental study will be discussed that will reveal if and how the SIMPLE intervention is effective. Ultimately, this intervention and research endeavor seeks to improve treatment programming for older veterans at risk for self-directed violence.

LIFE REVIEW, REMINISCENCE, AND AGING AMONG VIETNAM WAR VETERANS DIAGNOSED WITH PTSD

L. Daniels, *Dept of Veterans Affairs, Vet Center Portland OR, Portland, Oregon*

For over 30 years, Vietnam War veterans have been at the forefront of receiving PTSD counseling through VA special programs and community-based Readjustment Counseling centers (Vet Centers). Now, these veterans face a new and potentially daunting challenge in terms of developmental changes, unresolved traumatic memories, and the natural inclination to reminisce about their past. Almost no VA or Vet Center programs have protocols for treating aging war veterans suffering from traumatic stress. This pilot study investigated aspects of reminiscence that may be related to the stuck memories indicative of PTSD; the potential impact of PTSD on the natural inclination to reminisce; and if structured life-review made a difference in PTSD symptoms, levels of depression, satisfaction with life, subjective well-being, and self-forgiveness. This intervention study is in an effort to bridge the gap between PTSD and gerontology interventions and toward the goal of "successful aging" among older war veterans.

SESSION 1355 (SYMPOSIUM)

HIGH RISK GROUPS: WHAT ARE THEY DOING RIGHT?

Chair: B. Sellars, *Wesleyan College, Macon, Georgia*

Aging and disparities research often views groups that are at-risk as the ones needing the most help. However, there are lessons to be learned from high-risk populations, especially those who are thriving. This symposium highlights different samples of high-risk groups who are using positive strategies to maintain and improve both physical and mental health. While this symposium does not nullify the fact that these groups are vulnerable, it will highlight that even vulnerable groups have positive mechanisms for surviving against the odds. The first paper, "Something to Lose: Midlife Body Image and Weight-Related Goals as Midcourse Corrections," addresses how high-risk midlife adults can change weight-related behaviors to improve well-being outcomes. With a continued focus on health, the second paper, "Illness Perception and Self-Management among Older African Americans," discusses how older African Americans, another high risk-group, view their health and how they use social support to cope positively with their chronic illnesses. "Experiences with Discrimination: Coping Strategies of Healthy Older African Americans," will address how older African American men who are aging successfully cope with discrimination both in the past and present in a positive way. Another high-risk group, widows, is addressed in the papers, "Coping with Widowhood Through Positive Social Relations" and "Trajectories in Long Term Care: Do Individual Resources Buffer the Impact of Spousal Deprivation Over Time?" Both papers highlight the benefits of using social support among individuals who have experienced spousal loss. In sum, this symposium demonstrates that not all vulnerable individuals function poorly in high-risk situations.

SOMETHING TO LOSE: MIDLIFE BODY IMAGE AND WEIGHT-RELATED GOALS AS MIDCOURSE CORRECTIONS

N. Newton[1,2], S.A. Russell[1], *1. Northwestern University, Evanston, Illinois, 2. psychology, Univ Michigan, Ann Arbor, Michigan*

Many people regard midlife as a time of gradual physical decline. Changes in appearance, which typically include weight gain, often negatively affect psychological and physical well-being, predominantly among women (Halliwell & Dittmar 2003; Merrill & Verbrugge, 1999). According to Identity Process Theory, adults who adjust psychologically and behaviorally to the aging process exhibit greater self-esteem (Whitbourne & Skultety, 2002). Analyses using data from the Foley Longitudinal Study of Adulthood (age 56-59; N = 141), found no gender differences in midlife levels of Body Appreciation and Body Mass Index (BMI), or the relationship between Body Appreciation and self-esteem or psychological well-being. Most importantly, women and men with negative Body Appreciation were more likely than their counterparts with positive Body Appreciation to express weight-related goals. Results are discussed in terms of Identity Process Theory, and how "midcourse corrections" (Stewart & Vandewater, 1999) can motivate midlife adults towards positive behavioral change.

ILLNESS PERCEPTION AND SELF-MANAGEMENT AMONG OLDER AFRICAN AMERICANS

K.L. Phillips[1], C.R. Rogers[2], *1. IMPAQ International, LLC, Columbia, Maryland, 2. University of Minnesota, Minneapolis, Minnesota*

While African Americans suffer disproportionately from chronic diseases when compared to the general population, many older African Americans maintain very positive outlooks about their lives. Using the framework of Leventhal's self-regulatory model (SRM), the purpose of this study was to gain an understanding of illness perception among older African Americans. Two focus groups were conducted using previous participants of a chronic illness self-management program

(N=31). While the respondents were aware they had an illness, they did not have any concerns or emotions related to it. The majority of the respondents in both groups revealed that their faith or spiritual beliefs allowed them to cope and manage any adverse emotions associated with their illness. Many of the respondents also indicated that relied on the support of their families and friends. Information from this study may be used to understand and assist older African Americans with managing their illnesses.

EXPERIENCES WITH DISCRIMINATION: COPING STRATEGIES OF HEALTHY OLDER AFRICAN AMERICANS

B. Sellars, A. Hernandez, *Wesleyan College, Macon, Georgia*

Numerous research studies have discussed the role of discrimination on the health of African Americans with an increasing focus on African American men throughout the lifespan. This study investigates how older African American men who are aging successfully (e.g., low incidence of disease, high physical and cognitive functioning) have coped with and are currently coping with discrimination. The sample consists of eleven African American men aged 70 years and older (M=79.6 years) who participated in mixed methods interviews. Using the Schedule of Racist Events (SRE), men provided insight into their experiences with discrimination, both in the present and retrospectively. The mean scores for the SRE for past week, entire lifetime, and overall stressfulness were 27.7, 47.2 and 38.4, respectively. Participant's coping strategies included avoiding negative situations, findings alternative ways to vent anger, and accepting/anticipating discrimination due to the cultural context. Implications for positive lifespan development will be addressed.

COPING WITH WIDOWHOOD THROUGH POSITIVE SOCIAL RELATIONS

J.A. Manalel, T.C. Antonucci, *Psychology, University of Michigan, Ann Arbor, Michigan*

Spousal loss is typically considered the most stressful life event in adulthood. This leaves older adults, who often rely on their spouses as a primary source of support, especially vulnerable to the challenges of widowhood. Widows' stress appraisal of the loss may vary according to circumstances surrounding this event, like spousal relations and death anticipation. However, positive support from other network members is associated with decreased loss-related anxiety and yearning in widows. This study identifies associations between pre-loss factors, like marital quality and death anticipation, and post-loss social support and grief symptoms. Data from the prospective study of widowhood, Changing Lives of Older Couples study, include 265 widowed individuals (age 49-87). Preliminary regression analyses indicate that baseline support from family and friends and marital quality, but not death anticipation, predict positive support 6 and 18 months after the loss, suggesting that each contribute to positive long-term adjustment to widowhood.

TRAJECTORIES IN LONG TERM CARE: DO INDIVIDUAL RESOURCES BUFFER THE IMPACT OF SPOUSAL DEPRIVATION OVER TIME?

M. Broese van Groenou[1], D.J. Deeg[2], *1. VU University, Amsterdam, Noord-Holland, Netherlands, 2. VU Medical Centre, Amsterdam, Netherlands*

Single older adults are more likely to use professional services and care than those with a partner, but longitudinal evidence of how individual resources impact the use of long term care among those experiencing spousal deprivation (due to illness or death) is limited. Using data from a survivor sample (N = 1,055) in four waves of the Longitudinal Aging Study Amsterdam (1998-2008), we showed that spousal deprivation often coincides with health impairment, a smaller network size and moving house. Multivariate analyses showed that, compared to staying partnered, widowhood predicted increased use of professional home care (OR=3.81, $p< 0.05$), but spousal illness did not (OR=1.26, $p>0.05$). In general, higher levels of mastery decreased professional home care use, whereas a larger network size increased the use of social services. We conclude that individual and social resources may limit professional home care use related to spousal deprivation and health impairment in later life.

SESSION 1360 (SYMPOSIUM)

BRAIN PLASTICITY: FROM MIDLIFE STIMULATION TO LATE LIFE PREVENTION

Chair: H.H. Dodge, *Oregon Health & Science University, Portland, Oregon, University of Michigan School of Medicine, Ann Arbor, Michigan*

Discussant: J. Kaye, *Oregon Health & Science University, Portland, Oregon*

The human brain is more plastic than previously thought; Accumulating evidence suggests that diet, exercise as well as social engagement and network could have direct effects on brain structure and Alzheimer's disease (AD) pathology. Facing a rapid increase in prevalence of those with dementia, it is urgent to delay the onset and progression of dementia. In the absence of curative pharmacological treatment for AD, life style modifications could have large impact on reducing the prevalence of dementia. However, behavioral RCTs are needed to precisely define public health benefits and answer practical questions such as the optimal types, doses, and duration of behavioral modifications. In this symposium, we will present 4 unique studies which show human brain plasticity; The first comes from a longitudinal Japanese cohort study with over 2000 participants. It shows that cognitive stimulation through work could affect brain functions even when subjects reach the oldest old age group. Second, we will introduce novel physical exercise RCTs which examined dose-response relations between aerobic exercise, cognitive functions and AD biomarkers. The third study examined the association between social networks and brain structure via magnetic resonance imaging (MRI) using data from the Cardiovascular Health Study (CHS). The final study presents results of a unique RCT where the effect of increasing social interactions using internet/web-cam on cognitive functions was examined. This symposium aims to shed light on links between social behavioral factors and brain plasticity, and introduce the results of some of the most recent RCTs in this field.

RELATIONSHIP BETWEEN WORK EXPERIENCE AT MIDLIFE AND COGNITIVE FUNCTION IN LATE LIFE

Y. Ishioka[1], Y. Gondo[2], Y. Masui[1], H. Inagaki[1], K. Ikebe[3], K. Kamide[4], Y. Arai[5], R. Takahashi[1], *1. Tokyo Metropolitan Institute of Gerontology, Itabashi, Tokyo, Japan, 2. Graduate School of Human Sciences, Osaka University, Suita, Osaka, Japan, 3. Graduate School of Dentistry, Osaka University, Suita, Osaka, Japan, 4. Graduate School of Medicine, Osaka University, Suita, Osaka, Japan, 5. School of Medicine, Keio University, Shinjuku, Tokyo, Japan*

We examined whether complexity of the main lifetime work, a cognitive reserve marker, might be associated with cognitive function among three age groups (young-, old-, and oldest-old). Using data from 2300 Japanese community-dwelling participants in the Septuagenarian, Octogenarian, Nonagenarian Investigation with Centenarian (SONIC) Project, we conducted multiple group regression analyses separately by sex. Cognitive function was assessed using the Montreal Cognitive Assessment. Evaluation of complexity of work with data, people, and things was developed based on the Japanese job complexity score. More complex work with data was associated with higher cognitive performance for both men and women in the young-old age and for women in the old-old age. More complex work with people was associated with higher cognitive performance for men in the old-old and oldest-old age.

The results suggest evidence the importance of complexity of work in maintaining cognitive function even in the oldest old age.

THE ROLE OF EXERCISE IN THE PREVENTION AND TREATMENT OF ALZHEIMER'S

J.M. Burns[1], D.K. Johnson[2], E.D. Vidoni[1], *1. University of Kansas Medical Center, Kansas City, Kansas, 2. University of Kansas, Kansas City, Kansas*

Physical exercise may sustain cognitive function and delay dementia in older adults. We will introduce three randomized controlled clinical trials to examine the effect of aerobics exercise on cognitive function and biomarkers conducted at the University of Kansas. A 6 month dose-response trial (n=101) suggests cognitive benefits at low doses of aerobic exercise (75 minutes/week) and the benefits may increase with exercise dose. The best predictor of cognitive gain, however, is increased cardiorespiratory fitness (VO2peak). The optimal exercise "dose" may thus be individualized to maximize gains in fitness rather than time spent training. Another trial of exercise in individuals with early AD (n=43) suggests that aerobic exercise moderates hippocampal atrophy and thus may influence the neurodegenerative process. Our recently initiated RCT assesses the effect of exercise on biomarkers (brain atrophy and in-vivo amyloid load) among those in preclinical AD stage. Approaches, results and future directions are discussed.

RESULTS OF A RANDOMIZED CONTROLLED CLINICAL TRIAL AIMED TO EXAMINE THE EFFECT OF CONVERSATIONAL ENGAGEMENT ON COGNITIVE FUNCTIONS

H.H. Dodge[1,2], M. Bowman[1], N. Larimer[1], K. Wild[1], N.C. Mattek[1], J. Kaye[1,3], *1. Oregon Health & Science University, Portland, Oregon, 2. University of Michigan School of Medicine, Ann Arbor, Michigan, 3. Portland Veteran Affairs Medical Center, Portland, Oregon*

Past epidemiological studies have demonstrated that larger social networks or more frequent social interactions may have protective effects on the incidence of Alzheimer's Disease. We will present the results of a randomized controlled behavioral clinical trial which examined whether conversation-based cognitive stimulation has a positive effect on general and domain-specific cognitive functions among older adults with normal cognition or mild cognitive impairment. Daily face-to-face communications were conducted through the use of personal computers, webcams, and user-friendly interactive Internet with touch screen. We found high adherence to the study protocol and the experimental group significantly improved language-based executive function at the post-trial assessment in comparison with the control group, despite a small sample size and short trial period. User-friendly internet communication programs are shown to be feasible even among octogenarians and can be extended to a community-based cost-effective social-interaction prevention program. Limitations and future directions will be discussed.

SOCIAL NETWORKS AND MRI MEASURES OF BRAIN HEALTH IN OLDER ADULTS: THE CARDIOVASCULAR HEALTH STUDY

J.D. Flatt[1], N.R. Fowler[1], H.J. Aizenstein[1], R. Schulz[1], W. Longstreth[2], A.B. Newman[1], C. Rosano[1], *1. University of Pittsburgh, Pittsburgh, Pennsylvania, 2. University of Washington, Seattle, Washington*

We examined the association between social networks and measures of brain health assessed via magnetic resonance imaging (MRI) in 1794 older adults from the Cardiovascular Health Study (CHS). Social networks were assessed using the Lubben Social Network Scale and MRI brain health measures included grey matter atrophy and white matter hyperintensities. The cross-sectional association between social networks and MRI brain health measures were examined in logistic regression models. After adjusting for sociodemographics (age, gender, race, and education) and health-related characteristics (hypertension, diabetes, and depression), older adults with larger social networks were less likely to have grey matter atrophy (OR 0.72, 95 CI 0.58-0.90) and less likely to have white matter hyperintensities (OR 0.77, 95 CI 0.62-0.96) than those with smaller networks. These findings are consistent with the hypothesis that having larger social networks could help to preserve brain health in late life.

SESSION 1365 (SYMPOSIUM)

THE LIFELONG DISABILITIES SPECIAL INTEREST GROUP PRESENTS THE ABCS OF AGING WITH ID: ACCESS, BELIEFS, AND CARE GIVING/CARE RECEIVING

Chair: M. Clute, *Social Work, Eastern Washington University, Cheney, Washington*
Co-Chair: Y. Shirai, *University of Arizona, Tuscan, Arizona***Co-Chair:** K. Culler, *Arizona State, Phoeniz, Arizona*

We have much to learn about aging with an intellectual disability (ID). Aging in general is a not a steady predictable progression along a preconceived timeline. It is a dynamic process affected by many factors and shaped by others around us. Our resources, such as education, health, and the many aspects of our social capital affect the process. Aging with ID appears to be just as dynamic and perhaps even a more complex trajectory than aging for the general population. For those with ID, opportunities and access to education, health care, and gaining social capital are affected by societal belief systems and program policies as well as caregiver belief and knowledge throughout the individual 's life. Many external factors affect th aging processes for those with ID. One factor that may be truly unique for those aging with ID is the early or even lifelong relationship with caregivers. The dynamics of reciprocity, shared decision making and education and support for the caregivers are all essential for us to understand. This symposium will offer a variety of issues for audience consideration about aging with ID. Topics will focus on factors affecting aging with ID from education to aging within the context of care receiving and care giving.

MORTALITY AMONG OLDER ADULTS WITH INTELLECTUAL DISABILITY: UNDERSTANDING THE EFFECT OF EDUCATION

S. Landes, *University of Florida, Gainesville, Florida*

Though research suggests that socioeconomic status is likely a cause of poor health and premature mortality for persons with intellectual disability, prior studies have not explored the effect of socioeconomic status on mortality risk. The aim of this study was to investigate whether education predicted differential mortality risks among adults with intellectual disability living in the US. Data was analyzed from the 1997 to 2004 National Health Interview Survey linked with the National Death Index through 2006. Logistic regression models estimated the effects of demographic characteristics, education, and health on mortality risk for adults with intellectual disability. For the overall sample, mortality risk decreased for each level of education, up until the high school level. Mortality risk was also associated with older age and poorer health. For older adults, age 55 and over, lower mortality risk was associated with improved health and/or a high school level of education.

RECIPROCITY IN END OF LIFE CARE: ADULTS WITH ID AND THEIR AGING PARENTS

M. Clute, *Social Work, Eastern Washington University, Cheney, Washington*

In 2011, at the special interest group discussion on adults with ID/DD, members began discussion of the phenomenon of care giving by adults with ID/DD for elderly parents. In a current research project bereaved adults with ID and their guardians are being interviewed about parental bereavement. Questions related to reciprocity are included in the interviews. The data is still being gathered, but there is evidence that reciprocity does occur between some aging parents and their children with ID. What the researcher hopes to explore is how this reciprocity may affect the bereavement experience and quality of life for the adult with ID after the death of a parent. Parents and caregivers need to be aware of the importance of reciprocity and acknowledge the contributions to parental care the adult with ID may have provided at the end of life. Implications for parent/caregiver education and bereavement support will be addressed.

OLDER CAREGIVERS OF ADULTS WITH INTELLECTUAL DISABILITIES: RECIPROCAL AND SOCIAL NETWORKING RELATIONSHIPS

E.A. Perkins[1], W.E. Haley[2], K. LaMartin[2], W. Wang[2], *1. Department of Child and Family Studies, University of South Florida, Tampa, Florida, 2. University of South Florida, Tampa, Florida*

The majority of people with intellectual disabilities live with their family caregivers, and continue to do so throughout their adulthood. Caregiving relationships for parents of adult children with ID are lifelong, and can be subject to changing and evolving circumstances over time. This presentation amalgamates data from a study, literature review, and pilot study to report on the presence of reciprocity in co-resident aging caregivers and their adult children with ID, the use of social networking in aging caregivers, as well as highlight preferences for conducting data with this caregiving population. Both emotional and tangible reciprocity is evident, and some caregivers reported giving more than they received in emotional and tangible benefits – suggesting that mutual dependence may develop with increasing age. Potential benefits and pitfalls of caregiving communities online were identified, and the difficulties in recruitment and survey preferences that are present in this caregiving population are discussed.

MISSOURI MEDICAID WAIVERS FOR INDIVIDUALS WITH INTELLECTUAL AND DEVELOPMENTAL DISABILITIES: OLDER ADULTS' SERVICE UTILIZATION

K. Barton[1,2], G.S. Gotto[1], *1. University of Missouri Kansas City Institute for Human Development, Kansas City, Missouri, 2. Gerontology, University of Massachusetts Boston, Boston, Massachusetts*

In September 2010 the Centers for Medicare and Medicaid Services approved the Missouri Partnership for Hope (PfH) Medicaid Waiver, a Home and Community-Based waiver developed for individuals with intellectual and developmental disabilities (I/DD). The goal of PfH is to improve access, expand eligibility, and maximize funding for supports and services for individuals with I/DD of all ages. Unlike Missouri's Community Support and Comprehensive I/DD Medicaid waivers, where eligibility is crisis-driven, PfH services are designed to be preventative, with a $12,000 annual cap per participant. Analyses of service utilization rates for PfH, Community Support, and Comprehensive waiver participants by age reveal that many of the targeted waiver services provided through PfH (e.g. assistive technology) are infrequently utilized, particularly by participants age 50 or older. Findings indicate opportunity to prevent/delay costly care in older adulthood through utilization of PfH supports and services. Implications of the regional availability of services are also discussed.

THE ROLE OF AGING AND DISABILITY RESOURCE CENTERS IN SERVING ADULTS AGING WITH INTELLECTUAL DISABILITIES AND THEIR FAMILY CAREGIVERS

C. Coyle[1], J.E. Mutchler[1], J. Kramer[1], M. Putnam[2], *1. University of Massachusetts Boston, Boston, Massachusetts, 2. Simmons College, Boston, Massachusetts*

For the first time, adults with intellectual and developmental disabilities (I/DD) are now facing both their own aging processes and the aging of their family caregivers. The purpose of this project is to assess the activities of Aging and Disability Resource Centers (ADRCs) as they seek to serve older adults with intellectual disabilities and their family caregivers. Data come from in-depth qualitative interviews with ADRC coordinators and program site staff in the eight states participating in the Enhanced ADRC Options Counseling Program. Using a constant comparative approach, themes and sub-themes are extracted and models of service provision for this specific population are described at the state and local level; as well, comparisons are drawn across states. Results indicate that very few supports are available to explicitly serve adults who simultaneously require aging and disability services and their families and the nature of these supports varies greatly across states.

SESSION 1370 (SYMPOSIUM)

ENHANCING CARE CONNECTIONS FOR OLDER ADULTS WITH ANXIETY

Chair: S. Shrestha, *Psychology, University of St. Thomas, Houston, Texas, Baylor College of Medicine, HOUSTON, Texas*
Discussant: S.H. Zarit, *Pennsylvania State University, University Park, Pennsylvania*

Anxiety is common among older adults and is associated with increased disability, service utilization, and mortality. Anxiety also predicts poor treatment outcome in late-life depression and is a risk factor for dementia. Late-life anxiety is usually unrecognized by providers and undertreated, although evidence supports the effectiveness of psychosocial treatment. Most treatment studies, however, are conducted with homogeneous samples in academic or primary care settings. Reach of anxiety treatment needs to be expanded to include more diverse populations, varied settings, and different therapeutic approaches. In the proposed symposium, four papers will be presented. The first will present follow-up data on older adults who completed a primary-care-based study of Generalized Anxiety Disorder (GAD) offering modular cognitive behavioral therapy delivered by PhD and BA-level lay providers. Results showed maintained improvements in worry, anxiety and depression in both treatment groups at 12-months. The second paper will outline 3-month outcomes from a study comparing a modular, person-centered, culturally tailored intervention for late-life anxiety that includes an option to integrate religion/spirituality with telephone information and resource counseling. The study is on-going and currently includes 35 participants, most of whom are African American. The third study will present findings from a pilot study comparing cognitive-behavioral treatment with problem-solving therapy in older Veterans or Veteran caregivers with full or subsyndromal GAD. Individuals in both treatment groups exhibited clinically significant change in anxiety symptoms. The fourth study examines determinants of anxiety among Latino elders. Result showed that physical disability and depression predicted anxiety in this underserved group.

EXPANDING REACH OF LATE-LIFE ANXIETY TREATMENT IN UNDERSERVED, MOSTLY AFRICAN AMERICAN COMMUNITIES

S. Shrestha[1,2,3], N.L. Wilson[3], A. Bush[2,3], M. Armento[2,3], G. Evans[2,3], M.E. Kunik[2,3,4], M.A. Stanley[2,3,4], *1. Psychology, University of St. Thomas, Houston, Texas, 2. Houston VA Health Services Research and Development Center of Excellence, Michael E. DeBakey VA Medical Center, Houston, Texas, 3. Baylor College of Medicine, Houston, Texas, 4. VA South Central Mental Illness Research, Education and Clinical Center, Houston, Texas*

New treatment models are needed to expand the reach of mental health care to minority elders. Calmer Life (CL) is a skills-based, person-centered, culturally tailored intervention for late-life anxiety that includes resource counseling and an option to integrate religion/spirituality. The program was developed in the context of a community-academic partnership with senior-serving organizations in underserved communities, and nontraditional community providers were trained to deliver the intervention. This presentation will report 3-month outcome data comparing CL with telephone information and resource counseling called Enhanced Community Care (ECC). Currently, 35 individuals are enrolled in the program (18 CL and 17 ECC). The current sample is predominantly African American (89% CL and 71% ECC) and female (89% CL and 100% ECC). Recruitment will continue until the end of March. If effective, CL will help expand the reach of late-life anxiety treatment to minority populations that are often poorly represented in empirical research.

LONG TERM TREATMENT OUTCOMES FOR LATE LIFE GAD IN PRIMARY CARE PROVIDED BY PHD AND LAY PROVIDERS

J. Calleo[1,2], A. Bush[2,1], C. Kraus-Schuman[1], N.L. Wilson[2], M.E. Kunik[1,2], M.A. Stanley[1,2], *1. Michael E. DeBakey VAMC, Houston, Texas, 2. Baylor College of Medicine, Houston, Texas*

Primary care providers frequently encounter older adults needing help for anxiety. Implementation of evidence-based treatment in this setting requires a sustainable delivery model and demonstration of long-term benefits. A modified version of CBT for older adults with GAD was delivered by PhD and BA-level lay providers with no prior mental health experience in 2 primary care settings. Treatment was tailored to individual patient preferences and telephone-based delivery was used to provide and review treatment skills. CBT delivered by both PhD and lay providers reduced anxiety and GAD severity compared to usual care at post-treatment (6 months). This study examines the maintenance of gains over the subsequent 12-months (n = 96). Patients received up to 4 additional booster calls over this interval. Improvements in GAD symptoms (GADSS), anxiety (SIGH-A, STAI-Trait) and depression symptoms (PHQ-8) were maintained in both treatment groups. Thus, treatment delivered by lay providers can have lasting benefits.

A PILOT COMPARISON OF PROBLEM SOLVING THERAPY AND COGNITIVE BEHAVIORAL THERAPY FOR GENERALIZED ANXIETY DISORDER IN OLDER ADULTS

S.A. Beaudreau[1,2,3], C.E. Gould[2,4], J. Fairchild[1,2], T. Rideaux[1], T. Huh[1,2], R. O'Hara[1,2,3], *1. Sierra Pacific Mental Illness Research Education and Clinical Center, Palo Alto VA, Palo Alto, California, 2. Department of Psychiatry and Behavioral Sciences, Stanford University School of Medicine, Stanford, California, 3. School of Psychology, University of Queensland, Brisbane, Queensland, Australia, 4. Geriatric Research Education and Clinical Center, Palo Alto VA, Palo Alto, California*

This pilot study examined the preliminary efficacy of cognitive behavioral therapy (CBT) versus problem solving therapy (PST) in older Veterans or Veteran caregivers (M = 79.7 years) with full or subsyndromal Generalized Anxiety Disorder (GAD). We examined whether clinical improvements occurred for one treatment over the other on anxiety and related symptoms (worry, depression), cognition, sleep, functioning, and rational problem-solving. Both treatments led to clinically significant improvement (>10-point reduction) of anxiety symptom severity on the Hamilton Anxiety Scale. None of the patients randomized to CBT went from full to subsyndromal GAD or subsyndromal to minimal GAD symptoms pre- to post-treatment; all completers of PST went from full GAD to subsyndromal GAD status. Neither treatment led to clinically significant improvements in mental health symptoms, cognition, sleep, functioning or rational problem-solving. Recommendations for employing PST with older adults and its potential as an adjunct to CBT for late-life GAD will be discussed.

ANXIETY SYMPTOMATOLOGY IN OLDER LATINOS: THE ROLE OF PHYSICAL AND PSYCHIATRIC COMORBIDITY

M. Aranda, *Social Work, University of Southern California, Los Angeles, California*

Minimal research has been reported on anxiety in older Latino populations. Based on the BSI Anxiety Subscale, we examined the rates of self-reported anxiety symptoms in a clinical population (n=249) of primarily Spanish-speaking Latinos 60+ years of age. Anxiety symptoms ranged from 0 to 24, with an average score of 8.97 (s.d.=5.5). Using linear regression modeling we identified determinants of anxiety symptomatology, specifically: physical disability (p=.000); depression severity (p=.000); and level of pain (p=.025). Age, gender, among other variables were not significant determinants of anxiety. Although older Latinos will make the largest group of older Americans by 2028, their mental and behavioral health status is poorly addressed. Implications of the results will be discussed with regards to integrated models of clinical interventions.

SESSION 1375 (SYMPOSIUM)

INTERDISCIPLINARY RESEARCH IN THE BERLIN AGING STUDY: FROM CELLS TO INDIVIDUALS TO SOCIETIES

Chair: J. Drewelies, *Humboldt University Berlin, Berlin, Germany*
Co-Chair: D. Gerstorf, *Humboldt University Berlin, Berlin, Germany*

Lifespan and gerontological research has long acknowledged the multidimensional character of aging and the necessity for interdisciplinary research on aging processes. This symposium will consist of five presentations that highlight first results of the Berlin Aging Study II (BASE-II). Düzel and colleagues show that in healthy older individuals the subjective motivational perspective to engage in future novelty is correlated with current cognitive performance in working memory and episodic memory tasks. Drewelies and colleagues combine psychological and medical data from BASE-II to examine the role of perceived control in well-being change and its associations with abdominal adiposity and telomere length. Pawelec and colleagues examine linkages between immune parameter and socioeconomic status using data from the BASE-II. Kolbe and colleagues demonstrate the importance of green spaces for residents of urban areas by using Geographic Information System (GIS) and combining information on environmental factors (e.g., green spaces, noises) with BASE-II household data on special level. Steinhagen-Thiessen and colleagues use medical data from BASE-II to examine the role of lipoprotein (a), an independent risk factor for cardiovascular disease, in type 2 diabetes.

ASSOCIATIONS BETWEEN MOTIVATION TO ENGAGE IN FUTURE NOVELTY AND CURRENT COGNITIVE STATUS IN HEALTHY OLDER ADULTS - IMPLICATIONS FOR SUCCESSFUL AGING

S. Duezel[1], D. Gerstorf[2], J. Drewelies[2], N. Buchmann[3], I. Demuth[3], S. Kühn[1], U. Lindenberger[1], *1. Max-Planck Institute for Human Developement, Berlin, Germany, 2. Humboldt University Berlin, Berlin, Germany, 3. Charité Berlin, Berlin, Germany*

There is consensus that lifestyle factors such as physical exercise, cognitive stimulation, and social engagement help to maintain cognitive abilities in old age. However, the mechanisms driving the motivation to lead an active life, which requires novelty exploration, are largely unknown. S. Düzel et al. (2010) developed the 'subjective health horizon questionnaire' (SHH) to assess expectations about future health and physical performance. We collected SHH data from 1100 healthy older BASE-II participants (mean age=70 years; 50% female) along with cognitive measures, a medical exam, and subjective reports of health and wellbeing. The novelty exploration SHH subscale was associated with global and specific measures of episodic and working memory. Associations between SHH and metabolic risk factors were not reliable.

Our analyses point to an association between motivation to engage in future novelty and current cognitive status. Relations of the SHH to brain physiology are currently being explored in a BASE-II subsample.

PERCEIVED CONTROL AND WELL-BEING CHANGE – ASSOCIATIONS WITH ABDOMINAL ADIPOSITY AND TELOMERE LENGTH?

J. Drewelies[1], S. Düzel[2], N. Buchmann[3], I. Demuth[3], A. Meyer[3], D. Gerstorf[1], *1. Humboldt University Berlin, Berlin, Germany, 2. Max-Planck-Institute for Human Development, Berlin, Germany, 3. Charité Berlin, Berlin, Germany*

Perceived control often operates as a general-purpose resource for successful aging. However, the underlying pathways are less well understood. In this study, we investigate the role of physiological risk factors associated with health-promoting behavior and with stress regulation. Using 2-wave data from the Berlin Aging Study-II (n = 210; 52% women, mean age = 70,9), we found that participants who reported perceiving more control over their lives experienced less well-being decline over 2,6 years. We also found that perceived control was indeed associated with a reduced risk for abdominal adiposity (a major component of the metabolic syndrome) and with larger telomere length (a marker against accelerated cellular aging imposed by stress). We discuss how physical activity, diet, and people's repertoire of coping strategies contribute to our findings.

IMMUNE STATUS IN BASE-II DONORS: ASSOCIATIONS WITH SOCIOECONOMIC SCORE

E. Derhovanessian[1], P. Eibich[3], I. Demuth[2], E. Steinhagen-Thiessen[2], G. Pawelec[1], *1. Second Department of Internal Medicine, University of Tuebingen, Tuebingen, Germany, 2. Charite - Universitätsmedizin Berlin, Berlin, Germany, 3. German Institute for Economic Research (DIW Berlin) Socio-Economic Panel Study (SOEP), Berlin, Germany*

Immunosenescence is a descriptive term for the deleterious age-associated changes to immunity observed in all mammals studied so far. However, there are many difficulties in interpreting immunogerontological observations because immunological data are likely to be influenced by many parameters not commonly studied, including health, socioeconomic conditions, genetics, nutrition, psychological and cognitive status, pathogen exposures. The BASE-II study does aim to take account of all these parameters. Here, we will focus on socioeconomic score (SES) incorporating the individual's current occupational position, weighted income (in the household), vocational and educational level, and Cytomegalovirus (CMV) infection. We tentatively conclude that SES associates with the distribution of naïve and memory T cells in young people, but not in the elderly, whereas CMV infection does so in both young and old. Thus, interactions between CMV infection and SES require further dissection and integration with the other parameters measured in BASE-II.

THE GREENER, THE HAPPIER? THE EFFECTS OF URBAN GREEN SPACES ON RESIDENTIAL WELL-BEING

C. Krekel[1,2], J. Kolbe[2], H. Wüstemann[2], *1. German Socio-Economic Panel Study (SOEP), German Institute for Economic Research (DIW Berlin), Berlin, Germany, 2. Technical University Berlin, Berlin, Germany*

The evidence for physical and mental health benefits of urban green spaces is still scarce. This paper investigates the effects of urban green spaces on the mental and physical health of residents, especially the elderly, in Berlin, Germany, using panel data from the Berlin Aging Study (BASE-II) for the time period between 2008 and 2012 and geo-coded data from the Berlin Senate Department for Urban Development and the Environment. We calculated the coverage of urban green spaces in pre-defined buffers around households and the distance between households and the nearest green site. Health benefits are measured as self-reported life satisfaction and physical and mental health status, as well as morbidity and the frequency of hospitalization. The valuation of health benefits is based on avoided health care costs. In addition, we calculated the willingness-to-pay, using implicit marginal rates of substitution. Preliminary results indicate positive effects of urban green spaces on health.

THE ROLE OF LIPOPROTEIN (A) IN TYPE II DIABETES: DATA FROM THE BERLIN AGING STUDY II (BASE-II)

E. Steinhagen-Thiessen[1], N. Buchmann[1], T. Liu[2], L. Bertram[3], K. Norman[1], R. Eckardt[1], I. Demuth[1], *1. Charité - Universitätsmedizin Berlin, Berlin, Germany, 2. Max Planck Institute, Berlin, Germany, 3. Dept. of Vertebrate Genomics, Berlin, Germany*

Lipoprotein (a) (Lp(a)) is an independent risk factor for cardiovascular disease. While earlier studies suggested that Lp(a) concentrations are on average higher in type 2 Diabetes (T2D) patients, recent studies consistently found the opposite, an inverse association of Lp(a)-levels and T2D. So far little is known about the basic cause of this observation, however, there is some evidence from animal experiments that increased insulin levels might impact on Lp(a) serum concentration. Here we studied the relationship between Lp(a), insulin resistance and T2D (ESC Guidelines) in a total of 1,453 BASE-II participants (60-84 years, 67±17 years, women=53.3%). The prevalence of T2D was 9.9%. Lp(a)-levels were significantly lower in the T2D group when compared with non-T2D subjects (p=0.019). These data will be presented together with the results of a mendelian randomization analysis focusing on T2D as the driving factor in the Lp(a)-T2D relationship

SESSION 1380 (SYMPOSIUM)

A PRIMER ON THE WISCONSIN LONGITUDINAL STUDY: OVER 50 YEARS OF SOCIAL DATA COMBINED WITH GENETIC DATA

Chair: C. Roan, *Sociology, University of Wisconsin, Madison, Wisconsin*
Co-Chair: P. Herd, *Sociology, University of Wisconsin, Madison, Wisconsin*

The Wisconsin Longitudinal Study is a data source that connects cells to society. The study is a sample of one in three Wisconsin high school graduates, and a selected sibling, from the class of 1957. WLS is unique among major social scientific resources for the length with which it has followed a large population-based cohort sample and that it includes siblings. We recently released the latest round of data collected between March of 2010 and December of 2012. The new data include anthropometric and functioning measures which add yet a new dimension to the many types of WLS data. The data cover nearly every aspect of the participants' lives from early life socioeconomic background, schooling, family and work to health, social participation, civic engagement, well-being, and cognition. The study also has a wealth of unique data including examples such as administrative IQ scores from high school, information collected from high school yearbooks that include measures of attractiveness, proxy measures for obesity, and complete lists of student activities for all respondents. Examples of administrative data include Medicare records, Social Security records, and resource data on primary and secondary schools attended by participants. At the cellular level, DNA data can be merged with fifty-five years of social data. This session will introduce the study to researchers who are not familiar with the data by providing an overview of the study as well as practical information on the structure of the data. Attendees will be provided with a USB containing documentation and the data.

HOW TO ACCESS AND USE DATA FROM THE WISCONSIN LONGITUDINAL STUDY

C. Roan, *Sociology, University of Wisconsin, Madison, Wisconsin*

With over 27,000 analysis variables covering more than 55 years of data, new users of the WLS data may find themselves overwhelmed when looking for the measures they need to answer their research questions. We will give detailed instructions on how to use the tools and reference materials developed by WLS staff. Attendees will learn how to search for analysis variables, where to find copies of the survey instruments online, and how to download the public data. We will also explain the organizational structure of the data, variable naming conventions, and offer recommendations on how to break the data into smaller pieces if your computing resources are limited. Participants in this symposium will also learn about the differences between publicly available data and the small subset of data available only by application. Finally we will explain how to apply to use the genetic data and other non-public data.

A PRIMER ON GENETIC DATA AVAILABLE IN THE WISCONSIN LONGITUDINAL STUDY

C.S. Atwood, *1. Medicine, University of Wisconsin-Madison, Madison, Wisconsin, 2. Veterans Administration Hospital, Madison, Wisconsin*

The inclusion of genetic data into the WLS database allows analyses linking genotypic, biomedical, psychosocial, and life course outcomes in novel ways. WLS is a unique resource available to all qualified researchers for investigations exploring the genotypic contribution to observed associations among phenotypic measures across domains, gene × gene interaction studies, and gene × environment interaction studies. This presentation will give an overview of the current genetic data, future genetic analyses to be performed and the different analytical techniques (e.g. recursive partitioning, random jungle, multi-factor dimensionality reduction; machine learning algorithms) being used to mine this dataset. Examples of how the genetic data has been used to identify gene x gene and gene x environment interactions associated with the etiology of complex diseases and conditions will be presented.

WHAT'S IN THE WLS? AN OVERVIEW OF SURVEY CONTENT ACROSS TIME

P. Herd, *University of Wisconsin-Madison, Madison, Wisconsin*

This presentation will provide an overview of the WLS data. Survey years include 1957, 1964, 1975, 1993, 2004, and 2011. The content of the WLS has changed to reflect the life course of participants: education inspired the initial data collection, familial and career outcomes focused data collection in midlife, and later rounds have shifted attention to respondent's health, cognitive status, psychological and other dimensions of wellbeing, non-work activities, and caregiving and social support. Some examples of non-survey derived measures include: parent earnings from state tax records (1957-60), high school IQ scores; characteristics of high schools and colleges, employers, industries, and communities of residence; archival data on high school and elementary school resources; information on social participation, facial obesity, and attractiveness from yearbooks; matches to the National Death Index and the Wisconsin State Tumor Registry; and Medicare claims data for older siblings.

SESSION 1385 (PAPER)

MENTAL HEALTH AND WELL-BEING

THE IMPACT OF PSYCHIATRIC HISTORY AND COGNITIVE FUNCTION ON NURSING HOME USE AMONG OLDER AMERICANS

M. Brown, *Syracuse University Aging Studies Institute, Syracuse, New York*

Previous research indicates that older adults reporting a history of psychiatric, emotional or nervous problems are likely to have poorer cognitive function and experience steeper cognitive declines. This association between psychiatric history and cognitive function may result in greater levels of nursing home utilization. The current study uses growth curve modeling to analyze the eight waves of the Health and Retirement Study data to address the following research questions: 1) is a history of psychiatric, emotional or nervous problems associated with greater utilization of nursing homes, net the effect of selected life course variables, and 2) does respondent cognitive function interact with psychiatric history to further influence nursing home utilization. Nursing home utilization is measured as the number of nights spent in a nursing home in the two years prior to interview at any time point. Psychiatric history is independently associated with greater nursing home utilization; this association remains after controlling for a variety of life course variables in the model. Both psychiatric history and lower cognition scores are independently associated with increasing nursing home utilization as respondents age, and their interaction is associated with an even steeper increase in nursing home utilization with age. Evidence of a relationship between psychiatric history, cognitive decline, and nursing home utilization can enhance public understanding of the impact that psychiatric history has on the long-term care system, and educate policy-makers and long-term care providers about the need for appropriate community-based supports and services for older adults with a history of mental health issues.

MOVING PATIENT OUTCOMES TOWARD WELLNESS AND RECOVERY (MPOWR): SHARED DECISION MAKING WITH OLDER ADULTS

S. Pais[1], A. Reeve[2], M. Moore[1], C. Spensley[1], N. Milan[1], *1. Felton Institute, San Francisco, California, 2. University of New Mexico, Albuquerque, New Mexico*

Background: Despite their desire to be more involved in decision making about medications, hospitalization, and other aspects of treatment, the role of clients with serious mental illness in their treatment is largely passive. Defined as the collaboration between clients and care managers to achieve a shared agreement about health care decisions, shared decision-making contributes to improved health outcomes in several physical and mental health conditions. Purpose: To describe the implementation of Moving Patient Outcomes toward Wellness and Recovery (mPOWR), a toolkit with an evidence based questionnaire and decision aids designed to improve shared decision making with older adults in community mental health settings. Methods: Four community mental health agencies are participating in this study with one urban site and one rural site serving as the mPOWR implementation sites and the others as the control sites. Data is being collected in a time-series design, using qualitative and quantitative methods. Primary outcome measures include: quality of life, community living skills, patient-defined service goal attainment, patient perceptions of alliance, satisfaction, use of treatment options and shared decision-making. Results: This project which is funded by the Patient Centered Outcome Research Institute is ongoing. Preliminary results addressing the key aspects of shared decision making with older adults from the two intervention sites will be shared, including barriers and successes.

VERY OLD AND VERY HAPPY? STABILITY AND CHANGE OF MULTIPLE WELL-BEING INDICATORS IN ADVANCED OLD AGE

M. Wettstein, O.K. Schilling, H. Wahl, *Department of Psychological Aging Research and Network Aging Research (NAR), Heidelberg University, Heidelberg, Germany*

Research on stability and change of subjective well-being (SWB) has rarely included samples of very old individuals and considered a broad range of SWB indicators across an extended time interval. We investigated the amount of SWB stability and change as well as co-variation between changes over seven measurement occasions distributed across approximately four years in a sample of 124 participants aged between 87 and 97 years (M = 90.56 years, SD = 2.92 years) at the first measurement occasion. Included were measures of hedonic (life satisfaction, PANAS) and eudaimonic well-being (Ryff Scales of Psychological Well-Being). In addition, indicators of mental distress (depression, attitudes toward death and dying, and health concerns/disease phobia) were assessed. Although participants reported on average high and fairly stable well-being levels across most indicators, the mean number of depressive symptoms was close to the cutoff point of clinical depression. In addition, depression showed, together with a subset of other SWB indicators (positive affect, environmental mastery, purpose in life), a worsening change trend. In contrast, acceptance of death and dying was surprisingly high and increased, whereas the mean level in fear of death was very low and further declined over time. Based on correlations between SWB slope components derived by multilevel models, we found only limited evidence for uniform SWB changes and SWB dedifferentiation processes in old age. Findings suggest that SWB change in very old age follows a multidirectional trend.

ASSOCIATIONS BETWEEN CHANGES IN FORMAL AND INFORMAL VOLUNTEERING AND MENTAL HEALTH

C.M. Proulx, A.L. Curl, A. Ermer, *University of Missouri, Columbia, Missouri*

We employed longitudinal data from 6 waves (2000-2010) of the Health and Retirement Study (HRS) to examine whether changes in formal and informal volunteering impact depressive symptoms and cognitive functioning in adults ages 65 and older. Formal volunteering has been found to benefit mental health, but less is understood about whether informal volunteering exerts similar benefits. Examining both forms of volunteering simultaneously over time allows us to explore the long-term benefits of each, net of the other. Understanding whether changes in both formal and informal volunteering affect mental health is critical for designing interventions that may maximize opportunities for older adults to maintain these forms of productive engagement and the social benefits that likely extend from them. The analytic sample includes 6,402 older adults. Multilevel models controlled for adults' age, gender, race, ethnicity, health status, marital status, household income, household wealth, and driving ability. Results provide evidence of the negative impact of decreases in formal and informal volunteering on mental health. Decreases in both forms of volunteering were related to decreases in cognitive functioning ($\beta = .20$ and $.11$, $p < .001$ for formal and informal volunteering, respectively) and increases in depression over time ($\beta = -.05$ and $-.02$, $p < .05$ for formal and informal volunteering, respectively). Thus, when considered simultaneously, changes in both forms of volunteering independently influence mental health outcomes, suggesting that interventions aimed at promoting and maintaining volunteer activity in later adulthood are likely to positively impact mental health and functioning.

MENTAL HEALTH TREATMENT AMONG COMMUNITY-DWELLING OLDER ADULTS WITH ANY MENTAL ILLNESS

B. Han, *Center for Behavioral Health Statistics and Quality, Substance Abuse and Mental Health Services Administration, Rockville, Maryland*

Objectives: This study examined mental health treatment rates among community-dwelling older adults with past-year any mental illness (AMI) in the United States. Characteristics associated with receipt of mental health treatment among this population were also investigated. Methods: We analyzed data from 13,600 persons aged 65 or older who participated in the 2008-2012 National Surveys on Drug Use and Health (NSDUHs), which were then merged with the 2011-2012 Area Resource File. Past-year AMI was based on diagnostic criteria specified within the 4th edition of the Diagnostic and Statistical Manual of Mental Disorders. Descriptive and logistic regression modeling were applied. Results: Among community-dwelling older adults, 12.0% (annual average) had AMI in 2008-2012, which was stable between 2008 throughout and 2012. Among older adults with past-year AMI, 32.4% (annual average) received mental health treatment (3.7% received inpatient treatment, 13.9% received outpatient treatment, and 27.3% received prescription medications), and these corresponding treatment rates remained unchanged between 2008 throughout 2012. Multivariate logistic regression results suggested that among older adults with AMI, receipt of mental health treatment was more likely among those aged 65-74, women, non-Hispanic whites, those with college or more education, retired older adults, divorced/separated older adults, those who perceived need for mental health treatment, those with serious mental illness, those with over 2 emergency room visits in the past year, and those who resided in a county with over 30 psychiatric offices. Conclusions: These results indicate the need to screen for AMI among older adults and to improve their mental health treatment rates.

SESSION 1390 (PAPER)

MINORITY AGING I

THE EFFECT OF SOCIAL FACTORS BY GENDER ON EPISODIC MEMORY IN A POPULATION SAMPLE OF AGING BLACK AMERICANS

L.L. Swett, *Catholic University of America, Washington, District of Columbia*

Purpose of the Study: The purpose of this study is to examine select psychosocial factors (i.e. social ties, locus of control, lifetime discrimination) for non-demented, community-dwelling Black Americans by gender between the ages of 50 and 78 that are predictive of cognitive health. Design and Methods: Data for the study come from the University of Michigan Health and Retirement Study (HRS), a longitudinal panel study that surveys a representative sample of older Americans every two years. A secondary analysis of the 2010 wave was completed. Complete data are available for 162 men and 319 women. Regression analysis was run to predict a total cognitive score measuring episodic memory. Results: Black men were shown to have a higher level of episodic memory when they had higher levels of education ($\beta = .24$, $p < .001$), a lower perception of a positive relationships with their children ($\beta =-.23$, $p < .001$), a lower level of perceived constraints ($\beta = -.24$, $p < .01$), and a higher level of lifetime discrimination ($\beta = .20$, $p < .01$). Black women had a higher level of episodic memory when they had higher levels of education ($\beta = .50$, $p < .001$) and lower levels of perceived negative support from family, friends, and children ($\beta = -.17$, $p < .05$). The model explains 24% of the variance in episodic memory for men and 28% for women. Implications: These predictive psychosocial factors should be included in cognitive health policy discussions for aging Black men and women.

PERCEPTIONS, AWARENESS, AND SYSTEMS OF SUPPORT AMONG AFRICAN AMERICAN FAMILIES RESPONDING TO MILD COGNITIVE IMPAIRMENT

E. Potter[1], K.A. Roberto[2], N. Brossoie[2], R. Blieszner[1], *1. Human Development, Virginia Tech, Blacksburg, Virginia, 2. Center for Gerontology, Blacksburg, Virginia*

Despite increased knowledge of the risks of mild cognitive impairment (MCI) among older African Americans, researchers seldom detail minority families' experiences with early memory problems. We examined relationship and caregiving issues as experienced by African American families through a life course perspective. For this qualitative investigation, we analyzed semi-structured interview data to shed new light on the ways in which African American families perceived behavioral changes in their relatives with MCI (referred to as PwMCI), personal relationship changes attributed to memory decline, and family engagement in systems of support. The sample included 27 PwMCI (aged 55 to 88), 27 primary care partners (aged 29 to 92) and 14 secondary care partners (aged 42 to 91) who all identified as Black or African American. Our findings focus on three family issues related to MCI: (a) family acknowledgement or recognition of changes in PwMCI, (b) primary care partners' responses to memory decline or diagnosis, and (c) PwMCIs' and families' current and future use of outside support. Findings reveal no homogeneous African American family experience as family members were influenced by their personal relationships with PwMCI, attitudes towards aging, knowledge about memory loss, and the medical diagnosis. Family members also tended to have differing opinions on the need and use of outside support, relying heavily on friend and family networks. Moreover, for some care partners the church was an undesirable source of support. Family and caregiving researchers and practitioners need to consider complex relationships and personal attitudes that influence families' experiences with MCI.

PERCEIVED STRESS AND COGNITIVE DECLINE IN DIFFERENT COGNITIVE SYSTEMS IN A COHORT OF OLDER AFRICAN AMERICANS

A.D. Turner, B.D. James, A. Capuano, N.T. Aggarwal, L.L. Barnes, *Alzheimer's Disease Center, Rush University Medical Center, Chicago, Illinois*

Research indicates that stress is linked to cognitive impairment, however few community-based studies explore the relationship between stress and cognitive decline, and fewer still involve specific cognitive systems rather than a global measure of cognition. We examined the relation of perceived stress with rate of decline in different cognitive systems. Participants were 583 older African Americans from the Minority Aging Research Study (mean (SD): age = 73.6 (6.3); education = 14.8 (3.6) who were without dementia at baseline. The 4-item Cohen's Perceived Stress Scale was given at baseline and at annual intervals for up to 9 years, a battery of 19 cognitive tests was administered from which previously established composite measures of five cognitive domains were derived. In mixed effects models adjusted for age, sex, education and vascular risk factors, higher perceived stress was related to faster declines in global cognition (estimate=-0.019; SE=0.008; p=0.011), episodic memory (estimate=-0.023; SE=0.011; p=0.029) and visuospatial ability (estimate=-0.019; SE=0.009; p=0.023). Results were similar in subsequent models adjusted for depressive symptoms. The results indicate that higher levels of perceived stress are related to impaired global cognition and more rapid decline in episodic memory and visuospatial ability in older African Americans.

LEARNING STYLES AND CULTURAL PREFERENCES AMONG A SAMPLE OF OLDER BLACK ADULTS

J. Shellman[1], M. Mokel[1], Y. Noel[1], K. Bailey-Addison[2], *1. Nursing, University of Connecticut, Kensington, Connecticut, 2. Northend Senior Center, Hartford, Connecticut*

The purpose of this study was to obtain data that would inform the development of a training manual directed at preparing facilitators in a peer-led reminisce intervention to decrease depressive symptoms among a sample of older Black adults. Focus group methodology was used to obtain culturally appropriate learning styles among the participants and their acceptance of a peer led reminiscence intervention. Six focus groups (N=36) were held in a senior center in a northeast urban area. The mean age of the sample was 64.6 (SD=9.3), the majority of the participants were female (75%). Under the supervision of the second author, the focus groups were led by a Black graduate student who had been trained in focus group techniques. Data were collected until saturation was reached. Sessions were taped and transcribed verbatim. Borkan's immersion/crystallization techniques were used to analyze the data. The following themes related to learning styles and acceptance of the peer reminiscence process emerged: 1) "we can learn from one another", 2) prefer visual learning techniques, 3) emphasis on simple and clear language, 4) prefer experiential learning, 4) create a trusting, social environment, and 5) being sensitive to religious beliefs and practices. These data allow the investigators to address the learning needs of peer facilitators in ways that take into account cultural sensitively and learning styles. The next step in the process will be the testing of the manual among a sample of older Black adults.

THE PREVALENCE OF PERCEIVED STRESS AMONG U.S. CHINESE OLDER ADULTS

M. Zhang[1], C. Li[1], E. Chang[1], R. Chen[1], J. Huang[1], M.A. Simon[2], X. Dong[1], *1. Rush Institute of Healthy Aging, Chciago, Illinois, 2. Northwestern University, Chicago, Illinois*

Background: Perceived stress is an important indicator of well-being. Aging process, cultural factors and the immigration experience contribute to the perceived stress among U.S Chinese older adults. However, we have limited understanding of the experience of stress among this population. This study aims to describe the prevalence of perceived stress, and to quantify the levels of perceived stress by socio-demographic factors in a community-dwelling Chinese older population. Methods: Data were drawn from the PINE study, a population-based survey of U.S. Chinese older adults aged 60 and above in the greater Chicago area. We assessed perceived stress through face-to-face interviews using Perceived Stress Scale(PSS) (Cronbach's alpha=0.80). Results: Of the 3,159 participants, 58.9 % were women and the mean age was 72.8 (SD = 8.3). Our findings indicated 11.4 % to 31.8 % of U.S Chinese older adults perceived stress under specific scenarios in their lives. More than one third of participants felt they could not cope with things had to do in their lives. Older adults with older age, female gender, higher educational and income level tend to perceive higher level of stress. Participants with zero years of education showed the highest level of perceived stress among subgroups with mean score of 12.2. Conclusions: In sum, this study indicates that a significant amount of Chinese older adults in the U.S experience some level of stress in their daily lives. Future longitudinal studies are needed improve the understanding of risk factors and outcomes associated with perceived stress in Chinese older adults.

SESSION 1395 (PAPER)

ADULT PROTECTION AND ELDER ABUSE

UNDERSTANDING ELDER MISTREATMENT IN ASIAN AMERICAN AND PACIFIC ISLANDER (AAPI) COMMUNITIES

G. Choi[1], E. Lee[2], E. Koh[3], *1. Social Work, University of Northern Iowa, Cedar Falls, Iowa, 2. National Asian Pacific Center on Aging, Seattle, Washington, 3. University of Arkansas, Fayetteville, Arkansas*

While Asian American and Pacific Islander (AAPI) older adults can experience socio-cultural barriers in elder mistreatment help-seeking efforts (Lee & Shin, 2010), little is known about factors associated with such behaviors. Using survey methods, we examined the relationships between AAPIs' elder mistreatment experiences and social support, and socio-cultural factors. Elder mistreatment experiences were measured using the National Elder Mistreatment Study questionnaires (National Institute of Justice, 2009). Multidimensional Scale of Perceived Social Support was used to measure social support from significant others, family, and friends (Zimet, 1990). Help-seeking behaviors, cultural perceptions of elder mistreatment, and demographic characteristics were measured through the questionnaires developed for this study. A total of 70 participants from community agencies in a Western state completed the survey. They were 65.7 years old on average (SD=7.07) with majority of them being female (64.3%) and Korean-Americans (64.3%). Data were analyzed using chi-square and Spearman's rho statistic tests. Females are more likely to experience elder mistreatment ($\chi 2= 5.647$, $p< .05$). Older adults with higher levels of familial support are less likely to view adult child not paying the borrowed money back as financial mistreatment (rs= -. 315, p< .01). Older adults with higher levels of social support are more likely to report physical mistreatment to Adult Protective Services (APS) (rs=. 260, p<. 05). Older adults with higher English proficiency level are less likely to contact APS for emotional mistreatment (rs=-.251, -.252, and -.291 for speaking, reading, and writing, respectively, p<.05). Implications for culturally competent AAPI elder mistreatment services are discussed.

IMPACT OF SURVEY CONTEXT AND AGE ON SELF-REPORTED RATES OF FRAUD VICTIMIZATION

M. Beals, D.C. Carr, M.J. Deevy, L. Carstensen, *Stanford University, Stanford, California*

Using data from a survey of U.S. adults (n=3,000) ages 25 to 95 in 2013, this study examines how sensitization to fraud contexts impacts reporting of fraud victimization, and whether this sensitization is moderated by age. Survey participants were randomly assigned to one of three groups: 1) crime 2) consumer and 3) control. In the two experimental contexts, participants answered six questions related to recent crime or consumer purchasing behaviors before being presented with questions concerning personal fraud victimization. Results show that exposure to the crime context is associated with 20.8% lower odds of reporting victimization, but consumer context is not different than control. However, age moderates the effect of sensitization on reporting fraud in both contexts relative to control. Participants who are age 70 or older who receive the crime context have 68% decreased odds of reporting victimization compared to those under age 70. The effect of consumer context is moderated by age such that those age 70 or older who receive the consumer context have 73% increased odds of reporting victimization compared to those under age 70. These results suggest exposure to different survey contexts has a significant effect on self-reported rates of fraud victimization, and adults ages 70 and older are more susceptible to the sensitizing effects of survey design than younger age groups. We discuss the implications of these findings for obtaining more accurate information about the prevalence of elder fraud victimization.

CAREGIVER SENSE OF ENTRAPMENT AND PSYCHOLOGICAL ABUSE OF OLDER PERSONS WITH DEMENTIA

E. Yan[1], L. Chu[1], S. Cheng[2], T. Kwok[3], A.F. Tiwari[1], D. Fong[1], *1. Social Work and Social Administration, University of Hong Kong, Hong Kong SAR, Hong Kong, 2. Hong Kong Institute of Education, Hong Kong SAR, Hong Kong, 3. The Chinese University of Hong Kong, Hong Kong SAR, Hong Kong*

Guided by the frustration-aggression hypothesis, this study examined the associations between caregivers' sense of entrapment, perceived burden and psychological abuse of older Chinese with dementia. A total of 121 family caregivers were recruited from out-patient geriatric clinics in Hong Kong. Participating caregivers provided information on their demographic characteristics, sense of entrapment, caregiving burden, and psychological abusive behaviours directed towards the care recipient in the past year. Psychological abuse was common. Forty-five percent of the caregivers reported varying degrees of psychological abusive behaviours directed towards the care-recipients. Results of hierarchical linear regression indicated that proposed factors accounted for 35.8% of the variance in caregivers' psychological abuse. Psychological abuse was associated with caregiver female gender (β=-.187, p=.038), a larger number of co-residing days (β=.265, p=.016), a stronger sense of entrapment (β=.249, p=.008), a higher level of perceived caregiver burden (β=.279, p=.015), and absence of assistance from a domestic helper (β=-.226, p=.007). Perceived burden mediated the effect of sense of entrapment on psychological abuse while assistance from a domestic helper mitigated the effects of perceived burden on psychological abuse.

INTERDISCIPLINARY TEAMS: AN EVALUATION OF A MODEL DESIGNED FOR ELDER ABUSE PROFESSIONALS

B. Primetica[1], A. Bukach[1], D.M. Bass[1], S. Pla-Raith[2], *1. Benjamin Rose Institute on Aging, Cleveland, Ohio, 2. Cuyahoga County Department of Senior and Adult Services, Cleveland, Ohio*

Community-wide Interdisciplinary Teams (I-Team) for elder abuse, neglect, and exploitation is a newly evolving structure that brings together professionals from diverse organizations and disciplines to better serve vulnerable older adults in complicated, multi-problem situations. I-Teams typically include representatives from the legal system, law enforcement, aging services, mental health services, and medical services. An evaluation of the I-Team in Cuyahoga County, Ohio involved administering a structured survey that was completed by 43 (75.4%) of the 57 professionals who are members of this collaborative workgroup. The survey assessed a variety of perceptions of the benefits, challenges, and satisfaction with the I-Team. Survey results showed respondents rated the I-Team as having a positive impact (i.e., ratings above the desired benchmark) on a number of domains such as: agencies' responses to elder abuse (78%), communication and collaboration (73%), and knowledge about (77%) and trust among different service-organizations (83%). Responses also indicated a number of challenges and areas for improvement including: the need for more information on services provided by organizations represented on the I-Team (11% below benchmark), limited impact of the I-Team on client outcomes (24% below benchmark), and a lack of time for staff to participate in I-Team (17% below benchmark). The survey suggested a number of changes that may improve the functioning of the I-Team such as: creating a directory of services offered by member agencies, collecting data to measure client outcomes, and getting the commitment of leaders from member organizations to enable more comprehensive staff participation.

DOES EMBEDDEDNESS PROTECT? PERSONAL NETWORK DENSITY AND VULNERABILITY TO MISTREATMENT AMONG OLDER AMERICAN ADULTS

M.H. Schafer, *Sociology, University of Toronto, Toronto, Ontario, Canada*

Objectives: This study considers the association between personal network density and risk of elder mistreatment among American adults. Methods: Using egocentric network data from the National Social Life Health and Aging Project (NSHAP), we employ logistic and negative binomial regression to predict recent experience of elder mistreatment. We further unpack the density-mistreatment association by linking perpetrators to the victim's network and by assessing their position within its structure. Results: As hypothesized, older adults with dense networks had a lower risk of elder mistreatment. Interestingly, the perpetrators of these harmful acts were often found within seniors' close networks—though there was little evidence to suggest that perpetrators themselves were poorly embedded in the network. Discussion: Results highlight how network-level phenomena can operate distinctively from dyadic mistreatment processes. Dense personal networks seem to provide structural protection against elder mistreatment, even as many offensive acts are committed by those that are close to the victim and relatively well-embedded in their network.

SESSION 1400 (PAPER)

TRAINING, EDUCATION AND LONG-TERM CARE

PERSONAL CARE AIDES IN ASSISTED LIVING AND SIMILAR RESIDENTIAL CARE COMMUNITIES: AN OVERVIEW FROM THE 2010 NATIONAL SURVEY OF RESIDENTIAL CARE FACILITIES (NSRCF)

M. Sengupta[1], L. Harris-Kojetin[1], F.K. Ejaz[2], *1. CDC/NCHS, Hyattsville, Maryland, 2. Benjamin Rose Institute, Cleveland, Ohio*

Personal care aides (PCAs), along with other direct care workers, provide the hands-on care, including help with activities of daily living, for individuals living in assisted living and similar residential care communities (RCCs). However, earlier studies have demonstrated that recruitment and retention of such workers is a great challenge as low pay, inadequate training, high work demands and lack of benefits contribute to attrition. Using data from the Department of Health and Human Services' NSRCF, the first nationally representative survey of residential care communities with four or more beds (n=2302), this study aims to: (1) provide an overview of work activities performed, and training and employment benefits received by PCAs working in RCCs, and (2) assess if activities performed, and training and benefits received vary by RCC characteristics. Overall, about 96% of RCCs had one or more PCAs and about 94% of RCCs provided PCAs with on-going in-service training. Results from bivariate analyses (accounting for complex survey design using STATA software) showed that provision of training varied by size, with a higher percentage of small RCCs (4-10 beds) providing training (44%) compared to RCCs with more beds. Over 80% of PCAs performed recreational, laundry and other housekeeping services for residents. Most RCCs offered paid time-off (84%) but far fewer provided health insurance to PCAs and their families (44%). This overview of PCA activities, training and benefits may provide insights into approaches to improve the retention of such workers and subsequently the quality of care provided to residents living in RCCs.

THE IMPACT OF REMINISCENCE TRAINING ON HEALTH CARE WORKERS TO CARE FOR OLDER DEMENTIA PATIENTS IN VETERANS HOME

S.Y. Chen, *Department of Adult and Continuing Education & Graduate Institute of Elder Education, National Chung Cheng University, Chia-Yi, Taiwan*

Many studies found that reminiscence activities could promote social interaction of older adults with dementia, but less from care workers approach to investigate the effect.This study investigates the effect of reminiscence training for the care workers to care for the elderly with dementia and the executive barriers.Three are sixteen health care workers in dementia care units of Veterans Home, including one unit supervisor, seven nurses and eight care attendants.This study carried out two days reminiscence training for care workers and then, grouping by care unit, performed group reminiscence activities for the elderly. Nurses design and lead the activities by the help of care attendant. They work together to carry out eight group reminiscence activities and help twenty five older dementia patients to complete their life story picture books. At the mid-time and after activities carry out personal interview for the care workers.The results show that life story picture books become an important medium for care workers to communicate with older adults with dementia. For nurses, through the reminiscence activities let them more understand the older patients' functional decline, encourage communicating with patients' families and enhance capacity of designing senior activities. For care attendant, reminiscence activities help them understand dementia patients' past living experiences, so increase empathy and more patience to care them. But dementia causes older adults' cognitive functional decline and increase confuse behaviors become the most interference in the activities. This study suggests encouraging the participation of older adults' families.

SOURCES OF NEW WORKERS AND JOB MOBILITY IN LONG-TERM CARE

J. Spetz[1], B. Frogner[2], *1. University of California, San Francisco, San Francisco, California, 2. George Washington University, Washington, District of Columbia*

The past decade has seen substantial job growth in the health care industry overall, and the long-term care (LTC) sector in particular. Limited research is available as to where the LTC industry draws its supply of workers. The characteristics and experiences of LTC workers after they leave LTC jobs also are unknown. This project uses 12 years (2000 to 2011) of the publicly-available Current Population Survey (CPS) Annual Social and Economic Supplement ("March Supplement"), which is an annual cross sectional survey of approximately 200,000 individuals. This study uses descriptive statistics to analyze trends on where LTC draws their workforce, where leavers of LTC go, the jobs individuals take in the LTC sector, and the skills/education they bring into LTC. We use multivariate logistic regression to estimate the predictors of individuals entering or leaving the LTC sector. We document substantial industry and occupational turnover in LTC. We also find that many people who enter LTC jobs were not in the labor force before entering LTC work. Over a quarter of those who enter LTC jobs come from another part of the health care industry and another quarter were not previously working in the labor force. The LTC industry has also been drawing from the leisure and hospitality industry (11.8%) followed by from the retail trade industry (6.8%). Entrants are slightly younger and more diverse than current workers in LTC. This research will support efforts to ensure an adequate supply LTC workers and will provide guidance in designing retention strategies.

STUDENT VOICES: CNA PERCEIVED EFFECTIVENESS OF TRAINING PROGRAMS

K. Cassie, *College of Social Work, Univ of Tennessee-EPS, Nashville, Tennessee*

According to the Bureau of Labor statistics, the demand for certified nursing assistants (CNAs) to care for America's aged is increasing. Given that CNAs spend more time with patients than other health care professionals in many settings, their role is very important. However, some believe they are poorly trained and educated. The purpose of this research is to assess CNA perceived effectiveness of training programs at meeting their education needs and preparing them for their professional position in health care. This research reports on telephone surveys with 399 nursing assistants certified within the past 12 months. Respondents reported they were most confident in providing activities of daily living. However, they were least confident in discussing patient care with families, in working with nursing staff, supervisors, rehabilitation staff and social workers, in dealing with problems at work and in working with dying patients. Overall, participants of high school training programs were more likely to report that their training programs were excellent at preparing them for what it was actually like to work in health care ($p = .029$) and at dealing with patient behavior problems ($p = .033$). Those who participated in training programs sponsored by the Red Cross or Goodwill were most likely to report their training program was excellent at preparing them to discuss patient care with families ($p = .019$). No statistically significant differences were observed between training programs and CNA knowledge of aging on Palmore's Facts on Aging Quiz. Implications for practice, education and research will be discussed.

CONTINUING EDUCATION PRACTICES AND INTERESTS OF NURSING HOME SOCIAL WORKERS

K. Cassie, *College of Social Work, Univ of Tennessee-EPS, Nashville, Tennessee*

The National Association of Social Worker's Code of Ethics (2008) admonishes social workers to attain and maintain competence in their area of practice through participation in continuing education. This research assesses the extent to which 120 nursing home social workers in a single southeastern state participate in continuing education and their interest in future continuing education. On average, social workers reported attending 18 continuing education hours in the past 12 months. Common methods of participating in continuing education was face-to-face training outside of the work place (61%), followed by face-to-face training inside the work place (45%). The most common topics of continuing education were Alzheimer's disease and dementia (65.8%), behavior management (50%), advanced directives (48.3%), elder abuse and neglect (45%) and the MDS 3.0 (40.8%). Regression analysis revealed three characteristics associated with participating in continuing education: race, perceived time available and years at the work place. When asked about their future interest in continuing education, 73% of the sample indicated they were interested in participating in continuing education in the future, 23% might be interested and 4% were not interested. Most participants desired to attend face-to-face training outside of their work place (73%). The most requested topics included: behavior management (51.3%), depression (34.8%), Alzheimer's disease and dementia (33%), and mental illness (31.3%). Regression analysis revealed that those with higher levels of education were more likely to desire to participate in continuing education in the future. Implications for social work educators, researchers and practitioners will be discussed in this presentation.

SESSION 1405 (SYMPOSIUM)

AGING WELL: CONCEPTUAL ORIENTATIONS AND OBSERVATIONS FROM THE WOMEN'S HEALTH INITIATIVE STUDY

Chair: B.B. Cochrane, *School of Nursing, University of Washington, Seattle, Washington, Fred Hutchinson Cancer Research Center, Seattle, Washington*

Co-Chair: N.F. Woods, *School of Nursing, University of Washington, Seattle, Washington*

This symposium will provide a foundation for future dialogue about aging well, based on an integrative literature review of theoretical and empirical work dating from the 1970s, which revealed three conceptual orientations to this topic: successful aging, effective aging, and optimal aging. Methodological aspects of the integrative review and its findings, a full consideration of the three frameworks utilizing distinct indicators from the Women's Health Initiative (WHI) database, and a provocative discussion of their relevance and utility for future research will be addressed. The WHI is a large, nearly 20-year study of postmenopausal women's health, involving women 50-79 years at baseline in 1993, who were enrolled at 40 clinical centers across the U.S. Health history, physical measures, and psychosocial data were collected at baseline and throughout the study, along with medical history updates at least annually. Data analyses of aging well indicators included over 26,000 active participants in the WHI Extension 2, who were age 80 years and older at the time they completed a "lifestyle" questionnaire in 2011-2012. In the first paper, we will present an overview of the conceptual orientations and relevant measures from the WHI. The second, third, and fourth papers will explore profiles of successful, effective, and optimal aging, respectively, using these indicators. The final paper will provide a discussion of the results that compares and contrasts the three conceptual orientations, summarizes key insights gained, and poses a series of questions to spur on future health promotion research on aging well.

AGING WELL: CONCEPTUAL FRAMEWORK AND MEASURES

N.F. Woods[1], B.B. Cochrane[1], E. Rillamas-Sun[2], O. Zaslavsky[3], A.Z. LaCroix[2], *1. Univeristy of Washington, Seattle, Washington, 2. Fred Hutchinson Cancer Research Center, SEattle, Washington, 3. University of Haifa, Haifa, Israel*

Objectives for the Paper: After attending this session, participants will be able to: 1. Review contemporary theoretical and conceptual perspectives on aging well that are found in the published literature, and 2. Describe indicators of aging well that reflect these key differing concepts and perspectives as they were assessed in the Women's Health Initiative (WHI) An integrative review of the many contemporary conceptualizations of aging well was conducted and used to identify meaningful organizing frameworks within the literature, as well as relevant indicators of aging well. This approach was undertaken as a way to structure future discussion, research, and clinical considerations about aging well from multiple perspectives and among diverse groups of older women. Publications from the 1960s forward revealed three primary conceptualizations of aging well: successful aging, effective aging, and optimal aging. An exploration of measures used in the Women's Health Initiative – many of them well-established, standardized measures — revealed multiple indicators available for profiling each of the three conceptual frameworks of aging well. The large, well-characterized sample of older women who are continuing to contribute data in the WHI affords a unique opportunity to study aging well and its predictors, indicators, and outcomes through these different conceptual lenses.

SUCCESSFUL AGING AMONG WOMEN 80 AND OLDER: PROFILE OF WHI PARTICIPANTS

E. Rillamas-Sun[1], N.F. Woods[2], O. Zaslavsky[3], B.B. Cochrane[2,1], A.Z. LaCroix[4,1], *1. Public Health Sciences, Fred Hutchinson Cancer Institute, Seattle, Washington, 2. UW School of Nursing, Seattle, Washington, 3. University of Haifa Dept of Nursing, Haifa, Israel, 4. UCSD Family and Preventive Medicine, San Diego, California*

A commonly-used construct of aging well is “successful aging,” defined by Rowe and Kahn as freedom from disease or disability, high cognitive and physical functioning, and active engagement with life. Indicators of successful aging were examined in older women of the Women’s Health Initiative Extension 2 Study. The absence of major disease and mobility disability, good perceived health, residence in places with special services for older adult care (e.g. a nursing home), and physical functioning were analyzed to derive a profile of successful aging in 26,704 women, aged 80 years and older. Nearly half of these women had no major disease or mobility disability, and over 85% rated their health as good or better. Although the women’s physical functioning indicated some limitations, only 24.6% reported living in a place with special services for older adults. Consistent differences across the successful aging indicators by family income and alcohol use were observed.

EFFECTIVE AGING AMONG WOMEN 80 AND OLDER: PROFILE OF WHI PARTICIPANTS

B.B. Cochrane[1,2], N.F. Woods[1], E. Rillamas-Sun[2], O. Zaslavsky[3], A.Z. LaCroix[4,2], *1. School of Nursing, University of Washington, Seattle, Washington, 2. Fred Hutchinson Cancer Research Center, Seattle, Washington, 3. University of Haifa, Haifa, Israel, 4. University of California, San Diego, San Diego, California*

“Effective aging” was described by Curb and colleagues as the adaptation and rehabilitation that can occur as older adults develop disease. Effective or compensatory aging allows for the possibility of relatively high levels of functioning in the face of health problems common among older adults. Indicators of effective aging – resilience, self-mastery, environmental mastery, and self-control – were analyzed to profile women ages 80 and older who were enrolled in the Women’s Health Initiative Extension 2 and completed a Lifestyle Questionnaire in 2011-2012. On average, these women had high resilience scores, particularly among those who had higher baseline family incomes or reported drinking at least one alcoholic drink per week. Women with lower education levels had the lowest scores. Over half of women reported good environmental mastery and over 70% indicated they had good self-control. Differences in effective aging indicators by demographic characteristics, smoking, and alcohol use will be further elaborated.

OPTIMAL AGING AMONG WOMEN 80 AND OLDER: PROFILE OF WHI PARTICIPANTS

O. Zaslavsky[1], N.F. Woods[2], E. Rillamas-Sun[3], B.B. Cochrane[2], A.Z. LaCroix[4], *1. Department of Nursing, University of Haifa, Haifa, Israel, 2. University of Washington, Seattle, Washington, 3. Fred Hutchinson Research Instiitute, Seattle, Washington, 4. University of California in San Diego, San Diego, California*

The concept of well-being (WB) refers to perceived optimal psychological functioning. Many WB indicators were evaluated in the WHI, and those consistent with a conceptualization of optimal aging, as exemplified by Ryff’s work, will be described. Among these indicators, experienced (hedonic), evaluative and eudaemonic measures are especially pertinent as they present momentary affective states, global subjective evaluation and self-actualization in accordance with a true self. We will characterize the status of “optimal aging” among women ages 80 and over and report the influence of socio-demographic and behavioral factors on its indicators. In general, these older women reported high levels of optimal aging. About two-thirds reported enjoying life and having been happy at least most of the time. The women also reported moderately high levels of life satisfaction, social support and satisfaction with their current quality of life, but more modest levels of personal growth and purpose in life.

DISCUSSION, CONCLUSIONS AND IMPLICATIONS FOR RESEARCH, HEALTH PROMOTION AND PUBLIC HEALTH

A.Z. LaCroix[1,2], N.F. Woods[3], E. Rillamas-Sun[2], O. Zaslavsky[4], B.B. Cochrane[3,2], *1. University of California, San Diego, San Diego, California, 2. Public Health Sciences, Fred Hutchinson Cancer Research Center, Seattle, Washington, 3. University of Washington, Seattle, Washington, 4. University of Haifa, Haifa, Israel*

This paper summarizes findings across profiles of successful, effective, and optimal aging. Although many women in the Women’s Health Initiative (WHI) reported physical functioning levels consistent with disability, most rated their health as good or better. Most reported moderately high resilience, self-control, and self-mastery but lower levels of environmental mastery. They reported high optimal aging, as reflected in their high emotional well-being, moderately high life satisfaction and social support, and more modest levels of personal growth and purpose in life. Despite a wide range of functioning levels and other measured indicators, most women in the WHI have the potential to age well. Further examination of predictors of positive coping and resilience in the face of aging-related disability can identify opportunities to support and facilitate aging well among U.S. women. Implications of these findings for future research, health promotion, and public health programming for women as they age will be discussed.

SESSION 1410 (SYMPOSIUM)

UNDERSTANDING ASSOCIATIONS OF MEDICINES WITH GERIATRIC SYNDROMES: IMPLICATIONS FOR PRESCRIBING AND DEPRESCRIBING

Chair: S. Hilmer, *Royal North Shore Hospital, Kolling Insitute of Medical Research, University of Sydney, St Leonards, New South Wales, Australia, NHMRC Cognitive Decline Partnership Centre, Sydney, New South Wales, Australia*

Discussant: C. Boyd, *Johns Hopkins University School of Medicine, Baltimore, Maryland*

Geriatric syndromes (eg falls, confusion, incontinence, frailty) often occur with polypharmacy (use of 5 or more medicines) and/or use of specific classes of medicines. Here we will provide an overview of recent observational and interventional research studies that provide insights to the strength, mechanisms and causation of these associations. Our multidisciplinary international presenters will discuss new research and conceptual frameworks that can be applied to the practice of prescribing and deprescribing (withdrawing) medicines in older adults. Dr Gnjidic (pharmaco-epidemiologist, Australia) will review what pharmaco-epidemiology research tells us about the associations between medicines and geriatric syndromes. A/Prof Hilmer (geriatrician and clinical pharmacologist, Australia) will discuss the impact of interventional studies of prescribing and deprescribing on geriatric syndromes. Prof Patricia Slattum (pharmacist, USA) will present her recent study that addresses confounding by indication with an in depth investigation of the relationship between poor sleep, sleeping tablets and falls. A/Prof Cara Tannenbaum (geriatrician, Canada) will apply the principle of therapeutic competition to prescribing for older people with urinary incontinence. Dr Emily Reeve (pharmacist, Australia) will describe the development and application of a patient centred deprescribing process. Our discussant, A/Prof Cynthia Boyd (geriatrician, USA), will integrate these concepts and apply them to management of complex older people with multi-morbidity and geriatric syndromes.

INTERVENTIONAL STUDIES OF PRESCRIBING AND DEPRESCRIBING: IMPACT ON GERIATRIC SYNDROMES

S. Hilmer, *Royal North Shore Hospital, Kolling Insitute of Medical Research, University of Sydney, St Leonards, New South Wales, Australia*

Exposure to specific drug classes has been shown to cause geriatric syndromes such as falls, confusion and/or incontinence in relatively short term interventional studies. The pharmacologic mechanisms are often well understood and the effects can be reversed by deprescribing (drug withdrawal). No interventional studies have demonstrated that drugs cause frailty or that drug withdrawal can reverse it. Interventional studies of medicines to prevent or treat geriatric syndromes have had limited success. It is unethical to perform interventional prescribing studies to determine the effects of polypharmacy (use of >5 medicines) and other measures of 'high risk' or 'potentially inappropriate' prescribing on geriatric syndromes. There is scope to examine the impact of withdrawing these exposures on geriatric syndromes. However, clinical studies are limited by ethical and feasibility constraints and by enormous inter-individual variability in exposures (at baseline and after withdrawal), co-morbidities and environmental factors, which may all contribute to these multi-factorial outcomes.

WHAT DOES PHARMACO-EPIDEMIOLOGY TELL US ABOUT THE ASSOCIATIONS BETWEEN MEDICINES AND GERIATRIC SYNDROMES?

D. Gnjidic, *Faculty of Pharmacy, The University of Sydney, Sydney, New South Wales, Australia*

Evidence from pharmaco-epidemiological studies suggests that multiple drug use and high risk drugs contribute to risk of developing geriatric syndromes including frailty and cognitive impairment. However, research on how drugs influence clinical outcomes in older people who have already developed a geriatric syndrome is limited. In our prospective study of older people with and without Alzheimer's disease (AD) (n=33,206) there was a dose-response relationship between cumulative anticholinergic and sedative drug use and hospitalization and mortality over 1-year. In a prospective study of community-dwelling men aged ≥70 years (n=1,705) we found no association between statins and institutionalization (hazard ratio, HR=1.60; 95%CI 0.98-2.63) or mortality (HR=0.88; 95%CI 0.66-1.18). Moreover, frail men were two times more likely to be institutionalized and die over 7-years compared to non-frail men, regardless of statin use. It is critical to establish whether drugs do more good than harm in older adults with established geriatric syndromes.

UNTANGLING CONFOUNDING BY INDICATION: POOR SLEEP, SLEEP MEDICATIONS AND FALLS

Y. Min, P.W. Slattum, *Department of Pharmacotherapy and Outcomes Science, Virginia Commonwealth University, Richmond, Virginia*

Poor sleep, use of sedative medications and falls are common among older adults. In the 2010 Health and Retirement Study (n=9,937), 71% of older adults reported sleep problems and 21% reported taking medications or other treatments to help sleep in the past two weeks, and 36% reported falling in the past two years. In a prospective study of older adults living in retirement communities (n=116), 70% reported poor sleep quality based on the Pittsburgh Sleep Quality Index and 42% reported taking medications or other treatments to aid sleep. Falls were assessed over 6 months. In both studies, the association between the risk of falls, poor sleep and sleep medications was evaluated. Use of sleep medications is associated with an increased risk of falling regardless of sleep quality reported. It is important to consider medication-associated risk when treating sleep problems in older adults.

CAUSE, EFFECT AND MANAGING THERAPEUTIC COMPETITION: MEDICINES THAT CAUSE INCONTINENCE AND MEDICINES THAT TREAT INCONTINENCE AND CAUSE OTHER GERIATRIC SYNDROMES

C. Tannenbaum, *Université de Montréal, Montreal, Quebec, Canada*

Urinary incontinence complicates the management of other geriatric syndromes such as falls and dementia. For example, prescription of cholinesterase inhibitors for dementia can precipitate urinary incontinence. Conversely, treatment of incontinence with antimuscarinic medication may attenuate the effect of cholinesterase inhibitors. Another example is heart failure. Up to 50% of heart failure patients suffer from urinary incontinence, which exacerbates functional decline. The association between heart failure and incontinence may be attributable to worsening heart failure pathophysiology. However, medications used to treat heart failure, such as diuretics or ACE inhibitors may also indirectly provoke urinary symptoms. This type of bidirectional drug-disease interaction, in which the treatment for the first condition adversely impacts the second, and subsequent treatment of the second condition exacerbates the first, can be termed therapeutic competition. Recommendations and practical tips will be provided that outline more judicious management of incontinence in patients with other geriatric syndromes and comorbidities.

THE DEVELOPMENT AND APPLICATION OF A PATIENT-CENTERED DEPRESCRIBING PROCESS

E. Reeve, *1. University of Sydney, St Leonards, New South Wales, Australia, 2. NHMRC Cognitive Decline Partnership Centre, Sydney, New South Wales, Australia, 3. University of South Australia and Royal Adelaide Hospital, Adelaide, South Australia, Australia*

The term 'deprescribing' has been utilized to describe the complex process that is required for safe and effective medication cessation. Patients play an important role in their own health, and their attitudes towards deprescribing must be investigated and acknowledged for clinicians to provide optimal care. We recently conducted a review of previously proposed deprescribing processes and relevant literature to develop the patient-centered deprescribing process; a five step cycle that encompasses gaining a comprehensive medication history, identifying potentially inappropriate medications, determining if the potentially inappropriate medication can be ceased, planning the withdrawal regimen (e.g. tapering where necessary) and provision of monitoring, support and documentation. The evidence to support the individual steps of the process is limited, however, it provides important practical insights into deprescribing in clinical practice, in particular for older people with cognitive impairment and associated functional decline.

SESSION 1415 (SYMPOSIUM)

IN-HOME RESEARCH ON TECHNOLOGIES FOR AGING IN PLACE

Chair: E. Gonzalez, *Georgia Tech Research Institute, Atlanta, Georgia*

Co-Chair: C.M. Galambos, *University of Missouri, Columbia, Missouri*

Technology can provide supportive solutions for older adults to maintain independence. For these gerotechnology innovations to effectively support aging in place, research should incorporate the home environment. This symposium highlights four research initiatives that conduct in-home research on technologies for aging in place and represent a spectrum of home laboratory settings. Presentations will discuss these distinct but complementary research projects emphasizing research goals, capabilities, studies, and limitations of each initiative. Attendees of this symposium will 1) become familiar with recent advances of in-home research on gerotechnology 2) understand applied benefits of home laboratories and 3) recognize challenges related to privacy issues, development of interdisciplinary teams, and obtaining ground truth. The Center for Advanced Studies in Adaptive Systems (CASAS), Washington State University, utilizes smart home environments to conduct remote health and activity monitoring, establish predictive algorithms, and develop technological interventions to promote aging in place. At Georgia Tech, a multidisciplinary research team utilizes HomeLab, a population of over 550 independent living older adults, to conduct in-home evaluations of health and wellness technologies. From Oregon Health and Science University, the Oregon Center for Aging and Technology (ORCATECH) Life Lab is a population of community-dwelling older adults who participate in studies of health assessment and intervention within their homes outfitted with embedded sensing and computing technologies. Tiger Place is a University of Missouri affiliated senior living neighborhood, where an interdisciplinary team at the Center for Eldercare and Rehabilitation Technology (CERT) investigate, develop, and evaluate technologies for aging in place and coordinated healthcare.

CASAS: A SMART HOME IN A BOX

D. Cook, *Washington State University, Pullman, Washington*

The possibilities of using smart homes for health monitoring and assistance are extraordinary and are timely given the aging of the population. Participants at this talk will learn about smart home technologies and hear about the CASAS "smart home in a box" that can be easily installed and used out of the box. They will also find out how activities can be identified from sensor data and used to identify markers that indicate potential health issues. They will also learn how the information can be used to design activity-aware health interventions.

GEORGIA TECH HOMELAB: BRINGING TECHNOLOGY HOME TO SUPPORT AGING IN PLACE

E. Gonzalez, C. Bailey Fausset, W. Fain, *Georgia Tech Research Institute, Atlanta, Georgia*

As the gerotechnology market expands, research investigating the needs, consumer preferences, and home environments of older adults is essential. Georgia Tech's HomeLab initiative utilizes a multidisciplinary research team and an older adult population to conduct in-home health and technology research. HomeLab includes 556 participants (Mage = 71.5 years; SD = 9.8; Range: 50-100) living independently in Metro Atlanta. Demographic, health, lifestyle, and home environment data are collected for each participant; from these data, potential participants can be quickly identified for specific studies. HomeLab collaborates with industry and academia to enable innovation and support research by conducting user testing, ethnographic research, and longitudinal studies. Projects have included evaluating a remote health monitoring system, identifying user preferences for wearable health devices, surveying social media use, assessing use and attitudes about activity trackers, and investigating everyday technology usage. This presentation will highlight the HomeLab population, projects, challenges, and future research directions.

THE OREGON CENTER FOR AGING AND TECHNOLOGY (ORCATECH) LIFE LABORATORY: BUILDING EVIDENCE FOR EFFECTIVE PERVASIVE COMPUTING APPROACHES TO FACILITATE AGING IN PLACE

J. Kaye, K. Wild, P. Jacobs, N.C. Mattek, L. Boise, D. Austin, N. Larimer, H.H. Dodge, *Oregon Health & Science University, Portland, Oregon*

Current approaches to capturing data about health and well-being are limiting, relying largely on brief episodic encounters dependent on personal recall or data that imprecisely incorporates the time domain and are prone to be ecologically invalid. Recent developments (pervasive and ubiquitous computing, in-home and community based embedded sensing, wireless communication and "data mining" technologies) challenge the prevalent paradigm so as to provide real-time, real-world data that are objective, continuous and ecologically valid. ORCATECH has focused on creating extensible research procedures, a unique Life Laboratory of community volunteers, basic functional algorithms of human health-related activity and distinctive collaborations to create new knowledge and facilitate dissemination of evidence for using this new research approach. Based on over 1,000 community volunteers covering over 1,000,000 hours of continuous home assessment, examples of how this approach provides unique insight into key functions (cognition, socialization, physical activity and health) vital for maintaining independence will be presented.

TIGERPLACE: SUPPORTING AGING IN PLACE WITH TECHNOLOGY

C.M. Galambos[1,2], M. Skubic[3], M.J. Rantz[2], S. Miller[2], G.L. Alexander[2], J.M. Keller[3], M. Popescu[4], *1. School of Social Work, University of Missouri, Columbia, Missouri, 2. University of Missouri Sinclair School of Nursing, Columbia, Missouri, 3. University of Missouri Electrical and Computer Engineering Department, Columbia, Missouri, 4. University of Missouri Health Management Informatics Department, Columbia, Missouri*

The University of Missouri Eldertech Research Team has developed an unobtrusive, environmentally mounted, in-home monitoring system that detects changes in health status and supports aging in place. Our approach has demonstrated significantly lower costs and improved outcomes for our TigerPlace residents. A retrospective analysis of 104 significant events using our monitoring system revealed that changes appeared in the sensor data approximately two weeks prior to the health event. Using this information, an alert system was developed and tested in a one year prospective study. Alerts were sent to health care providers via secure e-mail of 20 intervention participants. Testing on a number of physical functioning measures, the intervention group showed significant improvement as compared to the control group. Current projects include the development of a hydraulic bed sensor, using Kinect depth images for in-home gait analysis and fall detection, and Doppler radar to detect falls and capture in-home walking speed.

SESSION 1420 (SYMPOSIUM)

FARMING FOR HEALTH: EXPLORING BENEFITS OF GREEN CARE FARMS FOR PEOPLE WITH DEMENTIA AND THEIR CAREGIVERS

Chair: J.P. Hamers, *CAPHRI School for Public Health and Primary Care, Maastricht, Netherlands*

Co-Chair: H. Verbeek, *CAPHRI School for Public Health and Primary Care, Maastricht, Netherlands*

Discussant: H. Chaudhury, *CAPHRI School for Public Health and Primary Care, Maastricht, Netherlands*

Innovations in health and social care are highly warranted, as the number of older people with chronic diseases are rising and a shortage of staff and resources is foreseen. Green Care Farms are new initiatives originated outside the healthcare sector to enable people with dementia and their family caregivers to live independently and to participate in society for as long as possible. Green care farms combine agricultural activities with care services for a diverse range of client groups from the health-care and welfare sector, including those with dementia. As opposed to regular health care institutions (e.g. residential and nursing homes), green care farms offer care activities in a home-like and small-scale setting. Green care farming is an upcoming phenomenon in the USA, Europe, and Japan. This symposium will provide insight into the potential value of green care farming for people with dementia and their family caregivers based on experiences from the Netherlands, United Kingdom and the USA. The first presenter provides insight into the potential value of day care for people with dementia and their family caregivers in terms of social participation. The second presentation addresses a first experiment of structural farm based day programs for seniors in the US. The third presenter focuses on green care farms as an alternative for 24hour nursing home care. Finally, presentations from the United Kingdom address the evaluation of an innovative intervention which helps people with dementia enjoy outdoors activities and being involved with animals, which has similarities with green care farms.

GREEN CARE FARMS FOR PEOPLE WITH DEMENTIA AS AN ALTERNATIVE TO TRADITIONAL NURSING HOME CARE

H. Verbeek, B. de Boer, L. Bastings, J.P. Hamers, *CAPHRI School for Public Health and Primary Care, Maastricht, Netherlands*

Objective: New dementia care models are increasingly directed towards small scale and homelike environments. In the Netherlands, green care farms combine agriculture with care activities, predominantly focused on daycare for people with dementia. This project, however, explores a green care farm providing 24hour nursing care. Methods: Mixed-method case study, collecting quantitative data on the physical environment and qualitative data on participants' experiences. Results: A dairy farm has established two small scale, homelike settings for 18 people with dementia at their farm. First experiences indicate more opportunity for meaningful activities for residents, as these are integrated in the physical environment. For example work related (gardening, feeding animals, sweeping the yard) and domestic activities (preparing meals) are facilitated. Conclusion: Positive first experiences were reported with a green care farm as an alternative for traditional nursing homes. However, more insight is needed in the quality of care provided, costs and effects on residents' quality of life.

ADVENTURES IN DEMENTIA: PROMOTING THE BENEFITS OF OUTDOOR ACTIVITY FOR PEOPLE WITH DEMENTIA

S.C. Evans, D. Brooker, J. Bray, *Association for Dementia Studies, University of Worcester, Worcester, United Kingdom*

Objective: To evaluate a programme encouraging staff to include people with dementia in outdoor activities. There is limited but growing evidence for the benefits of engagement with the natural environment for people living with dementia. The 'Natural Leaders' programme, delivered by Dementia Adventure in the UK, encouraged leisure and recreational organisations to include more people with dementia in their activities. The Association for Dementia Studies, based at the University of Worcester, were commissioned to evaluate the effectiveness of the programme. Methods: A mixed methods approach was adopted based on survey tools, established measures and in depth interviews to explore the impact of the training on staff. Results; Increased knowledge of dementia, altered attitudes towards risk and dementia, and higher levels of confidence about working with clients with dementia. Conclusion: Targeted training can support leisure and recreational staff to engage with people living with dementia and include them in outdoor activities.

INTERGENERATIONAL CARE FARM PROGRAMS IN MONTANA, USA FISCHER MF, SHEPPARD L

M.M. Fischer[1], L. Sheppard[2], *1. Day Programs, A Plus Health Care, Kalispell, Montana, 2. Agency on Aging, Kalispell, Montana*

Objective: Care farming is a new phenomenon in the US. First programs have been implemented on farms in Flathead Valley, Montana. In this pilot, the Area Agency on Aging, A Plus Health Care and eight farms have created care farm programs. Method: Mixed-method approach using qualitative interviews and quantitative measurements, including the empowerment matrix and the Geriatric Depression Scale. Results: Seniors suffering from depression, loneliness or substantial physical inactivity, and cases for respite care were offered opportunities to participate in a day on the farms (n=40; average age 76 years; 60% female). Focus was given to mixes of intergenerational participants of varying disabilities. Results involved increased stamina, improved GDS'scores, decreased problem-behaviors and significant effects in terms of respite and the ability to remain in a home-based care setting. Conclusion: The programs are seen as an innovative example of the paradigm shift in health care towards prevention, wellness and community inclusion.

MAINTAINING SOCIAL PARTICIPATION OF PEOPLE WITH DEMENTIA AND THEIR FAMILY CAREGIVERS; THE ROLE OF DAY CARE AT GREEN CARE FARMS

S. De Bruin, A. Stoop, C. Molema, C. Baan, *Centre for Nutrition, Prevention and Health Services, National Institute for Public Health and the Environment, Bilthoven, Netherlands*

Objective: Determine the value of green care farms (GCFs) for people with dementia and their family caregivers in terms of social participation. Methods: Semi-structured interviews with family caregivers and their relatives with dementia that attended day care at a GCF (GCF group, n=21) or attended regular day care (RDCF group, n=17). Results: People with dementia in the GCF group were primarily males (85%) of 71 years on average that all had a spousal caregiver, whereas those in the RDCF group were mostly females (53%) of 85 years on average that mostly had non-spousal caregivers (77%). In both groups, respondents indicated that day care positively affected their social participation. The aspects of social participation and the extent to which these aspects were affected, however, differed between the groups. Conclusion: Both differences in how both settings address social participation and characteristics of people with dementia and their family caregivers determine social participation.

SESSION 1425 (PAPER)

FORM, FUNCTION & FITNESS

IGF-1 AND LEAN MASS BEFORE AND AFTER A RESISTANCE EXERCISE IN FREE LIVING ELDERLY

A. Ramel, O.G. Geirsdottir, P.V. Jonsson, I. Thorsdottir, *University of Iceland, Reykjavik, Iceland*

Background and aim: As insulin-like growth factor-1 (IGF-1) is related to the preservation of muscle mass. Both acute and chronic resistance exercise has consistently been shown to increase intramuscular levels of IGF-1. Conversely, prospective studies investigating the effect of resistance training on circulating levels of IGF-1 have provided inconsistent results. The aim of the present study was to investigate circulating total IGF-1 in old adults who engaged in a 12 weeks of progressive resistance training. Methods: Subjects (N=236, 73.7±5.7 years, 58.2% female) participated in a 12-week resistance exercise program (3 times/week; 3 sets, 6-8 repetitions at 75-80% of the 1-repetition maximum), designed to increase strength and muscle mass of major muscle groups. Body composition and circulating IGF-1 were assessed. Results: At baseline IGF-1 was significanctly associated with lean mass (also when corrected for age, gender and various covariates). After the training period IGF-1 decreased significantly from 112.1 ± 35.6 to 106.1 ± 35.2 μg/L. On and individual level, IGF-1 decreased in 59% and increased in 39% of the participants. A reduction in IGF-1 was associated to greater gains in lean mass (r = -0.185, P =0.009) and appendicular muscle mass (r = -0.164, P =0.017) also when corrected for various confounders. Conclusion: Our study confirms known correlations between lean mass and IGF-1 in old adults. A reduction of IGF-1 after training was associated with higher gains in lean mass which indicates a redistribution of IGF-1 to the site of muscle building as hypothesized previously.

REDUCTIONS IN ADIPOSITY AND INCREASES IN LEG STRENGTH, BUT NOT MUSCLE MASS, REDUCE THE RISK OF MOBILITY IMPAIRMENT IN ADULTS WITH CHRONIC DISEASE

Y. Mavros[1], B. Parmenter[2,1], A. Wright[1], T.W. Tsang[1], P. Cormie[3], D. Galvao[3], R.U. Newton[3], M.A. Fiatarone Singh[1], *1. University of Sydney, Lidcombe, New South Wales, Australia, 2. University of New South Wales, Sydney, New South Wales, Australia, 3. Edith Cowan University, Joondalup, Western Australia, Australia*

Aim: We hypothesized that lower fat mass (FM) and higher leg strength, but not greater muscle mass (SMM), would independently reduce risk of impaired gait. Method: Data were pooled from 7 clinical trials in adults (> 40 years). The lowest quintile of gait was categorized as impaired; quintiles 2-5 categorized as normal. FM and SMM were determined using bioelectrical impedance assessment (BIA) or dual energy x-ray absorptiometry (DXA). Maximal knee extension (KE) strength was measured. Variables significantly different between gait speed categories were converted into quintiles, and entered into a logistic regression model, with age, sex and height as covariates. Results: Data were available in 715 participants (349 men, 366 women): 136 (19%) had impaired gait (0.96±0.16m/s); 579 (81%) had normal gait (1.29±0.15m/s). KE, FM and SMM were all significantly different between gait speed categories ($p<0.05$). Compared to the lowest quintile of KE, quintile 2 had a significantly reduced risk of impaired gait (OR 0.38; 95% CI 0.21 – 0.67) ($p<0.01$), with quintiles 3, 4 and 5 showing similary significant reductions. Similarly, compared to the lowest quintile of FM, quintile 2 had a significant reduction in risk for abnormal gait (OR 0.46; 95% CI 0.24 – 0.87) ($p=0.02$), with quintiles 3, 4 and 5 showing similar reductions in risk. Quintile of SMM was unrelated to gait category ($p>0.05$). Conclusions: Higher lower leg strength and lower adiposity independently reduce risk of impaired gait. Progressive resistance training addresses both domains, and is thus a potentially robust intervention for preservation of gait velocity with age.

COMPARISON OF HIGH- AND LOW-VELOCITY RESISTANCE TRAINING IN OLDER ADULTS: FUNCTIONAL FITNESS OUTCOMES

M. Powers[1], M. Gray[2], S. Smith[1], *1. University of Cental Oklahoma, Edmond, Oklahoma, 2. University of Arkansas, Fayetteville, Arkansas*

Recent studies have suggested that high-velocity resistance training (HV) may be more effective at improving functional outcomes than low-velocity resistance training (LV), but these results are equivocal. The purpose of this study was to compare functional fitness changes following HV to those experienced following LV. Forty-two participants over the age of 75 years completed the 52-week intervention. Participants were randomly assigned to HV, LV, or an active control group. Functional fitness was assessed using three tests from the Senior Fitness Test: chair stand test (CS), arm curl test (AC), and the 8-foot up-and-go test (UPGO). Assessments were taken at baseline, 26-, and 52-weeks. Repeated measures ANOVA revealed no significant interaction effects, but significant time effects were observed for all three tests ($p < .05$). Post host analyses indicated that the greatest improvements occurred in the first 26 weeks of training. AC continued to improve significantly from 26 to 52 weeks, but CS and UPGO plateaued after six months of training. These results indicate that HV is not different than LV training. In fact, neither is significantly different than the active control group, although univariate effect sizes indicated greater improvements in the HV and LV groups than the active control group. As expected, these results support that initiating an exercise program, regardless of intensity or velocity, improves functional fitness.

SARCOPENIA PREVALENCE BY DIABETES IN OLDER ADULTS IN THE HEALTH ABC STUDY

N. Chiles[1], Y. Huang[2], E.S. Strotmeyer[3], J. Guralnik[4], T.B. Harris[5], A.B. Newman[3], A. Ryan[4,6], D. Orwig[4], *1. University of Maryland, Baltimore, Baltimore, Maryland, 2. University of Maryland Baltimore County, Baltimore, Maryland, 3. University of Pittsburgh, Pittsburgh, Pennsylvania, 4. University of Maryland School of Medicine, Baltimore, Maryland, 5. National Institute on Aging, Bethesda, Maryland, 6. Baltimore Veterans Affairs Medical Center, Baltimore, Maryland*

Sarcopenia, defined by age-related low muscle mass, has been shown to be higher among diabetic vs. non-diabetic older adults. However, previous studies used definitions of low muscle mass, but did not additionally include low muscular strength as recently recommended. We determined the prevalence of sarcopenia among diabetic compared to non-diabetic participants in the Health, Aging, and Body Composition Study (Health ABC), a prospective cohort aged 70-79 years (N=2330; 54% women, 39% black, age 77.5+2.8 years) at 1997-98 enrollment. Sarcopenia was defined by concurrent low DXA-measured appendicular lean mass normalized for height (< 5.67kg/m2 for women; <7.23kg/m2 for men) and low grip strength (<20kg for women; <30kg for men). Diabetes was defined by self-reported diagnosis, use of hypoglycemic drugs, and fasting blood glucose, and glycemic control by Hemoglobin A1c (HbA1c) levels. Among diabetic participants, 60% had a diabetes duration >5 years. Diabetes was categorized as: none (n=1884), controlled (HbA1c<7%; n=270), and poorly-controlled (HbA1c>7%; n=176). Multivariable logistic regression analyses tested the association between diabetes at year 4 with sarcopenia at year 6. Sarcopenia prevalence at year 6 was 8.06% among those without diabetes vs. 5.74% with controlled diabetes, and 4.22% with poorly-controlled diabetes ($p=0.11$). Adjusting for age, sex, race, BMI, and comorbidities, controlled diabetes (OR:0.27; 95% CI:0.06-1.3), and poorly-controlled diabetes (OR:0.58; 95% CI:0.09-3.92) had no difference in sarcopenia at year 6 compared to those without diabetes. Using recent definitions incorporating strength, sarcopenia may not vary by diabetes/glucose control in older adults.

RELATIONSHIP OF SARCOPENIA AND FUNCTIONAL FITNESS AMONG COMMUNITY-DWELLING OLDER ADULTS

M. Gray[1], A. Binns[1], J.M. Glenn[1], J. Vincenzo[1], S. Paulson[2], *1. University of Arkansas, Fayetteville, Arkansas, 2. Shippensburg University, Shippensburg, Pennsylvania*

Sarcopenia is defined as age-related loss of lean-tissue mass (LTM) and is related to reductions in muscular strength and function. However, the relationship between sarcopenia, functional fitness (FF), and muscle function has not been adequately studied. Therefore, the purpose of the present investigation was to determine the relationship between sarcopenia and selected measures of FF and muscle function. Community-dwelling older adults ($n = 54$) were recruited from the surrounding area. Each participant performed the following assessments: 10-meter habitual walk (HW), 30-second chair stand (CS), chair stand power (POW), and dual energy x-ray absorptiometry (DXA). Appendicular skeletal mass (aSM), a measure of sarcopenia, was calculated by adding LTM (kg) of arms and legs and dividing by height (m2). Multiple regression analysis was performed to determine the amount of variance accounted for in aSM by the independent variables (HW, CS, POW). Results indicated 56% of the variance in aSM was accounted for by the predictor variables. The variable with the greatest unique contribution was POW, accounting for 54%. Based on the results, POW is the most significant contributor to aSM. This is important for clinicians that may not have access to DXA results. Furthermore, future studies are needed evaluating the relationship between sarcopenia, muscular power, and intervention strategies to decrease the loss of LTM with age.

SESSION 1430 (PAPER)

LONG TERM CARE II

PREVALENCE OF MRSA COLONIZATION IN ELDERLY RESIDENTS OF LONG-TERM CARE FACILITIES: A SYSTEMATIC REVIEW AND META-ANALYSIS

M. Pogorzelska-Maziarz, K.J. Alvarez, A. Smaldone, E.L. Larson, *School of Nursing, Columbia University, New York, New York*

Background: Infections caused by methicillin-resistant Staphylococcus aureus (MRSA) cause significant morbidity and mortality in long-term care facilities (LTCF). The objective of this study was to estimate the burden of MRSA colonization in LTCFs. Methods: A systematic search of the MEDLINE database was conducted from 2000 through August 2012 using PRISMA guidelines. A pooled prevalence of MRSA across studies was estimated using a random effects meta-analysis model. Heterogeneity was assessed using Cochran Q and I2 statistics. Sensitivity analyses were conducted to examine the effect of potential sources of heterogeneity across studies according to study characteristics. Findings: Twenty nine studies met the inclusion criteria for meta-analysis. Twenty five focused specifically on MRSA and four reported on multiple organisms. All but three studies used a cross-sectional design; only five utilized a random sampling of participants. The reported prevalence of MRSA ranged from 0-63%. A pooled MRSA prevalence of 11.9% (95% CI 9.2-15.2) was estimated based on 27,254 LTCF residents. Heterogeneity was greater than expected by chance (p-value≤0.001). Pooled MRSA prevalence was higher in the US (33.1%, 95% CI 21.6-47.2%) compared to Asia (6.1%, 95% CI 4.9-7.6%) and Europe (8.6%, 95% CI 6.2-11.8%). . Additionally, MRSA prevalence differed by specimen sites and rate of participation but not by study quality. Interpretation: The burden of MRSA in LTCFs is substantial; however, estimation of prevalence differs by geographic region, as well as variation in sampling. Continued surveillance is needed along with greater attention placed on prevention of MRSA in LTCFs.

EFFICACY OF A MULTIPARAMETRIC TELEMONITORING SYSTEM ON MORTALITY AND HOSPITAL ADMISSIONS OF ELDERLY PATIENTS WITH HEART FAILURE

C. Pedone[1,2], F.F. Rossi[1], L. Costanzo[1], R. Antonelli Incalzi[1,3], *1. Università Campus Bio Medico di Roma, Roma, Italy, 2. Fondazione “Alberto Sordi”, Roma, Italy, 3. Fondazione San Raffaele, Cittadella della Carità, Taranto, Italy*

Background. Trials on the efficacy of telemonitoring (TM) in heart failure (HF) have yielded contrasting results. We evaluated the effect of an innovative model integrating TM vital parameters and telephone support on 6-months survival and hospital admissions of elderly patients with heart failure. Methods and results. This was a parallel arms, randomized trial including HF patients aged 65 or older discharged from acute care ward or day-hospital. Patients were randomly assigned to the intervention group (TM of oxygen saturation, heart rate, and blood pressure plus telephone support, N = 47) or standard care (N = 43), and were followed up for 6 months. The outcome measure was a combination of all-cause death and hospital admissions. The mean age of the sample was 80 years, with an average ejection fraction of 46. The two groups were similar with the exception of prevalence of women and of disability (both more common in the control group). Incidence of the outcome was 42% in the control group and 21% in the intervention group (relative risk: 0.508, 95% CI: 0.508 – 0.977). The results were unchanged after taking into account the setting of enrollment, gender and disability (hazard ratio: 0.419, 95% CI: 0.187 – 0.937). Conclusions. TM of elderly people with HF is feasible and reduces the risk for death and hospitalization. Further studies are needed to confirm these findings and evaluate the cost-efficacy of the service.

REDUCING REHOSPITALIZATIONS FOR NURSING HOME RESIDENTS: APRNS CHAMPIONING THE CHANGE

L.L. Popejoy, A.A. Vogelsmeier, M. Flesner, M.J. Rantz, A. Lueckenotte, M. Niemeyer, *University of Missouri, Columbia, Missouri*

The Missouri Quality Initiative for Nursing Homes is one of the enhanced care and coordination providers funded through Centers for Medicaid and Medicare as a four-year demonstration project. Project goals include reducing avoidable hospitalizations, improving transitions of care, improving outcomes, and lowering costs. To achieve these goals advanced practice registered nurses (APRNs) were deployed into sixteen nursing homes in St. Louis, Missouri. Throughout all phases of the initiative, APRNs are being asked to document their integration into the nursing home setting; giving insight into challenges they faced when introducing advanced practice nursing into the nursing home setting. Major challenges include (a) building critical relationships with staff and management, (b) learning about the environment contemporaneous to changing the environment, (c) struggling for legitimacy, (d) changing the APRN’s mindset from primary care to long term care, and (e) influencing change at the organization and resident level. Organizational structures that were identified as contributing to the APRNs early successes included: (a) a united and functional administrator and director of nursing dyad, (b) willingness of the home and their corporate structure to change, and (c) willingness of the nursing home and their corporate structure to consider solving problems in novel ways. APRNs have great potential to improve resident outcomes, however; nursing homes leaders must be willing to hire and support the development of these well-educated staff. Moreover, APRNs have the ability to influence positive change by supporting front-line nursing home staff to consider new ways to address resident problems.

SUPPORTING AUTONOMY OF NURSING HOME RESIDENTS WITH DEMENTIA IN THE INFORMED CONSENT PROCESS

E. Beattie[1], D. Fetherstonhaugh[4], M. O’Reilly[1], W. Moyle[2], L. Chenoweth[3], E. Fielding[1], A. Group[5,6,1], *1. School of Nursing, Queensland University of Technology, Brisbane, Queensland, Australia, 2. Griffith University, Brisbane, Queensland, Australia, 3. University of Technology, Sydney, New South Wales, Australia, 4. LaTrobe University, Melbourne, Victoria, Australia, 5. Curtin University, Perth, Western Australia, Australia, 6. University of Tasmania, Hobart, Tasmania, Australia*

Proxy informed consent is commonly obtained in dementia research, although few researchers report undertaking formal assessment of the person with dementia’s consent capacity. This paper reports on an Australian national study of quality of life of people with dementia living in nursing homes (n=442) in which the Evaluation to Sign Consent (ESC) measure (Resnick et al., 2007) was used to determine capacity to provide informed consent. The vast majority of legal proxies (91%) gave permission for the person with dementia to be evaluated. Of the 404 participants who were administered the ESC, 95 (23.5%) were judged as able to consent. This finding highlights the importance of giving people with dementia the opportunity to provide their own consent. Ability to consent, as expected, was highly associated with level of cognitive impairment (measured by SMMSE categories of unable to complete, less than 10/30, 10+/30; $\chi2$ =92.28, df=3, p<.001), but not associated with gender ($\chi2$=0.91, df=1, p=.341), age (<80, 80-90, 90+ years; $\chi2$=.772, df=2, p=.680) or level of education (less than 10 years, junior certificate, high school certificate, trade certificate/diploma, bachelor’s degree; $\chi2$=6.800, df=4, p=.147). The practical management of informed consent procedures involving evaluation of aspects of capacity with the person with dementia will also be discussed. Although a diagnosis or suspicion of dementia constitutes reasonable grounds for doubt concerning capacity, researchers need to consider evaluating capacity with validated tools to ensure that the autonomy of potential participants is respected and not unduly diminished.

SESSION 1435 (SYMPOSIUM)

RESIDENTIAL CARE COMMUNITIES: THE EFFECT OF DEMENTIA ON HOSPITAL AND EMERGENCY DEPARTMENT USE, FACILITY CHARGES TO RESIDENTS FOR CARE, AND STAFFING

Chair: J. Wiener, *RTI International, Washington, District of Columbia*
Discussant: E. Rosenoff, *US DHHS, Washington, District of Columbia*

Residential care communities, including assisted living facilities, are an important component of long-term services and supports. In 2010, there were 31,100 facilities with 733,400 residents. This symposium presents analyses of the National Survey of Residential Care Facilities, the first nationally representative survey of residential care communities. Sponsored by the National Center for Health Statistics, the Office of the Assistant Secretary for Planning and Evaluation, and other federal agencies, this survey obtained responses from 2,302 communities and about 8,094 residents. The first presentation analyzes the effect of dementia on hospital and emergency department use. Although other studies found that older people age 65 and older in the community with dementia have much higher hospital and emergency department use than people without dementia, this is not the case for residents of residential care communities. The presentation also examines the effect of variables such as ownership type and staffing levels on use. The second paper analyzes residential care community charges for care. In 2010, communities charged residents an average of $37,988 per year; average annual charges were higher for residents with cognitive impairment and for residents living in larger communities. The third paper analyzes staffing in residential care facilities. On average, residents receive slightly over 2 hours of total care per resident per day. Staffing hours for most staff types decrease significantly as the size of the community increases. Almost all residential care communities require training of personal care workers; the most common requirement is to require less than 75 hours of training.

WORKFORCE IN RESIDENTIAL CARE: A NATIONAL PORTRAIT

G. Khatutsky[2], C. Ormond[2], J. Wiener[1], A.M. Greene[3], E. Jessup[3], M. Sengupta[4], C. Caffrey[4], L. Harris-Kojetin[4], *1. RTI International, Washington, District of Columbia, 2. RTI International, Waltham, Massachusetts, 3. RTI International, Research Triangle Park, North Carolina, 4. National Center for Health Statistics, Hyattsville, Maryland*

Residential care is an important component of long-term services and supports. This study, which analyzes the National Survey of Residential Care Facilities, provides a national picture of the residential care workforce. We report on types of staff employed in residential care setting, staffing ratios, and required training and fringe benefits offered to personal care aides. We also describe director background and qualifications and staff turnover. Approximately one-third of all communities have a registered nurse on site; almost all employ personal care aides or certified nursing assistants. Especially in many smaller communities, directors also provide hands-on personal assistance. On average, residents receive slightly over 2 hours of total care per resident per day— including nursing and personal care. Staffing hours for most staff types decrease significantly as the size of the community increases. Almost all residential care communities require training of personal care workers; the most common requirement is less than 75 hours of training.

EFFECT OF DEMENTIA AND COGNITIVE IMPAIRMENT ON HOSPITAL AND EMERGENCY DEPARTMENT USE AMONG RESIDENTIAL CARE COMMUNITY RESIDENTS

Z. Feng[2], J. Wiener[1], L. Coots[2], R.E. Johnson[3], *1. RTI International, Washington, District of Columbia, 2. RTI International, Waltham, Massachusetts, 3. RTI International, Research Triangle Park, North Carolina*

Little is known about hospital and emergency department (ED) use among people living in residential care communities (RCC) and whether use differs by the presence of dementia or cognitive impairment. Our analysis indicates that among older RCC residents in 2010, approximately 51% of residents had dementia or cognitive impairment. Of all residents, 23% were hospitalized and 34% visited the ED during the past year. Preliminary results from multivariate logistic regression models suggests that dementia or cognitive impairment was not significantly associated with the odds of having a hospitalization (adjusted odds ratio [AOR]=0.94, p=0.48), after adjusting for residents' demographics, functional status, chronic conditions, and other health characteristics. Presence of dementia or cognitive impairment also did not affect ED use (AOR=0.93, p=0.34). Among the factors increasing the likelihood of hospitalization or ED use were congestive heart failure, COPD, depression, high blood pressure or hypertension, stroke, and limitations in activities of daily living.

WHAT ACCOUNTS FOR VARIATION IN RESIDENTIAL CARE FACILITY CHARGES?

S. Karon[2], J. Wiener[1], G. Khatutsky[3], A.M. Greene[4], R.E. Johnson[4], *1. RTI International, Washington, District of Columbia, 2. RTI International, Madison, Wisconsin, 3. RTI International, Waltham, Massachusetts, 4. RTI International, Research Triangle Park, Northern Mariana Islands*

In 2010, the average charge for residential care across the US was $37,988 per year, much less than for nursing home care; average annual charges were higher for residents with cognitive impairment and for residents living in larger communities. Average charges vary widely, however, both when measured by the average facility level charge and when measured by the charge experienced by residents. Using data from the 2010 National Survey of Residential Care Facilities, we analyze sources of variation at both of these levels. Key sources of variation include facility characteristics, policies, and practices; rate structure; types of residents served; services provided; and market characteristics, including state Medicaid coverage. Implications for access to this important source of home and community-based care will be discussed.

SESSION 1440 (SYMPOSIUM)

STRATEGIES TO MOVE NURSING HOMES TO A QUALITY CULTURE AND A QUALITY SYSTEM: LESSONS FROM THE NATIONAL QAPI DEMONSTRATION

Chair: R.A. Kane, *DIv Health Policy & Management, University of Minnesota School of Public Health, Minneapolis, Minnesota*
Discussant: R. Kane, *DIv Health Policy & Management, University of Minnesota School of Public Health, Minneapolis, Minnesota*

The Affordable Care Act required Quality Assurance and Performance Improvement (QAPI) in nursing homes (NHs). The Centers for Medicare & Medicaid Services (CMS) was tasked to develop technical assistance and best practice information, and oversee a QAPI regulation. CMS enunciated a 5-element framework: i.e., design and scope; governance and leadership; feedback, data systems and monitoring; performance improvement projects (PIPs); and systematic analysis and systemic action. QAPI was intended to: be comprehensive and self-sustaining; be data-driven; use system approaches and root cause analysis; conduct structured PIPs to address data-driven quality priorities; and use an inclusionary approach to engage all staff in QAPI. This Symposium discusses lessons from the qualitative and quantitative evaluation of a 2-year QAPI demonstration in 17 diverse NHs (about ½ within corporations). Demo NHs joined a Learning Collaborative with in-person and webinar meetings, and received and commented on draft training materials, resources, and QAPI tools. The individual papers in the Symposium reveal that implementing QAPI locally in the NHs was a "tall order," requiring a major shift in work style and thinking. The demo NHs generally made progress in implementing QAPI, despite delays and derailments because of staff turnover and external stressors. Each presenter will highlight themes and lessons from the demo, leaving ample time for a panel and audience discussion of the timing and best strategies for making QAPI a reality in the nation's NHs. The panel also discusses how QAPI can help NHs succeed in the new health care environment, a point supported by the demo.

PUTTING QAPI IN PLACE: GETTING TOWARDS A PLAN AND A STRUCTURE

R.A. Kane, *DIv Health Policy & Management, University of Minnesota School of Public Health, Minneapolis, Minnesota*

Each NH needed to evaluate its own mission, goals and previous quality activities, invest resources in QAPI, and develop a leadership structure that broke down silos and reflected the full scope of QAPI. They were also tasked with engaging and training themselves, all department heads, and frontline staff. The demo NHs struggled with developing both breadth and depth of QAPI involvement, generating enthusiasm and trust, and encouraging the true cross-department and cross-discipline dialogue that would allow examination of system effects on quality. Success required investment of the attention of leaders and governing groups, but many models of leadership worked. Greatest challenges reported were: keeping a focus on QAPI; ensuring that QAPI's scope included post-acute services as well as long-stay services; balancing safety goals with goals for resident choice and autonomy, and developing a climate that included both individual accountability and an openness to discuss quality issues without fear of retribution.

DATA-DRIVEN MONITORING AND FEEDBACK AND PIPS IN THE QAPI DEMONSTRATION

E.M. McCreedy, R.A. Kane, R. Kane, *University of Minnesota, Minneapolis, Minnesota*

QAPI Element 3 challenges NHs to develop, display, and use data in a way that crosses departmental and disciplinary lines, turning data into actionable information, and incorporating resident feedback as data. NHs needed to monitor quality metrics at the aggregate level, using a dashboard or similar mechanism, and prioritize quality problems to select PIP topics (Element 4). Most demo homes conducted at least one PIP; the 49 PIPs in the demo varied in focus (e.g., quality of care, quality of life, human resources, transitions), complexity, and significance. The PIP process can entail: creating a project charter with measurable objectives; commissioning project teams balanced by discipline and including front-line staff; using process flowcharting to identify quality breakdowns and interventions, doing small-scale intervention tests; applying all phases of the Plan-Do-Study-Act (PDSA) PI cycle, and documenting the process. Common pitfalls, dashboards, and summaries of successful PIPs will be distributed and discussed.

BOTTOM-LINE: QUANTITATIVE ANALYSIS OF QAPI IMPLEMENTATION IN THE DEMONSTRATION, AND IIPLICATIONS FOR NATIONAL QAPI ROLLOUT

R. Kane, *School of Public Health, University of Minnesota, Minneapolis, Minnesota*

All demo homes were rated on their implementation of each QAPI elements; the results were analyzed according to other parameters of each NH. Five-star ratings at baseline, corporate ownership or tax structure, rural location, and culture change experience were not associated with degree of implementation; leadership turnover and multiple stresses reduced implementation. Overarching issues include: orchestrating a major shift starting with the comparatively low professional substrate and fragile ecosystems of NHs; melding a culture change to QAPI with the ongoing efforts at culture change towards individualized person-centered services; genuinely involving residents, including those with short stays, and family stakeholders; the large corporate advantage in mounting QAPI compared to a freestanding NH; the general role of regulatory mandates for a internally-driven QAPI process.; and determining a realistic time-frame to create a context for sustainable QAPI in most NHs.

DEVELOPING AND TESTING QAPI TOOLS, TRAINING, AND TECHNICAL ASSISTANCE

J. Pederson, K. O'Neill, M. Reierson, J.P. Lundblad, *Stratis Health, Bloomington, Minnesota*

Stratis Health (SH), a Quality Improvement Organization, performed a detailed analysis of objectives and tasks for any NH launching QAPI, and reviewed extant tools with potential to help NHs implement QAPI processes. Thirty-one QAPI Process Tools were drafted to test in the demo; most of these required substantial re-working for NHs. The NHs varied in the extent to which they adopted or adapted tools and their ratings of helpfulness. Tools for self-assessment, dashboard displays, prioritizing quality problems, structuring and conducting PIPs, and root-cause analysis were usually perceived positively but one size did not fit all. SH also led a structured Learning Collaborative with 3 in-person meetings and many webinars, some with "homework" and feedback NHs appreciated the collaborative structure, the stimulation provided and even the deadlines. Based on demo home feedback, on-line learning sessions are under-development with exercises and instructor guides to tailor to individual audiences at multiple levels.

SESSION 1445 (SYMPOSIUM)

INSIGHTS FROM THE NATIONAL HEALTH AND AGING TRENDS STUDY ON CAREGIVING AND UNMET NEED

Chair: J. Kasper, *Health Policy and Management, Johns Hopkins Bloomberg School of Public Health, Baltimore, Maryland*

Discussant: J. Haaga, *National Institute on Aging, Bethesda, Maryland*

NHATS was developed as a resource for the study of late life disability trends and dynamics in older people in the US. As a nationally representative study of Medicare beneficiaries ages 65 and older, NHATS provides data to inform policies and programs directed toward improving quality of life at older ages and addressing needs of older people experiencing declines in late life functioning. Papers in this session focus on caregiving to older adults with mobility, self-care and household activity limitations, the role dementia plays in functional limitations and caregiving, and unmet needs for assistance among older people with disabilities. National estimates on caregiving by family and friends, the main source of assistance for older adults with functional limitations, drawn from NHATS and the National Study of Caregiving will be presented. A second paper examines patterns of activity limitations among older persons with dementia and the types of assistance being provided to these individuals; implications of dementia caregiving in a national context are addressed. Availability of assistance to older adults also sometimes falls short, and a third paper provides national estimates on unmet need, defined by consequences of functional difficulties and lack of help. Objectives of this session are to provide new national estimates of caregiving and unmet need, and to highlight the role of dementia in caregiving. A brief overview of NHATS will be provided and a discussant will identify themes and promising future directions for research.

INFORMAL CAREGIVING FOR OLDER AMERICANS: AN ANALYSIS OF THE 2011 NATIONAL SURVEY OF CAREGIVING

B. Spillman[1], J. Wolff[2], V.A. Freedman[3], J. Kasper[2], *1. Urban Institute, Washington, District of Columbia, 2. Johns Hopkins University, Baltimore, Maryland, 3. University of Michigan, Institute for Social Research, Ann Arbor, Michigan*

We examine informal caregivers' roles and experiences, using a new resource, the National Survey of Caregiving. The NSOC interviews all informal caregivers for a nationally representative sample of informal care recipients age 65+. Caregivers report on a broad range of assistance beyond traditional household/personal care tasks, from transportation to medical tasks, as well as reporting on their family, work, health, and caregiving experiences. In 2011, 18 million caregivers provided 1.3 billion care hours monthly to 9 million older adults. Substantial positive consequences of caregiving are common (68%), and substantial negative consequences are rare (10%), most often exhaustion, too much to do, and too little time for themselves. Our estimates substantiate that beyond supportive care, today's informal caregivers assist with a range of health tasks and help older recipients navigate the health system and represent an important component of the workforce for maintaining the well-being and health of the older population.

DISABILITY AND CARE NEEDS OF OLDER AMERICANS BY DEMENTIA STATUS

J. Kasper[1], B. Spillman[2], V.A. Freedman[3], *1. Health Policy and Management, Johns Hopkins Bloomberg School of Public Health, Baltimore, Maryland, 2. Urban Institute, Washington, District of Columbia, 3. University of Michigan, Ann Arbor, Michigan*

Studies of the prevalence of dementia in the U.S. estimate that 14% of those over age 70 are affected, increasing to one quarter of persons over age 80. The implications of population aging for increases in older persons with dementia and the impact on families have been recognized worldwide in a 2012 World Health Organization report on Dementia as a Public Health Priority, and in the U.S. by the National Alzheimer's Project Act of 2012. Findings from the National Health and Aging Trends Study document the substantial role of dementia in late-life disability. Most (81%) older persons with dementia received assistance with self-care or mobility activities, or household activities for health or functioning reasons. Among all persons receiving this type of help, one-third had dementia. This paper reports on characteristics, residential settings, and aspects of caregiving for older persons with dementia.

THE ADVERSE CONSEQUENCES OF UNMET NEED AMONG OLDER PERSONS IN THE COMMUNITY

V. Mor, S.M. Allen, *Brown University, Providence, Rhode Island*

NHATS allows a national profile of older persons who experience unmet need for assistance in daily activities. Persons receiving help or reporting difficulty were asked about adverse consequences (e.g. going without bathing or a hot meal) because no one was there to help or the task was too difficult. Over 2 million beneficiaries experienced an adverse consequence; 4% who needed help eating went without, 13% who needed help bathing went without, and 43% who needed help with toileting wet or soiled their clothes. For household activity assistance, 17% experienced a negative consequence (10% went without hot meals; 20% made mistakes in medication management). The risk of experiencing a negative consequence increased for unmarried persons, those with dementia, and dual eligibles. The prevalence of unmet need, underestimated using this approach, is high; should we use this as a measure formal and informal community care system adequacy?

SESSION 1450 (SYMPOSIUM)

MAKING CONNECTIONS ACROSS DISCIPLINES TO SUPPORT AGING IN PLACE

Chair: E.A. Greenfield, *School of Social Work, Rutgers University, New Brunswick, NJ*

Discussant: L.N. Gitlin, *Johns Hopkins, Baltimore, Maryland*

Despite people's overwhelming preference to remain in their own homes and communities throughout later life, there is growing recognition of limitations within housing, neighborhood design, public policies, and service delivery systems that challenge individuals' ability to age in place. As research to address these issues and explore solutions has grown within the past decade, there is increased need for integrative scholarship to advance cumulative knowledge building in this area. This symposium addresses this need by convening researchers from different disciplines who are conducting cutting-edge research on systematic efforts to promote aging in place. The first paper will showcase research led by nursing, presenting on CAPABLE, which is a multi-component, home-based intervention that addresses mobility, functionality, and optimizing the home environment. The second paper will focus on social work perspectives, providing an overview of research on NORC programs and Villages as community-based models that emphasize strengthening social relationships to promote older adults' ability to age in place. The third paper will describe strategies from a health policy perspective to conduct secondary data analysis on aging in place, using the examples of falls and residential relocations. The fourth paper will highlight research from urban studies that offers an exploration of the intersection between age-friendly and sustainable development initiatives, with a focus on studies involving city planners, designers, and developers. The discussant will identify themes across the presentations, raise critical questions for future research, and moderate a discussion among the presenters and attendees to advance transdisciplinary research that has high potential to inform policy and practice.

A HOME-BASED, INTERDISCIPLINARY MODEL OF CARE FOR OLDER ADULTS: EARLY FINDINGS FROM CAPABLE

S. Szanton[1,2], L.N. Gitlin[1], B. Leff[1], R. Thorpe[2], J. Guralnik[3], Q. Xue[2], E. Tanner[1], *1. Johns Hopkins University, Baltimore, Maryland, 2. Johns Hopkins Bloomberg School of Public Health, Baltimore, Maryland, 3. University of Maryland, Baltimore, Maryland*

Nearly 40 percent of adults age 65 and over who live in the community report at least one functional impairment. Functional impairment can jeopardize ability to age in place especially when accompanied by multiple chronic morbidities (e.g., chronic pain and depression), inadequate supports, or precarious conditions within the home environment. Drawing on concepts from nursing, occupational therapy, and home repair and modification, this presentation will present research on CAPABLE (Community Aging in Place, Advancing Better Living for Elders), an interdisciplinary model of home visits by nursing, occupational therapy, and home repair to address functional needs as well the medical and environmental problems that limit function. Early findings from a randomized-control trial of CAPABLE with low-income older adults indicate the model's promise to reduce functional impairment, pain, and depression. These findings suggest the importance of multi-component, home-based, interdisciplinary models of care to support vulnerable older adults' ability to age in place.

SOCIAL WORK RESEARCH ON COMMUNITY INITIATIVES, SOCIAL CAPITAL, AND AGING IN PLACE

E.A. Greenfield[1], A.E. Scharlach[2], J.K. Davitt[3], A.J. Lehning[3], C. Graham[2], *1. School of Social Work, Rutgers University, New Brunswick, NJ, 2. University of California, Berkeley, California, United Kingdom, 3. University of Maryland, Baltimore, Maryland*

Social work, as a profession and an academic discipline, has a long-standing focus on supporting people in their own homes and communities. Consistent with this tradition, social work research increasingly has addressed community aging initiatives, which are systematic and collaborative efforts within a local area that seek to transform social and physical environments to support older adults' aging in place, health, and well-being. Fitting with the discipline's attention to social relationships as vehicles for change, research from a social work perspective has focused on two models in particular—Villages and NORC programs. These models emphasize enhancing local networks of relationships that can promote aging place, including those involving formal providers, as well as those concerning informal relationships among neighbors. The presentation will provide a summary of recent research on these models, including results from a national organizational survey, as well as studies of older adult participants in New York and California.

RESEARCH APPROACHES FROM HEALTH POLICY TO IDENTIFY RISK AND PROTECTIVE FACTORS FOR AGING IN PLACE

E.J. Nicklett, *School of Social Work, University of Michigan, Ann Arbor, Michigan*

Policymakers and advocates at the state and federal levels are increasingly interested in efforts to avoid or postpone institutionalization and better support older adults in their own homes and communities. Research to inform public health policy on aging in place, however, lags behind, as there is surprisingly little systematic population research on the variety of risk and protective factors shaping opportunities for community-dwelling adults to age in place. This presentation will describe—from health policy perspective—results from research using national U.S. data from the Health and Retirement Study. Specifically, the presentation will focus on research examining (1) sociodemographic and contextual risk factors for falls among community-dwelling older adults and (2) sociodemographic and contextual risk factors for residential transitions in old age. The presentation will address how results from these analyses can inform efforts of policymakers and advocates to promote appropriate services and supports for aging in place.

UNDERSTANDING THE INTERSECTION BETWEEN SUSTAINABLE AND AGE-FRIENDLY DEVELOPMENT

A. DeLaTorre, *Institute on Aging, Portland State University, Portland, Oregon*

Portland, Oregon has been considered an innovator in urban planning and sustainable development. Government agencies, nonprofit organizations, and businesses in Portland have engaged in policy creation and development practices aimed at creating a more sustainable city and region; however, little consideration regarding population aging has been made in the push for sustainable development, even though these practices maintain a focus on planning for "future generations." This presentation explores the intersection between sustainable and age-friendly development based on key informant interviews with planning, development, and design professionals. The meaning of sustainable development for an aging population will be discussed and policies will be detailed that influence the ability of older adults to age in their homes and communities. Findings will detail how aging can be introduced into the sustainable development discourse, including the need for sustainable development practices to pay closer attention to social equity issues arising due to population aging.

SESSION 1455 (SYMPOSIUM)

IMPROVING THE TRANSITIONAL CARE PROCESS

Chair: A. Schwartz, *Duke University, Center for the Study of Aging and Human Development, Durham, North Carolina*
Discussant: T.A. Allison, *University of California, San Francisco; San Francisco VA Medical Center, San Francisco, California*

Transitional care occurs in a variety of settings, and there is no best practice to aid older adults and their families in this process. The transitional care process is both clinically important, and is also an area of concern in health care policy. This symposium is timely in light of the implementation of the Centers for Medicare and Medicaid Services Community-based Care Transitions Program (CCTP), that focuses on the transitional care process across a variety of settings with the goal of reducing hospital readmissions. A variety of qualitative and mixed method approaches were utilized in the studies in this symposium in order to understand and improve the experiences of older adults and stakeholders during transitions in care. One presentation will present on the relationship between patient and hospital staff moods during the transition from hospital to nursing home. A second presentation will report case managers' processes of planning post-hospital transitions for Mexican American older adults in a "think aloud" study. A third study will present the importance of engaging stakeholders in the development of technology-based interventions to reduce nursing home resident emergency room visits. The final study will report case managers' views of the challenges in facilitating patients' access to services they require post-hospital discharge. Presenters will share the implications of their findings for clinical practice and health care policy. The discussant is an MD/PhD ethnographer and geriatric physician who builds clinical programs intended to keep older patients in their homes and return them home safely post-hospitalization.

LIVING IN TRANSITION

A. Kydd, *Nursing, University of the West of Scotland, Hamilton, United Kingdom*

This qualitative study explored both the phenomenon of 'delayed discharges'or 'bed blockers' and the experience of the frail older people in hospital who could not go home and did not know which nursing home they would be transferred to, or when.. The study borrowed from ethnography, and in a participant/observer role, the researcher went into the hospital over time as a visitor and collected the narratives of the frail older people in transition. This paper focuses on one finding; that the patients' were resilient in their distress, but their moods were linked to the mood of the staff on the ward. This fact could only be seen after time spent on the ward. The mood of the patients was determined by the atmosphere on the ward, that is, when the staff were content, the patients were happy. When staff were tired or stressed custodial care was evident.

COGNITIVE WORK ANALYSIS: TRANSITIONAL CARE FOR MEXICAN AMERICAN ELDERS

J.D. Crist, K.M. Koerner, A. Pasvogel, J.T. Hepworth, *Community and Systems Health Sciences Division, College of Nursing, The University of Arizona, Tucson, Arizona*

Effective transitional care results in cost savings and improved quality of life. Use of home health care services results in elders' improved health and functional ability, less depression, and fewer re-hospitalizations. Transitional care experts have studied how to improve the process; but they have not focused on Mexican American (MA) elders. Preliminary research found evidence of a non-systematic approach to transitional care. The proposed qualitative study was designed to discover whether transitional care planning for MA elders differs from planning for elders of non-Hispanic White elders. At two separate hospitals case managers were instructed to "think aloud" during their daily work tasks. All audible interactions were recorded. Transcripts and field notes were content analyzed and plotted according to the Cognitive Work Analysis framework. Insurance coverage over-rode other possibilities for post-hospital care even before diagnosis, prognosis, or elder/family preferences were assessed. Findings can connect local interdisciplinary practice with broader policy.

STAKEHOLDER PERSPECTIVES ON THE USE OF TECHNOLOGY TO REDUCE NURSING HOME RESIDENT ER TRANSFERS

C. Stephens[1], E. Halifax[1], P. Govindarajan[2], S. Lee[3,4], C. Ritchie[3,4], J. Shim[5], *1. University of California San Francisco School of Nursing, Dept. of Community Health Systems, San Francisco, California, 2. University of California San Francisco School of Medicine, Dept. of Emergency Medicine, San Francisco, California, 3. University of California San Francisco School of Medicine, Division of Geriatrics, San Francisco, California, 4. San Francisco VA Medical Center, Geriatrics, Palliative & Extended Care, San Francisco, California, 5. University of California San Francisco School of Nursing, Dept. of Social & Behavioral Sciences, San Francisco, California*

Transfers of frail nursing home (NH) residents to and from the emergency room (ER) are common, costly, and expose vulnerable residents to the well-documented risks associated with care transitions. Little is known about stakeholder perspectives on the use of emerging health technologies to help reduce these transfers and improve care coordination. We convened multiple stakeholder focus groups comprised of patient families, NH nurses, NH physicians/nurse practitioners, NH administrators and ER staff. Prior to the start of the focus group, participants completed a brief online survey regarding their background, experience and preferences related to technology and NH resident ER transfers. Focus group interviews were recorded and transcribed verbatim. Transcripts and field notes were analyzed using a Grounded Theory approach. Findings suggest that active engagement and input of key stakeholders is critical to the development, optimization and testing of technology-based interventions in vulnerable nursing home populations.

FACILITATING ACCESS TO WRAP AROUND SERVICES AFTER HOSPITAL DISCHARGE: CARE MANAGERS' PERSPECTIVES

R. Berman, M. Iris, C. Robinson, S. Dornberg-Lee, A. Loterstein, K. Newfeld, *CJE SeniorLife, Chicago, Illinois*

With the passage of the Affordable Care Act and efforts to contain health care costs, enhancing transitional care is seen as a promising strategy for reducing avoidable hospital readmissions. This paper focuses on an extended care management intervention to reduce hospital readmissions among Medicare-eligible patients at three Chicago-area hospitals. This intervention is one component of the Transitions Collaborative run by CJE SeniorLife, a partner in the Centers for Medicare and Medicaid Services' Community-based Care Transitions Program. Based on qualitative analysis of care manager documentation, meetings, and interviews, we describe how care managers use the results of risk assessments administered by nurse coaches to assist patients and their caregivers in need of wrap around services. We highlight factors affecting patients' access to and use of identified services that could enhance transitional care and discuss broader implications of using such approaches to realize the outcome of reduced hospital readmissions.

SESSION 1460 (SYMPOSIUM)

POLICY SERIES: CONGRESSIONAL AGING ISSUES UPDATE

Chair: B. Lindberg, *The Gerontological Society of America, Washington, District of Columbia*

This panel will present an update on aging and health legislation from the first session of the 114th Congress. Speakers will address key issues such as Social Security, Medicare, Medicaid, the Older Americans Act and more. The panel will also provide the audience a sense of what can be expected during the second session in 2015. Sponsored by GSA's Public Policy Committee.

SESSION 1465 (PAPER)

STATE-LEVEL EFFORTS IN LONG TERM SERVICES AND SUPPORTS

EXAMINING STATES' EFFORTS IN ACHIEVING A PERSON-CENTERED, BALANCED LTSS SYSTEM

S.A. Flanagan[1], J. Howard[1], K. Lida[2], *1. IMPAQ International, Washington, DC, District of Columbia, 2. Centers for Medicare and Medicaid Services, Baltimore, Maryland*

Federal mandates and initiatives (e.g., Americans with Disabilities Act, Olmstead Act) provide an impetus for states to pursue community integration for all individuals. As states continue to reform their long-term services and supports (LTSS) systems, there is growing interest in determining their success in providing LTSS systems that are person-centered and balanced between home and community-based and institutional-based LTSS. However, there is a gap in the availability of common indicators to examine states' efforts in achieving such a LTSS system. The Centers for Medicare and Medicaid Services (CMS) funded the National Balancing Indicators Project (NBIP or Phase II) from 2010-2014 to further refine and add to 18 "core" indicators and "short-term " developmental indicators developed under the CMS-funded National Balancing Indicators Contract (NBIC or Phase I) from 2007-2010. This paper will provide a brief overview of the approach used and the refined and expanded NBIP Principles and National Balancing Indicators (NBIs) and the State Self-assessment Survey instrument and Technical Assistance Guide for the NBIs developed; describe the key findings from the field testing of the State Self-assessment Survey instrument and NBIs conducted with seven State Profile Tool (SPT) grantees (ME, MA, MI, MN & KY) and the issues and challenges the grantees encountered in reporting the data needed to complete the State Self-assessment Survey instrument and implementing the NBIs; and discuss the challenges the federal government and states face in implementing a set of system-level NBIs and collecting the data necessary to implement them in a sustainable way.

OHIO'S LONG-TERM CARE FACILITIES IN THE ECONOMIC DOWNTURN: HOW HAVE THEY ADJUSTED?

P. Cummins[1,2], R. Walker[1], J. Straker[2], *1. Sociology & Gerontology, Miami University, Oxford, Ohio, 2. Scripps Gerontology Center, Oxford, Ohio*

The combination of the Great Recession, decreases in Medicaid and Medicare reimbursements, and a shift from institutional long-term care to home and community based services have created both challenges and opportunities for long-term care facilities. In recent years, long-term care facilities made a number of operational changes to improve their financial prospects. Data from Ohio's 2011 Biennial Survey of Long-Term Care Facilities – Nursing Homes and Residential Care Facilities (RCFs) were used in this research. The Biennial Survey is an internet survey of all nursing homes and RCFs in Ohio. A total of 584 RCFs and 921 nursing homes participated in the survey. For each of about 40 possible changes that could be made in response to changing economic conditions, administrators were asked to report whether they had considered each practice and either rejected it, considered but not acted on it, implemented the change during 2011, or implemented prior to 2011. Nursing homes and RCFs both implemented policies to increase revenues; nursing homes implemented strategies to increase the number of Medicare residents and RCFs sought to increase the number of residents with Medicaid waivers. Both RCFs and nursing homes made adjustments to reduce costs and increase revenues; most strategies to increase revenues were implemented prior to 2011 whereas personnel cost reductions more often occurred in 2011. As the economy and labor markets improve, it may be difficult to maintain some of these changes, such as reduced employee costs and increased employee productivity, when workers have other choices for employment.

A LIMITED LONG TERM SUPPORTS AND SERVICES FINANCING PACKAGE FOR HAWAII

L.H. Nitz[1], W.L. Lum[2], J.C. Wilkin[3], *1. Political Science, University of Hawaii at Manoa, Honolulu, Hawaii, 2. Director, Executive Office on Aging, Honolulu, Hawaii, 3. Actuarial Research Corporation, Columbia, Maryland*

The proposed Hawaii LTC Financing Program is a social insurance program. It contains some of the same elements as private insurance. Conditions of coverage, benefits, and financing will all be specified by law or regulation, in a manner similar to how insurance contracts specify benefits to which an insured policyholder is entitled. Individuals must earn coverage by making contributions to the program, just as private contracts require premium payments. Covered individuals have a statutory right to benefits without being subjected to a means test. In addition, the level of benefits is related to the number of years in which contributions have been made. As such, this is not a welfare program. Coverage is earned in the Hawaii LTC Financing Program through the payment of premiums. For each twelve (12) consecutive month period that a person pays the premium, the person shall earn one-tenth of the daily benefit amount. For each twelve consecutive months of nonpayment of the premium, the person shall forfeit one-tenth of the daily benefit amount. Vested (or insured) individuals become eligible for benefits under the program based on their inability to perform two or more Activities of Daily Living (ADLs) out of six or on cognitive impairment.. Benefits under the Hawaii program are paid to the recipient of long-term care services as a reimbursement for long-term care expenditures. The benefits are primary to private insurance and Medicaid, but secondary to Medicare

IMPLICATIONS OF NURSING HOME RESIDENT AND CAREGIVER CHARACTERISTICS ON POLICY EFFORTS TO PROMOTE COMMUNITY DISCHARGE: THE MINNESOTA RETURN TO COMMUNITY INITIATIVE

K. Abrahamson[1,2], K. Boston[5], D. Buttke[5], K. Glueckert[5], G. Arling[3,4], *1. School of Nursing, Purdue University, West Lafayette, Indiana, 2. Purdue University Center for Aging and the Life Course, West Lafayette, Indiana, 3. Indiana University Center for Aging Research, Indianapolis, Indiana, 4. Regenstrief Institute, Indianapolis, Indiana, 5. Minnesota Department of Human Services, St. Paul, Minnesota*

The Minnesota Return to Community Initiative (RTCI) is an innovative state-level intervention, administered by the Minnesota Board of Aging that promotes transition of nursing home (NH) residents to the community. The objectives of RTCI are to: re-balance long-term care (LTC) resources; employ LTC resources more efficiently; improve individual health and function; enhance consumer choice and quality of life; prevent or delay conversion to Medicaid. RTCI uses a data-driven approach to target private-pay residents who desire discharge, fit a discharge profile, and are early in their NH stay. We will discuss characteristics of the (>1,000) RTCI transitioned NH residents and caregivers in terms of function, cognition, health, service use, and well-being, highlighting correlations between resident needs and characteristics, caregiver role, services used, and levels of caregiver burden. Most residents (78%) transitioned to a private residence, often alone (34%), and expressed a willingness to pay for necessary services (91%). Transitioned residents were generally cognitively intact (76%), confident in their decision-making ability (79%), and had low rates of depression and behavior problems. Transitioned residents required more IADL assistance than ADL assistance. Caregivers were primarily female and evenly distributed between spouses (44%) and adult children (43%). The inter-personal burden of caregiving appeared highest for spousal caregivers. Of the types of services available, caregivers expressed the greatest interest in information-related services and respite care. We will discuss the implications of resident and caregiver characteristics on RTCI efforts to effectively employ resources and anticipate the needs of transitioned residents and caregivers.

SESSION 1470 (PAPER)

CIVIC ENGAGEMENT

EXPLORING THE CONNECTION BETWEEN PERSON-ENVIRONMENT FIT AND COMMUNITY ENGAGEMENT

B.M. Elias[1], S.L. Cook[2], M. Ginsler[2], *1. Family and Community Social Services, University of GuelphHumber, Caledon, Ontario, Canada, 2. York University, Toronto, Ontario, Canada*

Abstract Findings from Year 2 of this research project will report on the physical, psychological, emotional and social responses of a diverse population with special needs as they transition from various residential settings to a new “Intentional Community with Supports”. Methods Social participation is measured by examining emerging levels of activity in sports, recreation and leisure, volunteering and supported paid employment. Quantitative and qualitative methods were adopted in this longitudinal 5 year case study. Interview questions about the person-environment fit have now been administered 4 times: pre and post move, at year one and year two in September 2014 with 62 tenants. Findings A new definition of what life is like at the Reena Community Residence is emerging. Visitors, partners, staff and family members, volunteers, friends and caregivers make comments freely on this “ unique phenomenon of how supportive an intentional community can be”. It is fascinating to capture and document observations of the emerging social vision that focuses on the importance of living and sharing life together. Results describe the self-perceived responses of the tenants’ lived experience. Early findings reveal highly positive views by the tenants about their new home and in establishing a great pride in their community while establishing new levels of social participation. Conclusion The person-environment fit theory (M. Powell Lawton, 1986) is relevant to this research which follows 62 individuals and their lived experience tracing successful aging, lifelong learning, health and wellbeing in an intentional community.

ACTIVITY DISENGAGEMENT: UNDERSTANDING CHALLENGES AND OPPORTUNITIES FOR REENGAGEMENT

N. Morrow-Howell, S. Herbers, K. Fox, P. Plathe, C. Baum, *Washington University in St. Louis, St. Louis, Missouri*

AIMS: Activity engagement has been associated with wellness outcomes in later life; and in this study, we aim to 1) understand activity disengagement among older adults; and 2) to identify the challenges and opportunities for re-engagement in the face of both individual and environmental limitations. METHODS: Fifty one older adults residing in a low-income senior housing facility completed the Activity Card Sort, where 89 activities (classified as low-demand leisure, high-demand leisure, instrumental, or social) were reviewed. We identified past and present levels of activity engagement, reasons for giving up or doing activities less, what it would take to re-engage in these activities, and willingness to re-engage. We used descriptive statistics to address study aims. FINDINGS: Activities residents remained engaged in were instrumental (i.e. doctor visits, grocery shopping) and low-demand leisure (i.e. watching television, listening to music). Residents reported "do less" or "given up" most often for instrumental activities assumed by the housing facility (i.e. yard maintenance), and social activities (i.e. parties/picnics). The top ten activities residents would like to re-engage in were either low-demand leisure or social. "No opportunity" was identified by 94.1% of participants to be a barrier for at least one activity. Other common barriers included: "no interest", "physically difficult", and "no one to do it with". The highest reported facilitator to activity engagement was "someone to do it with me" (80.4%). IMPLICATIONS: These findings suggest that assessments and interventions might be developed to re-engage older adults in valued activities that they have reduced or dropped.

VOLUNTEERING AND ITS IMPACT ON SELF-IDENTITY: RESULTS FROM CHAOYANG DISTRICT IN BEIJING

L. Xie, *Institute of Gerontology, Renmin University of China, Beijing, China*

Ageism has negative influence on older peoples' self-identity and behavior, forming stereotypes of older population that further aggravate ageism. Volunteerism may reduce ageism by improving older adults' self-identification. This study examined potential positive impact of volunteerism among Chinese older adults from Chaoyang District on self-identity using the empowerment perspective. Data were collected from 206 volunteers and 43 non-volunteers aged 50 and above from a regional sample. Logistic regression modeling was applied, controlling for demographic characteristics, financial security and self-rated health. High volunteerism was significantly associated with positive self-identity. Older Chinese volunteers have more positive attitudes towards themselves than non-volunteers and less likely to regard themselves as old. Findings suggest that a volunteer program may be an effective self-identification promotion intervention for Chinese older population. Ways of promoting volunteering at individual, organizational and societal levels are discussed as way of empowering and promoting older adults' positive self-identity, and diminishing ageism.

THE HEALTH EFFECTS OF LATER-LIFE EMPLOYMENT AND THE IMPORTANCE OF WORK QUALITY POST-RETIREMENT AGE

K. Matthews, T. Chandola, J. Nazroo, N. Pendleton, *CCSR, University of Manchester, Manchester, United Kingdom*

Objective: With an ageing workforce and changes to normal retirement age, there is great importance in understanding how employment, and employment quality in later life affects health. This paper uses propensity score matching to account for selection biases in the effects of later life employment on health and well being. Methods: Caliper matching examines (i) the effects of working post-state pension age (65 for men and 60 for women) and (ii) the effects of the quality of this employment on depression, self-rated health and cognitive functioning. Robustness of results is further tested by sensitivity analysis using Rosenbaum bounds. Results: No significant differences in health remain between retirees and workers in general after accounting for selection bias. However, results show significant differences do exist when work is stratified by quality. Those working in high quality employment have significantly lower levels of depression and poor self-rated health than those in poor quality employment. Work stratified by its quality was also compared to retirement. Those in poor quality work had significantly higher levels of depression than those who had retired, and those in good quality work had significantly better self-rated health than those who had retired. Discussion: Significant differences in health between retirees and workers disappear when selection bias is accounted for, but findings also suggest that health after retirement age depends on employment characteristics beyond activity alone. The significant difference in health between those in high and poor quality employment demonstrates the importance of good workplace characteristics in later-life. Working past state pension age is good for health, but only for those In good quality work.

PERCEIVED SENSE OF CONTROL, POWER, AND CAPACITY IN CIVIC PARTICIPATION OF AGING CHINESE IMMIGRANTS IN CALGARY, CANADA

H. Tong, D. Lai, *Faculty of Social Work, University of Calgary, Calgary, Alberta, Canada*

Aging immigrants are often perceived as vulnerable or powerless due to their status as both immigrants and older persons. From a strengths-based perspective, participating in the community and having their voices heard is crucial to changing their vulnerable status, yet research on immigrant older adults' perceptions of their own civic participation capacity is lacking. This qualitative research, based on constructivist grounded theory, explores older immigrants' perceived sense of control, power, and capacity with respect to civic participation, focusing on aging Chinese immigrants in Calgary as a case example. 30 Chinese immigrants aged 65 and older were interviewed. Semi-structured in-depth personal interviews were conducted with 9 participants and 21 participated in two focus group discussions. The research results indicated that while most participants wished to participate in Canadian civic life and were concerned with events happening in Canada, opportunities for and level of civic participation were limited. Most participants described a lack of power and control, particularly in civic participation, and cultural bias, language barriers, transportation and technological challenges, and lack of support services limited engagement and civic participation capacity. This reflects a need for strategies to support immigrant older adults' civic engagement and to enable their voices to be better heard, including the development of civic participation opportunities by professionals working with immigrant older adults.

SESSION 1475 (SYMPOSIUM)

SEARCHING FOR DRUGS THAT SLOW AGING: PREDICTION, SCREENS, AND RODENT TESTS

Chair: R. Miller, *University of Michigan, Ann Arbor, Michigan*

Have biogerontologists, at long last, found something useful to do? The poorly repressed secret hope of biological gerontologists, to find a way to slow aging and delay multiple forms of late-life disease and disabilities in people, is no longer merely a science fiction fantasy, but a plausible research goal likely to transform preventive medicine a couple of decades down the road. This session presents three kinds of studies which may contribute to this evolving story in complementary ways. Dr. Joseph Baur will talk about the strategies by which short term tests - in cells or in animals - may help to select drugs worth the expense of screening for health and lifespan effects in rodents. Dr. Monica Driscoll will talk about the newly-funded NIA initiative to use nematodes to find drugs with robust effects on longevity across many species, Dr. Richard A. Miller will present a summary of the accomplishments of the NIA Interventions Testing Program, the status of work in progress, and plans for future collaborative studies.

DOES FINDING A LONGEVITY DRUG HAVE TO TAKE A LIFETIME?

J. Baur, *Physiology, University of Pennsylvania, Philadelphia, Pennsylvania*

A drug that could extend the number of healthy years of human life would have enormous benefits for society – the so-called "longevity dividend". However, testing large numbers of compounds for lifespan extension is impractical and expensive even in rodents, let alone humans. Although there have been some notable successes, the majority of potential longevity drugs that have been selected through candidate approaches have failed, raising questions about what a life-extending drug should look like, and about the nature of the underlying aging process that we seek to delay. An interesting case-in-point is resveratrol, which displays many of the characteristics one might expect of a longevity drug, but does not extend life in healthy mice. In contrast, rapamycin appears to have a number of detrimental effects, yet ultimately extends murine lifespan. This talk will discuss the role that short-term assays might play in the search for a drug that can deliver the longevity dividend in rodents, as well as humans.

NIA'S INTERVENTION TESTING PROGRAM: CURRENT STATUS AND FUTURE PLANS

R. Miller, *University of Michigan, Ann Arbor, Michigan*

The NIA Intervention Testing Program (ITP) tests drugs, suggested by collaborators, for effects on lifespan of genetically heterogeneous mice, at each of three sites. Of the 18 agents for which full datasets have been produced, at least five have produced significant lifespan extension in one or both sexes. The strongest effects so far have been produced by rapamycin and acarbose (both sexes), and by the nordihydroguaiaretic acid (males only). Significant, but smaller, effects have been noted for aspirin and for 17-alpha-estradiol, with follow-up studies at higher doses now in progress. This talk will briefly review the published results, show interim results for drugs now under test, and discuss future growth of the program, opportunities for collaborations, and ideas for translational research based on ITP discoveries. Key collaborators: Dave Harrison, Nancy Nadon, Randy Strong. Support: National Institute on Aging.

ITP FOR WORMS: PICKING AND PRIORITIZING DRUGS TO PROMOTE HEALTHY AGING

M. Driscoll[1], G.J. Lithgow[2], P.C. Phillips[3], M. Guo[4], R.A. Kohanski[4], *1. Rutgers University, Piscataway, New Jersey, 2. The Buck Institute, Novato, California, 3. The University of Oregon, Eugene, Oregon, 4. National Institute on Aging, Bethesda, Maryland*

The NIA-funded Interventional Testing Program (ITP) seeks pharmacological interventions that enhance healthy human aging by testing compounds for longevity in the mouse following a standardized protocol at three research facilities. To rapidly identify compounds with broadly efficacious impact on lifespan and healthspan across a variety of genetic backgrounds, the Caenorhabditis Intervention Testing Program (CITP) was established. Three parallel CITP teams will test compounds (singly or in combination) suggested by the research community and vetted through an Access Panel. Compounds (at multiple doses) will be tested for longevity and healthspan effects in at least 8-10 Caenorhabditis strains. An additional goal is to increase the number of compounds that can be quickly and robustly analyzed. We will present a standardized protocol for Caenorhabditis survival assays with compounds, report on the natural variation among healthspan and lifespan indicators in a diverse collection of wild Caenorhabditis variants, and discuss our first compound intervention trials.

SESSION 1480 (SYMPOSIUM)

BRIDGING INFORMATION ACROSS RESEARCH ENTERPRISES: NOVEL APPLICATIONS OF INTEGRATIVE DATA ANALYSIS IN GERONTOLOGY

Chair: A.L. Gross, *Johns Hopkins Bloomberg School of Public Health, Baltimore, Maryland*
Discussant: E.A. Stuart, *Johns Hopkins Bloomberg School of Public Health, Baltimore, Maryland*

From cognitive to physical functioning, synthesis of information from multiple sources is a pervasive challenge for all aspects of gerontologic research. Integrative data analysis (IDA) refers to the analysis of multiple datasets, together or in parallel, to address substantive research hypotheses. Presentations in this symposium highlight innovative applications of IDA in several aging-related areas of scientific inquiry, and address important methodological challenges. The first presentation by Hofer and colleagues highlights the importance of replicating and synthesizing results across longitudinal studies of aging and discusses the coordinated analysis approach used by the Integrative Analysis of Longitudinal Studies on Aging (IALSA) network. Gross and colleagues address a common challenge in IDA in which different amounts of information are available from different studies. They compare two approaches, equipercentile equating and factor analysis of item response data, for equating different versions of a neuropsychological test administered across 41 studies (N=106,612 older adults) into a common measure of mental status. Mehta and colleagues performed an exhaustive IDA of 17 prospective studies, representing N=144,716 white adults, to evaluate temporal trends over calendar time in the association of obesity to years of life lost. BMI and mortality data that spanned across different calendar periods. Different patterns were found for men and women. Finally, Varadhan and colleagues introduce an approach for combining prospective studies and randomized trials to obtained generalizable causal effects. They provide an empirical example involving congestive heart failure. Results demonstrate that treatment effects from non-representative clinical trials can be generalized to broad populations of interest.

INTEGRATIVE ANALYSIS OF LONGITUDINAL STUDIES ON AGING (IALSA): ACHIEVING REPRODUCIBLE INTERNATIONAL RESEARCH THROUGH COORDINATED ANALYSIS

S.M. Hofer[1,2], A.M. Piccinin[1], G. Muniz[3], S. Clouston[4], D. Mroczek[5], J. Kaye[2], D. Kuh[3], *1. University of Victoria, Victoria, British Columbia, Canada, 2. Oregon Health & Science University, Portland, Oregon, 3. MRC Unit for Lifelong Health & Aging, London, London, United Kingdom, 4. Stony Brook University, Stony Brook, New York, 5. Northwestern University, Evanston, Illinois*

The Integrative Analysis of Longitudinal Studies of Aging (IALSA; www.ialsa.org) research network (NIH/NIA P01AG043362) facilitates interdisciplinary, cross-national research on determinants and dynamics of within-person aging-related changes in cognitive and physical capabilities, health, personality, and well-being. A key feature of the IALSA network is the optimization and evaluation of the reproducibility of results from longitudinal and life course studies, achieved through a coordinated analysis approach based on comparable statistical models and measurement. Affiliated studies are catalogued on the IALSA Metadata and Harmonization Platform to permit the identification of studies for answering particular questions and measurement harmonization. Network activities encourage the examination of cross-cultural and cross-cohort effects and provide a strong basis for synthesizing evidence across longitudinal studies. Publically available analysis scripts enable both replication and extension to new projects. We discuss the merits of a coordinated analysis approach and current challenges for quantitative harmonization using examples from longitudinal studies of aging.

COMPARISON OF APPROACHES FOR HARMONIZING MENTAL STATUS ACROSS 41 INTERNATIONAL STUDIES

A.L. Gross[1], A.M. Kueider[1,2], C. Sullivan[2], D. Schretlen[2], *1. Johns Hopkins Bloomberg School of Public Health, Baltimore, Maryland, 2. Johns Hopkins School of Medicine, Baltimore, Maryland*

Different epidemiologic studies around the world administer different versions of the Mini-Mental State Examination (MMSE), complicating international comparisons of mental status. We compared two approaches for deriving comparable scores across MMSE versions. We used data from N=106,612 persons aged 40-99 from 41 studies across 32 countries, collected through the International Neuropsychological Normative Database Initiative. We equated 14-item, 15-item, 18-item, 21-item, and 23-item versions to a 30-item version using equipercentile-equating stratified by age and education. For a subset of N=65,992 participants in which item-level data were available, we derived IRT-based scores using two-parameter graded-response models. Equipercentile-equating yielded scores on a 30-point scale for all participants with MMSE data, while more reliable IRT-derived MMSE scores could only be constructed with item-level data. The scores were highly correlated (r=0.92). Bland-Altman plots revealed minimal bias. In conclusion, equipercentile-equating is more broadly applicable than IRT, and may facilitate comparisons of international norms for mental status.

OBESITY AND MORTALITY: ARE THE RISKS DECLINING? EVIDENCE FROM MULTIPLE PROSPECTIVE STUDIES IN THE U.S

T. Mehta, S. Keith, N. Pajewski, G. de los Campos, S. Bangalore, A. Bartolucci, D.B. Allison, *University of Alabama, Birmingham, Alabama*

We evaluated whether the obesity associated years of life lost (YLL) have decreased over calendar time. Individual-level data from seventeen prospective studies, across different calendar times and with at least 2 assessments of BMI at different calendar years (2 waves), were pooled. We estimated median longevities by standard BMI categories within each study wave using a parametric survival model. For each BMI category, we then pooled the longevities in a weighted regression and estimated the change in YLL between 1970 and 1990 on 144,716 whites with BMI of 18.5 to <25 as a reference category. Grade 1 obesity's association with decreased longevity has reduced for older men but not for younger ages. For women, there is evidence of a decline in the association of obesity with decreased longevity across all ages; however some of the findings are sensitive to the assumption of linear change in YLL over time.

CROSS-DESIGN SYNTHESIS FOR EXTENDING THE APPLICABILITY OF TRIAL EVIDENCE WHEN TREATMENT EFFECT IS HETEROGENEOUS

R. Varadhan[1], C. Weiss[2], *1. Johns Hopkins School of Medicine, Baltimore, Maryland, 2. Michigan State University, Grand Rapids, Michigan*

Randomized controlled trials (RCTs) provide reliable evidence for approval of new treatments, informing clinical practice, and coverage decisions. The participants in RCTs are often not a representative sample of the larger at-risk population. Hence the average treatment effect from the trial is not generalizable to the larger at-risk population. We present a new method to extrapolate the treatment effect from a trial to a target group that is inadequately represented in the trial. Our method integrates trial and observational data (cross-design synthesis). An essential component of the methodology is the estimation of calibration adjustments for unmeasured confounding in the observational sample. We demonstrate and validate the methodology in two clinical trials of Angiotensin-converting enzyme inhibitors for congestive heart failure, the Study of Left Ventricular Dysfunction (SOLVD), and an observational registry. Our results show that the method can validly estimate treatment effects for older women poorly represented in these trials.

SESSION 1485 (SYMPOSIUM)

AGE DIFFERENCES IN DECISION MAKING: BALANCING AFFECT AND REASON IN FINANCIAL AND HEALTHCARE SETTINGS

Chair: J. Strough, *West Virginia University, Morgantown, West Virginia*
Co-Chair: C.E. Loeckenhoff, *Cornell University, Ithaca, New York*
Discussant: T.M. Hess, *North Carolina State University, Raleigh, North Carolina*

Over the last decade, research on age differences in decision making has moved beyond a predominant focus on cognitive abilities and deliberative processing to acknowledge motivation and affect. The presentations in this symposium explore the interplay among these factors in the decision domains of finances and healthcare which carry high personal relevance for older adults. Lemaster and Strough examine explanations for age decrements in risk tolerance. Findings suggest that age effects are due to perceived reductions in future opportunities, but not greater reliance on the affect heuristic, even though the affect heuristic predicts less risk tolerance. Hershey and Gerrans study age differences in anxiety about consulting with financial advisors in an Australian sample. Although adults aged 50 and over show higher financial literacy than younger groups, financial planning may be hampered by emotional concerns about working with a financial advisor. Reed, Sims, English, and Carstensen examine the implications of the age-related positivity effect for decision quality in healthcare scenarios. Findings suggest that, compared to younger adults, older adults are less likely to review negative as compared to positive information and this may impair decision quality when critical information is negatively valenced. Riffin, Pillemer, Reid, and Loeckenhoff present a qualitative analysis of joint decision making among individuals with chronic pain. Findings suggest that social goals and trade-offs between information acquisition and emotion-regulatory goals play a key role when seeking advice. Finally, Hess integrates these findings with the existing literature on judgment and decision making and discusses directions for future research.

UNDERSTANDING AGE DIFFERENCES IN FINANCIAL RISK TOLERANCE: TEMPORAL PERSPECTIVES AND AFFECT

P. Lemaster, J. Strough, *Psychology, West Virginia University, Morgantown, West Virginia*

People are less tolerant of financial risk as they age, yet it is unclear why. We investigated two dimensions of future time perspective (opportunities, limitations) and reliance on the affect heuristic (i.e., perceiving that risks and benefits of hazards are inversely related) as mediators of age-related differences in financial risk tolerance. We administered a measure of financial risk tolerance that is widely used by financial planners to an adult life-span sample (N = 584, 53.6% female, 89.6% Caucasian; M age = 47.38, SD = 14.05, range = 25-89). With age, people viewed their futures as having fewer opportunities, and this fully explained why older age was associated with less risk tolerance. Use of the affect heuristic was not associated with age, but it was highly related to risk tolerance—people who viewed risks and benefits as inversely related were less risk tolerant. Focus on limitations was unrelated to risk tolerance. Findings suggest that shrinking time horizons focused on opportunities and greater reliance on the affect heuristic are important for understanding adults' tolerance for financial risk.

WHO'S AFRAID OF THE FINANCIAL PLANNER? DETERMINANTS OF ADVISOR ANXIETY AMONG WORKING ADULTS

D.A. Hershey[1], P. Gerrans[2], *1. Psychology, Oklahoma State University, Stillwater, Oklahoma, 2. University of Western Australia, Perth, Western Australia, Australia*

The future financial security of older adults will be influenced by the effectiveness of their financial plans. Key to ensuring this goal is the financial literacy of workers and their access to appropriate professional financial advice. In this talk, the authors explore these two dimensions as determinants of success in relation to financial decision making. It is suggested that financial advisor anxiety can arise from people worrying about sharing personal financial information, or being negatively judged by a financial advisor. Results from a study of over 2,200 Australians (aged 40-74 years) reveal that financial literacy was highest among adults over the age of fifty. Moreover, 25 percent of respondents reported moderate to severe levels of anxiety when asked about the prospect of meeting a financial advisor. It is argued that public information campaigns could improve people's attitudes toward personal financial responsibility and help workers plan for their long-term financial security.

THE AGE-RELATED POSITIVITY EFFECT IN DECISION MAKING: IMPLICATIONS FOR CHOICE QUALITY

A.E. Reed[1], T. Sims[1], T. English[2], L.L. Carstensen[1], *1. Department of Psychology, Stanford University, Stanford, California, 2. Washington University in St. Louis, St. Louis, Missouri*

Relative to younger adults, older adults pay greater attention to positive versus negative information when making decisions (e.g., Löckenhoff & Carstensen, 2007, 2008). The present study examined whether these age-related attentional preferences result in differential choice quality under various decision structures. Sixty-seven older adults (aged 60-90, M=70.0) and 60 younger adults (aged 20-37, M=29.2) made decisions among doctors and hospitals based on positive, negative, and neutral patient reviews. Optimal alternatives were differentiated by rigging the distribution of positive and negative reviews across options. Attentional preferences were surreptitiously measured via eye-tracking. As predicted, older versus younger adults paid more attention to positive reviews and less attention to negative reviews. Although younger adults made superior decisions when negative reviews differentiated optimal from suboptimal alternatives, no age differences emerged when alternatives varied based on positive reviews. Results indicate that age-related positivity may impair choice quality when optimal decisions require attention to negative information.

SOCIAL PREFERENCES AND JOINT DECISION MAKING AMONG OLDER ADULTS WITH CHRONIC PAIN

C. Riffin[1], K. Pillemer[1], C. Reid[2], C.E. Loeckenhoff[1], *1. Cornell University, Ithaca, New York, 2. Weill Medical College, New York City, New York*

Lifespan theories of motivation and emotion predict age-related changes in social preferences and trade-offs between information acquisition and emotion-regulation, but little is known about how culturally diverse older adults navigate such trade-offs in the context of pain management. To explore these questions, semi-structured interviews were conducted with Hispanic and non-Hispanic White older adults with chronic pain (N=47) recruited from one medical center and one senior center in NYC. Qualitative methods were used to identify themes related to participants' information-seeking and desire to involve others in treatment decisions. Consistent with developmental patterns of motivation, the oldest old (≥80) sought social network members that supported emotional well-being, whereas younger participants chose social network members that facilitated information acquisition. For Hispanic participants, cultural empathy played a key role in advice-seeking and social selection. Overall, individuals who engaged in meaningful dialogues expressed high levels of treatment satisfaction, especially when there was agreement among stakeholders.

SESSION 1490 (SYMPOSIUM)

AFFECTIVE EXPERIENCES LINKED TO TIME USE AND ACTIVITIES: FINDINGS FROM HRS AND ELSA

Chair: J. Smith, *University of Michigan, Institute for Social Research, Ann Arbor, Michigan*

Discussant: L. Nielsen, *National Institute on Aging, Bethesda, Maryland*

The last decade has seen renewed impetus in research on subjective well-being. In parallel with the application of technological and statistical innovations to collect real-time data and model the dynamics of affective experience over time, survey researchers are exploring new ways to understand and monitor changes in population subjective well-being. In 2012, for example, the Health and Retirement Study (HRS) and the English Longitudinal Study of Ageing (ELSA) included a harmonized day reconstruction measure of well-being to complement the information gained in traditional survey measures, such as life satisfaction and depression. Participants recall the time they spent on targeted activities the prior day and rate how they felt during those activities (e.g., happy, frustrated). Speakers in this symposium use these HRS and ELSA data to examine questions about subjective well-being in midlife and old age. Steptoe finds that the time spent socializing with family and friends and the happiness associated with socializing decreases with age. Smith and colleagues report that although a restless night does not constrain the time spent on activities, poor sleep is associated with fewer activity-related positive and more activity-related negative experiences. Gonzalez and colleagues utilize longitudinal data from HRS to examine the sensitivity of the day reconstruction measure to work-retirement and marital status transitions. Vanhoutte and Nazroo report social inequalities in the patterns of activities and experiences reported by participants in ELSA. Nielsen concludes with an integrative discussion of current efforts to define, measure, and monitor subjective well-being in midlife and old age.

SOCIAL ACTIVITY, AFFECT, AND TIME USE IN THE ENGLISH LONGITUDINAL STUDY OF AGEING

A. Steptoe, *Epidemiology and Public Health, University College London, London, United Kingdom*

There is growing enthusiasm for complementing questionnaire measures of affect and wellbeing in older people with more detailed assessments of mood and time use. We measured time spent in five common activities (eg watching TV, traveling), and two social settings (spending time with family and friends, and spending time alone), together with mood during these activities, in 8,905 participants (mean age 66.3 ± 9.7, range 50-90+ years) in the English Longitudinal Study of Ageing (ELSA). This presentation focuses on social settings. The amount of time spent with friends and family was negatively related to age, while the reverse was true for spending time alone. Ratings of happiness with friends and family decreased with age, even after controlling for global ratings of happiness yesterday, indicating that measuring affect in specific situations provides insight into the experience of older people that is not available from general measures of affect.

ACTIVITIES AND WELL-BEING YESTERDAY: THE EFFECTS OF A RESTLESS NIGHT

J. Smith, L.H. Ryan, S. Becker, W.H. Wan, *University of Michigan, Institute for Social Research, Ann Arbor, Michigan*

Chronic sleep disorders severely impact well-being, but less is known about the acute influence of a restless night on older adults' activities and feelings the following day. In the context of a day reconstruction measure included in the 2012 wave of the Health and Retirement Study (HRS: N=6777), 27% of participants aged 50 to 101 reported that they did not feel well-rested upon waking that day. On average, people who reported a poor sleep had also gone to sleep later the night before. Having had a restless night was not associated with time use or the number of activities reported but this was linked to lower activity-related positive affect and higher activity-related pain and negative affect. These findings remained after controls for age, marriage, work status, income, arthritis, disability, depression, and chronic sleep problems. Acute variations in sleep quality may play a critical role in experienced well-being in later life.

MAJOR LIFE TRANSITIONS: IMPLICATIONS FOR ACTIVITY-BASED AFFECTIVE EXPERIENCES

R. Gonzalez, J. Smith, L.H. Ryan, *University of Michigan, Ann Arbor, Michigan*

This paper reports on the role of major life transitions (e.g., changes in work for pay status, changes in marital status) on the activities people choose to engage and their affect during those activities. We use a sample from the Health and Retirement Survey who were asked a set of activity-based questions both in 2009 and in 2012, allowing for longitudinal analyses. Information about life transitions between 2009 and 2012 was collected from these longitudinal participants in the 2010 HRS wave and again in 2012. We show that while measures of affective experience, such as net affect and activity affect complexity (an index of the proportion of activities that include a mixture of positive and negative affect), are relatively stable at the level of means, there are changes in both the activities and their affective experiences when older adults undergo major life transitions.

THE SOCIAL DIMENSION OF TIME-USE AND ITS EFFECTS ON SUBJECTIVE WELLBEING IN LATER LIFE IN ENGLAND

B. Vanhoutte, J. Nazroo, *CMIST - School of Social Sciences - University of Manchester, Manchester, United Kingdom*

This paper explores the influence of time-use on multiple measures of subjective wellbeing (affect, satisfaction and self-actualisation) among older adults using the English Longitudinal Study of Ageing (ELSA), with specific attention to social inequalities. Latent class analysis of time-use data reveals a limited number of patterns of how older people spend their day. Which pattern of activities people choose is strongly related to their background and living circumstances, but equally has substantial effects on their life satisfaction, their potential for self-actualisation as well as their emotions while engaged in specific activities. Interrelations between the different measures of wellbeing are discussed. This paper illustrates that how people use their time, and how they feel when doing specific activities is nested in social structure. Our findings suggest that small changes in how people spend their day could have substantial influences on both their evaluated and experienced wellbeing.

SESSION 1495 (SYMPOSIUM)

THE SOCIAL NETWORKS, DIGITAL MEDIA USE, AND BARRIERS TO PARTICIPATION OF OLDER PEOPLE IN RURAL NEW ZEALAND: DIFFERENCES ACROSS REGIONS

Chair: C. Stephens, *School of Psychology, Massey University, Palmerston North, New Zealand*

Aging in place policies pose particular difficulties for older people in rural areas. Although many may wish to remain ‘in place’ there are problems with access to services and the loss of younger cohorts from rural areas. However, not all rural situations are equal. Much research has treated rurality as a singly construct, whereas many rural areas have different issues or provisions. The aim of this study was to examine these differences. Older people (aged 59-74), living in different rural localities across New Zealand, were compared on some critical issues that support participation of elders: social networks and digital media use. The results showed that, there are significant differences in the use of technology and the quality of social support between localities in regard to the types of social networks and area socioeconomic status. Future research is needed to investigate the structural issues that support aging in place in rural areas.

THE ROLE OF GENERATIVITY IN SUCCESSFUL AGING FOR RURAL ALASKA NATIVE ELDERS

J.P. Lewis, *School of Social Work, University of Washington, Seattle, Washington*

The concept of Generativity is important in Alaska Native (AN) cultures, that is, caring for the future, or Seventh, generation. Generativity is important to the Elders and a value associated with AN cultures and directly impacts the Elders’ sense of feeling needed by their family and community. As our Elders continue to engage in their community, teach the youth, and serve as role models, it will be important to ensure they are supported and have opportunities to teach others. In this study, the Elders (n=26) discussed the importance of passing on their knowledge to the youth and the importance of this role to their ability to age well. A majority of the communities in this study valued their Elders and understood the importance of their wisdom and experience, providing opportunities for them to participate and educate those who were interested.

COMMUNITY-BASED PARTNERSHIPS TO SUPPORT AGING IN PLACE FOR RURAL VETERANS

B.L. Hicken[1], R. Rupper[1], K. Shay[3], G. Sullivan[2], C. Turner[1], *1. VA Rural Health Resource Center- Western Region, VA Salt Lake City Health Care System, Salt Lake City, Utah, 2. National Hospice and Palliative Care Organization, Alexandria, Virginia, 3. VHA Office of Geriatrics and Extended Care, Ann Arbor, Michigan*

Nearly 9,000,000 US veterans are 65 years of age or older and a disproportionate number of these live in rural areas. Connecting with VA benefits and community resources to support aging in place can be especially problematic for older veterans living in rural communities. Veteran Community Partnerships (VCP) is a Veterans Health Administration (VHA) initiative to support local coalitions of VA and community organizations to help older veterans remain in their communities. VCPs are a coordinated effort to promote access to non-institutional extended care and support services from VA and community for older veterans and their caregivers. This presentation provides an overview of the VHA Veteran Community Partnership initiative and reports outcomes from various pilot implementations of Veteran Community Partnerships in rural communities throughout the US. These pilot implementations illustrate the benefits of public/private partnerships in supporting the diverse needs of all older adults living in urban and rural areas.

“I GO IN WITH HIM AND…ASK QUESTIONS”: ADVOCATES’ ROLE IN MEDICAL APPOINTMENTS WITH AFRICAN AMERICAN MALES IN THE RURAL SOUTH

R.S. Allen, J.S. Oliver, L. Mieskowski, M.K. Eichorst, L. Tang, *Psychology/Center for Mental Health and Aging, The University of Alabama, Tuscaloosa, Alabama*

Thirty-three rural-dwelling African American men (mean age 54.6; SD = 8.3) and their primary “health care advocate” (mean age 54.5; SD = 10.4) were independently interviewed regarding communication about health concerns and primary health care appointments. Health care advocates were uniformly women and 55% were spouses/ partners. The analysis team independently coded transcripts for each dyad and developed themes using qualitative description. Emergent themes related to medical appointments included 1) shared communication and decisions; 2) disagreement about communication; and 3) talking with others. Subthemes within shared communication included reliance on advocates for communication with providers and advocates’ promotion of positive health behaviors including good nutrition and exercise. One advocate stated, “he depends on me to take care of him, health-wise, from his teeth to his feet.” Interventions designed to harness advocate support may improve rural AA men’s communication with providers and reduce health disparities in the Deep South.

THE COMMUNITY, SOCIAL NETWORKS, AND HEALTH OF OLDER ADULTS IN RURAL AND REMOTE COMMUNITIES IN THE 21ST CENTURY

C. Adams-Price, *Psychology, Mississippi State University, Mississippi State, Mississippi*

In rural and remote communities, older adults may be socially isolated, or they may be the elders, i.e., the wise center of the community. In this symposium, we will discuss older adults from both perspectives. We will also examine the diversity of rural and remote areas, and how that diversity affects the social support networks of older adults. The first speaker will be Christine Stephens, who will discuss the potential of social networks and digital media for increasing social cohesion among older adults in rural areas. She will also discuss the diversity of rural communities in New Zealand in the use of new media, and barriers to participation. Jordan Lewis will discuss the role of older adults as elders in indigenous Alaskan communities. He will discuss the benefits of generativity (i.e., giving back to one's community) for health and well-being among older Alaska natives. Becky Allen and Joann Oliver will focus on older rural African American men, and family members who act as advocates for them in the prostate cancer screening process. They find that having a family member as advocates improves communication with health care providers, and increases the likelihood that the older adults will be screened in the future. Finally, Bret Hicken will address the benefits of partnerships between the community and aging rural veterans for health and well-being of those veterans.

SESSION 1500 (SYMPOSIUM)

CULTURE AND LONGEVITY: FINDINGS FROM FOUR CENTENARIAN STUDIES

Chair: P. Martin, *Iowa State University, Ames, Iowa*
Co-Chair: Y. Gondo, *Osaka University, Osaka, Japan*
Discussant: L. Poon, *Unversity of Georgia, Athens, Georgia*

Although quite a few studies have investigated aspects of longevity, cultural correlates of longevity have not been comprehensively explored. The purpose of this symposium is to investigate cultural components of longevity in Japan and the United States by highlighting findings from four centenarian studies: The Okinawa Centenarian Study, the Osaka SONIC Study, the Fordam Centenarian Study, and the Georgia Centenarian Study. Cultural components include broad environmental factors, family and community support, health behavior patterns, and the relative importance of autonomy and dependence among centenarians. Each project will highlight a specific culturally relevant theme. The Okinawa study is known for its emphasis on diet and eating behaviors. The current presentation will focus on the importance of culturally unique dietary patterns and healthy aging characteristic for centenarians in Okinawa. The second Japanese study is focusing on specific environmental and personality factors related to longevity by comparing urban and rural centenarians in Japan. The third study, conducted in New York, emphasizes family and community care issues relevant to centenarians living in a large metropolitan area. The final presentation will feature aspects of autonomy that are typical for North American centenarians. Taken together, this symposium will summarize key cultural components contributing to longevity in different regions and countries.

REGIONAL DIFFERENCES IN ENVIRONMENT AND PERSONALITY PROFILES OF CENTENARIAN

Y. Gondo, T. Nakagawa, Y. Tatuhira, M. Kozono, *Human sciences, Osaka University, Suita, Japan*

Psychosocial studies of aging have focused on clarifying common factors for longevity that could be attributed to individual characteristics. For example, the personality trait "conscientiousness" is a typical example repeatedly reported in different centenarian studies as a longevity trait. However, not consistently observed factors might also be important, because the basic make-up of broad environmental factors such as climate or social capital are different in studies on older adults, and these variables are thought to interact with individual characteristics. To consider this type of interaction, this study compared personality profiles of centenarians living in two regions with different social capital levels (rural vs. urban) in Japan. Consistent with previous reports, centenarians in urban areas showed higher extraversion, openness, and conscientiousness. Centenarians in rural areas showed higher agreeableness in addition to the three traits. Higher agreeableness might contribute to survival in economically disadvantaged regions but enrich the social relationship environment.

WHO HELPS CENTENARIANS LIVING IN NEW YORK CITY: FINDINGS FROM THE FORDHAM CENTENARIAN STUDY

D.S. Jopp[1], K. Boerner[2], M. Park[1], *1. Psychology, Fordham University, Bronx, New York, 2. Jewish Home Lifecare, New York, New York, USA Minor Outlying Islands*

Who helps centenarians in everyday live, when they live in large cities, such as New York, which offer substantial professional service structures, but also requires enhanced flexibility from its residents? This question was investigated in the Fordham Centenarian Study (N = 119, Mage = 99.25; range = 95-107 years). Findings indicate that despite high prevalence of health issues, over 70% of the centenarians lived in the community. Although the majority of centenarians with living children had a child who lives nearby, about one third did not, reflecting potential elder care challenges of spread out families. That only 43% of the centenarians reported daily help from children points to this interpretation. Overall, centenarian without children received significantly less daily help (informal and formal). Daily help from relatives and friends was also very limited. Explanations for and implications of shortages in informal day-to-day care options for New York centenarians will be discussed.

AUTONOMY AMONG CENTENARIANS: "I JUDGE MYSELF WHAT IS IMPORTANT"

P. Martin[1], L. Poon[2], *1. Iowa State University, Ames, Iowa, 2. University of Georgia, Ahtens, Georgia*

For older adults in the United States, a feeling of autonomy is an important aspect of overall psychological well-being. This is particularly true for oldest-old adults who are often confronted with physical, functional, and mental health challenges. This presentation highlights the importance of autonomy among centenarians. One hundred and thirty seven participants of the Georgia Centenarian Study were assessed on personality, autonomy, cognitive functioning, depression, subjective health, activities of daily living, and life satisfaction. Descriptive analyses, multiple regression analyses and structural equation modeling were computed assessing the relationship between personality and autonomy, and between autonomy and function. The results indicate that neuroticism was negatively and extraversion positively related to autonomy. Autonomy in turn was negatively associated with depression and positively associated with subjective health and life satisfaction. We conclude that in the United States autonomy plays an important role in the well-being of centenarians and is predicted by personality traits.

DIETARY PATTERNS AND LONGEVITY IN BIO-CULTURAL PERSPECTIVE: UNPACKING THE OKINAWAN DIET

D.C. Willcox[1,2], B. Willcox[2], *1. Okinawa International University, Ginowan, Japan, 2. Kuakini Medical Center/University of Hawaii, Honolulu, Hawaii*

This presentation will explore the traditional Okinawan diet. Defined by staple root vegetables such as sweet potatoes and taro, green and yellow vegetables, soybean-based foods, marine foods, lean meats and medicinal spices it is a distinct culinary pattern that shares many characteristics with other healthy dietary patterns, including the DASH diet and Portfolio diet. All these dietary patterns are associated with reduced risk for age-associated diseases. The lower caloric density of plant-rich diets results in lower caloric intake with concomitant high intake of phytonutrients and antioxidants. Other shared features include low glycemic load, less inflammation and oxidative stress, and potential modulation of aging-related biological pathways. Unlike the DASH or Portfolio diets, which were designed by researchers to lower risk for chronic diseases such as hypertension or hypercholesterolemia, the traditional Okinawan diet represents a real-world cultural, dietary pattern that may promote healthy aging and longevity.

SESSION 1505 (SYMPOSIUM)

HYPERGLYCEMIA IN OLDER AUTOLOGOUS HEMATOPOIETIC CELL TRANSPLANTATION RECIPIENTS

Chair: M.J. Hammer, *College of Nursing, New York University, New York, New York*

Patients with cancer are at risk for hyperglycemia which may further compromise an already impaired immune system, leaving the patient highly susceptible to adverse events including infections. Understanding the contributors to hyperglycemia and associated consequences in relation to immune integrity can lead to novel interventions for improved outcomes. A prospective pilot study investigating glycemic status, immune biomarkers, patient factors, and infections in patients without pre-existing diabetes undergoing treatment for hematological malignancies with autologous hematopoietic cell transplantation (HCT) was conducted. Pearson correlations were used to evaluate associations between factors. Among 33 older adult patients enrolled, the mean age was 62.7 years. Fasting blood glucose (BG) was associated with BMI (r=.225; p<.001), leukocyte nadir (r=-.160; p<.001), glucocorticoid dose (r=.126; p=.010), and infection occurrence (r=.146; p<.001). Infections occurred in 64% of patients. Further research and interventions to better control BG in older adult autologous HCT recipients are warranted.

GLUCOSE CHALLENGES IN OLDER ADULTS WITH CANCER

M.J. Hammer[1], D. Von Ah[2], *1. New York University, New York, New York, 2. Indiana University, Indianapolis, Indiana*

Individuals > 65 years old boast the highest rates of cancer diagnosis. In addition, 23% of older adults have diabetes (defined by hyperglycemia) compared to 11.3% in the general population. Independent of diabetes, all patients with cancer are at risk for hyperglycemia due to multiple factors including the malignancy itself, treatments (steroids and certain chemotherapies), nutritional imbalances, physical inactivity, stress, and infections. Older adults, in particular, are at risk for hyperglycemia during cancer therapies due to cellular- and immunosenescence. In turn, hyperglycemia further compromises an already impaired immune system leaving the host susceptible to further infections that can lead to sepsis, other clinical consequences, and even non-cancer related death. With an expected 2 billion older adults by 2050, the challenges of hyperglycemia related to cancer will be tremendous. In this symposium we present three pilot studies that evaluated glucose challenges in patients with cancer. Dr. Hammer investigated contributors to hyperglycemic events, immune integrity, and infection occurrences in autologous hematopoietic cell transplantation recipients. Dr. Hershey analyzed symptom clusters and factors that may predict symptom changes over time related to glycemic control in patients with solid tumor cancers. As part of a preliminary pilot study, Ms. Storey evaluated elderly hospitalized patients with leukemia and the impact of hyperglycemic events to days of neutropenia, length of stay, and infection rates. In each of these studies, hyperglycemia was associated with deleterious findings in the older adult patients. Further investigation and tailored interventions for optimizing glycemic control in older adults with cancer are greatly needed.

HYPERGLYCEMIA IN HOSPITALIZED ELDERLY PATIENTS WITH LEUKEMIA: A PILOT ANALYSIS

S. Storey[1,2], D. Von Ah[1], *1. Indiana University School of Nursing, Indianapolis, Indiana, 2. St. Vincent Hospital, Indianapolis, Indiana*

Increased age and hyperglycemia combined with a diagnosis of leukemia may place a patient at high risk for immune compromise and subsequent infections resulting in longer hospital length of stay (HLOS). Retrospective data of 14 patients were analyzed to examine the impact of hyperglycemia in hospitalized leukemia patient's ≥ 65 years of age. 36% experienced hyperglycemia during hospitalization. Fishers exact test demonstrated patients with hyperglycemia were 2.5 times (OR 2.5; 95% CI; 0.86, 7.31; p=0.027) more likely to develop neutropenia than those without hyperglycemia. Kaplan-Meier test was used to examine the relationship between hospital length of stay and hyperglycemia. Results indicate a longer length of stay in patients with hyperglycemia when compared to those without (p=0.039). However, no significant difference was noted in infection between groups (p=0.58). While these findings are preliminary, they suggest more research is needed to explore the impact of hyperglycemia in elderly cancer patients.

IDENTIFYING GROUPS WITH DIFFERENT LONGITUDINAL SYMPTOM EXPERIENCES AMONG OLDER ADULTS WITH TYPE 2 DIABETES AND CANCER

D.S. Hershey[1], S.J. Pierce[2], *1. College of Nursing, Michigan State University, East Lansing, Michigan, 2. Michigan State University, East Lansing, Michigan*

Diabetes and cancer are chronic conditions that produce symptoms, some unique to each condition and others common to (e.g. fatigue, numbness and tingling, nausea, and changes in appetite). Despite extensive research on both symptom clusters and changes in individual symptoms over time, few studies have examined symptom clustering from a longitudinal perspective. This study demonstrates a way to identify subgroups of patients who share distinct multivariate, longitudinal profiles with respect to how symptom severity changed over time for five symptoms. Using baseline and 8 week data, model-based cluster analysis with Bayesian regularization found 2 subgroups in this sample of 43 individuals with diabetes and a solid tumor cancer undergoing chemotherapy. Group 1 experienced mild symptoms that changed very little except for the appearance of mild appetite changes at 8 weeks, group 2 experienced mild to moderate symptom severity, with small increases in fatigue, nausea, and numbness and tingling.

SESSION 1510 (SYMPOSIUM)

THE INTERPLAY OF LEVEL AND CHANGE IN PERCEIVED CONTROL WITH HEALTH, WELL-BEING, AND SOCIAL RESOURCES IN MIDLIFE AND OLD AGE

Chair: F.J. Infurna, *Psychology, Arizona State University, Tempe, Arizona*

Perceived control is interrelated with health, well-being, and social resources across adulthood and old age. We used 16-year longitudinal data from the Americans' Changing Lives Study (N = 2,540; Mage=62.85, SD=12.15; 65% Women) to examine health, well-being, and social antecedents of rates of change in perceived control and whether rates of change in perceived control reduce mortality risk for individuals low in health, well-being, and social resources. Results indicated that more functional limitations and depressive symptoms and less emotional support were each associated with stronger declines in perceived control over time. Contrary to the buffering hypothesis, more positive rates of change in perceived control protected against mortality risk for those with fewer functional limitations and depressive symptoms, and more emotional support. Our discussion focuses on the interrelated and multi-directional nature of levels and rates of change in perceived control, role of age, and the implications of our findings for interventions.

CANCER-RELATED AND NON-CANCER ILLNESS FACTORS AS PREDICTORS OF HEALTH QUALITY OF LIFE AMONG OLDER ADULT, LONG-TERM CANCER SURVIVORS

G. Deimling, H.T. Renzhofer, N. Mallick, *Case Western Reserve University, Cleveland, Ohio*

As older adult cancer survivors continue to age they face the dual vulnerability of cancer and aging. This paper examines the relative impact of cancer-related and non-cancer illness factors such as co-morbidities and symptoms on functioning, perceptions of disability and self rated health among older adult survivors. Specific attention will be paid on the role that advancing age and temporal distance from treatment play in mediating these relationships. Data from an NCI funded, ten year longitudinal study of 471 survivors will be used to examine these issues. Results of descriptive and multi-variate analyses indicate that with advancing age and increased temporal distance from treatment co-morbidities began to displace cancer-related treatment and illness factors as the determinants of functioning and disability. Implications for primary care and oncology care practitioners will be discussed

BEYOND GRIP STRENGTH: ASSOCIATIONS BETWEEN FINE MOTOR ADL PERFORMANCE AND COGNITIVE ABILITY IN A NON-DEMENTED SAMPLE OF OLDER ADULTS

E.B. Fauth[1], S.Y. Schaefer[1], S.H. Zarit[2], M. Ernsth-Bravell[3], B. Johansson[4], *1. Family, Consumer, and Human Development, Utah State University, Logan, Utah, 2. Penn State University, State College, Pennsylvania, 3. Jönköping University, Jönköping, Sweden, 4. University of Gothenburg, Gothenburg, Sweden*

Many ADLs require fine motor ability (FMA), however function is often evaluated via gross motor assessment (grip strength). We hypothesize that in a non-demented sample, cognition explains significant additional variance in FMA. OCTO-Twin participants (n=218), aged 80+ (dementia, stroke or Parkinson's disease excluded) were assessed via self-rated health, depressive symptoms (CES-D), a cognitive battery, grip strength, and timed FMA. FMA did not differ by gender, was not correlated significantly with self-rated health or depressive symptoms, but was associated with grip strength ($r=0.346$; $p<0.01$). Correlations between cognitive tests and FMA ranged from -0.263 to -0.452 ($p<0.01$). A linear regression model with grip strength had $R2=.087$. Adding cognitive tests increased the R2 to 0.318 (R2 change $p<0.001$). Grip strength and object recall remained significant predictors. In a non-demented sample, cognitive performance predicted FMA after controlling for gross motor ability. Cognitive ability may underlie a significant portion of FMA and related disablement.

DISABLEMENT PROCESS: RECENT FINDINGS AND FUTURE DIRECTION

J. Lee, *Case Western Reserve University, Cleveland, Ohio*

With increasing age older adults are likely to develop chronic illnesses that often result in disabilities. Following Verbrugge & Jette's (1994) seminal work on the disablement process, subsequent theories and researchers have made significant advances in definitions, approaches, and methodologies on this subject. In particular, some of the antecedents, moderators, and outcomes of disablement process have captured the attention of many researchers as they offer practical implications for successful aging in the adulthood. Guided by the Disablement Process Model (Verbrugge & Jette, 1994), the proposed symposium, will highlight five distinct studies. Each paper will address patterns of change in disability as well as predictors of functional disability. The specific studies utilize diverse statistical methods that can shed light on complexities processes involved in the disablement process. G. Deimling will explore the disablement process from the perspectives of elderly cancer survivors. J. E. Lee will present data on multiple trajectories of disability using data from a 10 year longitudinal study. E. Fauth will examine the disablement process and its antecedents. K.Kim will discuss social supports associated with disability trajectory in late life. F. Infurna will discuss the moderating effects of locus of control in the disablement process. While each presentation will capture a unique perspective on disability process, discussant E. Kahana will highlight and integrate cross-cutting issues in conceptualizing life course influences on disability in late adulthood, while also underscoring important future directions for disability research.

TRAJECTORIES OF DISABILITIES IN LATE LIFE: LINKING WITH MORTALITY

J. Lee[1], E. Kahana[1], B. Kahana[3], K. Barnes[1], M.J. Rovine[2], *1. Case Western Reserve University, Cleveland, Ohio, 2. Penn State University, State College, Pennsylvania, 3. Cleveland State University, Cleveland, Ohio*

Prior studies have examined the various patterns of functional decline in the final years of life, but few empirical studies have tested these patterns in mental and physical domains and linked them to mortality. Using a longitudinal panel study (N=890; Mean Age: 81.38, SD=5.745), we examined trajectories of physical functional limitations and mortality among older adults who are age 70 and older. Longitudinal data from 3 waves of the Successful Aging survey are analyzed. To describe the end of life trajectories of disabilities, data are analyzed from the dates of death and extending backward. Using growth mixture modeling, we identified both common and multiple trajectories in several functional declines (e.g., ADL, PADL, and cognitive functioning). Results suggest that trajectories of functional decline near the end of life are quite variable. This analysis also advances understanding of late life functioning by identifying the heterogeneity of functional limitation experiences.

WITHIN-PERSON ASSOCIATIONS BETWEEN FUNCTIONAL DISABILITIES AND DEPRESSIVE SYMPTOMS IN LATE LIFE AND EFFECTS OF SOCIAL SUPPORT

K. Kim[1], J. Lee[2], E. Kahana[2], B. Kahana[3], *1. Human Development and Family Sciences, The University of Texas at Austin, Austin, Texas, 2. Case Western Reserve University, Cleveland, Ohio, 3. Cleveland State University, Cleveland, Ohio*

Research has shown positive associations between functional disability and depressive symptoms in late life. Drawing on longitudinal data from the Florida Retirement Study which interviewed people annually over an 8-year period (up to 9 waves), this study examined (1) age-related changes of functional limitations and depressive symptoms among retirement community-dwelling older adults (aged 70+) and (2) within-person associations between functional limitations and depressive symptoms across time points. Focusing on social support as a protective factor in the disablement process, this study also examined how different types of social support affect within-person associations between functional limitations and depressive symptoms. Our findings showed that both functional limitations and depressive symptoms increased over time. After controlling for the linear time trends in these variables, we still found significant positive within-person associations between functional limitations and depressive symptoms and the within-person associations differed by the levels of social support that older adults perceive.

SESSION 1515 (SYMPOSIUM)

FAMILY CAREGIVING: REPORTING ON CLINICAL TRIALS IN NURSING HOMES AND HOME HOSPICE

Chair: G. Demiris, *University of Washington, Seattle, Washington*
Discussant: B.A. Given, *Michigan State University, East Lansing, Michigan*

This symposium will present findings from three federally funded clinical trials exploring ways to support family caregivers in various settings of care. The first study is a clinical trial examining the use of video to engage hospice caregivers as virtual team members of the hospice interdisciplinary team meetings in order to improve pain management and communication between families and health care providers. The second study is a clinical trial examining the effect of a problem solving therapy intervention on family caregivers of home hospice patients. The intervention is tested in its delivery both face to face and via video. Finally, a clinical trial examining ways to support family caregivers of loved ones in nursing homes will be presented. The three presentations will highlight current evidence, practical and ethical challenges and lessons learned from the design and implementation of these trials. Furthermore, strategies to address translation of effective interventions into practice will be discussed in the context of implementation science.

A PSYCHOSOCIAL INTERVENTION FOR CAREGIVERS OF RECENTLY PLACED NURSING HOME RESIDENTS: A RANDOMIZED CONTROLLED TRIAL

R. Schulz, *U. of Pittsburgh, PIttsburgh, Pennsylvania*

We report the results of a psychosocial intervention for informal caregivers who recently placed their care recipient in a long-term care facility. The intervention, modeled after Resources for Enhancing Alzheimer's Caregiver Health (REACH) (Belle et al., 2006), used multiple treatment modalities and a range of strategies and techniques to address three characteristic needs of family caregivers who recently placed their relative: (1) knowledge about the nature of long-term care procedures and resident trajectories; (2) advanced and end-of-life care planning for the institutionalized relative; and (3) caregiver emotional problems, particularly depression and anxiety which are common among caregivers who recently placed their relative. The intervention was delivered during the 6 month period following baseline assessment. Follow-up assessments were carried out at 6, 12, and 18 months. Primary outcomes were caregiver depression, anxiety, burden, and complicated grief.Significant time effects were found for three of the four primary outcomes showing that caregiver depression, anxiety, and burden improved over time. No treatment effects were found for these outcomes. However, at 12 months, complicated grief was significantly lower for caregivers in the treatment condition.

ASSESSING CAREGIVERS FOR TEAM INTERVENTION VIA VIDEO ENCOUNTERS (ACTIVE): RESULTS OF A FOUR YEAR RANDOMIZED CLINICAL TRIAL IN US HOSPICES

D. Parker Oliver[1], G. Demiris[2], K.T. Washington[1], D.L. Albright[1], *1. University of Missouri, Columbia, Missouri, 2. University of Washington, Seattle, Washington*

This randomized controlled trial aimed to strengthen home hospice by enabling informal caregiver participation in care plan meetings using web-based conferencing. A mixed methods approach with 450 hospice caregivers explored the impact of the intervention on caregiver pain management, anxiety, depression, social support, and quality of life. Participation in meetings answered caregiver questions on pain, lowered anxiety and depression. Caregivers expressed the need for additional support and information. Hospice staff reported benefits of the intervention however, the time required was burdensome. It was concluded that while successful, ACTIVE would be strengthened with social media tools for caregiver social support and information. Numerous lessons were learned while implementing this trial. Issues related to protocol development, recruitment, retention, fidelity, and translation will shared.

THE PISCES INTERVENTION: A CLINICAL TRIAL EXAMINING A PROBLEM SOLVING THERAPY INTERVENTION FOR HOSPICE CAREGIVERS

G. Demiris[1], D. Parker Oliver[2], K.T. Washington[2], K.C. Pike[1], *1. University of Washington, Seattle, Washington, 2. University of Missouri, Columbia, Missouri*

Informal caregivers of hospice patients play a key role to the delivery of palliative services to patients at the end of life. The caregiving experience can be a fulfilling one but at the same time caregivers report feeling anxious, overwhelmed and often isolated. This presentation describes an ongoing four year clinical trial examining a problem solving therapy intervention for hospice caregivers called PISCES (Problem solving Intervention to Support Caregivers in End of life care Settings). Study participants are caregivers randomly assigned to an attention control group, or the intervention group where they participate in PST sessions with a therapist in person (intervention group 1) or via video (intervention group 2). We have recruited more than 450 subjects to date and will present findings on the impact of the intervention on caregiver outcomes such as quality of life and anxiety, discuss lessons learned and strategies to ensure the intervention can be easily implemented in practice.

SESSION 1520 (SYMPOSIUM)

A CONSUMER PERSPECTIVE ON DEMENTIA BIOMARKERS, ON-LINE DEMENTIA RESOURCES, AND DEMENTIA LITERACY

Chair: B.D. Carpenter, *Psychology, Washington University, St. Louis, Missouri*

Discussant: S.R. Sabat, *Georgetown University, Washington, District of Columbia*

Technological and biological advances are shifting how people learn about dementia and how dementia is diagnosed. This symposium addresses some of those changes and how they are affecting consumers. The first presentation addresses the emerging issue of biomarkers for early dementia detection. As biomarkers become more widely implemented, it is important to consider the extent to which people comprehend the implications of those biomarkers and their preferences regarding biomarker disclosure. This presentation provides empirical data on the consumer perspective in this area. The second presentation also adopts a person-centered approach and in this case examines how older adults react to a publicly available on-line dementia screening tool. Little is known about the psychological and behavioral impact of at-home screening for dementia, and this study provides data that could guide recommendations for these new screening approaches. The third presentation uses an innovative on-line recruitment strategy to investigate how knowledge about Alzheimer's disease changes when people undertake a brief visit to the website of the Alzheimer's Association. The fourth and final presentation takes an international perspective and examines knowledge about Alzheimer's disease in contemporary Japan. The symposium closes with integrative comments from a discussant with a long-standing person-centered approach to understanding the psychological and social ramifications of a dementia diagnosis.

DISCLOSURE OF BIOMARKER TEST RESULTS TO COGNITIVELY NORMAL RESEARCH PARTICIPANTS

J. Gooblar, *Psychology Department, Washington University in St. Louis, St. Louis, Missouri*

Biological indicators (biomarkers) can identify preclinical Alzheimer disease (AD) years prior to the appearance of overt symptoms. As biomarkers become more reliable and predictive of disease progression, it is important to understand the practical implications and psychological effects of biomarker disclosure. Cognitively normal older adults (N=103) at an Alzheimer Disease Research Center were surveyed on attitudes and knowledge about biomarker disclosure. Whereas most participants (97%) expressed a desire to learn their biomarker results, fewer (55%) reported having sufficient information to make an informed decision about disclosure. Most reported reluctance to share risk information with insurers and employers (76% and 77%). Few thought life would not be worth living if biomarkers indicated they had high risk of developing AD (M = 1.6). These results highlight the practical and ethical considerations in biomarker disclosure. Future research should identify effective education interventions and policy changes to address these considerations.

PSYCHOLOGICAL EFFECTS OF ONLINE SCREENING FOR DEMENTIA RISK

C. Merz, B.D. Carpenter, *Psychology, Washington University in St. Louis, St. Louis, Missouri*

The Dementia Risk Assessment (DRA) is an online screening tool for dementia risk factors that provides users with an individualized risk report. The purpose of the current study was to investigate the psychological impact of using the DRA. The sample included 74 community dwelling older adults, mean age = 71.7 years (SD = 9.7), 62% female. On average, participants rated their risk of developing dementia as higher after they completed online screening, t(64) = -2.71, p < .01. Fear of developing dementia also increased, t(73) = -2.99, p < .01. The majority of participants (58%) reported an intention to change health behaviors as a result of reading their risk report. Completing unsupervised online screening for dementia may have psychological consequences that suggest the importance for follow-up counseling.

THE ALZHEIMER'S ASSOCIATION WEBSITE IMPROVES KNOWLEDGE OF ALZHEIMER'S DISEASE IN A NATIONAL SAMPLE

S. Balsis[1], M.L. Hughes[1], D.A. Lowe[1], B.D. Carpenter[2], *1. Texas A&M University, College Station, Texas, 2. Washington University in St. Louis, St. Louis, Missouri*

Alzheimer's disease (AD) will affect nearly everyone at some point in their lives, either directly or indirectly. When this happens, many people will search for answers on the Internet. The purpose of the current study was to investigate whether the Alzheimer's Association website is effective at increasing an individual's knowledge of AD. A total of 552 participants were randomly assigned to two groups. One group visited on the Alzheimer's Association website (alz.org), while a control group did not visit the website. Both groups were then given the AD Knowledge Scale to assess their knowledge of AD. The brief exposure to this informational website worked. Participants who visited alz.org scored significantly higher on the ADKS than the control group. Participants who were non-AD health care workers benefited especially. Results suggest that the alz.org is effective at increasing people's knowledge of AD, and that it is especially helpful for healthcare workers.

MEASURING KNOWLEDGE ABOUT ALZHEIMER'S DISEASE IN JAPAN

T. Amano[1], K. Yamanaka[2], B.D. Carpenter[3], *1. Keio University, Shinjuku, Tokyo, Japan, 2. University of Tsukuba, Tsukuba, Ibaraki, Japan, 3. Washington University in St. Louis, St. Louis, Missouri*

It is said that knowledge about dementia is essential to provide good quality of care for people with dementia. However, there are no existing scales in Japanese that can be used to measure knowledge about dementia and thus evaluate the effectiveness of educational programs. The objectives of this study were to create a Japanese version of the Alzheimer's Disease Knowledge Scale (J-ADKS) and measure knowledge about Alzheimer's disease among Japanese people. The J-ADKS was administered to a total of 217 people including college students, community dwelling elderly people, family caregivers, health professionals, and social workers. Reliability and validity for the J-ADKS are good. Although knowledge about dementia is good in some domains, that knowledge varies across subsamples and differs from knowledge gaps in other international samples. Results from this study can guide the development of more targeted educational programs about dementia in Japan.

SESSION 1525 (PAPER)

DISCOVERY EXCHANGE: TRANSPORTATION AND AGING SUPPORTED BY THE TRANSPORTATION AND AGING INTEREST GROUP

"IT'S IN HOW YOU PRESENT THE QUESTION:" SCREENING OLDER DRIVERS IN PRIMARY CARE SETTINGS

M.E. Betz[1], J. Jones[2], E. Genco[1], D.B. Carr[3], C. DiGuiseppi[4], R. Schwartz[5], *1. Emergency Medicine, University of Colorado School of Medicine, Aurora, Colorado, 2. University of Colorado College of Nursing, Aurora, Colorado, 3. Washington University School of Medicine, St. Louis, Missouri, 4. Colorado School of Public Health, Aurora, Colorado, 5. University of Colorado School of Medicine - Division of Geriatric Medicine, Aurora, Colorado*

Objective: Widespread screening of older drivers, with in-depth evaluation only of those who screen positive ("tiered assessment"), might efficiently balance driver safety and mobility. To inform program development, we sought to use qualitative methods to explore more deeply the perspectives of older drivers and clinicians on the concept of tiered assessment in primary care settings. Design and Methods: We held iterative focus groups and interviews with 23 community-dwelling current drivers aged ≥65 years and eight primary care providers from an academic medical center. We used inductive and deductive theme analysis to explore driver and clinician perspectives and to identify barriers and facilitators to establishing tiered older driver assessment programs in primary care settings. Results: Four dominant themes emerged. Two addressed the overall concept: (1) general receptiveness to tiered older driver assessment; and (2) concerns about the consequences of older driver assessment (e.g., driving retirement) and how these could affect program viability. Two themes addressed screening: (3) the tension inherent in using a generalized approach to the highly individualized issue of driving; and (4) logistical considerations for screening in primary care settings (e.g., having a medical assistant administer part of the screening). Conclusions: Standardized older driver screening and referral might improve clinician-driver communication, but screening should occur in a context that includes mobility counseling and anticipatory communication about future driving retirement.

ASSOCIATIONS BETWEEN THE ATTENTION NETWORK TEST AND OTHER MEASURES OF COGNITION: RESULTS FROM THE CANDRIVE COHORT

J. Rut[1], H. Maxwell[1], B. Weaver[1], S. Marshall[2], M. Man-Son-Hing[2], G. Naglie[3], M. Rapoport[3], M. Bedard[1,4], *1. Centre for Research on Safe Driving, Lakehead University, Thunder Bay, Ontario, Canada, 2. Ottawa Hospital Research Institute, Ottawa, Ontario, Canada, 3. University of Toronto, Toronto, Ontario, Canada, 4. St. Joseph's Care Group, Thunder Bay, Ontario, Canada*

The Attention Network Test (ANT) is increasingly used to examine cognitive processes in humans. One of the ANT's strengths is the underlying theoretical model and evidence supporting it. Yet, little research has been conducted to examine how the ANT relates to abilities supporting safe driving in seniors. Two years ago we presented preliminary correlations between the ANT and other tests of cognition often used in driving assessment. We now present an update using data from 451 older drivers enrolled in the Candrive cohort research study. The data come from the third of five annual assessments. All participants were aged >70. Correlations were computed between several ANT measures and the Montreal Cognitive Assessment (MoCA), Mini Mental State Exam (MMSE), Motor-Free Visual Perception Test (MVPT-3), Trail Making Tests A and B (TMT), the Demtect, the SIMARD-MD, the Digit Span (forward and backward), and a "road sign recognition test". The ANT (median response time) was statistically associated with both tests measuring some form of visual attention (e.g., MVPT-3 [r

= .235, 95% CI = .146, .321, p < .001] and more general measures of cognition (e.g., MoCA [-.179, 95% CI = -.266, -.088, p < .001) but all correlations were very modest. There were no meaningful associations between the three network scores (alerting, orienting, executive function), suggesting that the three remain independent in seniors. These results strengthen our previous findings suggesting that the ANT may provide a unique window into important cognitive processes supporting safe driving that are not examined with other tests.

HOW DO BABY BOOMERS' MOBILITY PATTERNS CHANGE WITH RETIREMENT? EVIDENCE FROM DENMARK

A. Siren[1], S. Haustein[2], *1. The Danish National Centre for Social Research, Copenhagen, Denmark, 2. Technical University of Denmark, Kgs. Lyngby, Denmark*

Baby boomers will comprise a considerable percentage of tomorrow's older population. Previous scholarship has indicated higher travel activity and car use among baby boomers compared to older cohorts. However, there is little systematic evidence on the effects of boomers' ageing on the transport system. To analyse how retirement affects baby boomers' travel patterns and the related future travel demand, three groups of Danish baby boomers, distinguished by working status, were compared. Data were collected via standardized telephone interviews in 2009 and in 2012. We found a clear tendency to reduce the overall level of car use and mileage over time and as a consequence of retirement. By contrast, car use for leisure purposes increased after retirement. Retirement was found to have a bigger impact on men's than on women's car use. However, those women who continued working had a high car reliance that did not show decline over time. The present study suggests that retirement is a transition point that decreases car use. Hence, the population ageing is likely to have a decreasing effect on transport demand. However, the emergence of leisure and consumption as major cultural and social frameworks of the third age, prolonged careers and atypical working life, informal care giving, and boomer women's changing professional roles are likely to make this transition different than observed in previous cohorts.

EVALUATING THE USE OF AN INTERACTIVE DRIVING SIMULATOR BY OLDER ADULTS FOR INDIVIDUALS WITH MEDICAL CONDITIONS

A. Dickerson, A. Schwarga, C. Wetherington, *Occupational Therapy, East Carolina University, Greenville, North Carolina*

As a valued activity needed to keep older adults healthy and participating in their community, it is critical to keep persons driving as long as they are able. When an individual recovers from medical condition, such as a stroke, there should always be a discussion about fitness to drive. In many cases, evaluation or intervention is needed. The technology of driving simulators has become affordable for rehab centers and as such, may be valuable tools for evaluation and intervention in an effort to assist individuals return to driving. This study asked 31 older adults to "drive" the simulator (45 minutes) and evaluate its face validity as an evaluation and/or intervention tool. Likert scale questions (1 as low,10 as high) and interviews were used to collect the data. Results from the participants indicated the simulator was not seen as the same as a motor vehicle (M=5.3). Interestingly, most comments were in relation to the "operational" factors (Michon, 1985) (e.g., steering wheel, brakes). However, most participants felt the simulator was acceptable and realistic to use to identify risk for someone with a significant medical condition affects driving (M=8.1) and the feedback information from the program accurately reported performance (M= 8.0). A summary of the results, with the qualitative feedback will be highlighted; recommendations for protocols for use and implications for evaluation and intervention will be discussed.

A LONGITUDINAL STUDY OF THE IMPACT OF SPOUSAL DRIVING CESSATION ON BODY MASS INDEX

A.L. Curl[1], C.M. Proulx[2], J.D. Stowe[2,3], *1. University of Missouri, School of Social Work, Columbia, Missouri, 2. University of Missouri, Human Development and Family Studies, Columbia, Missouri, 3. Frank L. Mitchell Jr., MD Trauma Center, University of Missouri Hospital, Columbia, Missouri*

We used data from 6 waves (2000-2010) of the Health and Retirement Study (HRS) to examine whether patterns of driving cessation within couples predicted changes in Body Mass Index (BMI) in adults aged 65 years and older. Driving cessation has been shown to impact productive and social engagement (Curl, Stowe, Cooney, & Proulx, 2013), and driving cessation may also negatively impact other active forms of engagement that are related to weight maintenance in adulthood. Older adults in the United States are quite dependent on automobile transportation (Rosenbloom & Herbel, 2009), and it is unlikely that walking—an active form of transportation— will replace driving after cessation. Understanding whether driving cessation affects BMI may highlight additional needs for intervention post-cessation, such as programs targeting maintenance of physical activity or healthy weight. The analytic sample includes 1,844 married couples. Multilevel models controlled for age, race, ethnicity, education, IADLs, depressive symptoms, household income, household wealth, and couple ownership of a motorized vehicle. Results indicate that BMI decreases for both spouses when the husband is no longer able to drive but the wife is still driving. However, BMI is not affected when only the wife has stopped driving. These results highlight the importance of husbands' ability to drive on couples' health via changes in body mass index, and demonstrate the need to find ways for couples to maintain weight when husbands can no longer drive.

SESSION 1530 (PAPER)

TECHNOLOGY AND AGING I

REMOTE PATIENT MONITORING AMONG LOW INCOME COMMUNITY DWELLING OLDER ADULTS RESIDING IN A RURAL STATE: TECHNOLOGY ACCEPTANCE AND TIME TRENDS

J. Giger[1], N. Pope[2], H. Vogt[3], C. Gutierrez[4], J. Lemke[3], *1. Social Work, University of South Dakota, Sioux Falls, South Dakota, 2. University of Kentucky- Social Work, Lexington, Kentucky, 3. Sanford School of Medicine/USD/SD Area Health Education Center, Sioux Falls, South Dakota, 4. University of South Dakota-Health Sciences, Vermillion, South Dakota*

Aim of the Study: Despite the growing literature on older adult acceptance of remote patient monitoring technology (RPMT), no known research has specifically investigated acceptance among low-income, community-dwelling older adults residing in a rural region. The purpose of this study was to investigate rural older adults' acceptance of the Honeywell HomMed Genesis Touch over time. Method: We conducted a pilot study in a low income, independent living residential facility in a rural, upper Midwestern state. Honeywell technology was installed in the homes of 10 participants, largely female (80%), with a mean age of 73.90 (SD = 6.05). GLM repeated measures and trend analyses were conducted to determine if Honeywell acceptance means differed across five assessments over 13 weeks and showed time trends. Results: Participants accepted and intended to use the technology in the future. Differences in behavioral intention, usefulness, and ease variables were not significant over time. However, there was a significant effect of time on social influence, F(5, 40) = 4.14, p = .004, ES = .34, resulting in a significant linear, F(1, 8) = 6.92, p = .03, ES = .47, and cubic trends, F(1, 8) = 5.46, p = .048, ES = .41. Conclusions: The findings show rural, low-income community-dwelling older adults accept RPMT, and the longer participants had access to the technology, the more they believed those important to them would want them to use the technology. Implications of these findings are considered along with directions for future research.

SLEEP SENSORS FOR OLDER ADULTS RESIDING IN A DEMENTIA SPECIAL CARE UNIT: FEASIBILITY AND PRELIMINARY EFFICACY

J. Giger[1], W. Schweinle[2], S. Smallfield[3], *1. Social Work, University of South Dakota, Sioux Falls, South Dakota, 2. University of South Dakota-Physician Assistant Studies, Vermillion, South Dakota, 3. University of South Dakota-Occupational Therapy, Vermillion, South Dakota*

Objective: Sleep problems among older adults in dementia special care units (DSCU) are common but challenging to measure due to the frequent concurrence of neuropsychiatric symptomology, e.g. agitation and aggression. This study investigated the feasibility and preliminary efficacy of passive and unobtrusive sleep sensor systems in the bedrooms of older adults with moderate to severe dementia [Functional Assessment Staging Test (FAST) 5 ≤]. Method: We conducted a pilot study in a DSCU in an upper Midwestern state and used modern resampling statistics (1,000 resamples) to provide robust parameter estimates. The HealthSense® Wellaware® Non-invasive Analysis of Physiological Signals (NAPS) system was installed in the bedrooms of 10 participants with a mean age of 84.30 (SD = 8.58). Sensor and clinical data from a 9-week period and from a largely female sample (90%) with AD were retrospectively analyzed. Results: Negligible technical and human factor concerns were observed. There was one instance of system-wide equipment issues, a power outage, over the course of the study. Monthly participant subjective sleep/wake assessments by staff were approximately accurate but significantly different from sensor data. Bootstrapped Spearman correlation analyses revealed significant relationships between sleep continuity variability and cognitive impairment as assessed by BIMS, r = -.67, BCa CI = [-.07, -.98] and sleep continuity variability and participant weight as measured by BMI, r = .83, BCa CI = [.39, .99]. Conclusion: Findings support the practicality of passive and unobtrusive sleep pattern assessment for DSCU residents and suggest sleep continuity variability is a potential direction for future research.

TOWARDS GUIDELINES FOR OLDER ADULTS INTERACTIONS WITH TOUCHSCREEN-BASED MOBILE DEVICES

P.C. Castro[1], R.M. Fortes[2], Y.G. Passos[1], H.L. Antonelli[2], J. Oishi[1], *1. Universidade Federal de São Carlos - UFSCar, São Carlos, São Paulo, Brazil, 2. Universidade de São Paulo - USP, São Carlos, São Paulo, Brazil*

Objective. This study aimed to detect usability problems in interactions with touchscreen-based mobile devices for users over 40 years old. Method. It was conducted an exploratory qualitative study. An interview was applied to gather data in order to identify guidelines for interaction, by older adults, with touchscreen-based devices. For this study, only tablets were adopted as practical devices. Firstly, a content analysis was carried out by two experts in Gerontology. Then, the semantic analysis was performed with one volunteer from each age group: 40-49, 50-59, 60-70, 71-80, > 80 years old. Each volunteer was asked to perform 6 tasks on the tablet: turn on and off, make a call, use email, access a webpage, play games and take pictures. Results. The younger respondents (45, 55 and 67 years old) reported to have access to the Internet and previous experience with touchscreen-based devices. Older users (73 and 87 years) have had no experience with the use of the devices nor Internet, however they were able to open the phone, email, play games and take pictures. They answered that tablet was easy to use. The main difficulties were concerned to: the small font sizes, screen navigation, to find desired apps, alternate between programs, to find the keyboard, non-intuitive commands that have to be learned, the fat finger problem and excessive force. Conclusions. The data indicate the need of interviewing more people to establish new indicators and usability guidelines for designing haptic interfaces for touchscreen-based devices in web applications designed to senescent.

CROSS CULTURAL DIFFERENCES IN SPONTANEOUS HUMAN-ROBOT INTERACTIONS

W. Chang, L. Huber, S. Sabanovic, *Indiana University, Bloomington, Indiana*

The social shaping of technology framework suggests that people's response to technology is not a singular, logical inner product, but instead the result of social interactions relating to the creation and use of the technology (Williams & Edge, 1996). "Interpretive flexibility," a key construct of the social shaping of technology framework, suggests that different groups make their own meanings about technology (MacKenzie & Wajcman, 1999). In prior Japanese studies (Wada, Shibata, Saito, & Tanie, 2003), the spontaneous interactions of older adults with the socially assistive robot PARO are usually group oriented, intensive, and consistent. In this cross-cultural comparative study of acceptance and use of social robots, we put PARO in an open space in a long term care facility and observed spontaneous interactions for one hour periods over three months. To allow for interpretive flexibility, older adults with and without dementia were not given any information or instruction about interacting with the robot. Interaction type and frequency were coded. Four primary themes emerged: 1) US older adult need more guidance than Japanese older adults to develop interactive, sustained rapport with PARO; 2) Extended exposure to robots in open spaces in the U.S. may develop more advanced interpretations of possible uses for human-robot interaction; 3) Qualitative research is critical for these early U.S. studies to capture the nuanced complexity of human-robot interactions, not just frequency; 4) Use of social robots in the U.S. is dependent on expected and appropriate robot response to the social norms and social cues of this country.

USE AND DISUSE OF ASSISTIVE TECHNOLOGY DEVICES IN OLDER CAREGIVING DYADS

A.J. Harrill[1,2,3], J.A. Sanford[1,3], P.C. Griffiths[1,3,4], *1. Atlanta VA Medical Center, Decatur, Georgia, 2. Georgia State University, Atlanta, Georgia, 3. Georgia Institute of Technology, Atlanta, Georgia, 4. Emory University, Atlanta, Georgia*

The *__C__are__G__iver __A__ssessment of __S__kill __S__ets and __I__ndividualized __S__upport thru __T__raining (CG ASSIST)* program is a pilot study that targeted caregivers of older Veterans dependent in ADLs for (1) an assessment of current assistive technology (AT) needs and environmental features in the home and (2) an individualized, hands on skills training program for the dyad on AT provided as part of the intervention. Reported data on the origin or source in addition to the use and disuse of AT devices were collected as part of the comprehensive baseline assessments by the clinical experts. The sample was comprised of female, spousal caregivers who ranged in age from 50-86 years (M=71±9.7) and were caring for Veterans who ranged in age from 66-94 (M=80±6.9). Caregivers reported owning between one and eight devices (M=5±2). On average 4±1 devices were currently in use whereas 2±1 were reported as having been abandoned. The origin of existing AT in regards to procurement varied by device and dyad and fell into two categories. "Physician's orders" and "the pharmacy" were coded as examples of *conventional* sources of AT whereas "my deceased neighbor" and the "church yard sale" were designated as *unconventional*. Dyads obtained 4±2 devices from conventional sources and 2±1 devices from unconventional sources (range=1-7). AT source was unrelated to abandonment but was related to the clinical expert's assessment of environmental features and safety for specific ADL tasks. Results are discussed in terms of implications for assessment of ADL performance and assistive technology needs of older adults.

SESSION 1535 (PAPER)

LONG-TERM CARE

UNDERSTANDING ADULT FOSTER CARE PROVIDER EXPERIENCES IN NORTH CAROLINA

K.A. Munly, K.A. Roberto, K.R. Allen, *Human Development, Virginia Tech, Blacksburg, Virginia*

We explored Adult Foster Care (AFC) as a small-setting option for community-based long-term care. This option varies widely in accessibility and structure among states; thus, this initial research effort focused on AFC provider experiences in North Carolina. As of 2013, there were 632 AFC facilities in North Carolina, which state policy refers to as "family care homes" (NC DHHS, 2013). Family care homes are licensed by the state and allow service for 2-6 residents per home (Mollica et al., 2009). We conducted semi-structured, guided interviews with 26 providers. As a context for grounded theory data analysis, we relied on reflexive material stemming from Munly's positionality as a care worker. Emergent themes related to issues of the providers' motivation to provide care; likelihood to stay in the profession of family care provider; personal and professional role of the provider; the spectrum of AFC culture that ranged from more business-like to more family-like; provider perspectives about their care recipients; resident opportunity for choice; and family care provider values. Interview narratives revealed specific contexts related to provider financial struggle and success, as well as contexts related to models of hierarchy and caring between providers and residents. Findings shed light on state and organizational dedication to the AFC system, and policy context for provider-resident relationships.

WAIVER CLIENT CHARACTERISTICS SIGNIFICANTLY ASSOCIATED WITH PERMANENT NURSING HOME PLACEMENT

C.W. Given, H. An, K. Oberst, *College of Human Medicine, Michigan State University, East Lansing, Michigan*

Home and community based waiver (HCBW) programs (1915c) allow Medicaid eligible persons who qualify for nursing homes to receive services at home. However, as medical problems progress and functional capacity and cognition decline, patients enter nursing homes. This research describes how client and family factors predict transitions from waiver program participation to permanent nursing home residence. The eligible waiver population included 9,273 clients who had at least one MDS assessment during 2011 and 2012; of these approximately 12% transferred permanently to a nursing home. Medicaid/Medicare paid claims, RUGs score, age, caregiver availability, number of hospitalizations in prior three months, and post-discharge location were assessed for relationship to permanent nursing home placement. This research suggests permanent transfers from waiver programs to nursing homes are associated with at least one hospitalization versus no hospital admission. Among admissions, those clients discharged to skilled or custodial facilities had a greater likelihood of a permanent transfer. Caregiver characteristics contributed to explaining the differences among patient transfers. Further examination of hospital rates prior to and following the permanent transfer to nursing homes remained relatively unchanged suggesting that patient problems rather than setting explain continued hospitalization.

DOES STATE SPENDING FOR COMMUNITY-BASED CARE AFFECT INSTITUTIONALIZATION RISK AFTER HIP FRACTURE?

J. Blackburn[1], M.A. Morrisey[1], J.L. Locher[2], D.J. Becker[1], E.S. Delzell[3], M. Kilgore[1], *1. Health Care Organization and Policy, UAB School of Public Health, Birmingham, Alabama, 2. UAB School of Medicine, Birmingham, Alabama, 3. Epidemiology, UAB School of Public Health, Birmingham, Alabama*

Objective: To estimate the effect of state-level spending for home and community-based services (HCBS) on the likelihood of nursing home placement using state- and year-level fixed effects models. Data source: We used data on Medicaid long-term care expenditures devoted to HCBS and Title III spending by state and year from 2006–2010 combined with Medicare claims data from the 5% sample of beneficiaries covering the time period of 2005 through 2010. Study Design: We measured nursing home placement within 1 year within a cohort of 34,894 Medicare beneficiaries aged ≥65 years with incident hip fractures. We used two logistic model specifications, a naïve maximum likelihood estimate regression and a model including state and year fixed effects, to estimate the effect of state-level spending on nursing home placement. Principal Findings: The naïve logistic regression showed state HCBS spending reduced the absolute risk of nursing home admission by 15.8 percentage points ($p<0.01$) after controlling for Title III spending and other factors. However, the preferred model specification which accounted for unobserved state heterogeneity and controlled for time found no association. Conclusions: There appear to be non-uniform determinants of nursing home placement by states that vary over time. Examples may include other forms of state social support which are not captured in Medicaid spending and unobserved in our study.

SHIFTING THE PARADIGM FOR BABY BOOMERS FROM LONG-TERM CARE TO LONG-TERM LIVING!

J.G. D'Ambrosio, A.C. Faul, *University of Louisville, Louisville, Kentucky*

Current levels of long-term care for older adults do not assure quality of life. Moving from home to assisted living, then to a nursing home, is a journey dreaded by many. In a study of 564 baby-boomers (Boomers), none wanted to end up in a nursing home, with only one percent willing to live in assisted living facilities (Roberts, 2007). Another study of Boomers (D'Ambrosio & Faul, 2013) provides clear direction as to how Boomers want to change the current long-term care paradigm. Boomers want "Livable Aging" that includes a livable environment (shelter, safety, food, basic care), life-ability of the person (physical and mental health of older adults and health care workers), utility of life (perceived value of life for older adults and health care workers by those who create health environments), and appreciation of life (subjective evaluation of life satisfaction by older adults and health care workers) (Adapted from Veenhoven, 2000). Shifting to a new paradigm of long-term LIVING requires a vision focused on compassionate love of one another, not the profit motive generally used to create healthcare systems. In this presentation participants will be exposed to alternative ways to create livable communities including livable environments where life-ability of the person is central and where the utility of older adult life is prominent. These examples will challenge the stereotypes of aging and guide us to develop systems that value the status and prestige older adults bring to society. Data will be presented on what Boomers want as they age.

SOCIAL SECURITY INEQUALITY AMONG ELDERLY CHINESE PERSONS

Z. Feng[1], A. Vlachantoni[1,2], *1. Centre for Research on Ageing, University of Southampton, Southampton, United Kingdom, 2. ESRC Centre for Population Change, University of Southampton, Southampton, United Kingdom*

This paper examines social security provision which includes pension and medical insurance coverage for elderly people in contemporary

China. It also considers the subjective effectiveness of social security provision of the elderly population, which refers to the perceived financial security and adequacy of medical care. Using data from the Chinese Longitudinal Healthy Longevity Survey (CLHLS) in 2008 focusing on those aged above 60, we employed multivariate multilevel models to estimate simultaneously the differentials between individual and between provinces. The results show that substantial differences exist by the respondents' former occupation. Those who were state-own institution employees are more likely to have a pension and medical insurance than those who are non-state-own employees. While, those elderly people with formal education and living in rural areas have higher odds of having medical insurance. In terms of the subjective effectiveness of social security provision of the elderly population, elderly people who are in a low income families and without social security are the most vulnerable in terms of their perceived social security adequacy. Apart from the inequality between individuals with different characteristics, there are also substantial inequalities between provinces. These placed-based differences are important in policy terms and are likely to be exacerbated as China continues to develop economically, and younger members of households migrate away from rural areas and can no longer play a key familial role in filling the gap between poor provision and effective social security.

SESSION 1540 (PAPER)

MENTAL HEALTH AND DIVERSE POPULATIONS

DEVELOPMENT AND VALIDATION OF A TYPOLOGY OF RISK PROFILES FOR OLDER HOMELESS VETERANS

J. Schinka[1,2], R. Casey[1,2], W. Kasprow[3,4], *1. VA National Center for Homelessness Among Veterans, Tampa, Florida, 2. University of South Florida, Tampa, Florida, 3. VA Northeast Program Evaluation Center, West Haven, Connecticut, 4. Yale University, New Haven, Connecticut*

The characteristics of the homeless population have changed substantially in this millennium, with notable increases in the number of women, young veterans, adolescents, the elderly, and families joining the ranks of those without housing. In this study we examined the characteristics of older homeless veterans by applying a multi-stage clustering procedure to records in a large national database. Data were extracted from the program entry/exit records of homeless veterans age 55 or older who had participated in a national VA housing program in 20011-2013. An initial cluster solution was developed on a sample of 2,637 records. This solution was then validated on an independent sample of 2,490 records. An initial six-cluster solution resulted from examination of 26 clustering variables tapping risk characteristics such as substance abuse history, work status, and number of homeless episodes. The risk profile clusters were titled Working for Pay, Minimal Problem, Substance Abuse, Long-term Unemployed, Elderly, and Medical Problem. The profile seeds for these initial clusters were then used to classify cases in the validation sample. Approximately 86% of the validation sample cases were matched to one of the six profile clusters. The validity of the six-cluster typology was supported by results showing significant differences among the profiles on outcome variables such as program completion, residence status, and employment. Use of the typology should allow more refined intervention planning efforts. Future attempts to develop homeless typologies will be facilitated by the inclusion of clustering variables tapping psychiatric diagnoses and personality characteristics.

BURDEN OF LATE-LIFE DEPRESSIVE SYMPTOMS AND RISK OF LONG-TERM CARE PLACEMENT IN OLDER WOMEN

A.L. Byers[1,2], L. Lui[3], E. Vittinghoff[4], K. Covinsky[2,5], K. Ensrud[6], K. Yaffe[1,2,7], *1. Department of Psychiatry, University of California, San Francisco, San Francisco, California, 2. San Francisco VA Medical Center, San Francisco, California, 3. California Pacific Medical Center Research Institute, San Francisco, California, 4. Department of Epidemiology and Biostatistics, University of California, San Francisco, San Francisco, California, 5. Department of Medicine, Division of Geriatrics, University of California, San Francisco, San Francisco, California, 6. School of Public Health, University of Minnesota, Minneapolis, Minnesota, 7. Departments of Neurology and Epidemiology and Biostatistics, University of California, San Francisco, San Francisco, California*

Introduction: Little is known about long-term care needs associated with late-life depressive symptoms. Thus, we examined the influence of depressive symptoms on transition from community-living to long-term care among elderly women followed for nearly 20 years. **Methods:** We evaluated data on 4,039 elderly (age ≥ 65 years), mostly white, community-dwelling women enrolled in an ongoing prospective cohort study. The Geriatric Depression Scale (GDS) short form (range: 0-15) was used to assess depressive symptoms repeatedly over follow-up. We used a Poisson model with random slopes to determine GDS trajectories and then estimated depressive symptom burden based on area under the curve and corresponding quartiles (quartile 1 to 4=minimal to high burden). We lagged values of GDS burden by 3 years. Using Cox proportional hazards analyses, we examined association between cumulative depressive symptom burden and risk of long-term care over 18 years. **Results:** 16.5% of older women had long-term nursing home placement during follow-up. After adjusting for demographic variables (education, marital and living status), risk of nursing home placement was increased by over 3-fold for quartile 4 (high GDS burden) compared with quartile 1 (minimal burden) (hazard ratio [HR]: 3.27, 95% CI: 1.74-6.14). Upon additional adjustment of comorbidities and functional impairment, the association attenuated but remained high and statistically significant (HR: 2.50, 95% CI: 1.27-4.90). Further adjustment for lifestyle factors and antidepressant use showed similar results. **Conclusions:** Long-term depressive symptom burden was associated with greater risk of long-term care. Early intervention and monitoring may delay placement in a long-term nursing home facility.

FACTORS ASSOCIATED WITH SUICIDAL IDEATION IN OLDER INMATES

L.C. Barry[1], R.L. Trestman[2], D.B. Wakefield[1], K. Sullivan[1], Y. Conwell[3], *1. UCONN Center on Aging, Farmington, Connecticut, 2. UCONN Correctional Managed Health Care, Farmington, Connecticut, 3. University of Rochester, Rochester, New York*

Inmates age ≥50 (older inmates) are the fastest growing segment of the prison population and have high suicide rates. Yet, knowledge regarding suicidal ideation (SI) in older inmates, a risk factor for suicide, is essentially non-existent. We sought to determine if demographic (age, race, sex, education), prison-related (sentence length, time until release, number of incarcerations), and/or health-related factors (self-rated health[SRH], vision/hearing loss, total chronic conditions) were associated with SI in older inmates after considering "typical" risk factors for suicide and SI (past suicide attempt, depression). From September 2012-October 2013, we conducted chart reviews and face-to-face interviews with 83 inmates (71% male) age ≥50 from 3 Connecticut prisons. Past suicide attempt (yes/no) and SI severity were assessed using the Geriatric Suicide Ideation Scale (GSIS); higher scores indicated increasing severity (range 31-165). SRH was assessed by asking, "How would you rate your overall health?"; responses were categorized as Excellent/Very Good/Good and Fair/Poor. Depression was assessed using the PHQ-9; scores >15 indicated likely clinical depression. Mean GSIS score was 61.5±26.1 (range 34-137). Thirty(36%) participants reported a prior suicide attempt and 19(23%) were depressed. Variables significant at $p<0.10$ in bivariate analyses were entered into a linear regression model. In addition to past suicide attempt (beta=22.8±5.9; $p<0.001$) and clinical depression (beta=23.0±5.6;$p<0.001$), SI severity was higher among those with longer time until release (beta=0.46±0.20;p=0.02) and fair/poor SRH (beta=15.5±6.7;p=0.02). This work suggests that variables beyond "typical" risk factors for suicide and SI may contribute to understanding which older inmates may be more likely to experience increased SI severity.

PSYCHOSOCIAL INTERVENTIONS FOR MEN OVER 55: A CRITICAL REVIEW

E.C. Price, A. Fiske, B. Edelstein, *Department of Psychology, West Virginia University, Morgantown, West Virginia*

There is a paucity of research, and little consensus, addressing the efficacy and effectiveness of psychosocial interventions for middle-aged and older men. Middle-aged and older men are less likely than women of similar age to present for psychological treatment, which may lead to their underrepresentation in clinical trials. For this critical review, fifteen studies were identified within the broad categories of depressive symptoms and disorders, anxiety disorders and stress, substance abuse and dependence, and mixed outcomes. Ten studies compared treatment efficacy or effectiveness in men and women over age 55. Five additional studies reported statistically significant treatment effects in groups of exclusively male participants over 55. The preponderance of the evidence suggests that psychosocial treatments are associated with similar outcomes in men and women or that men may actually benefit more than women. In some settings, men may begin treatment with more impairment than women. Cognitive and behavioral therapies were the most frequently tested. Common themes and methodological problems inherent in the literature are summarized. Research examining psychotherapy outcomes in middle-old (70+) and old-old men (85+) is extremely limited, as is research assessing outcomes in older men of color. Treatments that address suicide risk are needed because this group has very high rates of death by suicide. Overall, it is crucial to include older men in carefully controlled experimental studies that examine clinically significant change.

INTERNALIZED GAY AGEISM AND DEPRESSIVE SYMPTOMS AMONG MIDLIFE AND OLDER GAY-IDENTIFIED MEN

R.G. Wight[1], A.J. LeBlanc[2], I.H. Meyer[3], *1. Department of Community Health Sciences, UCLA Fielding School of Public Health, Los Angeles, California, 2. Health Equity Institute, San Francisco State University, San Francisco, California, 3. The Williams Institute, UCLA School of Law, Los Angeles, California*

Background: Midlife and older gay-identified men (hereafter, gay men) are subject to aging difficulties that all persons must deal with but they also may be subject to additional strains associated with being a member of a social group known for placing a disproportionate amount of emphasis on youth and appearance. Objectives: We examine the relationship between a newly developed scale, "internalized gay ageism," and depressive symptoms among midlife and older gay men, controlling for 28-year depressive symptom trajectories, which increases explanatory power. We also examine the stress mediating effects of "mattering," or the belief that one is important to others. Methods: Data are from the UCLA site of the Multicenter AIDS Cohort Study (ongoing since 1984) and the accompanying 2013 Aging, Stress, and Health among Gay Men study. The analytic sample is comprised of gay men (N = 312) with a mean age of 60.63 years (range=45-78); 38.78% are HIV-positive. Depressive symptoms are measured with the Center for Epidemiologic Studies-Depression scale. Multivariate regression models include HIV status and sociodemographic characteristics. Results: Net of all control variables, internalized gay ageism was positively associated with depressive symptoms ($p < 0.001$). This relationship was mediated ($p < 0.001$) by mattering, a significant ($p < 0.001$) predictor of depressive symptoms. Conclusions: Among these aging gay men, internalized gay ageism is a powerful source of stress that is harmful to mental health, above and beyond the influence of depressive symptom histories. Mattering may alleviate the psychological distress associated with aging in a youth oriented context.

SESSION 1545 (SYMPOSIUM)

FEDERAL AGING RESEARCH AND FUNDING OPPORTUNITIES: NIA AT 40 YEARS

Chair: M. Bernard, *National Institute on Aging, Bethesda, Maryland*
Discussant: R.A. Barr, *National Institute on Aging, Bethesda, Maryland***Discussant:** R. Hodes, *National Institute on Aging, Bethesda, Maryland*

Since 1974 the National Institute on Aging (NIA) at the National Institutes of Health, Department of Health and Human Services has supported biomedical and behavioral research with a focus on understanding basic processes of aging, improving prevention and treatment of diseases and conditions common in later years, and improving the health of older persons. The NIA also supports the training and career development of scientists focusing on aging research and the development of research resources. The symposium, meant for junior faculty and emerging scholars, provides an update on some of the latest research findings from the NIA, presented by the Institute Director, followed by a brief update on funding mechanisms. An opportunity is provided to meet and consult with representatives from the Office of the Director and extramural staff from the divisions of Extramural Activities, Geriatrics and Clinical Gerontology (GCG), Behavioral and Social Research (BSR), Aging Biology (DAB) and Neuroscience (DN). Learning objectives: 1) describe recent research findings from projects funded by NIA; 2) describe the NIA mission and extramural divisions supporting clinical, biomedical, behavioral and social research; 3) discuss recent policy changes which affect the funding environment; and 4) meet with representatives of NIA, including Sue Zieman (GCG), Felipe Sierra (DAB), Creighton Phelps (DN), Ramesh Vemuri (Review Branch), Chyren Hunter (Training Officer), and Carl Hill (Director, Office of Special Populations).

A RUN THROUGH NIA FUNDING MECHANISMS

M. Bernard, R.A. Barr, *National Institute on Aging, Bethesda, Maryland*

This presentation will discuss the current funding environment at NIA and steps NIA and NIH are taking to maintain a reasonable climate of funding opportunity for students, postdoctoral trainees and early stage investigators. The presentation will include discussion of particular programs and strategies designed for these groups of students and investigators. Current announcements for funding will be highlighted (Requests for Applications and Program Announcements with set-asides). The final theme of the talk will be the new tools of communication NIA is using to keep the community informed. These include the videocast and archiving of the National Advisory Council on Aging open session meetings and a weekly blog post – with the opportunity for comments - on the NIA website.

CURRENT NIA RESEARCH

M. Bernard, R. Hodes, *National Institute on Aging, Bethesda, Maryland*

The National Institute on Aging of the National Institutes of Health is focused on aging research, the development of aging research resources, Alzheimer's disease, and the dissemination of research outcomes. Dr. Richard Hodes, the NIA Director, will provide an overview of recent research outcomes from each of the primary extramural NIA divisions

– Aging Biology, Neuroscience, Behavioral and Social Research, and Geriatrics and Clinical Gerontology

SESSION 1550 (SYMPOSIUM)

RISK FACTORS FOR DECLINE IN MUSCULOSKELETAL HEALTH IN MEN: THE BACH/BONE STUDY

Chair: B. Bartali, *New England Research Institute, Watertown, Massachusetts*
Discussant: L. Ferrucci, *NIA-NIH, Bethesda, Maryland*

The underlying mechanisms contributing to age-related decline in musculoskeletal health are not well understood. This symposium examines the relation of changes in body composition, genetic ancestry and air pollution to changes in muscle strength, bone loss or bone microarchitecture in the Boston Area Community Health/Bone (BACH/Bone) Survey. BACH/Bone is a longitudinal study on factors contributing to decline in musculoskeletal health including 1,219 racially/ethnically diverse men aged 29-80 years. The baseline assessments were conducted in 2002-2005 and the follow-up in 2010-2012. Bone mineral density, fat and lean mass were assessed using dual-energy X-ray absorptiometry (DXA); bone microarchitecture using high-resolution peripheral quantitative computed tomography (HR-pQCT) and muscle strength using hand-held dynamometer. During this symposium, Dr. Bartali, PhD, will show the relationship between changes in fat and lean mass and decline in muscle strength in this racial/ethnic diverse population of men. Ms. Suarez, MPH, will present findings on the relationship between genetic ancestry and bone microarchitecture; Ms. Tinsley, MPH, will show the contribution of changes in lean and fat mass on changes in bone mineral density. In the final presentation, Dr. Prada, MD, PhD will present data on the relationship between air pollution (black carbon) and decline in bone mineral density. The discussion will focus on the importance of investigating the relation of these risk factors with musculoskeletal health and will propose future research directions.

CHANGES IN BODY COMPOSITION AND DECLINE IN MUSCLE STRENGTH

B. Bartali[1], N. Dagincourt[1], T. Curto[1], A. Araujo[2], *1. Epidemiology, New England Research Institute, Watertown, Massachusetts, 2. Eli Lilly, Indianapolis, Indiana*

Decline in muscle strength (MS) is a risk factor for disability in older persons. The role of changes in body composition on MS decline is unclear. We examined the relationship between changes in lean mass (LM) and fat mass (FM) on decline in MS during 8-y follow-up in 692 men aged 30-80y. There was a significant difference in change in MS in men who declined in FM compared to those who did not decline (p=.009; mean change: no decline=-.06; 95%CI:-.24,0.12; mean change, decline:-.47, 95%CI:-.72,-.22). Differences in MS were not significant for decline in LM (p=.26; mean change, no decline=-.17; 95%CI:-.38,.04; mean change, decline=-.34; 95%CI:-.55,-.12). The results did not substantially change after mutual adjustment for FM and LM.In men, decline in FM contributes to decline in MS independently of LM. These results suggest that adipose tissue-related factors (e.g. endocrine function) may play a role on muscle strength decline with aging.

CHANGES IN BODY COMPOSITION AND BONE LOSS IN MEN

L. Tinsley[1], R. Piccolo[1], N.N. Maserejian[1], J. Zmuda[2], M.F. Holick[4], M.L. Bouxsein[3], A. Araujo[5], B. Bartali[1], *1. Epidemiology, New England Research Institute, Watertown, Massachusetts, 2. University of Pittsburgh, Pittsburgh, Pennsylvania, 3. Harvard Medical School, Department of Orthopedic Surgery, Boston, Massachusetts, 4. Boston University School of Medicine, Boston, Massachusetts, 5. Eli Lilly, Indianapolis, Indiana*

The role of changes in body composition on bone loss is unclear. We examined the relationship between longitudinal changes in fat or lean mass and decline in bone mineral density (BMD) in 692 racially/ethnically diverse men aged 30-79y. After adjustment for age, race, income, height, health and lifestyle characteristics, declines in lean mass were significantly associated with change in BMD at the total hip, femoral neck, trochanter and ultradistal radius. For example, each unit decrease in lean mass was associated with a decline per year in BMD at the total hip (0.05%, 95% CI: 0.02-0.07%), femoral neck (0.03%; 95%CI: 0.007-0.05%) ultradistal radius (0.03%, 95% CI: 0.006-0.06%). No significant associations were observed for changes in fat mass and BMD. In conclusion, decline in lean mass was significantly associated with greater bone loss in men. These findings may help identify preventive efforts to reduce bone loss with aging.

THE INFLUENCE OF GENETIC ANCESTRY ON BONE MICROARCHITECTURE IN MEN

E. Suarez[1], R. Piccolo[1], A. Araujo[2], J. Zmuda[5], M.F. Holick[3], M.L. Bouxsein[4], B. Bartali[1], *1. Epidemiology, New England Research Institute, Watertown, Massachusetts, 2. Eli Lilly, Indianapolis, Indiana, 3. Boston Univeristy School of Medicine, Boston, Massachusetts, 4. Harvard Medical School, Department of Orthopedic Surgery, Boston, Massachusetts, 5. University of Pittsburgh, Pittsburgh, Pennsylvania*

Racial differences in fracture rates and bone mineral density (BMD) are well established. However, little is known about the influence of genetic ancestry on bone microarchitecture. A panel of 63 single nucleotide polymorphisms were selected and genotyped based on their ability to estimate percent West African, Native American, and European ancestry in admixed populations. Bone microarchitecture was measured among 650 men aged 37-87y. After adjustment for socio-demographic, health, and lifestyle characteristics, a 10% increase in West African ancestry was associated with 0.72% higher trabecular volumetric BMD(vBMD), 0.69% higher trabecular thickness, and 1.16% higher total area at the radius. At the tibia, a 10% increase in West African ancestry was associated with 0.30% higher cortical vBMD and 0.78% higher total area. In conclusion, West African genetic ancestry has an independent positive association with bone microarchitecture, and racial/ethnic differences in bone microarchitecture may be, at least in part, genetically determined.

BLACK CARBON EXPOSURE IS ASSOCIATED WITH HIGHER RATES OF BONE LOSS IN MEN

D. Prada[2], A. Baccarelli[2], T. Curto[1], A. Araujo[3], M.F. Holick[4], J. Zmuda[5], B. Bartali[1], *1. Epidemiology, New England Research Institute, Watertown, Massachusetts, 2. Harvard School of Public Health, Boston, Massachusetts, 3. Eli Lilly, Indianapolis, Indiana, 4. Boston University School of Medicine, Boston, Massachusetts, 5. University of Pittsburgh, Pittsburgh, Pennsylvania*

Air pollution increases systemic oxidative damage, induces inflammation and affects vitamin D metabolism, which are known risk factors for bone loss. However, it is unknown if air pollution contributes to bone loss. We examined the association of exposure to particulate air pollution from traffic, as traced by ambient black carbon (BC) levels, on longitudinal changes in bone mineral density (BMD) in 692 men aged 30-79 years, participating in BACH/Bone. Baseline BC levels (1-year average) were estimated using a validated spatiotemporal land-use model. For a 1-unit (μg/m3) increase in BC concentration, femoral neck BMD decreased 0.73%/year in BMD (95%CI -1.3to-0.19; p=0.008) and ultradistal radius BMD decreased by 0.58%/year (95%CI -1.12to-0.03; p=0.04) after adjustment for age, race, height, smoking, physical activity, caffeine consumption, household income, weight and serum 25(OH) D. In conclusion, air pollution was associated with increased bone loss. If confirmed in other studies, these results may have important public health implications.

SESSION 1555 (SYMPOSIUM)

MULTIDISCIPLINARY TRENDS, ASSOCIATIONS, AND OUTCOMES IN AGING, ALCOHOL, AND MEDICATION

Chair: F. Zanjani, *BCH, University of Maryland, College Park, Maryland*
Discussant: A.A. Moore, *UCLA, Los Angeles, California*

Alcohol consumption and prescription medication, both common in old age, can have positive and negative outcomes on successful aging and health status. While over half of older adults consume alcohol (25% consume more than a single drink/day) and most older adults take medications (60% of adults over 60 years old use prescription drugs, nearing 90% of adults by the age of 80 years), abusive or hazardous consumption of alcohol and medication can lead to falls/injuries, hospitalizations, neurodegeneration, medication interactions, thwarted drug effectiveness, and liver disease. There is also increasing evidence that moderate levels of alcohol consumption (approximately 1 drink/day) and consuming medications responsibly and as medically advised, leads to cognitive, social, mental, physiological, and behavioral benefits. To explore the duality of alcohol and medication use and aging, several large-scale studies explore epidemiological rates and trends, psychological/neurological inspection of cognition, public health investigation of hospitalizations, and psychiatric understanding of sleep and falls. Specifically rates of low risk, at-risk drinking, and binge drinking (+5 drinks) is examined in National Epidemiologic Survey on Alcohol and Related Conditions (NESARC) and National Longitudinal Alcohol Epidemiologic Survey (NLAES). Using the Seattle Longitudinal and the Framingham Heart Study, cognitive abilities and indicators are explored with relation to alcohol consumption levels. Thereafter hazardous outcomes are explored using the Kentucky State emergency room hospitalization data and the Health and Retirement Study (HRS) and Prescription Drug Study (PDS; nested within HRS) on sleep-medications and falls. Altogether aging related conclusions and implications will be made about safe alcohol and medication use.

SECULAR TRENDS IN AT-RISK AND BINGE DRINKING AMONG ADULTS OVER 50: 1991 AND 2001

P. Sacco[1], K. Burruss[1], A. Kuerbis[2], *1. Social Work, University of Maryland, Baltimore, Maryland, 2. Columbia University, New York, New York*

At-risk and binge drinking are a threat to public health due to alcohol related-illness and injury. With changing demographics of older adults, rates and profiles of drinking may be evolving over time. We characterized rates of low risk (<2 drinks per day) at-risk drinking (average +2 drinks per day) and binge drinking (+5 drinks) from two national surveys: NLAES (1991-2992) and NESARC (2001-2002). Past-year low-risk drinking and modest increases in rates of at-risk drinking were present from NLAES to NESARC, but binge drinking rates were stable. For men and women, higher education and income, White race, tobacco use, and lifetime alcohol use disorder were associated with low-risk use and at-risk consumption. Past-year nonmedical use of drugs was also a predictor of low-risk and at-risk drinking. Findings suggest that rates of low-risk and at-risk use have increased, but that correlates of low-risk, at-risk and binge drinking over 50 were stable.

ALCOHOL CONSUMPTION ASSOCIATED WITH HIGHER COGNITION AND REDUCED INTRAINDIVIDUAL VARIABILITY

J. Blaskewicz Boron[1], F. Zanjani[2], S.L. Willis[3], K. Schaie[3], *1. Psychology, Youngstown State University, Youngstown, Ohio, 2. University of Maryland, College Park, Maryland, 3. University of Washington, Seattle, Washington*

Prior research has suggested low to moderate alcohol consumption may be protective to cognitive function; however, the focus has been on global cognition and group differences in mean level. We investigated the association of intraindividual variability (IIV), a measure sensitive to cognitive risk and impairment, and alcohol consumption in a Seattle Longitudinal Study sample in 2005 (N=999; Mage=65.78, SD=14.19; Meduc=15.75, SD=2.55). ANCOVA results (F(2,994)=3.51, p<.05) indicated those drinking 8+ drinks/week had significantly lower IIV in cognition compared to abstainers; younger age was also associated with less variability. Analyses on a subsample (n=141) with cognitive data in 2005 and 2008, indicated a lack of concurrent relationships; however, alcohol consumption in 2005 was predictive of level of numerical ability and word fluency in 2008, again with alcohol consumers scoring higher than abstainers. Findings extend prior research by examining consumption as a 3-year predictor of cognition and identifying specific ability relationships.

EFFECTS OF LATE LIFE ALCOHOL CONSUMPTION AND APOE E4 ALLELE STATUS ON REGIONAL BRAIN VOLUMES AMONG OLDER ADULTS

B. Downer[1], Y. Jiang[2,5], F. Zanjani[3], D. Fardo[4,5], *1. University of Kentucky, Graduate Center for Gerontology, Lexington, Kentucky, 2. University of Kentucky,Department of Behavioral Science, Lexington, Kentucky, 3. University of Maryland, SPHL-Behavioral & Community Health, Baltimore, Maryland, 4. University of Kentucky, Department of Biostatistics, Lexington, Kentucky, 5. University of Kentucky, Sanders-Brown Center on Aging, Lexington, Kentucky*

Background: Several explanations have been proposed for the observed benefits of moderate alcohol consumption for cognitive functioning later in life. This study examined the hypothesis that moderate alcohol consumption contributes to preserved regional brain volumes, specifically the hippocampus and frontal lobe, which are two important brain regions underlying cognition. Methods: This was a secondary analysis of data from the Framingham Heart Study Offspring Cohort. Results: Compared to late life abstainers, subjects who were moderate alcohol consumers during late life had larger hippocampal volume (P=0.004), but not frontal lobe volume. When subjects were stratified by APOE e4 allele status (e4+ / e4-), APOE e4- moderate consumers had larger hippocampal volume compared to APOE e4- abstainers (P=0.009). There was insufficient evidence for differences in hippocampal volume among APOE e4+ subjects. Conclusion: Larger hippocampal volume may contribute to higher cognitive functioning among older adults who are moderate alcohol consumers during late life.

COMORBID ALCOHOL AND MEDICATION HOSPITALIZATION TRENDS IN OLDER KENTUCKIANS

F. Zanjani[1], R.V. Smith[2], R. Clayton[2], C. Martin[2], N.E. Schoenberg[2], *1. BCH, University of Maryland, College Park, Maryland, 2. University of Kentucky, Lexington, Kentucky*

To better understand alcohol and medication interactions hospitalization data from Kentucky was analyzed. Comorbid diagnosis of drug poisoning (ICD-9 960-979) {excluding poisoning by illicit drugs (ICD-9 965.00, 965.01, 968.51, 969.6)} and a diagnosis of toxic effect of ethyl alcohol (ICD-9 980.0) were examined. Current findings indicate that there is an approximate 80% increase in alcohol and medication related hospitalization among older adults (aged 50+) in Kentucky, from 2001-2011. The increase was seen in all age groups, except for the oldest old (85+ years), with greatest increase (138%) seen in the

50-59 year age group. The characteristics of the hospitalizations were primary unintentional, followed by suicidal intent, with drug poisoning as the primary diagnosis. Interestingly, if the primary diagnosis was not drug poisoning, it was most often mental disorders, followed by respiratory or circulatory system diseases. In conclusion, comorbid alcohol and medication problems are increasing and need increased public health attention.

ASSOCIATION BETWEEN USE OF SLEEP-AIDS AND FALLS IN A POPULATION BASED SAMPLE OF MIDDLE AGED AND OLDER ADULTS

C.N. Kaufmann, S.L. Canham, R. Mojtabai, G. Alexander, K. Bandeen-Roche, L. Rutkow, A.P. Spira, *Johns Hopkins Bloomberg School of Public Health, Baltimore, Maryland*

Research has shown an association between use of sleep-aid medications and falls among older adults. Few studies have examined this association in a population-based cohort of community-dwelling seniors. We examined the association between sleep-aid use and falls among a nationally representative sample of adults age 50+. Data were from the Health and Retirement Study (HRS) and the Prescription Drug Study (PDS; nested within HRS). In 2005, PDS participants reported medications used; benzodiazepines and non-benzodiazepine sedative hypnotic drugs were considered “sleep-aids.” In HRS 2008, participants reported whether or not they had fallen. In 2005, 8.8% of participants were sleep-aid users. Compared to non-users, sleep-aid users had 45% greater odds of reporting falls in 2008 (95% CI=1.09-1.93, p=0.012) after controlling for demographic, health and insomnia variables. Findings reveal that older adults taking sleep-aids were at risk for falls. Non-pharmacological treatment of sleep disorders may reduce rates of falls related to sleep-aid use.

SESSION 1560 (SYMPOSIUM)

NEUROMUSCULAR IMPAIRMENTS CONTRIBUTING TO MOBILITY DECLINE AND DISABILITY: NEW FINDINGS FROM BOSTON RISE

Chair: J.F. Bean, *PM&R, Spaulding Rehabilitation Hospital, Cambridge, Massachusetts, Harvard Medical School, Boston, Massachusetts*

Discussant: J. Guralnik, *University of Maryland, Baltimore, Maryland*

Mobility problems are prevalent among older adults and can lead to subsequent disability. While there is ample evidence identifying chronic conditions and health problems leading to mobility decline, there is insufficient evidence guiding rehabilitative care. To fill this knowledge gap, in 2009 we initiated the Boston Rehabilitative Impairment Study of the Elderly (Boston RISE), a longitudinal cohort study of 430 older primary care patients in greater Boston, with annual follow-up for mobility decline over 2 years. A battery of 11 neuromuscular attributes (rehabilitative impairments) linked to mobility decline and treatable within the context of rehabilitative care has been evaluated in order to understand which impairments are most responsible for changes in mobility and disability. At enrollment, participants were 68% female, aged 76.5 years on average and manifested pre-clinical disability. This symposium will provide 5 presentations. First, we will review the study rationale, its conceptual model, its methods and summarize previously reported findings from baseline analyses. Second, we will show that our primary outcome, the Late-Life Function and Disability Instrument, has high predictive validity for adverse outcomes at 2 years, and is responsive to change. Third, we will describe predominant patterns of change in mobility and disability over time and report differences among demographic and health characteristics based on each pattern of change. Finally, through two separate presentations evaluating changes in mobility and disability respectively, we will identify the subset of rehabilitative impairments most strongly associated with changes in these outcomes.

CREATING AN EVIDENCE BASE FOR MOBILITY REHABILITATION: THE BOSTON REHABILITATIVE IMPAIRMENT STUDY OF THE ELDERLY

J.F. Bean[1,2], N.E. Holt[3], L.A. Kurlinski[1], S. Percac-Lima[3], N. Latham[4], S.G. Leveille[5], A. Jette[4], *1. Spaulding Rehabilitation Hospital, Boston, Massachusetts, 2. Department of PM&R, Harvard Medical School, Boston, Massachusetts, 3. Department of Medicine, Massachusetts General Hospital, Boston, Massachusetts, 4. Health and Disability Research Institute, Boston University School of Health, Bosotn, Massachusetts, 5. College of Nursing and Health Sciences, University of Massachusetts Boston, Boston, Massachusetts*

Despite advances in mobility research, there are still significant knowledge gaps with regard to the body system impairments that should be targeted in rehabilitative care. The Boston Rehabilitative Impairment Study of the Elderly (Boston RISE) was designed to address these knowledge gaps. Among a demographically representative sample of 430 primary care patients with preclinical disability (mean age 76.5, 68% female), 11 neuromuscular attributes were evaluated for their respective association with changes in mobility and disability over 2 years. Boston RISE is unique in that it includes a battery of neuromuscular attributes (rehabilitative impairments) that are amenable to rehabilitative treatment and is methodologically based within primary and rehabilitative care. At 2 years, 86% (N=369) participants completed the study, 3% (N=15) participants died, 9% (n=37) dropped out for health or personal reasons and 2% (N=9) were lost to follow up. These results will be compared to other cohort studies addressing mobility outcomes.

PSYCHOMETRIC PROPERTIES OF THE LATE-LIFE FUNCTION AND DISABILITY INSTRUMENT IN PRIMARY CARE PATIENTS

M.K. Beauchamp[1,2], R. Ward[1,2], L.A. Kurlinski[1], A. Jette[2], J.F. Bean[1], *1. Physical Medicine and Rehabilitation, Harvard University, Spaulding Rehabilitation Hospital, Cambridge, Massachusetts, 2. Health and Disability Research Institute, Boston University, Boston, Massachusetts*

The Late Life Function and Disability Instrument (LLFDI) is a widely used patient-reported measure designed for older adults. While there is strong data to support its construct validity, few studies have examined the LLFDI’s predictive validity and responsiveness. We analyzed data over 2 years of follow-up from Boston RISE (n=430) to examine the predictive validity and responsiveness of the LLFDI Function compared with commonly used performance-based measures, including the Short Physical Performance Battery (SPPB) and 400-meter walk. The LLFDI, SPPB and 400-meter walk showed similarly high predictive validity for low self-rated health and hospitalizations; only the LLFDI overall function subscale predicted falls. From baseline to 2 years, the proportion of subjects that experienced a decline exceeding the minimal detectable change was greater for the LLFDI compared to performance-based measures (31-36% vs. 7-23%). These results support the use of the LLFDI as a primary outcome in studies of community-dwelling older adults.

CHARACTERIZING MOBILITY CHANGE GROUPS IN BOSTON RISE

R. Ward[1,2,3], P. Ni[3], M.K. Beauchamp[1,2], N. Latham[3], R. Goldstein[1,2], A. Jette[3], J.F. Bean[1,2], *1. Physical Medicine and Rehabilitation, Spaulding Hospital, Canbridge, Massachusetts, 2. Department of PM&R, Harvard Medical School, Cambridge, Massachusetts, 3. Health and Disability Research Institute, Boston University School of Health, Boston, Massachusetts*

To investigate mobility decline within Boston RISE, we defined three patterns of change over two years with the Late-Life Function and Disability Instrument (LLFDI): 1) Favorable change - improving ≥0.5 SD or maintaining the best function/disability quartile; 2) No change - maintaining the middle two function/disability quartiles; and 3) Unfavorable change - declining ≥0.5 SD or maintaining the worst function/disability quartile. We sought to characterize these change groups through demographics, physical impairments, and health status. ANOVA and Chi-squared tests were used to examine differences across groups. Age, BMI, leg strength, velocity and asymmetry, trunk extensor endurance, knee flexion range, reaction time, chronic disease score, depression and cognition varied across some groups. Gait speed, balance and executive function varied across all groups. Unfavorable change groups were older, had higher BMI, worse impairment and function, poorer cognition and more comorbidity. These findings may inform prevention and intervention strategies targeting mobility decline.

NEUROMUSCULAR ATTRIBUTES CONTRIBUTING TO MOBILITY DECLINE: NEW FINDINGS INFORMING THE REHAB PRESCRIPTION

J.F. Bean[1,2], N. Latham[3], R. Ward[1,2,3], L.A. Kurlinski[1], P. Ni[3], S.G. Leveille[4], A. Jette[3], *1. Spaulding Rehabilitation Hospital, Boston, Massachusetts, 2. Department of PM&R, Harvard Medical School, Boston, Massachusetts, 3. Health and Disability Research Institute, Boston University School of Health, Boston, Massachusetts, 4. College of Nursing and Health Sciences, University of Massachusetts Boston, Boston, Massachusetts*

While rehabilitation is prescribed commonly for older adults with mobility problems, there is insufficient evidence guiding this aspect of care. The Boston RISE study was designed to evaluate which of 11 neuromuscular attributes (rehabilitative impairments) are most responsible for mobility decline over 2 years of follow up. Among the 430 primary care patients enrolled in the Boston RISE longitudinal cohort study, 42% and 47% had an unfavorable change (decline 0.5 SD or remained in lowest quartile) in basic- and advanced-lower extremity function respectively over 2 years of follow up. Through multivariable multinomial analyses, that considered clinically and statistically important adjustment variables, baseline leg strength, leg speed, trunk extensor muscle endurance and ankle range of motion contributing significantly to changes in both basic and advanced mobility as measured by the Late Life Function and Disability Instrument. The relevance of these findings for mobility care will be discussed.

CHANGES IN DISABILITY OVER TWO YEARS IN OLDER PRIMARY CARE PATIENTS: FINDINGS FROM BOSTON RISE

N. Latham[1], A. Jette[1], P. Ni[1], S.G. Leveille[2], J.F. Bean[3,4], *1. Health and Disability Research Institute, Boston University School of Public Health, Boston, Massachusetts, 2. College of Nursing and Health Sciences, University of Massachusetts Boston, Boston, Massachusetts, 3. Spaulding Rehabilitation Hospital, Boston, Massachusetts, 4. Department of PM&R, Harvard Medical School, Boston, MA, Massachusetts*

Changes in disability and factors that contribute to these changes are not well understood in older primary care patients. Boston RISE evaluated changes in disability over two years in 430 older adults recruited from primary care. The Late Life Function and Disability Instrument (LLFDI) measured self-reported disability in two domains: Limitations in activities and Frequency of performing activities. Participants were categorized as having Favorable, No change or Unfavorable outcomes, based on maintenance of high or low levels of disability, or experiencing >0.5SD change from baseline LLFDI score during follow-up. Differences were found in disability outcomes between the Limitation and Frequency domains: Unfavorable outcome occurred in 52% of subjects for Frequency domain and 44% for Limitation domain, while Favorable outcome occurred in 22% of subjects for Frequency and 35% for Limitation. Among predictors of disability, including 11 rehabilitative impairments, some were consistent between the two domains, but differences were also observed.

SESSION 1565 (SYMPOSIUM)

THE ROLE OF DIET AND NUTRITIONAL STATUS IN PHYSICAL FUNCTION AND FRACTURE RISK

Chair: M. Visser, *Health Sciences, VU University Amsterdam, Amsterdam, Netherlands, VU Medical Center, Amsterdam, Netherlands*
Co-Chair: D.K. Houston, *Wake Forest School of Medicine, Winston-Salem, North Carolina*
Discussant: S.B. Kritchevsky, *Wake Forest School of Medicine, Winston-Salem, North Carolina*

A healthy lifestyle is an important determinant of successful aging. A diet that meets the dietary recommendations is known to reduce the risk of chronic diseases and early mortality. However, less is known about the contribution of a healthy diet in old age to physical function. This symposium will specifically focus on a range of nutritional factors using data from three established aging cohort studies based in the USA (Health ABC), Iceland (AGES-Reykjavik Study) and the Netherlands (Longitudinal Aging Study Amsterdam or LASA). The first speaker, Coosje Dijkstra, will describe the motivations to eat a healthy diet in LASA participants and the differences in motivations among specific subgroups of older adults (e.g. based on health status). Two presentations will follow on the relationship of plasma polyunsaturated fatty acids with physical function and fracture risk in AGES. Ilse Reinders will discuss the role of these fatty acids in incident mobility disability and gait speed decline over 5 years of follow-up, after which Rachel Murphy will discuss their potential role in predicting osteoporotic fractures. Kyla Shea will discuss plasma vitamin K status in relation to lower extremity physical function using data from the Health ABC knee osteoarthritis sub-study. The final presentation by Denise Houston will discuss the relationship of dietary protein intake with lower extremity physical function and strength over 4 years of follow-up in Health ABC. Together, these presentations support the important role of diet and nutritional status in the maintenance of physical function and prevention of fractures in older adults.

WHY DO OLDER DUTCH ADULTS EAT HEALTHILY?

S. Dijkstra[1], J.E. Neter[1], I.A. Brouwer[1], M. Huisman[2,3,4], M. Visser[1,2], *1. Department of Health Sciences and the EMGO Institute for Health and Care Research, Faculty of Earth and Life Sciences, VU University, Amsterdam, Netherlands, 2. Department of Epidemiology and Biostatistics, VU University Medical Center and the EMGO institute for Health and Care Research, Amsterdam, Netherlands, 3. Department of Sociology, VU University, Amsterdam, Netherlands, 4. Department of Psychiatry, VU University Medical Center, Amsterdam, Netherlands*

This study identifies motivations to eat healthily in older adults and investigates if these motivations are associated with socioeconomic position (SEP), demographic, lifestyle and health variables. We used data of 1,050 older Dutch adults (65-80 year, independently living, good cognition). Motivations to eat healthily were measured with a self-reported questionnaire. The most reported motivations were: feeling fit (51.7%), people's current health (49.7%) and body weight (39.2%). Lower SEP groups were less likely to report "prevention of disease" and those with obesity were less likely to report "current health". Those with health problems were more likely to report "current disease" as motivations to eat healthily. This study indicates that reported motivations largely depend on the characteristics of older adults. Those with health problems seem to be aware of the link between their disease and nutrition. Attention should be paid towards lower SEP groups and obese people and their disease-nutrition knowledge.

POLYUNSATURATED FATTY ACIDS AND FISH OIL CONSUMPTION IN RELATION TO MOBILITY DISABILITY AND GAIT SPEED DECLINE

I. Reinders[1,2], R.A. Murphy[1], X. Song[3], M. Visser[1], G. Eiriksdottir[4], V. Gudnason[4,5], T. Harris[1], I.A. Brouwer[2], *1. National Institutes of Health, National Institute on Aging, Bethesda, Maryland, 2. VU University, Amsterdam, Netherlands, 3. Biomarker Laboratory, Fred Hutchinson Cancer Research Center, Seattle, Washington, 4. Icelandic Heart Association Research Institute, Kopavogur, Iceland, 5. Faculty of Medicine, University of Iceland, Reykjavik, Iceland*

Background: Long chain polyunsaturated fatty acids (PUFAs) are associated with physical function, however, prospective studies of circulating PUFAs are scarce. Methods: Data are from the AGES-Reykjavik study (n=557, age 75.1±5.0 years). Plasma phospholipids PUFAs were assessed with gas chromatography. Fish oil consumption across the lifetime was assessed by questionnaire. Incident mobility disability and gait speed decline (decline ≥ 0.1 m/s) after 5 years of follow-up was determined. Odds ratios (and 95% confidence intervals) adjusted for demographics, risk factors and serum vitamin D were estimated by logistic regression. Results: In women, per SD increment of total n-3 PUFAs and docosahexaenoic acid, lower mobility disability risk was observed; 0.50 (0.26; 0.96) and 0.45 (0.24; 0.85), respectively. There were no associations with gait speed decline or for fish oil consumption in any life period and physical function. Conclusions: Higher concentrations of n-3 PUFAs were associated with lower incident mobility disability risk in women.

PLASMA FATTY ACIDS AND FISH OIL INTAKE IN RELATION TO OSTEOPOROTIC FRACTURE RISK AMONG OLDER ADULTS

T. Harris[1], X. Song[2], T.F. Lang[3], K. Siggeirsdottir[4], G. Eiriksdottir[4], T. Aspelund[4], I.A. Brouwer[5], R.A. Murphy[1], *1. Epidemiology, Demography and Biometry, National Institute on Aging, Bethesda, Maryland, 2. Fred Hutchinson Cancer Research Center, Seattle, Washington, 3. University of California, San Francisco, San Francisco, California, 4. Icelandic Heart Association, Kopavogur, Iceland, 5. VU University, Amsterdam, Netherlands*

A limited number of studies suggest polyunsaturated fatty acids (PUFA) may be important for fracture. We examined associations between plasma fatty acids measured in late life and fish oil consumption reported for early, mid and late life with osteoporotic fracture risk in a case (n=540) cohort (n=898) study of older adults followed for 5-9 years. In men hazard ratios (95% confidence interval) for tertile 3 of PUFA, n-3 and eicosapentaenoic acid were 0.60 (0.41,0.89), 0.66 (0.45,0.95) and 0.59 (0.41,0.86). In women PUFA was inversely associated with fracture risk (P-trend=0.03), while tertile 2 of n-6 and arachidonic acid were associated with greater fracture risk, 1.43 (1.10,1.85) and 1.42 (1.09,1.85). Daily fish oil consumption in late life in men and midlife in women were associated with lower fracture risk, 0.64 (0.45, 0.91) and 0.75 (0.58,0.98). Our results suggest a role of fatty acids in fracture, particularly PUFA and marine n-3 fatty acids.

VITAMIN K STATUS AND LOWER-EXTREMITY FUNCTION IN OLDER ADULTS: THE HEALTH ABC STUDY

K. Shea[1], R.F. Loeser[2], F. Hsu[2], S.L. Booth[1], M. Nevitt[3], K. Kwoh[4], S.B. Kritchevsky[2], *1. Tufts University Human Nutrition Research Center on Aging, Boston, Massachusetts, 2. Wake Forest School of Medicine, Winston Salem, North Carolina, 3. University of California San Francisco, San Francisco, California, 4. University of Pittsburgh, Pittsburgh, Pennsylvania*

Knee osteoarthritis (OA) is the leading cause of lower-extremity disability in adults. Vitamin K (VK) insufficiency has been associated with greater knee OA progression, but it is unknown if VK status is relevant to functional consequences of knee OA. We analyzed the cross-sectional association between VK status and lower-extremity function in older adults with symptoms of knee OA (n=702; mean(SD) age=75(3) years, 60% female, 45% black). VK status measures included plasma VK and uncarboxylated matrix gla-protein (ucMGP, a functional VK biomarker). Participants with insufficient plasma VK (<1.0nmol/L) had worse physical function scores and slower gait speed [p-trend<0.01, 0.04 respectively, adjusted for demographics, lifestyle characteristics and co-morbidities]. Participants in the highest ucMGP tertile (reflecting lower VK status) had worse physical function scores, worse leg strength and slower gait speed [p-trend=0.01, <0.01, 0.04 respectively, fully-adjusted]. These findings suggest improving VK status may lead to improved lower-extremity function related to knee OA.

PROTEIN INTAKE AND LOWER EXTREMITY PHYSICAL PERFORMANCE IN OLDER ADULTS: THE HEALTH ABC STUDY

D.K. Houston[1], J. Tooze[1], K.R. Garcia[1], M. Visser[2], F.A. Tylavsky[3], A.B. Newman[4], T.B. Harris[5], S.B. Kritchevsky[1], *1. Wake Forest School of Medicine, Winston Salem, North Carolina, 2. Vrije Universiteit, Amsterdam, Netherlands, 3. University of Tennessee Health Science Center, Memphis, Tennessee, 4. University of Pittsburgh, Pittsburgh, Pennsylvania, 5. National Institute on Aging, Bethesda, Maryland*

Current protein recommendations (0.8 g/kg body weight/d) may underestimate the intake needed to optimally preserve physical function in older adults. We examined the association between baseline protein intake and lower extremity physical performance (physical performance battery (PPB), gait speed, and leg strength) in 2,164 Health ABC participants (36% black, 53% female, mean age 74.6) with at least one follow-up exam over 4 years. Whites in the highest protein intake tertile (>1.0 g/kg) had higher PPB scores, faster gait speed, and greater leg strength at baseline, 2- and 4-years compared to those in the lowest tertile (<0.7 g/kg; all p<0.01). In blacks, higher protein intake was associated with greater leg strength at baseline, 2- and 4-years (p<0.05). In general, protein intake was not associated with the rate of decline in lower extremity physical performance. Dietary protein should be studied further as a modifiable risk factor for impaired lower extremity physical performance.

SESSION 1570 (SYMPOSIUM)

UNDERSTANDING AGING PROCESSES THROUGH BED REST?

Chair: M. Heer, *Nutritional Sciences, Profil, Neuss, Germany, University of Bonn, Bonn, Germany*
Discussant: J. Vernikos, *Thirdage llc, Culpeper, Virginia*

The course of Aging is determined by both genetic and epigenetic influences and though little can be done at this time to alter genetic factors, but a great deal can be achieved by understanding and testing the contribution of lifetime habits. This requires a reliable and tested translational model. Extreme sedentary lifestyle such as in bed rest leads to marked deconditioning in several physiological systems even in young, healthy people. Studies have shown that even short periods of bed rest and reduced mobility have significant effects on human physiology. These may range from metabolic changes such as decreased glucose tolerance and insulin resistance, reduced metabolic flexibility in general, to reduced cardio cardiovascular fitness, deconditioning of the musculoskeletal system and balance disorders. It has been suggested that not only the symptoms but also that the mechanisms are similar to some extent to those of aging. Moreover, younger people tend to recover their health and functional status sooner after discharge, while in older persons the recovery is slower and often incomplete. The main premise of this symposium is that bed rest provides a unique tool and model to induce aspects of aging and their recovery. This model may also support a better understanding of the recovery processes after immobilization, such as after falls, illness or surgery in the elderly. To address this topic, this symposium will focus on physiological systems that are known to be directly affected by aging as well as by bed rest, including metabolic, endocrine, cardiovascular, musculoskeletal and balance systems. New approaches to improve health and mobility recovery after immobilization and hospitalization will be specifically addressed.

PARALLEL CARDIOVASCULAR CHANGES IN AGING AND BED REST

R. Hughson, *Schlegel-University of Waterloo Research Institute for Aging, Waterloo, Ontario, Canada*

Bed rest imposed in research studies of young healthy men and women is an extreme form of sedentary lifestyle that accelerates cardiovascular deconditioning with parallels to the aging process. Impaired regulation of arterial blood pressure on return to the upright posture occurs after as little as 4h bed rest. Similar problems of blood pressure regulation occur with increased risk of falls when older individuals rise from bed at night or early morning. Vascular aging, characterized by increased arterial stiffness, shares some common mechanisms in bed rest and aging related to nervous activity, hormonal balance and interplay between oxidative stress and anti-oxidants in arterial smooth muscle. Physical inactivity of bed rest increases formation of advanced glycation end-products that could contribute to vascular wall changes and arteriosclerosis. Bed rest provides an ideal model to test interventions with outcomes making a strong case for the promotion of healthy aging.

PHYSICAL INACTIVITY-INDUCED METABOLIC ADAPTATIONS SIMILAR TO AGING : EVIDENCES FROM BED REST

S. Blanc, *CNRS, Strasbourg, France*

Metabolic adaptations to spaceflight ie muscle atrophy, bone demineralization, cardiovascular deconditionning, motor coordination or development of an insulin resistance, mirror aging on Earth. Some recent evidences based on simulated weightlessness in humans through bed rest suggest that physical inactivity is in part associated with the physiological changes attributed to aging per se. We will present evidences on the metabolic side and suggest countermeasures that may be applied in humans to improve healthy years of living. The strength of the space field applied to aging is the study of adaptation on healthy subjects that will recover. The mechanisms of rehabilitation can be therefore be studied as well as the adaptation per se.

MUSCLE LOSS, AGING AND INACTIVITY: IS 50 THE NEW 70?

D. Paddon-Jones, K.L. English, *Nutrition and Metabolism, University of Texas Medical Branch, Galveston, Texas*

The progression of sarcopenia and the disparate musculoskeletal and metabolic consequences of bed rest in young and older adults suggest that the debilitating effects of physical inactivity increase progressively with age. Middle age adults (45-60 y) are comparatively underrepresented in research, falling between the typical age based group assignments of: “young” (20-40y) or “elderly” (65y +). While they often display “youthful” physiological responses during acute, metabolism studies, emerging research suggests that middle-aged adults may be as vulnerable to the deleterious effects of physical inactivity as their older counterparts. Metabolic perturbations, such as bed rest induce anabolic resistance, increase the rate of loss of muscle mass and strength and promote an aging phenotype. Strategies to prevent or reduce inactivity-induced muscle and strength loss should not focus exclusively on older adults, but should be implemented early to establish healthful practices in early adult life.

IMPACT OF AGEING AND INACTIVITY ON MUSCULOSKELETAL HEALTH

M.V. Narici, *University of Nottingham, Nottingham, United Kingdom*

One of the major consequences of chronic inactivity is muscle loss which, in older people, exacerbates sarcopenia, leading to physical frailty, loss of balance, increased risk of falls, greater morbidity and mortality. Hence understanding the mechanisms responsible for the loss of muscle mass due to ageing and inactivity is crucial for preserving musculoskeletal health and independence. Chronic inactivity models such as unilateral lower limb suspension (ULLS) and bed rest (BR) afford important insights into these mechanisms. Using stable isotopes, we have shown that the decrease in muscle mass with BR and ULLS is mostly due to a fall in protein synthesis of about 50% of basal rate within just 10 days of unloading. Also 10 day of inactivity are sufficient for developing insulin resistance. Unfortunately, because anabolically resistant, older people are more affected by inactivity as their recovery even with exercise and amino acid feeding is much slower than that of young people.

SESSION 1575 (PAPER)

PHYSICAL ACTIVITY & EXERCISE

TESTING ACUTE CARDIOVASCULAR RESPONSE TO SIGN CHI DO

C.E. Rogers, K. Garver, A. Gardner, J. Carlson, A. Ramey, *Nursing, University of Oklahoma Health Sciences Center, Oklahoma City, Oklahoma*

Older adults with sedentary lifestyles are at increased risk for functional decline and disability. Sedentary older adults are recommended to begin with low intensity exercise to build endurance. Sign Chi Do (SCD) is a low intensity exercise that engages the activation of large muscle groups using sign gestures and transitional leg movements. Studies show that SCD can improve fitness outcomes in sedentary older adults. There is no evidence reporting acute cardiovascular (CV) response to SCD. The purpose of this study was to evaluate the acute CV response of older adults participating in a single 10 minute bout of SCD. Methods: Participants were 34 sedentary or active older adults, aged 64.03 ± 7.28 years, recruited from the community. After 10 minutes of SCD exercise Blood pressure and heart rate (HR) were assessed at 0, 5, and 10 minutes of SCD and after 10 minutes of rest following the completion of SCD. An unpaired t-test was used to examine the differences in CV response between sedentary and active participants. Results: All participants remained at or below 180/90 BP or 40% of their estimated VO2max. There was no difference between groups in baseline or maximum systolic blood pressure (SBP) or HR maximum during SCD or change in SBP or HR. Conclusions: These findings show that SCD is indeed a safe exercise for healthy sedentary and active older adults. Future research is required to determine the CV response to chronic practice which has the potential to improve health and function.

META-ANALYSIS OF PHYSICAL ACTIVITY INTERVENTIONS AMONG OLDER ADULTS

J.D. Chase, L.J. Phillips, T. Ruppar, V.S. Conn, *University of Missouri-Columbia, Columbia, Missouri*

PURPOSE: To determine the overall effectiveness of interventions designed to increase physical activity (PA) behavior among community-dwelling older adults. METHOD: Extensive literature searching identified eligible published or unpublished studies 1) from 1960-2013; 2) written in English; 3) testing interventions to increase PA behavior; 4) among community-dwelling adults age 65 and older. Diverse study characteristics were extracted. Outcome data were duplicate coded. Overall mean effect sizes (d, ESs) were synthesized using a random-effects model. Heterogeneity of effects was analyzed using Q and I2 statistics. Exploratory moderator analyses were conducted using meta-regression and subgroup analysis for continuous and dichotomous variables, respectively. RESULTS: Of 13,527 citations reviewed, 53 two-group and 48 single-group design studies were eligible. ESs were calculated from 13,829 total primary study subjects. The overall mean ES for two-group posttest comparisons was 0.18 (95% CI 0.10-0.26, $p<0.001$), representing a difference of 620 steps/day or 73 minutes of PA/week between treatment and control groups. Significant moderators included the use of theory (d=0.28), behavioral strategies (d=0.24), barriers management (d=0.30), and problem solving (d=0.30). Non-significant moderators included the interventionist type, delivery setting, and intervention dose. CONCLUSION: PA interventions modestly improved PA behavior among community-dwelling older adults. Moderator analyses findings identified effective PA intervention characteristics. Future PA intervention research could test and compare combinations of behavioral strategies more effective in improving PA behavior. The specific dose of PA intervention needed to change PA behavior in this population is not yet clear. Future studies might also consider comparing the effectiveness of specific PA intervention doses.

PARTICIPATION LIMITATIONS AND THEIR IMPACT ON THE HEALTH OF OLDER PEOPLE WITH FUNCTIONAL VISION IMPAIRMENT

B.A. Steinman, J.E. Mutchler, *Center for Social and Demographic Research on Aging, University of Massachusetts, Boston, Boston, Massachusetts*

Previous research has linked both vision impairment and participation restrictions with relatively poorer health. Such studies reiterate the importance of remaining engaged with life via participation in community-based activities to achieve optimal health in old age. Nevertheless, older adults with vision impairments are often at a distinct disadvantage with respect to remaining actively engaged in their communities, and this disadvantage may play a role in explaining health disparities often reported in this population. The purpose of this study is to assess whether effects of functional vision impairment on new physician-diagnosed chronic disease is mediated by participation restrictions. We analyzed data from two rounds of the National Health and Aging Trends Study (NHATS; 2011-2012), an annual longitudinal survey of Medicare beneficiaries, ages 65 and older. When weighted, the baseline sample of NHATS (N= 8245) is nationally (U.S.) representative of the Medicare population. Key analytical variables in our analyses included functional vision status, participation restrictions, physician-diagnosed chronic conditions, as well as covariates such as household activity limitations, functional impairments, environmental factors, and demographic control variables. We conducted a series of ordinary least squares regression analyses to test mediation of the effect of self-reported vision status on new diagnosed chronic disease, via measures of participation. Limited evidence was found for a partially mediating effect of participation on vision impairment with respect to chronic conditions. Implications of these findings are discussed including the need for prioritizing improved strategies for facilitating community inclusion of older adults with poor vision as a preventive measure against disease.

PROMOTING PHYSICAL ACTIVITY AMONGST OLDER ADULTS: WHAT IF WE ASKED THEM WHAT THEY WANT?

E.R. Boulton[1], M. Horne[2], C. Todd[1], *1. Nursing, Midwifery & Social Work, University of Manchester, Manchester, United Kingdom, 2. University of Bradford, Bradford, United Kingdom*

A two-phase PhD research project is presented, considering the effects of involving older adults in developing and promoting physical activity interventions. In Phase One, 11 focus groups and 12 interviews were carried out with 61 community-dwelling older adults in the north of England. Participants were asked what attracted them to participate in physical activities, or what might do so. Core results include some essential characteristics and preconditions for engagement in physical activities. The top six ingredients for success were that activities must be enjoyable; sociable; affordable; flexible, seasonal and have pleasant surroundings. The health benefits of physical activity held far less importance for participants. In Phase Two, these results were used in a participatory research study to promote existing community-based physical activity sessions. Six older adults running community groups, 2 community development workers and the researcher collaborated to identify problems and develop 17 actions. Visually appealing promotional literature was developed, which focused on enjoyment, fun, social opportunities, affordability and easy access. Residential properties where people over 50 years were known to live, GP surgeries and chemists were targeted to receive leaflets and posters. Follow up questionnaires were distributed to the residential properties to ascertain views on the activities promoted. Results included an increase in attendance at activity sessions although feedback indicated that people were attracted to specific activities, rather than to sessions defined by age. The 'Over 50s' label deterred some older adults. Men were not attracted to the sessions on offer and further research with this demographic is required.

PORTUGUESE VALIDATION OF THE YPAS – A PHYSICAL ACTIVITY SURVEY FOR OLDER PEOPLE

M. Machado[1,2], C. Tavares[2], F. Carnide[1,2], H. André[1,2], V. Moniz-Pereira[1,2], F. Ramalho[2], A. Veloso[1,2], *1. Universidade de Lisboa, Faculdade de Motricidade Humana, Lisboa, Portugal, 2. Neuromechanics Research Group, CIPER, LBMF, Lisboa, Portugal*

PURPOSE: To translate and adapt the YPAS (Dipietro, 1993) to Portuguese cultural and linguistic issues in order to assess the level of physical activity in a European country with one of the world highest percentage of senior citizens. METHODS: After the author's permission, the translation was performed in accordance with WHO guidelines. The reconciliation version was tested and solved by an expert committee in health and sports sciences. The study included 471 older adults (70.3% women; 74.9±6.5 years), and covers the following steps: (1) Content Validation – Criterion Validity through Spearman's rho, with a cross-reference standard, by accelerometry with 96 subjects (64.6% women; 75.2±7.1 years); (2) Reliability –(2.1) Internal Consistency through Cronback's α with 471 subjects (70.3% women; 74.9±6.5 years), (2.2) Temporal Stability through ICC involving 30 subjects (43.3% women; 71.9±3.9 years); (3) Responsiveness – through Standardized Effect Sized including 39 subjects (87.2% women; 71.9±5.2 years 1st moment and, 72.7±6.2 years, after 5 months of an aquatic exercise program). RESULTS: The Portuguese YPAS version was perceived as suitable and relevant, showing moderate levels for all psychometric parameters, i.e. significant correlations (rho) were found for all variables with accelerometer data ranging from 0.201 to 0.452 ($p<0{,}001$). Reliability was guaranteed with $\alpha\geq0.835$ value of Internal consistency and temporal stability value of ICC>0,75. Responsiveness was satisfactory: $d\geq0.20$ in three Physical Activity dimensions and $d\geq0.80$ in the other two. CONCLUSION: The Portuguese YPAS version seems a valid instrument to assess the physical activity patterns of elderly Portuguese both in the research and social interventions field.

SESSION 1580 (PAPER)

MODELS OF CARE

COST OUTCOMES OF PARTNERS IN DEMENTIA CARE

R.O. Morgan[1], D.M. Bass[4], K. Judge[5], C. Liu[9], N.L. Wilson[2,3], A. Snow[6,7], N. Fouladi[1], M.E. Kunik[2,3,8], *1. Tuscaloosa Veterans Affairs Medical Center, Tuscaloosa, Alabama, 7. University of Alabama, Tuscaloosa, Alabama, 8. South Central Veterans Affairs Mental Illness Research, Education and Clinical Center, Houston, Texas, 9. VA Puget Sound Health Care System, Seattle, Washington*

We examined whether “Partners in Dementia Care” (PDC), a telephone-based care-coordination and support-service for veterans with dementia and their caregivers that is delivered through partnerships between Veterans Administration (VA) medical centers and local Alzheimer’s Association (AA) chapters, reduced direct VA health care costs compared to usual care. Veterans (N=434) and their caregivers were recruited over a 30 month period from VA medical centers (two intervention [N=269] and three comparison sites [N=165]). We tested for differences in total VA health care costs, including hospital, emergency department, nursing home, outpatient, and pharmacy costs, as well as program costs for intervention participants. Covariates included caregiver reports of veterans’ cognitive impairment, behavior problems, and personal care dependencies. We used OLS regression to model change in log total cost over a one-year follow-up period post-baseline. Intervention participants showed higher VHA costs than comparison participants before and after the intervention, but did not differ significantly in change in log-costs from the pre- to post-baseline periods. Pre-baseline log cost ($p <= .001$), baseline cognitive impairment ($p <= .01$), the number of personal care dependencies ($p <= .01$), and VA service priority ($p<= .01$) all predicted change in log total cost. Prior work has shown that PDC addresses unmet needs and improves psychosocial outcomes and satisfaction with care. These analyses show that it meets veterans’ needs without increasing VHA health care costs. PDC addresses the care-coordination priority area in the National Plan to Address Alzheimer’s Disease, offering a low-cost, structured, protocol-driven, evidence-based method for effectively delivering care coordination.

COLLABORATION BETWEEN VA AND INDIAN HEALTH SERVICE: NEW MODELS OF HOME BASED PRIMARY CARE

B. Kramer[1,2], B. Creekmur[1], S. Cote[1], M.L. Katz[1], B.D. Kraus[1], *1. VA Greater Los Angeles Healthcare System, Los Angeles, California, 2. David Geffen School of Medicine at UCLA, Los Angeles, California*

Background: Veteran Health Administration (VA) funded 14 VA medical centers (VAMC) to deliver Home Based Primary Care (HBPC) on American Indian reservations in collaboration with Indian Health Service (IHS). Our study aimed to identify emerging models of collaboration or co-management and to identify barriers and facilitators to successful implementation. Methods: A mixed methods design was used to identify program- and organizational-level characteristics. Key respondent interviews were conducted using a semi-structured interview guide informed by the Consolidated Framework for Implementation Research. Transcribed interviews were analyzed using summaries and matrices for cross-case comparisons. Secondary data included the organizational culture-items from the VA All Employee Survey, that were analyzed using exact logistic regression and publicly available descriptions of VA, IHS and Tribe’s medical facilities that were summarized into site abstracts. Results: All VAMCs were represented by key respondents (n=37). In addition to the traditional interdisciplinary HBPC program, non-traditional models emerged: 1) streamlined VA staffing and 2) VA-IHS partnership. VA organizational culture differs significantly between traditional and non-traditional models with higher entrepreneurial and team subscale ratings for the traditional programs. Identified challenges included distrust in federal institutions by individuals and Tribes, and difficulties with efficient clinical coordination in the absence of shared medical records. Successful implementation was often facilitated by active involvement of a VA leader or VA staff who were experienced in working in native communities. Conclusion: These evolving collaborations present new models for delivery of patient-centered care in rural areas as well as opportunities to coordinate clinical care between federal healthcare organizations.

EVALUATION OF A NURSE-LED SPECIALIST DEPARTMENT FOR PALLIATIVE HOME CARE

L.B. Imhof, V. Waldboth, S. Kipfer, *Institute of Nursing, Zurich University of Applied Sciences, Winterthur, Switzerland*

Due to complex conditions of palliative patients dwelling at home community nursing services often lack resources and skills to meet patients’ needs. Therefore, a specialist department led by Clinical Nurse Specialists (CNS) for palliative care was implemented. In order to evaluate these services a mixed methods study was pursued. Semi-structured interviews were conducted with staff, physicians and family members and analyzed with a grounded theory approach. (n=41). In addition, a questionnaire assessing quality of interdisciplinary collaboration was distributed. The nurse-led specialist department has been identified as a competence center with low-threshold access for patients, families and professionals. Referrals to the nurse-led service occurred when the patients and families insisted to dwell at home despite of deteriorating end-of life conditions. In addition to providing services to the patients and families at home, the CNS had leadership and case management roles, and collaborated closely with physicians, community nurses, and pharmacists. The coordination by the CNS led to feelings of empowerment in all parties involved. Family members felt less anxious and more competent in caregiving due to the collaboration with the CNS. Physicians and community nurses felt confident to provide best care to patients due to the coordination of the CNS. All stressed that continuity of care had improved, that emergency situations had dropped and that there were less unplanned hospital admissions. The study showed that a nurse-led specialist department for palliative care can benefit patients and families, but also health care professionals. The pivotal components of such services will be discussed.

EXERCISE PROGRAM FOR CHRONICALLY ILL AND MOBILITY-LIMITED ELDERLY IN PRIMARY HEALTH CARE: AN RCT

T. Hinrichs[1,2], B. Bücker[3,4], R. Klaassen-Mielke[5], M. Brach[6], S. Wilm[4], P. Platen[7], A. Moschny[5,7], *1. Swiss Paraplegic Research, Nottwil, Switzerland, 2. Department of Health Sciences and Health Policy, University of Lucerne, Lucerne, Switzerland, 3. Institute of General Practice and Family Medicine, University of Witten/Herdecke, Witten/Herdecke, Germany, 4. Institute of General Practice, University of Düsseldorf, Düsseldorf, Germany, 5. Department of Medical Informatics, Biometry and Epidemiology, University of Bochum, Bochum, Germany, 6. Institute of Sport and Exercise Sciences, University of Münster, Münster, Germany, 7. Department of Sports Medicine and Sports Nutrition, University of Bochum, Bochum, Germany*

Background Chronically ill and mobility-limited elderly are difficult to reach for exercise interventions when they live in their own homes. A pilot study showed good feasibility of a home-based exercise program that is delivered to this target group through cooperation between general practitioners (GPs) and exercise therapists. The present study evaluated effects of this program on physical function, physical activity, quality of life, fall-related and exercise self-efficacy. **Methods** Two-hundred-nine chronically ill and mobility-limited patients ≥70 years were recruited for an RCT (HOMEfit; Registration ISRCTN17727272) in 15 GP practices (2011-2012). The experimental intervention (duration 12 weeks) – a multidimensional home-based exercise program integrating behavioral strategies – was delivered by an exercise therapist in individual counseling sessions at the GP's practice and on the telephone. The control intervention focused on promoting light-intensity activities of daily life. Primary outcome was functional lower body strength (chair rise test). Secondary outcomes were physical function (motor tests), physical activity (step count), health-related quality of life (SF-8), fall-related (FES-I) and exercise self-efficacy (SSA-Scale). Post-interventional differences between the groups were tested with ANCOVA (adjusted for baseline value and GP practice; level of significance $p \leq 0.05$). **Results** Participants were aged 80±5 years (74% female; 64% with ≥4 chronic diseases; 54% using a walking aid). The drop-out rate was 22% in the experimental and 14% in the control group. Intention-to-treat analysis showed no significant differences between the groups. **Conclusions** The program was ineffective in the target population. Possibilities to improve the concept will have to be evaluated. *(Research cooperation PRISCUS, Funding: BMBF 01ET1005A)*

INFORMAL CAREGIVERS' ATTITUDES TOWARDS NEW KITCHEN AND PERSONAL CARE TECHNOLOGY TO SUPPORT CAREGIVING

S. Beach[1], R. Schulz[1], J. Matthews[1], K.L. Courtney[2], A. DeVito Dabbs[1], *1. University of Pittsburgh, Pittsburgh, Pennsylvania, 2. University of Victoria, Victoria, British Columbia, Canada*

We report results of a survey designed to assess informal caregiver likelihood of use and perceived benefits/barriers of emerging kitchen and personal care technologies to aid caregiving. A national web panel of 512 adults (18 to 64) caring for parents (79%), spouses (10%) or other relatives (11%) with a variety of health conditions participated. Multivariate ordered logistic regression models for likelihood of use were examined with the following predictors: socio-demographics, caregiving context variables, general technology attitudes/usage, and use of currently available technologies for caregiving. Caregivers' were generally accepting of both new kitchen (27% very likely to use, 26% somewhat likely) and personal care (26%, 28%) technologies to aid caregiving. Multivariate models showed that caregivers with the following characteristics had higher likelihood of use for new kitchen technology: African-American, Hispanic, age 18 to 44 (vs. 55-64), more positive general technology attitudes, use more everyday technologies, use the internet "often" to find caregiving information, and currently using more available technology for caregiving. Significant predictors of likelihood of use of new personal care technology included age 18 to 54, caregiver lives with care recipient, more positive general technology attitudes, and use the internet "often" to find caregiving information. Follow-up analyses of perceived benefits/barriers of these technologies showed that caregivers with more positive general technology attitudes, and those who are currently using more caregiving technologies were more likely to perceive both benefits and barriers, suggesting that in addition to being more receptive to emerging technologies, they may also hold more complex attitudes towards them.

SESSION 1585 (SYMPOSIUM)

SAFETY AND THE PERCEIVED NEED FOR 24-HOUR CARE ARE POWERFUL DETERRENTS TO ENCOURAGING COMMUNITY CARE: RE-ENVISIONING AND REINFORCING A REASONABLE SAFETY STANDARD

Chair: R.A. Kane, *DIv Health Policy & Management, University of Minnesota School of Public Health, Minneapolis, Minnesota*

Qualitative interviews are replete with references to the need for 24-hour care as a barrier to affordable, safe discharge unless family or friends are continuously regularly. Different informants have different thresholds for what they consider safe and different triggers to action in the face of what they consider risky. Some study participants believe that the ultimate choice is the resident's and professionals should shore up the resident's preferred plan; others believe they have professional responsibility to advise consumers that if they leave against medical advice (AMA), adult protective services will be notified and they will receive no further assistance or even discharge orders. The AMA discharge was sometimes used as a "club" to change the resident's mind. Possible correctives for this stance would include team discharge decisions to cushion sense of responsibility, further training and discussion of what 24-hour care actually means, and deeper understanding that safety is an unachievable ideal even in nursing homes, and that reasonable safety is what is required under the Minnesota Vulnerable Adults act.

RETURNING TO THE COMMUNITY FROM NURSING HOMES: NEW PARTNERSHIPS, ROLES, CHALLENGES AND POSSIBILITIES IDENTIFIED IN QUALITATIVE RESEARCH

R.A. Kane, S.C. Reinhard, *DIv Health Policy & Management, University of Minnesota School of Public Health, Minneapolis, Minnesota*

The Return to the Community Initiative (RTCI) offers Minnesota nursing home (NH) residents assistance in planning community discharge and follow-up thereafter. RTCI is staffed by Community Living Specialists (CLS's) supported by the Senior LinkAge Line specialists in each Area Agency on Aging. RTCI is targeted at non-Medicaid residents with potential and desire for discharge who have been residents for 60 days, but accepts referrals of newly admitted residents who present discharge challenges. In Minnesota, most nursing homes are staffed with one or more qualified social workers, and many have developed their own innovative teams and processes for discharge, presenting a best-case scenario for affecting community discharges because of the internal capability of NHs and the investment in community resources, including RTCI. This Symposium provides insights from qualitative interviews of CLS's, nursing home discharge personnel, and consumers and their families related to: barriers and obstacles to discharge for privately paying NH residents; partnerships forged between NH and community personnel and perceptions of "added value" of the CLS; and some of the issues perceived by family and resident decision-makers. Most NH residents are admitted from hospitals, and informants report that residents are more complex and unstable in their medical conditions than formerly, resulting in longer "short-term stays." Determining what constitutes reasonable safety on discharge, and what discharge "against-medical-advice" means in a NH context have emerged as themes. Discussant, Susan Reinhard, will identify implications, considering best practices in community-based long-term supportive services, and inter-state variation that might affect replication.

FAMILY MATTERS IN NH DISCHARGE: PRACTICES THAT COULD SUPPORT FAMILY IN A DECISION TO RETURN TO THE COMMUNITY

T.P. Shippee, *Health Policy and Management, University of Minnesota, 420 Delaware St. SE, MMC 729, Minnesota*

This study examines the role of family members on the process of returning nursing home (NH) residents to the community. Specifically, this paper elucidates how family members influence the decision-making process, and identifies cases of successful and unsuccessful transitions. Data for the study come from interview cases described by the community living specialists (CLS), nursing home social workers, and family member interviews on the process of discharging NH residents in Minnesota to the community. Quite often, family members decline the assistance of the CLS because of practical concerns about their relative's safety. The findings identify issues of particular salience to families that make them reluctant to encourage community care, and explore what might lead to a different decision. Family perception of safety is of particular salience. This study's findings provide a better understanding of NH discharge process in the context of family decision-making and could guide future interventions

THE CLS, THE NH STAFF AND THE NEW WORLD OF NH DISCHARGE: NEW PARTNERSHIPS ADD VALUE BUT BARRIERS REMAIN

K. Abrahamson[1,2], R.A. Kane[3], T.P. Shippee[3], *1. School of Nursing, Purdue University, West Lafayette, Indiana, 2. Purdue University Center for Aging and the Life Course, West Lafayette, Indiana, 3. University of Minnesota, Minneapolis, Minnesota*

Based on qualitative interviews with CLS's and NH home discharge personnel, this paper identifies the added value of the CLS and the continued barriers to discharge. CLS's and NH social workers perceive the challenges similarly: insufficient financial resources to pay for home health agency assistance, lack of available support from family or friends, needs in some cases for specialized housing or mental health resources, and issues in rural areas, including transportation gaps. Both CLS's and NH social workers give weight to resident preferences yet both refer to residents as "unrealistic." Despite barriers, the paper also reports positive perceptions that the CLS and related LinkAge Line services provide reassurance to residents and families in discharge, and make NH personnel feel more confident in encouraging a discharge.

SESSION 1590 (SYMPOSIUM)

CREATING AGE-FRIENDLY SERVICES: EXPLORING NEEDS AND PREFERENCES IN A DIVERSE, LOW INCOME COMMUNITY

Chair: L. Simon-Rusinowitz, *Health Services Administration, University of Maryland, College Park, Maryland*

National efforts have expanded publically-funded community services; however, the majority of public funding for long-term services and supports (LTSS) for elders and adults with physical disabilities supports nursing homes. Maryland has lagged behind many states in shifting LTSS spending to community options. Thus, Maryland legislators passed the 2011 Maryland Communities for a Lifetime Act, which includes services such as LTSS, housing, transportation, health care, and civic engagement. We know little about the feasibility of implementing age-friendly services in a racially and economically diverse community. This pilot project explored community needs and preferences in designing age-friendly services in one such Maryland County. Highlighting the importance of communicating with community members, the project comprised focus groups with key stakeholders, elderly residents of two low-income senior buildings, and family members. We also reviewed existing county data. Findings will inform a proposal seeking funds to design and evaluate age-friendly county services.

IDENTIFYING COMMUNICATION AND INFORMATIONAL NEEDS IN AN AGING COMMUNITY

K. Black, *College of Arts and Sciences, University of South Florida at Sarasota-Manatee, Sarasota, Florida*

Communities across the nation are currently grappling with unprecedented increases among their older adult populations, and bracing for even greater growth in the decades ahead. Conducted in a Southeastern region of the United States in which nearly one-third of the residents are age 65 and older, this study utilized multiple methods of qualitative inquiry to explore older adults' perceptions about aging in community. Communication and information represented a core theme identified in the research. Sub-themes include the following: (1) Limited knowledge about supports needed to age in place; (2) Interest in personal input and peer to peer sharing regarding programs, services, and activities; (3) Increasing roles of older adult peers as navigators of information relevant to late life circumstances; (4) Mixed experiences with technology as a means to communicate; and (5) Variable informational outreach approaches needed to enhance aging in community for all residents. Implications for enhancing communication and informational strategies among older adults aging in community are discussed.

GETTING THE WORD OUT: ENHANCING PLANNING IN AGE-FRIENDLY COMMUNITIES

D.B. Bradley, K. Fitzgerald, *Center for Gerontology, Western Kentucky University, Bowling Green, Kentucky*

Many communities are responding to population aging by asking how they can make their cities more "age-friendly." This is an important research question which involves collaborative communication strategies. An aging population presents opportunities for communities because many older adults are committed, long-time residents who contribute their time, energy and assets. One of the most challenging things that research teams confront is how information is both gathered from and provided to seniors so that they may be able to participate fully. This symposium explores four perspectives of collaborative communication and its role in the planning of age-friendly communities. The first paper examines strategies to involve volunteers in a rural small town age-friendly research project primarily through the eyes of senior participants. Next, insights from Portland, Oregon's, multi-year research, development, and beginning implementation of an action plan to improve the city's age friendliness are presented. Then a paper reports on the communication and informational needs identified in an exploratory study conducted in a Southeastern region in which nearly a third of the residents are age 65 and older. Lastly, the planning experiences in a low-income, racially/ethnically diverse Maryland community highlight the importance of communication in initial steps implementing a new state policy. Supporting an age-friendly aging-in-community environment is very geographically-centric. While each research study has identified different communication challenges, the outcomes suggest that best practices could be shared more widely. The symposium concludes with a discussion about the opportunities to connect seniors with their communities from a global perspective.

STRATEGIES FOR KEEPING COMMUNITY PARTNERS CONNECTED IN AN AGE-FRIENDLY COMMUNITY

D.B. Bradley, M. Hunt, H.K. Ruggles, *Center for Gerontology, Western Kentucky University, Bowling Green, Kentucky*

Bowling Green, KY, is implementing the World Health Organization Age-Friendly City framework with particular attention to developing strategies to increase communication. The primary goal of its Age Friendly Bowling Green (AFBG) - The Portal project, is to capture and disseminate knowledge relevant to aging community dwellers. As part of a stakeholder analysis, the role of volunteers in designing and implementing the Portal was examined. The survey, administered to representatives of city government, sixty nonprofit agencies, two hospital-based organizations and community members, many of which are over 65 years, included open and closed- ended items. Several themes related to volunteer expectations were identified including attention to recruiting and rewarding volunteers. Interestingly, respondents who identified themselves as "age 60 and older" were more likely to strongly identify with the stated goals of the project. The paper concludes with implications for using senior volunteers to enhance planning for age-friendly communities.

CREATING A MORE AGE-FRIENDLY PORTLAND: APPROACHES, SUCCESSES, AND CHALLENGES

M.B. Neal, A. DeLaTorre, *Institute on Aging, Portland State University, Portland, Oregon*

Communities around the globe have begun recognizing the enormous implications of population aging for public policy, business, health care, technology, and urban planning. This presentation describes the approaches taken in Portland, Oregon, to plan and implement changes aimed at creating a more age-friendly community. In 2006-2007, Portland was one of 33 cities in 22 countries to participate in the World Health Organization's Global Age-Friendly Cities project. Building on the study's findings and relationships developed and expanded, as well as policy windows (Kingdon, 1984) that opened to allow an age-friendly agenda to be set, university researchers acted as policy entrepreneurs and disseminators of empirical findings in collaboration with members of an advisory council composed of government and community partners, including older adults. The results of consultations with older adults via instant polling, an action plan approved in 2013 and currently being implemented, and successes and challenges to date are also described.

SESSION 1595 (SYMPOSIUM)

NCI-AD: EXPANDING THE NATIONAL CORE INDICATORS FOR AGING AND DISABILITY SERVICES

Chair: D. Hiersteiner, *Human Services Research Institute, Cambridge, Massachusetts*

National Core Indicators: Aging and Disability (NCI-AD) Project grew out of concern about the limited information available to states about the impact of public LTSS services on QOL of older adults and adults with disabilities. Some data are available about the quantity of and satisfaction with public LTSS services, yet almost nothing is known about the impact of these services on recipients' lives. National Association of States United on Aging and Disabilities (NASUAD) partnered with Human Services Research Institute (HSRI) and National Association of State Directors of Developmental Disabilities Services (NASDDDS) to create a survey to measure outcomes of state aging and disabilities services. It will be used by state agencies to compare their performance with other states' and to allow national benchmarking. NCI-AD has recently entered the pilot stage. This symposium will spotlight its' development, goals, implementation and utility. Presentations will: 1) Discuss the need for the survey and the project's origins. 2) Outline the survey design and development process to date. 3) Profile a state involved with survey development and the pilot process, why they decided to be involved with the project, how they plan to use the data and outcomes, and the role the survey will play in policy-making. 4) Look at preliminary data and discuss the next steps for the project.

NCI-AD: IDENTIFYING THE NEED FOR DATA ON PUBLIC LTSS SERVICES

V.J. Bradley[2], M. Roherty[1], *1. National Association of States United on Aging and Disability, Washington, DC, District of Columbia, 2. Human Services Research Institute, Cambridge, Massachusetts*

The NCI-AD survey was conceived to address a dearth of information on system performance of publicly-funded Long Term Services and Supports for older adults and adults with disabilities. NASUAD and member states agreed that it was necessary to develop a survey that could be used to demonstrate the performance of state services in terms of their impact on recipients' quality of life. This presentation will discuss the conception of the NCI-AD project. Specifically, how the need for data was identified, how the collaboration between HSRI, NASDDDS and NASUAD was conceived, how states were engaged and the conceived uses for resulting data. This presentation will also discuss the ongoing support of federal agencies such as the Administration for Community Living. In addition, this presentation will look at how this tool differs from existing measures of service quality and quality-of-life targeted at this population.

NCI-AD: SURVEY DEVELOPMENT

J. Bershadsky[1], K. Walter[2], D. Hiersteiner[1], *1. Human Services Research Institute, Cambridge, Massachusetts, 2. National Association of States United on Aging and Disability, Washington DC, District of Columbia*

Once the need for data on public aging and disabilities service system performance was identified and the collaboration between NASUAD, HSRI and NASDDDS was begun, development of the survey tool commenced. Survey tool development was a complex process that involved many steps. This presentation will detail the process by which the NCI-AD tool was developed. The process started with research into existing measures of system performance, followed by several meetings of the NASUAD steering committee to discuss potential performance measures and indicators. There were several iterations of the draft survey tool, each taking into account the edits and suggestions of various stakeholder groups, administrators, policy-makers and academics. The development process also further engaged stakeholders through the administration of focus groups and field testing. This presentation will also discuss the pilot process and challenges encountered in the roll-out of the pilot.

NCI-AD: A STATE AGENCY PERSPECTIVE

K. Benson[1], D. Clifford[2], *1. Minnesota Board on Aging, St. Paul, Minnesota, 2. Ohio Department on Aging, Columbus, Ohio*

Three states, Georgia, Minnesota and Ohio, agreed to administer the NCI-AD survey in its pilot phase. All three of these states recognized the need for performance data on public services and expressed a desire to aid in the development and testing of such a tool. This section of the symposium will be presented by a representative from one of the three states that agreed to pilot the tool. The state representative will discuss the value of such a tool to her state, why the state decided to pilot the tool, how the approval to pilot the tool was secured, and how the state plans to use the data. In addition, the representative will outline the current policy context in the state and its impact on the decision to pilot and participate in the future of the project.

NCI-AD: RESULTS FROM THE PILOT AND NEXT STEPS

J. Bershadsky[1], K. Walter[2], D. Hiersteiner[1], *1. Human Services Research Institute, Cambridge, Massachusetts, 2. National Association of States United on Aging and Disability, Washington DC, District of Columbia*

It is anticipated that as of November 2014, the NCI-AD team will have completed the pilot data collection of the Survey data and will have preliminary results from the pilot. This section of the symposium will present preliminary data resulting from the pilot. Data on the three participating pilot states will be presented, as well as overall results. Potential methodology for risk-adjustment will be discussed. In addition, this presentation will discuss elements of the pilot that went well, challenges faced in the pilot of the tool, and lessons learned in the pilot process. To conclude the symposium, this presentation will also discuss the next steps for this project, including the larger-scale rollout of the NCI-AD survey tool and its timeline, as well as the planned development of family/caregiver indicators to assess the impact of publicly-funded services on caregivers.

SESSION 1600 (SYMPOSIUM)

THE SHIFTING POLITICAL CONSTRUCTION OF OLD AGE AND ITS CONSEQUENCES

Chair: R. Hudson, *Social Work, Boston Univ, Boston, Massachusetts*

At one time a marginal presence in American politics, older adults have more recently assumed a significant electoral presence throughout the nation and an imposing organizational standing in Washington, D.C. Public policies directed toward seniors, once of modest scope and size, today cover a range of late-life contingencies and constitute upwards one-third of federal government spending. Indeed, policy-generated improvements in the well-being of older adults stand as America's foremost social policy success. Yet, that very success, in conjunction with broader economic and political developments, is at once a cause for both celebration and concern, presenting unprecedented challenges to the aging policy enterprise. Through use of a "typology of target populations," this symposium frames how the political construction of older adults has changed over the course of several decades. Specifically, it identifies three stages – "dependent," "advantaged," "contender" – that have marked the political evolution of older Americans over this time period. The individual presentations investigate both the consequences and controversies associated with this evolution. Robert Hudson's presentation sets forth the basic typology and applies it to the populations, politics, and policies of aging. Fay Lomax Cook documents the growing political presence of older Americans and a growing divide between popular and elite opinion about older Americans' needs and standing. Judith Gonyea presents cautionary data on how misleading such overarching constructions may be. Larry Polivka assesses how new understandings of elders' place in politics is playing out at the state and local level.

THE POLITICAL CONSTRUCTION OF SENIORS OVER TIME: A MOVEMENT IN THREE ACTS

R. Hudson, *Social Work, Boston Univ, Boston, Massachusetts*

Using a typology of target populations organized by social construction and political power, this presentation suggests that the political standing of older Americans has evolved through three stages since the beginning of the modern welfare state : first, as Dependents (positively viewed with little political power); second, as Advantaged (positively viewed with considerable political power), and, third, as Contenders (negatively viewed with considerable political power). This shifting balance of perceptions and resources provides a useful framework for understanding the policy challenges facing today and tomorrow's older population.

TWO FACES OF THE POLITICAL PRESENCE OF AMERICA'S SENIORS: PUBLIC SUPPORT AND SENIOR PARTICIPATION

F.L. Cook, *Institute for Policy Research, Northwestern University, Evanston, Illinois*

To understand seniors' presence on the political stage today and the extent to which they could be characterized as "contenders," this paper presents two perspectives. First, using NORC's GSS data over time, we find that the vast majority of the public supports Social Security. However, wealthy Americans have become less supportive recently, a troubling finding since wealthy Americans have demonstrably high levels of political influence. Second, using NES data on seniors' political participation beyond voting from the 1980s to 2012, we find that seniors' political participation has increased since the mid-1980s both in comparison to prior levels and in comparison to younger age groups. These findings portray seniors having broad support but support that bears careful monitoring for cracks that seem to be beginning to develop. At the same time, since seniors' political participation is increasing, they have the potential to be ever more active spokesmen on their behalf.

THE WEAKENING POLITICAL LEGITIMACY OF SENIORS: CONSEQUENCES FOR AGING BOOMERS

J.G. Gonyea, *Social Work, Boston Univ, Boston, Massachusetts*

Throughout the past two decades, messages in the media have both reflected and fueled fears about the public costs of an increasingly older society. It is often emphasized that the aging baby boomer generation will place unprecedented pressures on our entitlement programs. Yet, it is not only their sheer numbers which have revived debate concerning the desirability of public services and benefits based exclusively or primarily on old-age status. The public portrayal of baby boomers as an affluent, self-absorbed, generation with a strong sense of entitlement has also weakened their political legitimacy. As this discussion makes clear, however, baby boomers are not a monolithic group. Indeed, rising economic inequality in this cohort may lead to a greater economic bifurcation of America's seniors into two very different worlds of aging. We explore the consequences of the fracturing of the long-standing political singularity of the old for the most vulnerable baby boomers.

ARE THE ELDERLY SLIPPING FROM ADVANTAGED TO CONTENDER STATUS IN FLORIDA?

L. Polivka, *Claude Pepper Center, Florida State University, Tallahassee, Florida*

Over the last twenty years the elderly population in Florida has slipped from advantaged to contender status as defined by Hudson and Gonyea (2012). Until the early 1990s, policymakers, on a bipartisan basis, identified Medicaid and general revenue funded programs for the elderly as high priorities. These nursing home and community-based long-term care and quality of life programs were comparatively well funded through the early 1990s; however, by the mid-1990s, funding for these programs began to decline and has never returned to the same levels achieved in the 1970s and 1980s. The two worlds of aging are increasingly evident in Florida with the powerful 1 percent supporting low taxes at virtually all costs, with the bottom 50 percent facing lengthening wait lists for HCB services. The emergent "contender" construction of seniors has put lower income elders at great risk.

SESSION 1605 (SYMPOSIUM)

EXAMINING IMPACT OF CHANGING ENVIRONMENTS ON HEALTH AND PSYCHOLOGICAL WELL-BEING

Chair: J. Norstrand, *Social Work, Boston College, Newton, Massachusetts*

Co-Chair: A. Glicksman, *Philadelphia Corporation for Aging, Philadelphia, Pennsylvania*

Discussant: H. Wahl, *Heidelberg University, Heidelberg, Germany*

This symposium examines associations between changes in the environment and health. Research on the impact of the social and physical environment on the health has primarily looked at static environments. Less is known about how changes in the environment may be associated with health and psychological well-being. Examining environmental changes may enhance our ability to work with policy planners in designing environmental modifications that will bring the maximum positive effect on the health of older adults. This symposium presents research from six countries focused on change in the environment (i.e. social, physical, economic, policy) in terms of physical and psychological well-being. Gong & Kendrick, based in Australia, describe the health changes over time in relation to economic and political changes. Hunter, based in USA, evaluates environmental and policy change in the areas of pedestrian safety, walkability and wayfinding in relation to health and health-related behavior. Nyqvist, based in Finland, examines change in residential location in terms of loneliness among the very old. Slaug, based in Sweden, examines policies to improve housing accessibility in terms of activities of daily living (ADL), usage of home services and related costs. Finally, Wu, based in UK, describes both micro (area deprivation) and macro (societal) level changes in the environment in terms of health among elderly from UK and China, respectively. It is hoped these diverse papers will provide opportunity for an in-depth discussion of the role of changes in the environment, along multiple dimensions, is important for health.

IMPACT OF CHANGING ENVIRONMENT ON HEALTH: HEALTH OUTCOMES AND SOCIAL CHANGE AMONG AGEING AUSTRALIANS

C.H. Gong[1,2], H. Kendig[1,2], *1. Centre of Research of Ageing Health and Wellbeing, Australian National University, Canberra, Australian Capital Territory, Australia, 2. ARC Centre of Excellence in Population Ageing Research (CEPAR), Canberra, Australian Capital Territory, Australia*

Of the many 'environmental' influences on the health of older people, one of the most important concerns is the impact of social, economic and policy change. This paper examines health outcomes, as indicated by both self-assessed health and subjective well-being, among Australians aged 40 years and over from 2001 to 2011. The information source is the Household, Income and Labour Dynamics in Australia (HILDA) Survey. This household-based longitudinal data enables us to conduct a 'cross-sequential' and "age-cohort" analysis of how health outcomes have changed for individuals as they grew older in an Australia that was changing in terms of economic growth, the shock of the Global Financial Crisis, increasing policy and public concern for the costs of population ageing, and two changes of government with related policy redirection. The social determinants of health perspective, with a focus on disadvantaged groups and age-specific effects -will be applied to interpret the findings

THE PREVALENCE OF LONELINESS IN THE VERY OLD: A FOCUS ON CHANGES OVER TIME

F. Nyqvist[1], M. Cattan[2], Y. Gustafson[3], *1. National Institute for Health and Welfare (THL), Mental Health Promotion Unit, Vaasa, Finland, 2. Northumbria University, Faculty of Health and Life Sciences, Newcastle upon Tyne, United Kingdom, 3. Umeå University, Department of Geriatric Medicine, Umeå, Sweden*

Although researchers have provided evidence that social, functional and mental resources are linked to loneliness, few studies have focused on the very old, or people aged 85 and above. In this study we assess whether the prevalence of loneliness in a sample of very old people changes over time. We compare the levels of loneliness in two population-based cross-sectional samples of very old people in northern Sweden in 2000-2002 and 2005-2007. Furthermore, we assess the protective factors of loneliness such as social, functional and mental resources. The prevalence of those reporting frequent loneliness increased slightly between 2000-02 and 2005-07 in the total sample. However, the increase in loneliness was significant only among ≥95 year olds. Changes in loneliness among ≥95 year olds seem to be related to selected social, functional and mental resources.

ASSESSING ENVIRONMENTAL CHANGE: CHALLENGES, OPPORTUNITIES AND STRATEGIES

R.H. Hunter[1], D.X. Marquez[2], A. Perez[3], A. Graces[4], *1. UNC Center for Health Promotion and Disease Prevention, Chapel Hill, North Carolina, 2. University of Illinois, Chicago, Chicago, Illinois, 3. Arizona State University, Phoenix, Arizona, 4. Urban Health Solutions, Miami, Florida*

Environmental and policy change is typically complex and often costly. Accordingly, we must achieve a better understanding the impact of change on older adult health and health-related behavior so that the best decisions can be made about resource allocation. Research to date points to conditions that favor healthy aging, but assessing the impact of neighborhood, community and/or policy change has proven to be challenging, making it difficult to build the necessary evidence base for specific changes. This presentation builds upon the work of the CDC-Healthy Aging Research Network and partner communities to plan, implement and evaluate environmental and policy change in the areas of pedestrian safety, walkability and wayfinding. Drawing upon lessons learned in key initiatives and selected communities, we highlight the importance of cross-sector collaboration, identify specific assessment tools, such as the CDC-HAN Environmental Assessment Tool, and explore strategies and criteria for assessment decisions and implementation.

IMPROVED HOUSING ACCESSIBILITY FOR OLDER PEOPLE: AFTER INDIVIDUAL ASSESSMENTS OR BY POLICY CHANGES

B. Slaug[1], C. Chiatti[2,1], F. Oswald[3], R. Kaspar[3], S. Schmidt[1], *1. Health Sciences, Lund University, Lund, Sweden, 2. Istituto Nazionale di Riposo e Cura per Anziani, Ancona, Italy, 3. Goethe University, Frankfurt am Main, Germany*

A change for the better in the housing environment, such as a home adaptation, may be achieved after establishing an individual need or by implementing a policy change. From a public health perspective, it is important to be able to evaluate and compare the potential impact of alternative strategies on health-related outcomes. We will present mathematical simulations of the potential impact of alternative strategies to improved housing accessibility, by estimating the change in the performance of activities of daily living (ADL), usage of home services and related costs. We adapted health impact assessment (HIA) methods that consider the best available empirical evidence, and utilized the results from the ENABLE-AGE and other scientific studies to generate the simulations. Our findings suggest that environmental changes by an alternative policy implementation, may contribute to averting cases of ADL dependence and ultimately also to a reduction of societal costs.

SOCIETAL CHANGES AND PREVALENCE OF DEMENTIA IN MAINLAND CHINA, HONG KONG AND TAIWAN

Y. Wu, C. Brayne, *Department of Public Health and Primary Care, Institute of Public Health, University of Cambridge, Cambridge, United Kingdom*

Economic development and the change of social environment affect the living conditions of people with substantial influence on population health. In China, dramatic societal changes in the last hundred years, including rapid change of government, frequent wars, political conflicts and recent economic growth, could have caused different life experience with a major impact on health and well-being of ageing population. Several factors, such as life expectancy, education opportunities, nutrition, stress and increase of chronic diseases, are moderated by the societal level influence and considered to be associated with dementia. This study includes the existing prevalence studies of dementia in mainland China, Hong Kong and Taiwan from 1980 to 2012 and explores the temporal variation of dementia prevalence across different time periods and birth cohorts taking study methods into account. The results provide insights to the impact of societal changes on mental health in older population.

SESSION 1610 (PAPER)

ELDER ABUSE IN INSTITUTIONAL SETTINGS AND THE COMMUNITY

ELDER ABUSE IN PRISONS: THE CALL FOR EXTENDING ELDER JUSTICE TO INCARCERATED OLDER ADULTS

T.M. Maschi, *Graduate School of Social Service, Fordham University, New York, New Jersey*

Recent human and civil rights reports suggest that the poor social and environmental conditions of confinement may have devastating health consequences, especially for aging people in prison (HRW, 2012). However, there is a lack of knowledge about the lived experiences of incarcerated older adults and their exposure to abuse in prison. Therefore, the purpose of this mixed methods study was to examine older adults' objective and subjective experiences of trauma, abuse, neglect, and exploitation in prison using quantitative and qualitative measure. It used a cross-sectional design and a sample of 677 older adults. Participants completed a mailed survey that included the Life Stressors Checklist-Revised (McHugo, 2005) and open-ended questions that asked about their experiences of abuse and neglect in prison. Descriptive statistics revealed that about two out of three participants reported some type of abuse in prison. Using content analysis strategies to analyze revealed types of trauma, abuse, and neglect not captured in quantitative measure. Participants reported experiencing mistreatment, exploitation, and medical neglect by staff, solitary confinement, and fears about personal safety. Many participants reported minimal to contact with their families while in prison, which was significant source of distress, especially when a family member in the community was sick or dying. These findings also suggest that incarcerated older persons are a population deserving of elder justice protections and advocacy efforts. Strategies for improving measurement of elder trauma and abuse in prison as well as practice and policy reform efforts that results in increased protections for older adults in prison.

BULLYING IN NURSING HOMES

N. Castle[1], J. Engberg[2,1], *1. University of Pittsburgh, Pittsburgh, Pennsylvania, 2. RAND, Pittsburgh, Pennsylvania*

In this research, we build on our prior pilot work in this area and present findings on bullying as a form of resident abuse in nursing homes. We examined the opinions of bullying from a large sample of nurse aides (N=3,000). The survey was developed using focus groups, pilot testing, and content experts; and was sent to a nationally representative group of nursing homes. Data were merged with the Online Survey Certification and Reporting data and the Area Resource File. Multivariate regression models using GEE were used. Overall, we found bullying to be somewhat common; with rates as high as 30% of residents experiencing bullying. The highest rate of bullying came from other residents and not staff. The rates identified were also associated with characteristics of the residents and nursing home settings (such as size and staffing levels). These associations will be presented. The findings provide tentative evidence that bullying may be an important abuse characteristic in nursing homes.

CONSERVATORSHIP CHARACTERISTICS AMONG FORENSIC CENTER AND ADULT PROTECTIVE SERVICES CLIENTS

J.M. Yonashiro-Cho, Z.D. Gassoumis, K. Wilber, *Davis School of Gerontology, University of Southern California, Los Angeles, California*

Studies estimate that 11.4% of elders have experienced abuse within the past year. While service providers frequently use conservatorship to intervene in cases of mistreatment or self-neglect, little has been documented about its use or the characteristics of proposed conservatees and conservators. The purpose of this study is to explore the use of conservatorship intervention among clients receiving services from an Elder Abuse Forensic Center and a matched sample of usual care Adult Protective Services clients. Data were extracted from program case files and publicly available court documents. Analyses included descriptive statistics and multivariate logistic regression. About a quarter (22.7%;n=130/572) of elderly victims were subjects of conservatorship proceedings. African American (OR=2.07) or Asian/Pacific Islander (OR=3.17) race, self-neglect (OR=2.31) and involvement in the Forensic Center (OR=5.11) increased the odds of conservatorship petition. In a preliminary analysis of a subset (n=50) of petitions, 84% (n=42) were fulfilled. Although 94% requested plenary conservatorships over the conservatee's person and estate, 12% of those granted were limited in scope. Common petitioners included the Public Guardian (PG; 62%;n=31), adult children (20%;n=10), other relatives (28%;n=14), or professional fiduciaries (8%;n=4). Appointed conservators included the PG (52.4%; n=22), adult children (14.3%;n=6), other relatives (21.4%;n=9), friends (9.5%;n=4), or professional fiduciaries (14.3%;n=6). One-third of filings involved competing petitions. In contested cases, PG was appointed the conservator 40% of the time. Because conservatorship is a highly restrictive intervention, it's important to identify these and other characteristics of proposed conservatees and conservators to better promote appropriate care relationships.

ELDER MISTREATMENT AS A PUBLIC HEALTH PROBLEM

P.B. Teaster[2], J. Halll[1], *1. Centers for Disease Control, Atlanta, Georgia, 2. Virginia Tech, Blacksburg, Virginia*

Elder mistreatment is the last of the abuses to come to public attention. Its late arrival is because it is a complex public health problem with issues running the gamut from micro to macro levels of society, all of which demand a committed, interdisciplinary approach engaging the brightest minds possible. This presentation argues that it is critical to situate elder mistreatment as a public health problem. Situating it within the core functions of public health, the presenters contend that it is a public health problem by: 1) stressing that primary, secondary, and tertiary prevention of the problem is well within the scope of work performed by public health professionals; 2) addressing major public policy/public health initiatives as they relate to elder mistreatment (e.g., Healthy People 2020, White House Conference on Aging, Elder Justice Act, Affordable Care Act, ADA); and 3) framing elder mistreatment as a global and human rights issue. We embed our argument within the Socio-Ecological Framework and maintain that knowledge of elder mistreatment by public health professionals addressing issues of aging is essential for effective, well-informed efforts to identify, analyze, and address the facets that elder mistreatment involves. Finally, we provide examples of activities and structures that have, are, or will shape movement in the many sectors that intersect with public health to prevent elder mistreatment.

A MULTIAGENCY APPROACH TO COUNTER ELDER ABUSE: ARRIMAGE IN MONTRéAL

M. Beaulieu, J. Loock, S. Garon, *Gerontology, U. Sherbrooke, Sherbrooke, Quebec, Canada*

In 2010, the Quebec Government launched the Québec Government Plan of Action to Counter Elder Abuse 2010-2015. One of its main principles is to reinforce a continuum of services for prevention, detection and direct intervention. In the scientific literature, multiagency approaches (public, private and NGOs, including senior's NGOs) are highly recommended but very few models were evaluated; therefore we know little about their efficiency and efficacy. In Arrimage, we aim to fill the gap. This action-research project includes 11 agencies in the North-East part of Montréal. Our methodology consists of focus groups, individual interviews and observation of direct practice. Building from an informal collaboration between health and social services, police, a grouping together of seniors' organizations, and an NGO offering direct services to older adults with a focus on abused older adults, a multiagency approach is getting formalised, without rigidity, on who does what, with whom, in which case of elder abuse. This presentation will present our model of multiagency work including the strengths, challenges and limits of such approach. It will stress on a series of issues such as confidentiality, formal or informal links between people or between agencies, difficulties to recruit certain partners such as policy makers, banks, etc. We will conclude by presenting the detail of an innovative action to counter elder abuse: duos between police and community workers.

SESSION 1615 (POSTER)

INTERVENTIONS TO PREVENT AGE-RELATED DECLINE

ISONIAZID DOES NOT ACTIVATE THE INTRINSIC DEATH PATHWAY IN YOUNG AND OLD FISCHER 344 RATS

J. Mach[1,2,3], A. Huizer-Pajkos[1,2], V. Cogger[3,4], D.G. Le Couteur[3,4], B. Jones[1,3], R. De Cabo[5], S. Hilmer[1,2,3], *1. Kolling Institute of Medical Research, Royal North Shore Hosp,, Sydney, New South Wales, Australia, 2. Dept of Clin Pharmacol and Aged Care, Royal North Shore Hosp, Sydney, New South Wales, Australia, 3. Sydney Medical School, Univ of Sydney, Sydney, New South Wales, Australia, 4. Centre for Education and Research on Ageing and Anzac Research Institute, Concord Hospital, Sydney, New South Wales, Australia, 5. Laboratory of Experimental Gerontology, National Institute on Aging, National Institute of Health, Baltimore, Maryland*

Isoniazid is the first-line medication in prevention and treatment of tuberculosis, however its hepatotoxicity increases in old age. In vitro, toxic doses of isoniazid stimulate mitochondria dependent apoptosis. The intrinsic death pathway is also activated in ageing and this may provide a mechanism for increased susceptibility to isoniazid hepatotoxicity. We therefore characterised the intrinsic death pathway in response to a toxic regimen of isoniazid (4 doses/day: 100, 75, 75, 75mg/kg intraperitoneal every 3 hours over 2 days) in young (6 months) and old (24 months) male Fischer 344 rats (isoniazid: young n=7, old n=5; saline: young n=7, old n=8). 15hrs post last injection animals were euthanized, livers perfused and prepared for histology and for immunoblotting of target proteins BAX, BAK, VDAC1, Bcl-2, Bcl-Xl, Cytochrome C and caspase 3. A toxic regimen of Isoniazid did not activate the intrinsic death pathway or increase apoptosis in young or old animals. Hepatic mitochondrial expression of pro-apoptotic proteins BAX, BAK and VDAC1 did not change with age or treatment groups. In saline treated old animals compared to young, anti-apoptotic protein Bcl-2 significantly decreased (young: 1±0.09, old: 0.4±0.04, $p<0.05$), and apoptosis markers cytosolic cytochrome C (young: 1±0.3, old: 2.8±0.8, $p<0.05$) and activated caspase-3 increased (young: 1±0.2, old: 17.9±7.7, $p<0.05$). Our preliminary results suggest isoniazid does not activate the intrinsic death pathway in young and old Fischer 344 rats in vivo and this pathway is unlikely to be involved in the increased hepatotoxicity found in older people.

SYNERGISTIC ANTI-SENESCENCE EFFECT OF VITAMIN C AND CLOVE VIA INHIBITION OF LIPOPROTEIN OXIDATION

J. Yoo[1,2,3], E. Lee[1,2,3], K. Cho[1,2,3], *1. School of Biotechnology, Yeungnam University, Gyeongsan, Republic of Korea, 2. Research Institute of Protein Sensor, Gyeungsan, Republic of Korea, 3. BK21 plus Serum Biomedical Research and Education Team, Gyeungsan, Republic of Korea*

It is well known that Vitamin C and clove, a culinary spice, have potent antioxidant activity. Glycation is a major pathologic process to cause aging related disease such as diabetes and atherosclerosis. Clove extract showed anti-glycation effect. Co-supplementation effect of vitamin C and cineole was investigated in lipoprotein metabolism in vitro and in vivo. The co-supplementation more inhibited fructose mediated glycation up to 80%, and cupric ion mediated oxidation up to 38%, compared with control. Dermal cell senescence and atherogenic phagocytosis were more inhibited by the vitamin C and clove up to 77% than control. Eight weeks co-consumption vitamin C and clove in zebrafish resulted 68% and 78% reduction of serum total cholesterol level and triglyceride with reduction of SA-β-gal positive cell and fatty liver change in liver. In conclusion, co-consumption of vitamin C and clove showed anti-aging and anti-atherogenic effect via inhibition of lipoprotein oxidation and glycation. (The authors are grateful for the BK21 plus program of the National Research Foundation for the support of graduate students)

EFFECT OF EICOSAPENTAENOIC ACID ON SKELETAL MUSCLE IN SENESCENCE-ACCELERATED MICE

T. Koike, Y. Natsume, Y. Oshida, *Research Center of Health, Physical Fitness, and Sports, Nagoya University, Nagoya, Japan*

Aim: Eicosapentaenoic acid (EPA), an omega-3 polyunsaturated fatty acid in fish oil, has been shown to regulate muscle protein synthesis and degradation. We analyzed the effects of EPA on skeletal muscle ageing. Methods: SAMP1 (senescence-accelerated mouse prone 1) and SAMR1 (senescence-resistance mouse) were fed standard chow diet with either 6% EPA or corn oil. Mice were fed either from 8 weeks (experiment I) or 25 weeks (experiment II) of age until 30 weeks, when muscles were extracted and analyzed for the cell signaling pathway associated with muscle protein synthesis and degradation. Results: All SAMR1 survived for 30 weeks. However, only 50% (experiment I) and 67% (experiment II) of SAMP1 fed corn oil survived, while 100% (experiment I) and 83% of SAMP1 (experiment II) fed EPA survived. The insulin tolerance test at 18 weeks of age (experiment I) showed that EPA improves insulin sensitivity in SAMR1 but not in SAMP1. Grip strength test showed the tendency that EPA increases muscle strength in SAMP1 but not in SAMR1. Weights of gastrocnemius and quadriceps muscles were significantly higher in SAMR1 fed EPA than those fed corn oil (experiment I and II), while there was no significant change in SAMP1. Protein expression and phosphorylation of AKT are higher in SAMP1 than in SAMR1. However, phosphorylation of p70S6K and 4E-BP1 are lower in SAMP1 than in SAMR1. Conclusions: EPA administration increases muscle mass in normal mice, but not in senescence-accelerated mice. However, muscle strength may be improved by EPA administration in senescence-accelerated mice.

AGING, COGNITIVE DECLINE AND THE EFFECTS OF INSULIN-LIKE GROWTH FACTOR (IGF)-1 ON NEURONAL ACTIVITY

A. Orock, S. Logan, M. Mitschelen, A. Csiszar, W.E. Sonntag, F. Deak, *ROCA - Geriatric Medicine, OU HSC, Oklahoma City, Oklahoma*

Vascular cognitive impairment, Alzheimer's and other neurodegenerative diseases affect millions of elderly patients in the USA. According to recent results of the dementia research field a key event in the pathomechanism of dementia is the disruption of synaptic connections among neurons. Synapses are the structural elements for information processing, neuronal communication in the brain and essential for learning and memory as well as other cognitive processes. The core mechanism for transmitter release from synaptic vesicles requires the SNARE (SNAP Receptor) complex. Three proteins form the synaptic SNARE complex in the brain: SNAP-25, syntaxin1 and synaptobrevin. Using the knock-out mouse strains as a novel model of dementia and fluorescence imaging functional assays we have found that the levels of SNARE proteins significantly correlate with synaptic release. As prevalence of cognitive impairment and dementia cases is accelerating in our aging population, more efficient therapies are urgently needed. Insulin-like Growth Factor (IGF)-1 is an important trophic hormone and its expression decreases with age. Deficiency of this hormone therefore may influence cognitive decline in the elderly. We hypothesized direct synaptic effects of IGF-1 and tested its role in memory improvement. We present novel data on synaptic mechanisms of learning and memory after IGF-1 treatment acquired using electrophysiological and fluorescence imaging functional assays. Based on these new results on the effects of IGF-1 on synaptic communication, we propose the IGF-1/PI3K/Akt pathway as a possible therapeutic target and a novel approach to improve cognitive function for the elderly.

MODULATION OF MITOCHONDRIAL DNA MUTATION FREQUENCY AND ACCUMULATION BY CALORIC RESTRICTION AND RAPAMYCIN IN AGING MOUSE MUSCLE

J. Wanagat[1], J. Bielas[2], *1. UCLA, Los Angeles, California, 2. Fred Hutchinson Cancer Research Institute, Seattle, Washington*

Cell loss is an important aspect of aging in post-mitotic tissues. We hypothesized that age-associated mitochondrial DNA (mtDNA) mutations contribute to cell loss by accumulating to detrimental levels within cells. Our hypothesis suggests that preventing mtDNA mutation accumulation may be a point of intervention in aging. Recent *in vitro* studies demonstrated reductions of mtDNA mutations through the induction of autophagy by the mTORC1 inhibitor, rapamycin. We examined the *in vivo* effects of rapamycin and caloric restriction (CR), another inducer of autophagy, on mtDNA mutations and intracellular mutation accumulation in mouse skeletal muscle. Quadriceps muscles were isolated from 22mo male and female mice and histochemical staining was used to detect cytochrome c oxidase negative fibers, a marker of mtDNA mutation accumulation. Mitochondrial DNA was isolated from intervening sections and mtDNA deletion mutations detected by a novel droplet digital PCR method. At this age, we found sex and treatment effects on mtDNA mutation frequency and cytochrome c oxidase number in mouse skeletal muscle. These results corroborate observed sex differences for rapamycin and CR and highlight the challenges in the human clinical translation of the *in vitro* observations of altered autophagy.

SELECTIVE NEUROPROTECTIVE EFFECTS OF ENVIRONMENTAL ENRICHMENT IN AGING

S.L. Hong[1], A. Estrada-Sanchez[2], S.J. Barton[2], G.V. Rebec[2], *1. Biomedical Sciences, Ohio University, Athens, Ohio, 2. Indiana University, Bloomington, Indiana*

This study compared the effects of two isolated-housing conditions [Running Wheel (IHRW) and Empty Cage (IHEC)] against two enriched environments [Static (EEST) and Dynamic (EEDY)], housed 12 mice per cage. The EEDY group had the location of toys and food and water sources changed daily, while the placement of these items remained unchanged for the EEST group. Mice (C57BL/6) were randomly assigned to one of these four groups at ~4 weeks of age and remained in their respective environments for the next 25 weeks, and then housed singly until brains were extracted between 90 and 100 weeks of age. We measured glutamate (GLU) clearance capacity post-mortem via western blot for GLT1 (glutamate transporter) expression in three brain regions: A) striatum; B) hippocampus; and C) cortex. In striatum, GLT1 levels were significantly higher in the EEDY group in comparison to the IHEC and IHRW. The opposite change was observed in hippocampus, where the EEDY mice had significantly lower GLT1 levels than the IHEC and EES. In cortex, GLT1 levels in EEST and EED were both were lower than the IHEC. These results suggest that early exposure to novelty has a strong neuroprotective effect on striatum, which is most vulnerable to GLU excitoxicity. The effects of enrichment also appear to be selective, as GLT1 levels were lower in hippocampus and cortex. When paired with behaviorally-relevant electrophysiological data demonstrating improved corticostriatal communication, our results indicate that novelty is an essential component of environmental enrichment beyond that of socialization and exercise.

EFFECTS OF SODIUM NITRITE ON MOTOR AND COGNITIVE FUNCTION IN HEALTHY MIDDLE-AGED AND OLDER ADULTS

J.N. Justice[1], A.E. DeVan[1], C.J. Bassett[1], M.B. Chonchol[2], T. Giordano[3], R.M. Enoka[1], D.R. Seals[1], *1. Integrative Physiology, University of Colorado Boulder, Boulder, Colorado, 2. University of Colorado Denver, Aurora, Colorado, 3. TheraVasc, Inc., Cleveland, Ohio*

Declines in motor and cognitive function are associated with an increased risk of disability and mortality in older adults. In preclinical aging models, sodium nitrite (SN) supplementation improves motor function and other nitric oxide-boosting agents reverse cognitive dysfunction. We performed a translational pilot study to compare the influence of chronic oral SN supplementation and placebo (Pl) on motor and cognitive function in middle-aged and older (MA/O) healthy adults (n=31, 60.9 ± 1.2 yrs). Subjects abstained from dosing for >12-hr before completing a functional battery. Although subjects showed no impairments at baseline, 10 weeks of SN supplementation (80 or 160 mg/d capsules, TheraVasc, Inc., randomized, placebo-control, double-blind) improved rate of torque development in knee extension (80mg: 964 ± 385 to 1204 ± 492 Nm/s; 160mg: 902 ± 281 to 1208 ± 429 Nm/s) and knee flexion (80mg: 983 ± 249 to 1309 ± 416 Nm/s; 160mg: 1034 ± 320 to 1481 ± 410 Nm/s) vs. placebo (897 ± 354 to 905 ± 399 and 989 ± 368 to 839 ± 243 Nm/s, respectively, $p < 0.01$). Balance errors ($p < 0.05$), grip strength ($p < 0.05$), heel-rise endurance (trend, $p < 0.06$), and time to complete TMT-B (Pl: 59 ± 23 to 65 ± 28 s; 80mg: 56 ± 11 to 46 ± 10 s; 160mg: 59 ± 19 to 51 ± 12 s, $p < 0.01$) also improved with SN. These preliminary results suggest that SN supplementation improves some subdomains of motor and cognitive function in well-functioning MA/O adults.

EFFECTS OF PIOGLITAZONE AND EXERCISE IN OLDER ADULTS WITH MCI AND INSULIN RESISTANCE

K. Hildreth[1], K.F. Hoth[2], J. Grigsby[1], V.S. Pelak[1], S.A. Linnebur[3], P. Wolfe[4], K. Moreau[1], R.E. Van Pelt[1], *1. University of Colorado School of Medicine, Aurora, Colorado, 2. University of Iowa Carver College of Medicine, Iowa City, Iowa, 3. University of Colorado Skaggs School of Pharmacy and Pharmaceutical Sciences, Aurora, Colorado, 4. Colorado Biostatistical Consortium Colorado School of Public Health, Aurora, Colorado*

Background Mild cognitive impairment (MCI) is thought to represent the earliest clinically detectable stage of Alzheimer's Disease (AD) in many patients. Insulin resistance (IR), an early stage of Type 2 diabetes, increases risk for cognitive decline and AD. Interventions targeting IR may delay or prevent further cognitive decline in individuals with MCI. We sought to determine whether improving IR with six-months of endurance exercise training (EET) or pioglitazone could attenuate cognitive decline in older adults with MCI and IR at baseline. Methods Seventy-eight sedentary older adults aged 65±7 years (mean±STD) with abdominal obesity (waist >88cm for women; >102cm for men) and MCI were randomized to six-months of EET, pioglitazone or placebo. Primary outcomes were changes in performance in four cognitive domains: memory, language, visuospatial and executive function. IR (insulin-mediated glucose disposal rate; GDR) was measured by hyperinsulinemic-euglycemic clamp. Results Overall MCI was mild. Six-months of EET did not significantly affect peak oxygen uptake compared to placebo (p=0.12). Compared to placebo, GDR improved in the pioglitazone group (increase of 1.7 mg/kg/min; p=0.002) but not in the EET group (increase of 0.7 mg/kg/min; p=0.25. There was no measureable effect of pioglitazone or EET on any cognitive domain compared to placebo. There was no significant correlation between change in GDR and cognitive performance. Conclusions In older adults with both MCI and IR, six-months of EET or pioglitazone did not change cognitive performance compared to placebo. Future studies targeting

IR in MCI may benefit by including participants across a broad range of MCI severity.

RETINAL REGENERATION BY LGR5+ AMACRINE CELLS IN ADULT MAMMALS: IMPLICATIONS FOR AGE-RELATED RETINAL DEGENERATIVE DISEASES

H. Liu, S. Tian, X. Yang, *Ophthalmology, University of Pittsburgh School of Medicine, Pittsburgh, Pennsylvania*

Age-related vision decline and loss have major impact on the health and well-being of the elder population. Most adults start to experience vision problems, such as presbyopia, beginning in their early to mid-forties. With age advancing, their vision continues to decline and they are more frequently affected by vision-threatening eye diseases, including cataracts, glaucoma, and age-related macular degeneration. Without appropriate treatments, these disorders can cause vision loss and blindness. Among many factors, neuronal loss in the retina is the leading cause of vision impairment and blindness. It is now commonly believed that the retina of adult mammals lacks regenerative capacity. This lack of regeneration leads to irreversible neuronal losses and contributes to the pathogenesis of a host of retinal degenerative diseases, including age-related macular degeneration. Here, we demonstrate that the adult stem cell marker Lgr5 is expressed in the retina of adult mice. Although Lgr5+ retinal cells exhibit characteristics of retinal amacrine interneurons, they can re-enter the cell cycle, proliferate, and generate other retinal cell lineages. The generation of new retinal cells from Lgr5+ amacrine cells begins in early adulthood and continues as the animal ages. Together, these findings suggest that the retina of adult mammals is not devoid of regeneration as previously thought. It is rather dynamic, and Lgr5+ amacrine cells functions as the endogenous regenerative source, contributing to retinal homeostatic maintenance. The identification of such cells provides mechanistic understanding and potential therapeutic opportunities for a wide spectrum of debilitating retinal diseases.

MATERNAL EXERCISE DELAYS CHEMICAL-INDUCED CARCINOGENESIS IN MOUSE OFFSPRING

K.J. Pearson, A.L. Jarrell, R.J. Charnigo, T.E. Fischer, K.M. Platt, *University of Kentucky, Lexington, Kentucky*

To date, caloric restriction has shown itself to be the most reproducible and promising intervention to improve cancer outcomes in laboratory animals. An intense and expanding area of research is focused on discovering easily achievable interventions that can have long-lasting positive effects. As part of this study, we hypothesized that maternal exercise during pregnancy and nursing will protect mature offspring against chemical carcinogens because of increased activities of antioxidant enzymes. Three month old mouse offspring born to sedentary or exercised ICR dams were exposed to a two-stage carcinogenesis model to determine whether or not maternal exercise would provide long-term tumor resistance in offspring. Tumors were counted weekly by the same individual blinded to groups until 90% tumor incidence was reached in carcinogen-treated offspring born to sedentary dams (control group). The experiment was terminated, RNA was extracted from treated skin following euthanasia, and a spectrum of genes was quantified using NanoString nCounter Gene Expression CodeSets. Both male and female offspring had significantly decreased tumor incidence and tumor number as a result of maternal exercise. Significant differences were found in expression of stress-response genes in the skin as a consequence of maternal exercise. Nuclear factor (erythroid-derived 2)-like 2, glutathione peroxidase 1, and superoxide dismutase 3, which are all genes involved in antioxidant response, were among those genes whose expression was significantly altered. We have shown that maternal exercise has exciting potential to improve offspring stress response and tumor resistance. Future studies will further explore the mechanisms behind this protective effect.

CENTRAL VS PERIPHERAL “SELF-CR” EFFECT OF RAPAMYCIN IN YOUNG AND OLD RATS

C.S. Carter, M. Matheny, H.Z. Toklu, N. Kirichenko, K.Y. Strehler, N. Tumer, D. Morgan, P.J. Scarpace, *Universitiy of Florida, Gainesville, Florida*

Previously, we reported that rapamycin treatment initiated either earlier or later in life to FBN rats results in a state of “self calorie restriction (CR)” with resultant preferential loss of fat mass. Furthermore, adipose tissue protein leptin levels (a major central regulator of ingestive behavior) in these treated animals were reduced suggesting that rapamycin may also influence food-intake via a central mechanism of action even when administered peripherally. Therefore the current study addresses changes in mTOR signaling and adipose leptin synthesis following rapamycin treatment initiated early (3 mos) and later (25 mos) in life in male FBN rats. Rapamycin was delivered every other day (ip 1 mg/kg) for a total of 5 weeks. As previously reported, rapamycin treatment reduced food intake and body weight at both ages, fat mass in older animals, and attenuated growth-related accumulation of fat in younger animals. There was a resultant reduction in circulating leptin as well as mRNA and protein levels in WAT. Rapamycin treatment attenuated mTOR signaling (p70-S6 and p70-S6K) in liver, and levels of p70-S6 in hypothalamus at both ages suggesting that peripheral administration of rapamycin also inhibited centrally mediated mTOR activity. We previously established that adipose leptin synthesis is under a leptin mediated central feedback mechanism. Thus, these data suggest that rapamycin likely mediates a “self CR” effect through both peripheral and central mechanisms. (Supported by NIH DK091710 and P30 AG028740)

SESSION 1620 (POSTER)

TECHNOLOGY: APPLICATIONS AND IMPLICATIONS

UNDERSTANDING OLDER ADULT PREFERENCES FOR TECHNOLOGY ADOPTION

M.S. Heinz[1], P. Martin[2], *1. Upper Iowa University, Fayette, Iowa, 2. Iowa State University, Ames, Iowa*

The purpose of this study was to understand differences in older adult technology adoption by conducting in-depth interviews with older adults. Four participants were selected for qualitative interviews from a larger sample of 176 older adults who participated in a study assessing technology adoption via a survey. This study focused on conducting qualitative interviews with high and low adopters of technology in order to find out more about why technology was (or was not) readily adopted. Based on the interviews, three themes were noted specifically highlighting the importance of 1) earlier life experiences (e.g., workplace experiences), 2) personal preferences (e.g., choices regarding keeping up with technology), and 3) societal perspectives (e.g., concern for human interaction) on technology adoption. Based on these findings earlier life experiences (e.g., workplace experiences and exposure to technology) were particularly influential on current technology use. We suggest implementing lifelong learning opportunities teaching older adults the usefulness of technology and giving them a chance to interact with technology in a supportive environment. Interviewing participants with a wide array of previous occupations and work experiences in future qualitative work may be particularly useful. A revised theoretical model of technology adoption is suggested, tying together the findings of both the qualitative findings of the current study and existing models of technology adoption.

THE UTILIZATION OF TECHNOLOGY IN HEALTH-RELATED MANAGEMENT AND COMMUNICATION

L. Zettel-Watson[3], M. Horn Mallers[1], J. Mogle[2], D. Almeida[2], *1. Human Services, CSU Fullerton, Fullerton, California, 2. Penn State University, University Park, Pennsylvania, 3. CSU Fullerton-Psychology, Fullerton, California*

Technology can enhance independence and personal control, and has been shown to be efficacious for facilitating health behaviors. However, in terms of health management and communication, little is known about the types of technology being used, reasons for use, or the users themselves. Further, age and gender differences in health-specific technology use are unknown, though such information is becoming increasingly important as technology use is expanding in all age groups. The purpose of the present study is to present the first national profile of health-related technology use. Participants were 377 men and women (28-69 years old, M=45, SD=8.4) from the National Study of Daily Experiences (NSDE) who reported on their health-related technology usage in the previous week. Half (50.1%) used at least one form of technology related to their health; technology was used to make appointments, refill prescriptions, and seek information from healthcare providers (47.1%), monitor a health behavior (42.2%), and communicate with family members, friends or caregivers about health (37.4%). The most common technology forms were phone, email, and internet, though these varied by age. Participants under 40 were more likely to use internet and texting, 40-49 year olds primarily used internet and email, and those over 50 used telephone and internet for health purposes. Interestingly, women used more health-related technology than did men (54% and 45%, respectively). Findings contribute to a greater understanding of varying health-related technology experiences across adulthood and can aid clinicians and health educators in enhancing their patients' health self-management practices.

A PHOTOVOICE EXPLORATION OF AGE-RELATED HEARING LOSS

K. Southall[1,2], V. Kenyon[1], J. Gagné[3], *1. Institut Raymond Dewar, Montréal, Quebec, Canada, 2. McGill University, Montreal, Quebec, Canada, 3. Université de Montréal, Montreal, Quebec, Canada*

The purpose of this paper was to explore the utility of the Photovoice methodology for studies involving older adults, and to describe a Photovoice study that explored the myths and realities of age-related hearing loss. Photovoice is a technique used by researchers and community members to represent their community, assess participatory needs and study health promotion topics. Nine Montreal-based older adults (F=6, M=3) each took part in 13 (2-hour) group discussions and one in-depth personal interview. Over a three month period, participants captured photographs that represented myths and realities of hearing loss, and attended weekly group meetings to view and discuss images. Photographs were used as elicitation items in in-depth audio-video recorded interviews. Verbatim transcripts of interviews were prepared and content analysis was employed to uncover meaningful patterns of findings across interviews. In the Spring of 2014, participants welcomed community members, health care workers and policy makers to a photo exhibit aimed at sensitizing Montrealers to age related hearing loss. In the interviews participants described individual challenges associated with both planning and capturing photographs that portray a subject as abstract as hearing loss. Moreover, relinquishing control to research coordinators in the exhibit planning phase proved to be difficult for some. While participants described social benefits attributed to group meetings, there were important logistical challenges associated with decision making and planning the exhibit. The Photovoice methodology proved to be an intense, yet richly rewarding methodology for both participants and researchers. Yet, prior to embarking on a Photovoice study, researchers are advised to give critical consideration to the suitability of this methodology for the population under investigation.

AGE DIFFERENCES IN PERCEIVED BENEFITS OF RECEIVING PSYCHO-ONCOLOGICAL SUPPORT ON THE INTERNET: OPTIMISM AND POSITIVE SELF-IMAGE

G. Seckin, R. Amini, *Sociology, University of North Texas, Denton, Texas*

Objectives: The present study gathered data to determine if older women with cancer have different perceptions about coping with cancer, and are influenced to a different extent by online peer support compared to younger women. Methods: Women living with cancer (N = 255) participated in an online survey. Age differences were tested with ANOVA and chi-square tests. Separate multivariate linear regression models estimated the covariates for statistical significance of their unique effects on three outcome variables. A stratified analysis was performed to examine variations within age-based subsamples (≥51 and ≤50). Results: The average number of support groups the women participated was higher in older age group. Older women reported seeking online coping support more frequently and for longer months. Perceived contribution of online peer support for positive coping outlook, specifically to sense of optimism for a healthy future, was stronger among the older respondents. The older respondents perceived more benefit with regard to feeling in control of their health and less distressed. The younger patients perceived more contribution to their sense of feeling proud about how they were coping with cancer. As severity of the symptoms increased, the younger patients increased the amount of time they were online while the older patients increased the number of groups they participated. Beta coefficients for online peer support were stronger than that of medical variables. Conclusions: Diagnosis of cancer may lead to perceived lack of control over health. The Internet might be particularly helpful for older adults who feel helpless to cope with cancer in old age.

THE DIGITAL HEALTH DIVIDE: EVALUATING ONLINE HEALTH INFORMATION ACCESS AND USE AMONG OLDER ADULTS

A.K. Hall[1], J. Bernhardt[2], V. Dodd[2], *1. University of Washington, Seattle, Washington, 2. University of Florida, Gainesville, Florida*

Objective: Innovations in Health Information Technology (HIT) provide opportunities to reduce healthcare spending, improve quality of care, and improve health outcomes for older adults. However, concerns relating to older adults limited access and use of HIT, including use of the Internet for health information, fuel the digital health divide debate. This study evaluated the potential digital health divide in relation to characteristic and belief differences between older adult users and nonusers of online health information sources. Materials and Methods: A cross sectional survey design was conducted using a random sample of older adults. A total of 225 older adults (age range 50–92, M = 68.9, SD = 10.4) participated in the study. Results: Seventy-six percent of all respondents had Internet access. Users and nonusers of online health information differed significantly on age (M = 66.29 versus M = 71.13), education, and previous experience with the healthcare system. Users and nonusers of online health information also differed significantly on Internet and technology access, however, a large percentage of nonusers had Internet access (56.3%), desktop computers (55.9%), and laptop computers or netbooks (43.2%). Users of online health information had higher mean scores on the Computer Self-Efficacy Measure than nonusers, t(159) = -7.29, p <.0001. Furthermore, use of online health information moderated the relationship between computer self-efficacy and age. Conclusion: This study found significant differences between older adult users and nonusers of online health information. Findings suggest strategies for reducing this divide.

EXPLORING THE ACCEPTABILITY OF HOME-BASED SENSOR TECHNOLOGIES IN A CULTURAL CONTEXT

J. Chung[1], J. Joe[2], A.K. Hall[2], H.J. Thompson[1], G. Demiris[1,2], *1. University of Washington School of Nursing, Seattle, Washington, 2. Biomedical and Health Informatics, University of Washington, Seattle, Washington*

Introduction: Home-based sensor technologies have the potential to help older adults live independently and safely in home or community. However, limited information exists regarding older adults' acceptance of sensor technologies, especially for people with diverse cultural backgrounds. This study sought to understand Korean (KOA) and Korean American older adults' (KAOA) perceptions of sensor technology in a cultural context. Methods: A qualitative analysis of two focus groups using a constant comparative approach for emerging themes was conducted (n = 6: KAOAs, n = 6: KOAs) to examine perceptions of older adults towards home-based sensor technologies. This study assessed cultural factors influencing technology acceptance and examined participants' satisfaction with current health care services. Results: Participants in both the KAOA and KOA groups perceived that sensor technologies would be useful. Most participants reported few privacy concerns related to in-home sensors, however, some participants expressed concerns that placing sensors in their homes would change their behaviors. KOAs who were dissatisfied with health care services were more receptive to innovative sensor technologies for their health than KAOAs who showed a higher level of satisfaction with the U.S. long-term care system. Conclusion: This study is the first to examine sensor technology acceptance among KOAs and KAOAs. Immigration seemed to influence the level of satisfaction with the health care system, which ultimately affected willingness to adopt innovative technologies. Although this study is limited in generalizability, this study provides insight into factors that can increase technology adoption of Asian older adults both in the U.S. and internationally.

ASSISTIVE TECHNOLOGY IN LATER LIFE: ACCEPTANCE OF AN INTERNET-BASED MOBILITY PLATFORM

J. Schoch[1], V. Cihlar[2], A. Kruse[1], *1. Institute of Gerontology, Heidelberg, Germany, 2. Federal Institute for Population Research, Wiesbaden, Germany*

Mobility has a high individual and social value and is a key factor in maintaining independence, social participation and quality of life. Health problems, decreasing physical functioning and sensory losses can constrain mobility in old age. Taking up this issue, our interdisciplinary project "S-Mobil 100" aims to support the everyday mobility of older adults and to minimize existing barriers by developing a platform based on the internet and mobile communication. Our mobility platform can be used via computer or smartphone to search for accessible means of transport such as public transportation, taxi or private volunteer lifts connecting the current location with a desired destination. To explore the willingness to use and acceptance of this kind of technical assistance system, particularly in old age, we conducted a quantitative study. Use of technology, life-long experience with technology, general technology commitment and acceptance of the mobility platform were investigated in different age groups. The sample consisted of 358 participants aged 40-90 (M=61.18; SD= 12.02). Findings indicate that the mobility platform was overall well accepted. Age, residence (rural vs. urban), income, and general technology commitment significantly predicted the judgment of the platform. Older participants reported more concerns about handling problems, less trust in their own technology competences and wished for more support when using the platform. Acceptance of this system might be enhanced by offering computer- and smartphone trainings or individual assistance for older users.

KINECT GAMES FOR OLDER ADULTS: UNDERSTANDING USABILITY CHALLENGES

W.A. Rogers, E.C. Marinelli, G. Cha, J. Hartley, T.L. Mitzner, *School of Psychology, Georgia Institute of Technolog, Atlanta, Georgia*

Many older adults do not engage in the requisite level of physical activity to achieve optimal health. An estimated 54% of people age 65-74 and 68% of those over 75 do not meet U.S. Federal Physical Activity guidelines for either aerobic or muscle strengthening activities (National Center for Statistics, 2011). Exergames are video games in which players engage in physical activity; they could help older adults elevate their levels of physical activity to gain associated health benefits. However, the majority of exergames on the market are not designed for older users. We evaluated the usability for older adults of exergames for Microsoft Xbox 360 with Kinect. Through task analysis, expert heuristic evaluation, and usability testing, we identified challenges that older adults are likely to encounter when using game programs. We evaluated activities from two games, Body and Brain Connection (Bandai Namco Games, 2011) and Your Shape Fitness Evolved 2012 (Ubisoft Entertainment, 2011) that are likely to appeal to older adults – one is called the 'Brain Fitness Test,' and the other is a combination of yoga and tai chi. Our objective was to simulate the situation wherein an older adult receives a game, perhaps from a family member who sets it up, but then needs to be able to interact with the system independently. Our overarching goal is to develop a tutorial that will enable older adults to benefit from this technology to increase their activity levels at home – leading to better health and increased quality of life.

PERCEPTIONS OF USEFULNESS FOR ROBOT ASSISTANCE: DIFFERENCES BETWEEN OLDER ADULTS WITH AND WITHOUT MOBILITY LOSS

J.M. Beer[1], A.D. Fisk[2], W.A. Rogers[2], *1. University of South Carolina, Columbia, South Carolina, 2. School of Psychology, Georgia Institute of Technolog, Atlanta, Georgia*

Developing robots that are useful to older adult independence requires more than simply creating robots that complete household tasks. Ensuring that older adults find a robot useful requires careful consideration of the user, robot, and task. However, older adults' needs vary widely according to their capabilities and limitations. Understanding perceptions of usefulness is critical in determining whether existing technology acceptance models are applicable to robotics. In this study we investigated perceived usefulness of robot assistance for 12 mobile older adults and 12 with mobility loss (walker and wheelchair users). In an interview study, two personas were used; one depicted a physically-able older adult, and the other depicted an older adult with physical limitations due to arthritis. Participants were asked to discuss the usefulness of robot assistance for the tasks of organizing, monitoring, dressing, and transfer for each persona. They rated the usefulness of robot assistance via a questionnaire adapted from the Technology Acceptance Model (TAM; Davis, 1989) and participated in a semi-structured interview. The older adults agreed that robot assistance would be useful for the persona with arthritis. However, they varied in their perceptions of usefulness for the physically-able persona. The older adults with mobility loss were overall more positive toward robot assistance for this persona compared to the mobile older adults. Barriers and facilitators of acceptance identified suggest that perceived usefulness judgments are complex, and some constructs were interpreted differently between older adults. Thus, care should be taken when applying TAM constructs to robot assistance for older adults.

ACCESS TO NEW TECHNOLOGIES - IPHONE USE BY OLDER ADULTS WITHOUT SMARTPHONE EXPERIENCE

A. Steinert, M. Haesner, E. Steinhagen-Thiessen, *Geriatrics Reseach Group, Charité - Universitätsmedizin Berlin, Berlin, Germany*

Background: Modern communication technologies such as the internet and smartphones are ubiquitous. Especially for older adults, the use of recent communication technologies can prevent isolation and loneliness (Segrist 2004). Smartphones allow older adults to participate in social life and can provide access to extensive information. Method: Thirty older adults without smartphone experience took part in a pilot study. After an intensive iPhone training, the participants completed a test on their ability to use different functions of the smartphone. Subsequently, they used the iPhone for a total of five weeks. After one week the user behavior was assessed and the test was repeated. Results: Making a phone call and checking the weather forecast were the most frequently used functions on the smartphone. After five weeks, half of the subjects also played games on the iphone. The best rated functions were the possibility to make phone calls and send messages, to take pictures and receiving a weather forecast. Conclusion: Older people as a target group are often not recognized by software developers, possibly because they believe that the elderly are afraid or confused by new technology (Tatnal, Lepa 2003). However, with an extensive training and senior-friendly training materials, an access to new technologies can be given.

TABLET USE AND ADOPTION BY COGNITIVELY-IMPAIRED SENIORS: A LONGITUDINAL IN-HOME ASSISTIVE TECHNOLOGY STUDY

C. Kerssens[1], R. Kumar[1], A. Adams[1,2], L. Matalenas[1,2], C. Knott[3], J.A. Sanford[2], W.A. Rogers[2], *1. R&D, SimpleC, LLC, Atlanta, Georgia, 2. Georgia Institute of Technology, Atlanta, Georgia, 3. Aptima, Inc, Washington, District of Columbia*

Although persons with dementia (PWD) and their family caregivers need in-home support for neuropsychiatric symptoms (NPS) common in dementia, few if any assistive technologies exist to help manage NPS. This study tested the feasibility and adoption of a tablet-based care tool, the Companion, that delivers psychosocial interventions to the home to address individual NPS and needs The immediate goal is to make the Companion usable for individuals with and without cognitive impairments. The overall goal is to support wellness, independence and quality of life in seniors and their caregivers aging in place. Seven dyads were included and used the Companion for a minimum of 3 weeks. Care recipients had mild cognitive impairment or dementia per self-report and Mini-Mental State Examination. Caregivers expressed a need for help with NPS and respite, and defined 3 to 5 intervention goals each. Intervention adoption, barriers and effectiveness were studied using a single-subject (dyad) pre-post case study design and a combination of qualitative and quantitative measures. Usage and adoption data showed that care recipients were capable of using the Companion for extended periods of time (hours per day), and find joy and comfort in doing so. Caregivers experienced significant respite. The intervention addressed a range of NPS including agitation, anxiety and sleep disturbances, and post-intervention, a majority of intervention goals (80%) were better than expected. Our findings suggest that mobile health applications such as the Companion are feasible and useful in the home and can help address pervasive care challenges

EXPLORING THE POTENTIAL OF COMPUTERS TO ENRICH OLDER PERSON’S SOCIAL NETWORKS

S. Ofei-Dodoo, L. Medvene, K. Nilsen, R. Smith, A. DiLollo, *Psychology, Wichita State University, Wichita, Kansas*

Older persons receiving services in community settings, rather than Nursing Homes, are at risk of social isolation. Computer mediated communication offers technological resources which recipients of Home and Community-Based Services (HCBS) might use to reduce their social isolation. The present study involved personal interviews with 40 HCBS clients regarding their interest in communicating with members of their social networks, and using computers. At the time of the interview, 30 of the 40 participants did not use computers and reported cost, lack of training, physical limitations, lack of interest and access, and fraud as the reasons for not using computers. After watching a videotape illustrating an easy-to-use computer interface that allows older persons to communicate with families and friends, 90% reported that it would be helpful for people like them. Participants said such a computer would be helpful because it would make communication with friends and family easy, it could accommodate visual and manual disabilities, and would be interesting. Eighty-five percent said they would use a system like the one they were shown if it were available to them.

INTERNET USE BY BABY BOOMERS: HEALTH LITERACY, FINANCIAL LITERACY AND SOCIAL CONNECTEDNESS

J.A. Spears, R. Zheng, F.E. Wilby, M. Luptak, *College of Social Work, University of Utah, Salt Lake City, Utah*

The internet provides a method of communication for overcoming barriers to social interaction and access to health information for older adults (Kubeck, Miller-Albrecht, & Murphy, 1999). The baby boomer generation is the second leading cohort to learn the computer. Data from the Pew Internet and American Life project collected in late 2008 (Horrigan, 2008) indicated that 74% of baby boomers (born between 1946 and 1964) used the Internet in 2008 compared to 40% in 2000. Three hundred fifty-six respondents aged 55-70 completed a survey addressing Internet use. Eight percent reported they did not use the Internet, 16% reported using the Internet 5-6 hours/week, 29% reported using the Internet 7-8 hours/week, and 15% reported using the Internet more than 8 hours/week. Of those respondents using the Internet more than 8 hours/week, half reported using it 11-20 hours/week. Respondents indicated they currently used the Internet in the following ways: 85% used email, 84% searched for general information, 72% used online banking, and 48% searched for medical information. As they approach retirement, 74% of respondents plan on using the Internet for medical information, 64% to locate Medicaid/Medicare information, and 56 % to search for services offered at senior centers. Implications for practice include the need for services/information to be readily available to baby boomers. In looking for more information post retirement, baby boomers are using the Internet as a viable source in terms of health literacy, financial literacy, and social connectedness.

OLDER ADULTS PERFORMING TECHNOLOGY-BASED TASKS: THE ROLE OF MILD COGNITIVE IMPAIRMENT

L.I. Schmidt[1,2], H. Wahl[2,1], H. Plischke[3,1], *1. Network Aging Research, Heidelberg University, Heidelberg, Germany, 2. Department of Psychological Aging Research, Heidelberg University, Heidelberg, Germany, 3. Munich University of Applied Sciences, Munich, Germany*

The potential of technological devices able to profoundly support older adults gains rapidly increasing attention in gerontological research as well as practice contexts. Specifically, the hope is that physically or cognitively frail older individuals may profit from user-friendly technologies in terms of facilitating activities of daily living, autonomy, and participation in society. However, successful technology use also requires physical and mental resources to release its potential benefit. Still, data to better understand this tradeoff are rare, particularly, when it comes to those with mild cognitive impairment (MCI). The present study assessed the performance of older adults (age: M=73, SD=6.5) without cognitive impairment (n=33) and with MCI (n=31), using three types of technology representing key areas of everyday functioning (communication: mobile phone; leisure: e-book reader; health: blood pressure meter). Relationships between performance and a range of cognitive abilities (e.g., working memory, visual-spatial abilities), personality-related characteristics (e.g., obsolescence), and previous technology experience were examined based on cognitive testing, self-report, and video data. Regarding performance, participants with MCI needed more time for tasks and made more mistakes. After controlling for cognitive status, higher self-efficacy and lower obsolescence (feelings of being antiquated) still contributed to better performance. Spatial abilities and obsolescence were among the best predictors to explain effectiveness and efficiency, whereas age was only related to the time required, but not to the number of errors. Nuanced knowledge of older adults' specific difficulties, abilities, and resources may help improve the fit between user needs and technological requirements, with implications for developers and practitioners.

COMPUTER USE AND COMPUTER ANXIETY IN OLDER KOREAN AMERICANS

H. Yoon, Y. Jang, *School of Social Work, University of Texas at Austin, Austin, Texas*

Purpose: Despite the growing interest in the use of computer and technology in aging populations, little attention has been paid to racial/ethnic minority older adults. The present study aims (1) to examine the status of computer use and computer anxiety and (2) to explore their common and specific predictors, using a sample of older Korean Americans. Methods: Data were drawn from 209 older Korean-Americans surveyed in Central Texas (Mean age=69.6, SD=7.50). Multivariate models of computer use and computer anxiety were estimated using the sets of predictors: (a) demographic variables (age, gender, marital status, and education), (b) physical health indicators (chronic conditions, functional disability, and self-rated health), and (c) sociocultural factors (acculturation and attitude toward aging). Results: Approximately 40% of the sample were non-computer users, and they had a significantly higher levels of computer anxiety than their computer-using counterparts ($t = 14.6$, $p < .001$). Due to the anticipated high correlation between computer use and computer anxiety ($r = –.71$, $p < .001$), separate regression analyses were conducted. Younger age, male gender, advanced education, more positive self-rating of health, and higher acculturation were identified as common factors that are significantly associated with the use of computer and low levels of computer anxiety. Attitude toward aging was also found to be a significant predictor of computer anxiety. Implications: Findings help better understand the factors linked to the use of computer and its related anxiety. Such information should be incorporated in intervention efforts for computer training/education targeted to racial/ethnic minority older adults.

USE OF A NOVEL WEARABLE CAMERA SYSTEM TO INFORM TAILORED INTERVENTION WITH DEMENTIA CAREGIVERS: A FEASIBILITY STUDY

L. Hu, J. Lingler, J.N. Klinger, L. Person Mecca, G. Campbell, A. Hunsaker, S. Hostein, J.T. Matthews, *University of Pittsburgh, Pittsburgh, Pennsylvania*

Family caregivers (CGs) of persons with dementia (PWDs) are often stressed by their responsibilities. Little objective evidence shows when distressing dementia-related behaviors occur and how they are handled. In this presentation we describe a novel camera system worn by CGs to capture daily interactions and present findings from our first 5 caregiving dyads. Following assessment of caregiving burden (Zarit) and self-efficacy, CGs wore our system at home during waking hours for 3 to 7 days. The research team used video clips from this wearing and CG self-reports to conduct focused discussion with CGs of new strategies for handling difficult behaviors. Three phone calls reinforced the intervention, which were followed by reassessment of burden and self-efficacy and interviews regarding CGs' views of the study. CGs were husbands (n=2) and daughters (n=3) with a mean age of 65.2±19.4 years. All PWDs (n=5) were female (mean age: 79.8±5.2 years) with mean MMSE scores of 18±11.7. From baseline to post-intervention, mean CG self-efficacy increased from 58.3 to 65.3; burden decreased from 27.4 to 26.8. Positive comments included "… maybe a one or two-day video should be supplied … to the doctor so he can see for himself what's going on" and "… what made the study unique was having you see through my eyes what a day is like." Our wearable system permits remote assessment of distressing dementia-related behaviors and yields examples of interactions that can provide a springboard for tailored interventions to improve CG confidence and reduce CG burden.

ACCEPTANCE OF MOBILE WELLNESS TECHNOLOGY IN A FRAIL SENIOR HOME HEALTH POPULATION

J.D. Gentry[1], C.E. Sutton[1], M.A. Doffing[1], S. Qualls[1], S.E. Stock[2], D. Davies[2], *1. Gerontology Center, University of Colorado Colorado Springs, Colorado Springs, Colorado, 2. AbleLink Technologies, Colorado Springs, Colorado*

Frail seniors receiving home health services may benefit from prompting to complete health and wellness related tasks when staff are not present in the home. Technology-based prompting can provide personalized prompts to complete and track home wellness tasks. Little is known about acceptability of technology and perceptions of its value, factors that are likely key to abandonment, a major concern with translation of technology from lab to field. The present study compared a paper-based tracking system with a technology-based prompting system for monitoring self-care behaviors. An ABAB design was used with 16 older home health patients (7+ days per phase). Analysis of ratings of perception of ease of use, familiarity, comfort with task, usefulness, confidence that doing tasks improved health and function, and desire to continue use of each system yielded 3 key findings. The technology was perceived positively (means of 3.6-4.5 of 5), equivalent to more familiar paper-based system for all ratings. However, wide variability in responses was evident. Qualitative and graphic analysis showed substantially more positive valuing of the technology when the agency integrated the technology into their ongoing intervention. Future research on home-based technologies needs to report on the extent to which clinicians integrate the technology into agency services. Predictors of positive valuing of technology need to be identified, including factors related to the user, agency, and technology.

TECHNOLOGY USE AND DEPRESSIVE SYMPTOMS IN OLDER ADULTS

A.J. Elliot, C.J. Mooney, K.Z. Douthit, *University of Rochester, Rochester, New York*

Despite a growing research base, it remains unclear whether older adults' use of information and communications technology (ICT) is related to better mental health. In a prior study using data from the first wave of the National Health and Aging Trends Study (Elliot, Mooney, Douthit, & Lynch, 2013), we found no effect of ICT use on depressive symptoms. However, level of ICT use moderated the effects of ill-health and limitations in activities of daily living (ADLs). We build on these findings by examining separate interaction effects involving information and communication components of ICT use, and by conducting longitudinal analyses incorporating Wave 2 data. In a linear regression analysis of Wave 1 data, there was again no main effect of ICT use after adjusting for relevant covariates. However, frequency of emailing/texting over the past month interacted with both self-rated ill-health ($\beta=-.10$, $p<.001$) and chronic disease burden ($\beta=-.07$, $p<.003$) to predict lower depressive symptoms. In an ANCOVA controlling for Time 1, there was again no main effect of ICT use on Time 2 depressive symptoms, and no significant interaction effects. However, Cox regression analysis showed that a 1-unit increase in ICT use was associated with 0.93 (95% CI: 0.87 to 0.99) times, or a 7-percent lower, hazard of incident depression as measured by exceeding the clinical cutoff score on the PHQ-2. These findings suggest that ICT use, particularly for communication purposes and in combination with poor health, may afford some protection against depression, although future research needs to examine these effects over longer periods of time.

SESSION 1625 (POSTER)

GENDER, PERSONALITY AND AGE DIFFERENCES

AGE AND GENDER DIFFERENCES IN DECISION-MAKING STYLE PROFILES

R. Delaney[1], J. Strough[1], W. Bruine de Bruin[3,4], A. Parker[2], *1. West Virginia University, Morgantown, West Virginia, 2. RAND Corporation, Pittsburgh, Pennsylvania, 3. University of Leeds, Leeds, United Kingdom, 4. Carnegie Mellon University, Pittsburgh, Pennsylvania*

It has been suggested that due to age-related cognitive declines, older adults may postpone, rely on intuition, depend on others, and be less rational when making decisions compared to younger adults. Cultural stereotypes depict women as more intuitive and dependent, and men as more rational, but findings are inconsistent. To investigate age and gender differences in decision-making styles, we used an established measure of individuals' habitual ways of making decisions as measured by five subscales: rational, intuitive, dependent, avoidant, or spontaneous (Scott & Bruce, 1995). Rather than using a variable-centered approach to look at each decision-making style separately, we adopted a person-centered approach and used cluster analysis to see whether decision-making styles formed distinct profiles and then investigated whether profiles differed by age and by gender. Participants were from RAND's American Life Panel (N=1075, 18-93 years, M=53 yrs) and completed a web-based survey. A 3-cluster solution was identified: (1)high spontaneous/low dependent, (2)highly dependent, and (3)low spontaneous/low dependent. Those in the highly dependent group were significantly older than those in the low spontaneous/low dependent group. More males than females were in the high spontaneous/low dependent group. Lastly, more women than men were in the low spontaneous/low dependent group. Age differences were consistent with the hypothesis that older adults were more dependent. The greater prevalence of women in the low spontaneous/low dependent group contradicted stereotypes that women are more likely than men to rely on others more when making decisions. Implications regarding the advantageous nature of each style will also be discussed.

GENDER DIFFERENCES IN SPOUSE INVOLVEMENT DURING DIABETES MEDICAL ENCOUNTERS

M. Marshall[1], J. Briggs[1], L. Fuzzell[1], S.K. Oates[2], M.M. Franks[1], C. Shields[1], *1. Purdue University, West Lafayette, Indiana, 2. IU Health Arnett, Lafayette, Indiana*

Many spouses support patients in managing diabetes by accompanying them to their medical appointments. We investigated spouse language use and differences by gender during medical visits. We examined pronoun use as a marker of spouses' involvement in care. Our study examined conversations among patients, their spouses, and their physician during diabetes management appointments ($n = 58$). Female spouses spoke for the patient ($t = 6.67$, $p < .0001$) and used first person plural pronouns ($t = 5.94$, $p < .0001$) more than male spouses did. We used ANCOVA to examine differences by spouse gender in speaking for the patient and in using first-person plural pronouns, controlling for patient's age, spouse's age, and household income. Again we found that female spouses spoke for the patient at a greater frequency than did male spouses ($B = 2.87$, $SE = .78$, $p < .01$), and we found that female spouses used more first-person plural pronouns than male spouses ($B = 5.46$, $SE = 1.47$, $p < .01$). Male and female spouses use different language when accompanying partners to diabetes maintenance appointments. Speaking for the spouse and using first-person plural pronouns may indicate a sense of connection between the couple and a sense of joint ownership of the patients' medical problems. When physicians witness these language patterns in their offices, it may provide clues to which patients are receiving more or less support to manage their diabetes. Future research should examine how physicians could capitalize on this information to improve patient care.

MORAL JUDGMENT: BE HARSH TOWARD YOUNG MALE PERPETRATORS AND SYMPATHETIC TOWARD OLD FEMALE VICTIMS?

Q. Chu, D. Grühn, *Psychology, North Carolina State University, Raleigh, North Carolina*

Everyday moral judgment is seldom purely rational. Socioemotional processes, such as the perception of group membership and stereotypes about a group, may influence moral judgments. Despite the obvious relevance of socioemotional processes, little is known about whether the age of a perpetrator or a victim actually influences moral judgment. The current study investigated how moral judgers' age and sex, social attitudes (i.e., benevolent ageism and benevolent sexism), and characteristics of moral situations (i.e., the age and sex of the perpetrator and victim) interact with each other impacting moral judgment. Five hundred and twenty-one adults viewed 32 moral scenarios and evaluated how acceptable the perpetrators' behaviors were. Sixteen variations were created for each scenario by manipulating the age and sex of the perpetrator and victim (2x2x2x2). The findings were consistent with expectations: 1) Young or male perpetrators were judged more negatively than old or female perpetrators; 2) A perpetrator was judged more negatively when the victim was old or female than when the victim was young or male; 3) participants' age and ageism moderated their judgment, depending on the age of the perpetrator and victim; 4) participants' sex and sexism moderated their judgment, depending on the sex of the perpetrator and victim. The results provide support for the complex interplay between moral judgers' social characters, social attitudes, and the perpetrators' and victims' social characters in moral judgment. The findings are relevant in court by emphasizing that persons' judgment might be affected by the age of the victim or perpetrator.

A DISTANCING FROM AGING QUESTIONNAIRE AND ITS CORRELATIONS WITH PERSONALITY VARIABLES

C.J. Tyrrell, *Psychology Department, University of Colorado Colorado Springs, Colorado Springs, Colorado*

Individual differences and personality characteristics have been found to affect both one's general view of aging as well as one's view of the personal process of aging. The Distancing from Aging Questionnaire (DAQ) was developed and validated in this study as one tool for exploring attitudes toward the aging process. This measure comprised two components of the tendency to distance one's self from aging: avoidance of older adults and avoidance of one's own aging. Responses to the 10 items are given on a 4-point Likert scale; higher scores indicate increased distancing from aging. One hundred and five undergraduate students completed the DAQ, two other measures related to ageism, a personality questionnaire, and a demographics questionnaire. The DAQ was found to have convergent validity, as it correlated with both the Fraboni Scale of Ageism ($r = 0.57$, $p < .001$) and the Anxiety About Aging Scale ($r = -0.73$, $p < .001$). In addition, this scale was found to have moderate correlations with the subscales of the Eysenck Personality Questionnaire – Abbreviated that assess extroversion and neuroticism. Further analysis found that the subscale assessing avoidance of one's own aging was significantly positively associated with extroversion ($r = 0.25$, $p = .01$) and significantly negatively associated with neuroticism ($r = -0.26$, $p = .01$). Avoidance of older adults was not significantly associated with either variable. Results suggest that the personality traits of extroversion and neuroticism are associated with one's view of the personal aging process but not with one's view of older adults.

EFFECTS OF PERSONALITY AND SPECIFIC RISK FACTORS ON THE HEALTH OF BEREAVED ADULTS

N.M. Silva[1], J.H. Patrick[1], J. Henrie[2], *1. West Virginia University, Morgantown, West Virginia, 2. Research Inst. on Addictions, SUNY, Buffalo, New York*

Approximately 20% of Americans are at high risk for developing metabolic syndrome (Beltran-Sanchez et al., 2013). Adults with metabolic syndrome are twice as likely to develop cardiovascular disease (USDHHS, 2011). Furthermore, research suggests that individuals who report higher levels of depression, anger, and hostility have an increased risk relative to their counterparts (Cohen et al., 2010). Data from 800+ adults, ages 18 to 80 years (M age = 32.27), were used to test a path model examining whether individuals at risk for metabolic syndrome differ in personality and whether the associations with physical health differed as a function of metabolic syndrome risk (X2 (df = 8, N =802) = 54.16, p < .001; GFI = .98, R-square for Health = .19). Age was positively associated with risk for metabolic syndrome (β =.24***). Risk for metabolic syndrome was positively associated with neuroticism (β =.07*), while it was negatively associated with extraversion (β =-.13***), conscientiousness (β = -.09*), openness to experience (β = .10**) and physical health problems (β = -.36***). Furthermore, higher levels of agreeableness were negatively associated with physical health problems (β=.09*). The complex interplay among age, personality traits and metabolic risk are discussed.

AGE-RELATED TRAJECTORIES AND DETERMINANTS OF POSITIVE AND NEGATIVE RECIPROCITY

M.K. Rohr[1], J. Wagner[2], F.R. Lang[3,4], *1. Departement of Psychology, University Leipzig, Leipzig, Germany, 2. Humboldt University, Berlin, Germany, 3. Friedrich-Alexander University, Nuremberg, Germany, 4. German Institute for Economic Research, Berlin, Germany*

Positive reciprocity (i.e., striving to reciprocate favors) and negative reciprocity (i.e., the striving to retaliate negative actions) represent two independent individual dispositions. Previous research on both types of reciprocity often relies on theories of social exchange that use experimental approaches. Less is known about the life span development of these dispositions as well as possible differential association with resources. In the present study, we aim at a) exploring stability and change of positive and negative reciprocity in adulthood, and b) examining the impact of existing resources on the development of reciprocity. We applied two complementary approaches to address our research questions: Study 1 used representative macro-longitudinal data of the German Socio-Economic Panel (GSOEP, N = 13,169, age 20 to 96 yrs.) to examine long-term developmental trajectories of positive and negative reciprocity. Findings showed relative stability of positive reciprocity across the entire adult life span, but decreases in negative reciprocity in older age. Study 2 used a web-based sample (N = 743, age 20 to 91 yrs.) to examine micro-longitudinal associations of available resources in the health, educational, and social support domain with robustness and change of reciprocity over the course of four months. We found emotional and health resources to explain differential change patterns of positive and negative reciprocity in adulthood. We discuss potential emotion regulative functions of reciprocity and sketch future research questions based on life span theories of resources.

PERSONALITY, SUBSTANCE USE, AND LONGEVITY AT A 50 YEAR FOLLOW UP

E. Kranz Graham[1], N.A. Turiano[2], C. O'Brien[1], J. Rutsohn[1], D. Mroczek[1], *1. Northwestern University, Chicago, Illinois, 2. West Virginia University, Morgantown, Illinois*

Personality traits predict both substance use and mortality risk across the life course. However, few investigations that have examined both of these effects in a single study and with a long term follow up. Utilizing 50-year mortality data from a sample of adults in the Normative Aging Study, we tested whether smoking behavior mediated the personality-mortality association, using the 16pf personality inventory. Mediation tested in a structural equation modeling framework (with censored outcome) provided evidence that personality predicts mortality via smoking behavior for seven of the sixteen traits. By itself, personality appears to have minimal impact on mortality, with suspicion (vigilance) being the sole predictor. However, when smoking behavior was included in the model as a mediator, we detected a number of significant effects, providing evidence for suppression mediation. We found warmth, impulsivity, suspicion, and tension to be risk factors, such that individuals high on these traits had a 20-46% increase in odds of being heavy smokers, and thus an increased hazard of dying. The protective factors were conformity, sensitivity and openness, such that individuals high on these traits had a 16-19% decrease in odds of being heavy smokers, and thus a decreased hazard of dying. The current study provides empirical support for the Health Behavior Model of Personality, which holds that personality influences health behaviors, which in turn affects health and longevity. Furthermore, this study shows that personality may have a far-reaching impact on mortality.

WHO I AM IS BECAUSE OF WHAT I WANT TO FEEL? THE ROLE OF IDEAL AFFECT ON PERSONALITY CHANGES ACROSS ADULTHOOD

D. Jiang, H. Fung, *Psychology, Chinese University of Hong Kong, Hong Kong, Hong Kong*

As people age, personality changes. Extraversion, Neuroticism, and Openness decrease, while Agreeableness and Conscientiousness increase. Previous research proposed that particular personality traits were selected to fulfill different life goals across the lifespan. In addition to life goals, Socioemotional selectivity theory (SST) argues that emotional goals are increasingly important with age. Meanwhile, emotional goals (i.e. ideal affect, the feelings that people value) were found to be correlated with personality. For instance, extroverted people valued high-aroused positive (HAP e.g., enthusiastic) more and low-aroused positive (LAP; e.g., peaceful) less. Based on SST and aforementioned research, we argued that emotional goals at least partially drove personality changes. Study 1 found that both ideal HAP and LAP partially mediated age differences in Extraversion, Agreeableness, and Conscientiousness across European Americans aged 20 to 90 years (EA; N= 268), Chinese Americans aged 20 to 89 years (CA; N= 268), and Hong Kong Chinese aged 18 to 89 years (CH; N= 321). Study 2 primed participants with the importance of HAP or LAP for well-being, and then tested whether self-report personality changed. Among 63 younger (M=20.51 years, SD=1.64 years) and 57 older adults (M=69.77 years, SD=5.67 years), we found that, in the control condition, older adults were more extroverted, agreeable and conscientious than were younger adults. The age differences in Agreeableness and Conscientiousness increased in the condition that valued LAP, while the age difference in Extroversion increased in the condition that valued HAP. These results shed light on the role of emotional goals in personality changes across adulthood.

AGE, ATHEISM, AND TRUST: PERCEPTIONS AND INTERACTIONS

H.J. Bryson[1], S. Sequeira Grass[2], S. Figueroa[1], N. Bain[1], L.K. Swan[2], A. Stripling[1,2], *1. School of Psychological and Behavioral Sciences, University of West Florida, Pensacola, Florida, 2. University of Florida, Gainesville, Florida*

It is well documented that older adults are stereotyped as both religious and trustworthy whereas atheists are often distrusted—based on the perceived lack of supernatural monitoring. However, to date, the implications of these stereotypes, and the interplay of these concepts, have yet to be explored. Two studies were employed to better understand the intersections of religious and age identities. The first study examined the intersection of age and religiosity in 399 college students.

Relative to a religious target, participants viewed a demographically-ambiguous atheist as younger F(4,390)=6.39, p<.00 regardless of whether the target was assigned a label of young (M=20.91, SD=4.51; M=28.06, SD=9.51) or old (M=54.58, SD=16.5; M=57.44, SD=16.03). A follow up study explored the dimension of trust with this relationship utilizing 218 Mechanical Turk workers. Analysis revealed a significant interaction F(2,544)=8.26, p<.00, where an older (73) atheistic target received higher trust ratings (M=5.23, SD=.12) than a younger (16) counterpart (M=4.52, SD=.13), although this increase did not moderate differences between atheistic and religious targets. Taken together, findings from these two studies suggest participants interpret atheism as a characteristic of youth. Interestingly, participants were more likely to identity an older person as trustworthy, but, if faced with the competing characteristics of older age and atheism, participant responses suggest that they put more emphasis on whether or not the target was an atheist than on his or her age. Implications include an increased understanding of the intersection of age and religious identities with the goal of reduced stereotypical thinking through education.

THE EXPERIENCE OF HEALTH ANXIETY AMONG OLDER AND YOUNG ADULTS

L.A. Gerolimatos, B. Edelstein, M.A. Pifer, *Department of Psychology, West Virginia University, Morgantown, West Virginia*

The experience of heath anxiety among older and young adults is poorly understood. Most studies (e.g., Abramowitz & Moore, 2007; Gramling et al., 1996) have examined cognitions and behaviors associated with health anxiety, with little to no studies examining emotions and physiological arousal. The present study induced health anxiety in a laboratory setting with 36 older (age: M = 66.11, SD = 6.31) and 36 young adults (age: M = 19.75, SD = 1.70) by providing false health-related feedback. Outcome variables included heart rate, blood pressure, and self-reported emotions recorded across three periods: baseline, induction, and recovery. Repeated measures MANCOVAs were conducted with baseline measures as covariates. Results revealed a main effect of time for heart rate, such that heart rate decreased from induction to recovery. A main effect of time for subjective distress was also found, with distress increasing during induction and decreasing during recovery. A main effect of time was revealed for anxiety, depression, and positive affect, such that anxiety and depression were highest during induction and positive affect was lowest during induction relative to recovery. A significant age by time interaction was found for anxiety, with young adults reporting greater anxiety than older adults during induction. No effect for blood pressure was found. Results indicate health anxiety is experienced as a combination of anxiety, depression, low positive affect, distress, and increased heart rate for both older and young adults. Implications for the understanding of health anxiety among older adults are discussed.

INTERGENERATIONAL EXCHANGE AND MEDIATORS IMPACT AMBIVALENCE ABOUT FUTURE OLDER SELVES

S.E. Jarrott, J. Savla, *Human Development (0416), Virginia Tech, Blacksburg, Virginia*

Programs involving youth and older adults are promoted to improve youth attitudes towards elders, often with measurable success. Intergenerational contact can also foster multiple stereotypes of elders, contributing to ambivalence about aging. We explored the relationship between intergenerational contact and young adults' ambivalence about their own aging. Mechanisms of anxiety, empathy, and knowledge were tested as mediators of the relationship. Young adult respondents completed one online survey (*N*=457). We used a multiple mediator path analysis model to test the hypothesis that anxiety, knowledge, and empathy would mediate the impact of intergenerational contact on feelings of ambivalence about aging. Intergenerational contact predicted ambivalence about aging (β = -0.04, SE=0.01, *p* <0.01) in the model without mediators. The multiple mediator path analysis model had an adequate fit [$X^2(8) = 32.48$, *p*< 0.01, Standard Root Mean Error (SRMR)=0.03, Comparative Fit Index (CFI) = 0.95)]; anxiety (β =-0.07, *p*<0.01) and empathy (β =0.02, *p* <0.01) fully mediated the relationship between contact and ambivalence about future older self (knowledge did not). Those with higher ratings of intergenerational contact, lower aging anxiety, and higher empathy expressed less ambivalence about aging, indicating positive expectations for late life. Intergenerational contact can influence expectations for old age. Exchange between youth and elders that fosters empathy and reduces anxiety can be facilitated to support positive and counteract negative images of future older selves, which may affect late life health.

TO LIVE OR NOT TO LIVE? OLDER PEOPLE REASON THEIR WISHES TO BECOME CENTENARIANS

H. Karppinen[1,2], M. Laakkonen[1,3], T.E. Strandberg[2,4], E. Huohvanainen[4], R.S. Tilvis[2], K. Pitkälä[1,2], *1. Department of General Practice and Primary Health Care, University of Helsinki, Helsinki University, Finland, 2. Helsinki University Central Hospital, Helsinki, Finland, 3. Laakso Hospital, Helsinki, Finland, 4. University of Oulu, Oulu, Finland*

Background: Lifespan is increasing, but little is known about opinions of older people whether they want to live an extremely long life. Even less is known about how they reason their wish to live or not to live up to 100 years. Methods: A random sample (n=1637) of home-dwelling people (mean age 85,0 years, range 75-96 years) in Helsinki, Finland, responded a survey including an inquiry: Do you wish to become a centenarian (yes/no)? Why/ Why not (open-ended question)? Analysis of the reasoning for their wishes was performed using thematic content analysis. Results: Every third (32,9%) wished to reach the age of 100 years. Those willing were older, more often males, and they reported good subjective health more often than those not willing to live a hundred years. There was no difference between the groups in comorbidities or years of education. In qualitative analysis those wishing to become centenarians were curious to see what happens, with a twinkle in the eye, and they loved life. Many of them wanted to live long in case they would stay healthy. Significant roles in life were common, whereas those not wishing to live up to 100 years reported meaningless life. Also bitterness was an emerging attitude. Most of them feared loss of autonomy or loneliness, or they were reluctant to become a burden to society or their closest ones. Several responders also stated that they do not want to intervene in evident fate. Conclusion: One third of home-dwelling octogenarians wish to become centenarians.

SCHOOL CLIMATE, ATTENDANCE, AND RETENTION OF OLDER ADULTS IN SCHOOL-BASED VOLUNTEER ROLES WITHIN THE BALTIMORE CITY EXPERIENCE CORPS STUDY

C.M. Ramsey, A.L. Gross, J.M. Parisi, A.P. Spira, G. Rebok, *Johns Hopkins University, Baltimore, Maryland*

Volunteerism is associated with improved health and psychosocial well-being, and studies further suggest a dose-response relationship between hours volunteered and these outcomes. Despite these clear advantages of volunteering, the impact that organizational factors (i.e., climate) has on volunteer attendance and retention has received less attention. Within the Baltimore Experience Corps Trial, we evaluated school climate (i.e., safety, resources, learning environment, etc.) as a predictor of average weekly attendance (hours/week) and retention (total weeks volunteered) of older adults in school-based volunteer roles. Our sample included 298 older adults (age 67.3 ±5.9; 86.9% female; 91.3% African American). We assessed eight dimensions of school climate rated by school staff and students in grades 3-5 as predictors of older adult attendance and retention using linear mixed-effects and Cox regression models, respectively. Staff ratings of school climate were associated with retention but not attendance of volunteers. Volunteers in schools with better staff ratings of school safety were less likely to discontinue volunteering than older adults in schools with worse safety ratings (hazard ratio (HR): 0.6, 95% confidence interval (CI): 0.4, 1.0). Similar trends were observed for learning environment (HR: 0.7, CI: 0.41, 1.1), resources (i.e., programs for students with learning disabilities, school supplies, etc.; HR=0.7, CI: 0.4, 1.1), and overall satisfaction (HR: 0.7, CI: 0.4, 1.0). No significant associations were observed between student ratings of school climate and volunteer attendance or retention. Our results suggest that targeting organizations with positive staff-rated climates could have important implications for sustaining participation of older adult volunteers.

AGE-RELATED DIFFERENCES IN IMMEDIATE AND DELAYED FEEDBACK PROBABILISTIC CLASSIFICATION LEARNING

S.E. Eichorn[1], K.L. Seaman[1], D. Howard[2], J. Howard[1,2], *1. Psychology, The Catholic University of America, Washington, District of Columbia, 2. Georgetown University, Washington, District of Columbia*

Recent research suggests that two learning systems are involved in feedback learning; one for immediately presented feedback supported by the striatum, and one for delayed feedback in which the medial temporal lobe (MTL) plays a central role (Foerde, Race, Veraellie, & Shohamy, 2013; Foerde & Shohamy, 2011). The striatum declines gradually with age throughout adulthood (Raz et al., 2003) resulting in impaired performance on associative learning tasks (Price, 2005; Seaman, Howard, & Howard, 2013). There is also decline in the MTL, which appears at later ages and is less universal (Raz et al., 2005), affecting the hippocampus which facilitates feature binding (Mitchell, Johnson, Raye, & D'Esposito, 2000). Therefore, we hypothesized that older adults would be impaired in feedback learning, particularly with immediate feedback, reflecting age-related declines in striatal function. To test this, the present study examined feedback learning in younger and older adults by administering a probabilistic learning task in which cue-outcome associations are learned through response feedback under immediate (1000 ms) and delayed (7000 ms) conditions, with delay condition varying within-subjects (as in Foerde et al, 2013). As expected, we found less learning in old than young adults, but contrary to expectations, age differences were no larger for immediate than delayed feedback. In addition, accuracy on the immediate and delayed conditions was correlated for young adults (r = .689, p<.001), but not for older adults (r=-.020, ns), perhaps reflecting differential decline of these learning systems across individuals in old age.

MARITAL STATUS PREDICTS BETTER EPISODIC AND SEMANTIC MEMORY PERFORMANCE IN OLDER ADULTS

C.L. Nelson, A.J. Revell, *University of Massachusetts Dartmouth, North Dartmouth, Massachusetts*

The association between marriage and health benefits is commonly investigated. However, few studies have examined marriage and its relationship with episodic and semantic memory. Mousavi-Nasab, Kormi-Nouri, Sundstrom, and Nilsson (2012) were one of the first to examine age and multiple memory domains in relation to marital status and found that older married individuals performed better than non-married individuals on episodic and semantic memory. The current study attempted to replicate these findings using a smaller sample of community-dwelling older adults from Southeastern Massachusetts enrolled in the Southcoast Cognitive Aging Study. Fifty-five older adults (mean age= 69.16, SD age = 8.92, range 52-89) were assessed to determine whether marital status is a significant predictor of episodic and semantic memory performance. Episodic memory was assessed with the WMS-R Logical Memory Delayed Recall (Story A) and semantic memory was assessed with the WAIS-R Vocabulary (Voc) subtest. Results from group means testing indicated that the married group (n=14, Mean Recall=14.00) had significantly higher episodic memory scores than the non-married group (n=30, Mean Recall=11.17), t(43)=2.70, p=.01. The married group also had significantly higher semantic memory scores (Mean Voc =53.47) than the non-married group (Mean Voc=45.60), t(43)=2.12, p=.04. In secondary hierarchical regression analyses, after controlling for age and education as covariates, marital status remained a significant predictor only for lower episodic memory performance (p=.03). Future studies could expand the non-married group in a larger sample to assess differences in memory performance for the widowed, divorced, and single never-married groups.

AGING-RELATED DIFFERENCES IN WORRY IN CANCER SURVIVORS

J. Moye[1,2], E.A. Mulligan[1,2], J.S. Wachen[1,3], A.D. Naik[4,5], *1. VA Boston Healthcare System, Boston, Massachusetts, 2. Harvard Medical School, Boston, Massachusetts, 3. Boston University School of Medicine, Boston, Massachusetts, 4. Michael E Debakey VA Medical Center, Houston, Texas, 5. Baylor College of Medicine, Houston, Texas*

Cancer is diagnosed across the lifespan; most often in older adults. Due to improvements in treatment, many survive cancer, but have persisting side effects in medical, psychological, and social domains. Advancing age may convey some protection in coping with cancer, as older adults have more lifespan experience with medical illnesses. In this study, 121 adults age 40-50s (n=31), 60s (n=58) and 70s-80s (n=32) (M=65.29+9.17) were interviewed at 6, 12, and 18 months post diagnosis of oropharygeal, digestive, or colorectal cancers. Worries about recovery from treatment, (e.g., something in my body that no longer works) were most frequently endorsed, followed by worries about family (e.g., burdening my family), recurrence (e.g., my cancer coming back), and existential issues (e.g., getting done what I want before I die). Worries about healthcare quality were minimally endorsed. Over time, worries about the impact of cancer on family improved (t=2.72, p<.01), but worries in other areas did not. Worry was not associated with cancer stage, at 6 (r=.11), 12 (r=.03) or 18 months (r=.01) post diagnosis. However, worry was associated with age: the oldest old (70s-80s) displayed far less worry at all time periods (T1 M=6.58 + 6.02) than those in their 60s (M=17.19+ 14.15) or 40s-50s (M=20.62 + 15.10), with significant main effects for age (F=172.60 p<.01), but not time. Similar age patterns were found across sub-domains, although the oldest old showed small increases in existential worries over time. Advancing age / lifespan development may convey resilience against worry in the face of life-threatening illness.

GENERATION TO GENERATION: EFFECTS OF INTERGENERATIONAL INTERACTIONS ON ATTITUDES

L. Wagner, S. Dangerfield, S. Rodriguez, *Department of Psychology, University of San Francisco, San Francisco, California*

Meaningful intergenerational interactions between older and younger adults are rare outside of family relationships. Generation to Generation, a course at University of San Francisco for older (over age 55) and younger (18-30 year old) adults, was designed to promote positive intergenerational contact. This study examines changes in attitudes for older and younger adults who attended the class. Each fall semester, 18 older and 18 younger adult students met once a week for 8 weeks and discussed topical issues. Pre- and post-course questionnaires assessing allophilia, liking for another group, were distributed to both age groups. Participation in the study was voluntary. Combining responses from three semesters, 53 younger and 27 older adults completed the pre-course questionnaire. At the beginning of the course, both older and younger adults reported greater comfort and kinship for their own age group but greater engagement with the other age group. Younger adults reported more affection and enthusiasm for older than younger people, but older adults had similar levels of affection and enthusiasm for both age groups. Forty younger and 16 older adults completed both Time 1 and 2 measures. Younger adults reported increases in affection, comfort, kinship, engagement and enthusiasm for older adults and increased affection for younger adults from beginning to end of the course, but no significant change in comfort, kinship, enthusiasm and engagement for younger adults. Older adults' ratings did not show significant changes over time. Results suggest that intergenerational interactions in a classroom setting may increase younger adults' liking for older adults.

TIMING OF RETIREMENT: A GENDERED DEVELOPMENTAL TRANSITION

R.R. Stoiko[1], J. Strough[1], A. Parker[2], W. Bruine de Bruin[3,4,2], *1. West Virginia University, Morgantown, West Virginia, 2. RAND Corporation, Pittsburgh, Pennsylvania, 3. University of Leeds, Leeds, United Kingdom, 4. Carnegie Mellon University, Pittsburgh, Pennsylvania*

Timing of retirement can be conceptualized as a developmental transition that occurs "early," "on time," or "late" relatively to age peers. A recent study showed that individuals retiring "on time" or "late" have better subjective physical and mental health than individuals retiring "early," controlling for health (Calvo, Sarkisian, & Tamborini, 2013). However, less is known about what predicts retirement timing or whether predictors vary by gender. The present investigation used the Health and Retirement Survey (HRS), a longitudinal study of 37,000 participants assessed biennially since 1992, to examine predictors of retirement timing. Regression analyses examined the predictive value of demographic, health, economic, and cognitive variables at Wave 1 of data collection on the subsequent retirement timing for participants retiring after Wave 1 (N = 4807). Excluding gender, significant predictors of retirement timing were marital status (β = -.05), number of children (β = .04), self-reported health (β =-.07), and memory (β =.05). Total wealth and BMI were not significant predictors. When gender was added, it became the most important predictor (β = -.34), with women retiring earlier than men. The variance accounted for increased from .01 to .12. BMI also became a significant predictor (β = .03). Finally, gender-by-predictor interactions revealed that marital status (β = -.09) and number of children (β = -.20) are more important predictors for women's retirement timing than men's, while wealth (β = .13) was a more important predictor of men's retirement timing. These results have implications for retirement decision-making for individuals, institutions, and policy.

THE AFFORDABLE CARE ACT AND OLDER WOMEN'S HEALTH BEHAVIORS

E.A. Nalepa, *Case Western Reserve University, Cleveland, Ohio*

A large proportion of the stated aims of the Affordable Care Act (ACA) involve prevention as a means of lowering healthcare costs. This assumes that increasing insurance rates will actually change health-seeking behavior. Women between the ages of 55 and 64 fall into what has been called a "window of vulnerability." They are more likely to be employed part time than in other age cohorts in jobs unlikely to come with benefits. They are disproportionately expected to rely on the individual exchanges set up by the ACA for their health care. To explore whether or not increase access will change behavior, this paper examines how current changes in health insurance fit older women's overall orientation throughout their lives toward formal medical care. A small group (N=15) of older women not yet eligible to retire were recruited from a women's social club. They were interviewed using semi-structured interviews. Women reported that while they were more likely to have insurance after the ACA, this did not increase their intended frequency of utilizing medical care. Many of the interviewees intended to discontinue treatment options perceived as expensive until they become eligible for medicare. These findings indicate that as well-meaning as the ACA is, it is unlikely to change the health outcomes of segments of the population already under-utilizing preventative care.

MENTAL HEALTH DIFFERENCES BETWEEN MEN AND WOMEN CAREGIVERS

V. Edwards, L. Anderson, W.W. Thompson, A.J. Deokar, *Healthy Agingi Program, Centers for Disease Control and Prevention, Atlanta, Georgia*

It is expected that the proportion of men caregivers will increase substantially with the aging of the baby boomer generation, i.e. those born between 1946 and 1964. Although numerous studies have shown that women have larger and more complex social networks than men, there is little information about whether these more developed networks confer a protective effect that would mitigate the differences in health outcomes between men and women caregivers. Furthermore, there is a dearth of information on gender differences that include large samples of caregivers despite significant progress in understanding the nature and effects of caregiving. Recent findings from the 2009 Behavioral Risk Factors Surveillance System (BRFSS) found that roughly one-quarter of respondents 18 years of age or older reported providing care to a friend or family member during the month preceding the survey. We used data from the 2011 BRFSS administered to over 100,000 participants to examine differences between male and female caregivers by demographics, health-related quality of life (HRQOL), and the effect of social support on HRQOL. Roughly two-thirds of caregivers were women, and demographic characteristics differed among men and women caregivers. Women caregivers reported significantly more mentally and physically unhealthy days than men, but there were no differences between men and women in general health or life satisfaction. Men were significantly more likely to report that they rarely or never received social support. However, the effect of social support on HRQOL was stronger in women than in men. Implications for caregiver support programs are discussed.

GENDER DIFFERENCES IN PERCEIVED SOCIAL SUPPORT IN AN U.S. COMMUNITY-DWELLING OLDER CHINESE POPULATION

R. Chen[1], M.A. Simon[2], E. Chang[1], M. Zhang[1], J. Huang[1], K. Lam[1], X. Dong[1], *1. Rush Institute for Healthy Aging, Chicago, Illinois, 2. Northwestern University, Chicago, Illinois*

Background: Social support is an important component of successful aging. This study aimed to examine gender differences in perceived positive and negative social support among U.S. Chinese older adults. Methods: Data were drawn from a population-based face-to face interview survey of Chinese older adults aged 60 years and above in the greater Chicago area. We assessed participants' levels of social support through asking the frequency of receipt of positive and negative support from spouse, family members and friends. Results: Of the 3,159 participants, 58.9% were female and the mean age was 72.8 (SD = 8.3). Women were more likely than men to perceive positive spousal support (rely on: 89.8% vs. 85.2%, p<0.01), family support (open up to: 88.5% vs.81.5%, p<0.001; rely on: 91.8% vs. 87.9%, p<0.001) and friend support (open up to: 74.7% vs. 64.4%, p<0.001; rely on: 61.4% vs. 56.9%, p<0.05), whereas men were more likely to perceive negative spousal support (been demanded too much: 17.4% vs. 10.7%, p<0.001; been criticized: 35.6% vs. 25.9%, p<0.001). Younger age, higher levels of education, being married, living with a larger number of people, higher overall health status, better quality of life, and improved health over the past year were positively correlated with perceived positive social support in older women. Conclusions: Perceived social support varied by gender among U.S. Chinese older adults. The development of support group interventions should take gender differences into account. Longitudinal studies are needed to understand the outcomes associated with positive and negative social support.

GENDER COMPARATIVE STUDY OF SUCCESSFUL AGING IN OLDER ADULTS IN COLIMA, MEXICO

B.A. Corona-Figueroa, E. ArIas-Merino, N.M. Mendoza-Ruvalcaba, M.E. Flores-Villavicencio, C.A. Gonzalez Nuñez, L. Alemán-de la Torre, *Salud Pública, Universidad de Guadalajara, GUADALAJARA, JALISCO, Mexico*

INTRODUCTION The model of successful aging by Rowe and Kahn (1997) operationalized by McLaughlin (2010) is the most influential in positive aging. Prevalence rate is 3.1% -21% in different countries and protective factors are: male gender, high education, not smoking and married status. OBJECTIVE Determine and compare the prevalence and associated factors of successful aging in men and women in elderly population of the state of Colima, Mexico. METHODOLOGY Descriptive transversal study derived from "Health, Wellness and Aging Survey" Colima, Mexico; n=1454 elderly. Indicators of successful aging: no serious illness or physical disability, high cognitive and physical functioning and commitment to life. Age, gender, education, marital status and pension were independent variables. Odds ratios and binomial logistic regression, 95% confidence intervals were calculated. RESULTS Prevalence of successful aging was 12.5% (18% in men, 9.1% in women). 61.4% of participants were female and 38.6% male, mean age was 72.18 years (SD±8.6). Married status OR=0.13(0.57-0.31), younger age, OR=0.35 (0.20-0.60) and high school or higher OR=0.58 (0.36-.0.94) were protective factors for successful aging in men. On the contrast, married women OR=0.23(0.13-0.42) with a younger age OR=0.33 (0.17-0.67) were more likely to age successfully, but education was not a protective factor in their case. OR=0.71 (0.41-1.22). CONCLUSIONS Prevalence of successful aging in Colima showed an average level compared to international prevalence. Differences among men and women reveal that it is necessary to develop further study to determine if they are due to biological or sociocultural factors.

MEN, MASCULINITY AND USE OF ANTI-AGING PRODUCTS IN THE GLOBAL NORTH

H. Ojala[1], T. Calasanti[2], I. Pietila[3], N. King[2], *1. University of Tampere - School of Social Sciences and Humanities, Tampere, Finland, 2. Virginia Tech, Blacksburg, Virginia, 3. University of Tampere - School of Health Sciences, Tampere, Finland*

The neo-liberal ideologies that point to individual responsibility for risks increasingly influence countries of the global North. The anti-aging industry reflects this dictate and encourages people to use their products and services to avoid aging. Middle age is a time when bodily changes will prompt individuals to begin to manage their aging (Fishman, et al., 2010). However, given the negative connotations attached to the term "anti-aging", which is usually seen to focus on aesthetics, and the extent to which appearance is taken to be a woman's concern, men may be likely to disavow being involved in such anti-aging activities. This paper uses interview data collected from men aged 42-70 from the U.S. and Finland, to explore whether and how men answer the call to manage their risks of aging when such activities are seen to be potentially feminizing. We find that these men reflected neo-liberalism in the sense that they felt that, although aging cannot be prevented, it can be controlled. And while they generally rejected anti-aging products and services that were judged to be about aesthetics, they reported that they use and consume them once they are re-defined as promoting health and performance instead. Our findings suggest that men in both countries respond to similar ageist and consumerist cultures in the global North, wherein the cultural dictate to fight the visible signs of aging is considered to be every individual's task.

CONSEQUENCES OF EARLY PARENTAL LOSS ON COGNITIVE FUNCTION IN OLD AGE: DOES GENDER MAKE A DIFFERENCE?

R. Fu, *Purdue University, West Lafayette, Indiana*

Drawing from the cumulative disadvantage theory, this article examines (1) whether losing a parent in early life affects cognitive function in old age; and (2) whether this association differs by respondents' gender and their parents' gender. Using the 2005 wave of the Chinese Longitudinal Healthy Longevity Survey, this study estimated logistic models of parental loss and cognitive function for a nationwide sample of sample of older adults aged 63–120 years (N = 15,638). Older women who lost their mother before or at the age of 16 had worse cognitive functions compared to their counterparts who lost their mother later in life. This association was not found in older men. Losing one's father in young age had no significant effects on late-life cognitive function for both men and women. Evidence from older Chinese women lends support to the cumulative disadvantage theory. Both respondents' gender and their parents' gender shape the relationship between childhood trauma and cognitive function in old age. These findings suggest that women losing a mother at young age are a vulnerable group at higher risk for cognitive impairment in late life.

ADULT AGE DIFFERENCES IN THREE MEASURES OF INTRAINDIVIDUAL VARIABILITY DURING AN IMPLICIT LEARNING TASK

K.L. Seaman[1], D. Howard[2], J. Howard[1,2], *1. Psychology, The Catholic University of America, Washington, District of Columbia, 2. Georgetown University, Washington, District of Columbia*

Age differences in intraindividual variability (IIV) in reaction time have been well documented in relatively simple perceptual-motor tasks (i.e. Li, Aggen, Nesselroade, & Baltes, 2001) and are thought to predict long-term changes in cognitive performance (Bielak, Hultsch, Strauss, MacDonald, & Hunter, 2010; MacDonald, Hultsch, & Dixon, 2003). Here we use three measures of IIV: individual standard deviation (ISD), coefficient of variation (CoV), and mean successive squared differences (MSSD) to examine IIV on a more complex, sequence learning task, the Triplets Learning Task (Howard, Howard, Dennis, & Kelly, 2008) in young and older adults. While ISD is the most frequently used measure of IIV, these other measures have distinct advantages in that the CoV is not as influenced by the overall mean reaction time and MSSD is not as influenced by trends in the data. As expected, we found significant age-related differences in sequence learning, with young adults showing more learning than older adults. Also consistent with previous studies, we found significant age differences in ISD and MSSD and marginal age differences for CoV, with older adults exhibiting greater IIV than young adults. Additionally, within the entire sample, there was a significant relationship between IIV and learning, with greater variability related to less learning. Collectively, these results extend prior work by showing age-related differences in IIV on a more complex sequence-learning task. Furthermore, they suggest that IIV is related to overall task performance.

THE EFFECT OF PERSONALITY TRAITS ON COGNITIVE FUNCTIONING AND FUNCTIONAL STATUS IN THE OLDEST OLD

A.A. Rahman-Filipiak[1], J.L. Woodard[1], P. Martin[4], L. Miller[2], A. Davey[3], L. Poon[2], *1. Wayne State University Institute of Gerontology, Detroit, Michigan, 2. University of Georgia, Atlanta, Georgia, 3. Temple University, Philadelphia, Pennsylvania, 4. Iowa State University, Ames, Iowa*

Introduction: Low neuroticism and high conscientiousness, in particular, are associated with positive psychological and physical health, but the impact of personality on neuropsychological and functional performance in older adults is unknown. The study investigates whether personality traits incrementally predict cognitive functioning, verbal fluency, abstraction, executive functioning, and functional status better than age, education, and gender alone. Methods: Eighty octogenarians and 244 centenarians from the Georgia Centenarian Study completed measures of cognition, functional status, and personality. Hierarchical regressions were performed to examine the incremental predictive value of Openness, Conscientiousness, Extraversion, Agreeableness, and Neuroticism beyond demographic variables. Demographic variables were entered on the first step. NEO-PI summary scores were entered on the second step. Outcome measures included the Mini Mental State Examination (MMSE), Controlled Oral Word Association Test (COWAT), WAIS-III Similarities Subtest, Behavioral Dyscontrol Scale (BDS), and the Direct Assessment of Functional Status Basic (BADL) and Instrumental (IADL) Activities of Daily Living scores. Results & Conclusions: Personality accounted for significant, unique proportions of variance in all cognitive and functional outcomes. For octogenarians, lower agreeableness and higher conscientiousness were the most consistent personality predictors of better neuropsychological and functional performance. For centenarians, lower neuroticism was the most consistent personality predictor of better outcomes.

AN EXPLORATION OF OLDER MEN'S ACCEPTANCE OF AGE INEQUALITY

N. King[1], I. Pietila[2], T. Calasanti[1], H. Ojala[2], *1. Virginia Tech, Blacksburg, Virginia, 2. University of Tampere, Tampere, Finland*

Age relations serve to increase the marginal status of people as they grow old. They also interact with such inequalities as gender to produce varying degrees of acceptance of that marginal status. We propose that belief in the ideals of categories of identity tied to social inequalities, such as youth-based gender ideals of masculinity and femininity, can affect acceptance of age relations. Thus, maintaining youth-based ideals of masculinity may lead men to treat their increasingly marginal status as biologically inevitable or their own individual fault. Using interview data obtained from middle-aged men from Finland and the U.S., we explore the extent to which aging men's adherence to youth-based ideals of masculinity correlate with acceptance of their own subordination based on age relations. We find that these aging men express the belief that they should be able to live up to the ideals of youth-based masculinity and be able to compete for status in a similar manner, and that if one is unable to do so, that one should expect to be in a subordinate position. These findings help us to understand why and how it is that men, who are in a more dominant position in earlier life, do not rebel against age-based inequality as a group.

SESSION 1630 (POSTER)

EMOTIONS AND AGING

PATH MODEL EXAMINATION OF HEALTH AND ATTACHMENT-RELATED AFFECTIVE REGULATION

P. Goodwin, R.C. Intrieri, *Western Illinois University, Macomb, Illinois*

Recent theory exploring the role of attachment has highlighted the concept of affective-regulation (Mikulincer, Shaver, & Pereg, 2003). Consistent with Bowlby, the assumption is that exposure to a potential threat activates the attachment system. Once activated, an individual engages in proximity-seeking behavior(s) as a way of managing the distress associated with the threat. If proximity-seeking fails, the individual will fall back on secondary attachment strategies in order to regulate distress associated with the perceived threat (i.e., hyperactivating versus deactivating regulation of emotion). 130 community-dwelling older adults participated in a study examining affective experience and daily life. The sample of 130 included 80 women (M=67.68, SD=8.497) and 50 men (M=67.70, SD=9.519) with an average age of 67.568(SD = 8.873). In addition to measures of psychosocial functioning, participants completed a modified version of the Day Reconstruction Method (DRM). Of the 130 participants, 32 were securely attached while 98 were insecurely attached (i.e., preoccupied, dismissing or fearful). The current analysis examines the construction of a path model linking the experience of a health stressor to attachment-related styles of affect regulation (i.e., anxiety or avoidance). The path model used aggregated physical and mental health from the SF-36 and the anxiety and avoidance subscales derived from the Adult Attachment Scale. The model also included measures of life satisfaction and perceived stress as possible mediators. Results from the path model suggest a well-fitting model (CFI = .994, $\chi 2(1) = 2.121$, p = .145). Discussion will focus on the potential mediators of attachment avoidance and anxiety.

AGE DIFFERENCES IN RUMINATION, CO-RUMINATION, AND THEIR RELATIONSHIP WITH DEPRESSIVE SYMPTOMATOLOGY

L. Emery, S. Gizdarska, *Psychology, Appalachian State University, Boone, North Carolina*

Co-Rumination, or "extensively discussing and re-visiting problems" with another person (Rose, 2002), is a construct that has primarily been studied in adolescent populations. Among adolescent girls in particular, co-rumination is paradoxically related to both closer friendships and increased emotional problems. Given that older adults often report both better emotion regulation strategies and social relationships relative to those at younger ages, we conducted an exploratory study to investigate age differences in co-rumination. Young Adults (N = 27; Mean Age = 19.2) and Older (N=29; Mean Age = 73.0) adults filled out questionnaires about Rumination (the Ruminative Responses Scale; Nolen-Hoeksema,, Wisco, & Lyubomirsky, 2008), Co-Rumination (a modified Co-Rumination Scale; Rose 2002), and Depressive Symptomatology (the DASS-21; Wood, Nicholas, Blyth, Asghari & Gibson, 2010). Results indicated that there were significant age difference in both rumination, F(1,52) = 9.26, p = .004, and co-rumination, F(1,51) = 9.63, p = .003, with young adults engaging in these behaviors more than older adults. In addition, there was an Age x Sex interaction for co-rumination, F(1,51) = 4.78, p = .03, with larger age differences in women than in men. Finally, although rumination was strongly and positively correlated with depressive symptoms in both groups (r = .53 for young; r = .69 for old), co-rumination was only significantly correlated with depressive symptoms in the older adults (r = -.19 for young; r = .53 for old). The results suggest that co-rumination is a potentially useful construct for understanding age differences in social and emotional processes.

EXAMINATION OF AGE AND GENDER DIFFERENCES IN COGNITIVE AND EMOTIONAL EMPATHY IN YOUNG, MIDDLE-AGED, AND OLDER ADULTS

E.S. Emerick, S.N. Sedall, J. Blaskewicz Boron, *Gerontology, Youngstown State University, Youngstown, Ohio*

Age differences and changes in emotional processes have been investigated in prior literature; results documenting age differences have suggested these changes result from motivational shifts in goals. More recently, investigations have incorporated empathy, which integrates perspective-taking and emotional experience. The purpose of the current study was to examine age differences in cognitive and emotional empathy, as well as emotion regulation strategies in adulthood. Participants included 37 young (M=21.68; SD=4.50; Range=18-39), 28 middle-aged (M=49.32; SD=5.62; Range=40-59), and 26 older adults (M=72.12; SD=6.84; Range=60-87). A series of multivariate and univariate analyses of covariance tests, with age and gender as grouping variables, were conducted. Depression served as a covariate, as age differences emerged, F(2,88)=13.37, p<.01, with young and middle-aged adults scoring higher than older adults. A significant age group by gender interaction emerged for one measure of cognitive empathy, F(2,83)=4.18, p<.05, indicating middle-aged men and women performed similarly, and significantly higher than young and older adult men, but not significantly different from young and older women. Significant age differences were observed in three emotion regulation strategies: self-blame (p=.01), acceptance (p=.008), and other blame (p=.024); Young and middle-aged adults were significantly more likely to use self-blame and acceptance, while older adults were significantly more likely to use other blame. Gender differences in the positive refocusing strategy (p=.02), showed women scored higher than men. These results coincide with and extend prior literature. Thus, discussion will consider mechanisms of these age and gender differences in empathy and emotion regulation strategies.

LONELINESS IN A DAY: ACTIVITY ENGAGEMENT, TIME ALONE, AND EXPERIENCED EMOTIONS

T.L. Queen[1], R.S. Stawski[2], L. Ryan[3], J. Smith[3], *1. Department of Psychology, University of Utah, Salt Lake City, Utah, 2. Oregon State University, Corvallis, Oregon, 3. University of Michigan, Ann Arbor, Michigan*

Previous research has established that the experience of chronic loneliness is associated with poorer physical health and well-being, including declines in cardiovascular health and higher levels of distressed affect. The purpose of the current study was to obtain a more detailed picture of the experience of loneliness in midlife and older adulthood by incorporating the context of a day's activities. We obtained a detailed picture of loneliness in midlife and older adulthood (age 50 – 96) by using a modified day reconstruction task to examine the activities in which middle age and older adults engage (such as work, exercise, socializing, watching television), the amount of time they spent alone, and the emotions experienced while engaging in a day's activities. Lonelier individuals did not participate in different daily activities or spend more time alone during the day; however, loneliness was associated with engaging in more activities alone than with other people. In regards to emotional experiences, we report that daily activities yield a different profile of positive emotional experiences for lonelier individuals. The social context of daily activities was an important factor in understanding the effects of loneliness on experienced negative emotions. The results of this study provide insight into the influence of loneliness on the structure of a day and context for understanding the emotional experiences of lonely older adults.

THE RELATIONSHIP BETWEEN SOCIAL CAPITAL AND HEALTH AMONG THE ELDERS IN TAIWAN

C. Chu, *Asia University, Taichung City, Taiwan*

Methods: Cross-sectional and individual-level secondary data analysis. Data for the analysis came from the 2007 Taiwan Social Chang Survey with a nationally representative sample of 1,038 adults. Social capital was measured using social trust, social involvement, social support (name generator) and occupational positions (position generator). Logistic regression was applied to explore whether social capital was associated with health. Results: Overall, 85.7% reported did not had summed depressive symptoms, and 74.5% reported their physical health as being good. High social trust was significantly associated with self-rated good physical health and did not had summed depressive symptoms, while high instrumental support had summed depressive symptoms. Conclusions: Social capital was very significant in determining health among the eldes in Taiwan.

AGE DIFFERENCES IN FUTURE ANHEDOINA: THE ASYMMETRY IN THE PROCESSING OF GAINS VS. LOSSES

X. Ma, A. Milam, *University of Houston Clear Lake, Houston, Texas*

Future anhedonia is the tendency for individuals to believe that they will experience less intense affects when an event happens in the future, compared to the same event happening in the present. The current study examined age differences in future anhedonia in both monetary gain and loss condition, and the role of future anhedonia in time discounting. Ninety-one younger adults, 69 middle-aged adults, and 69 older adults participated in the study. We found that all age groups display future anhedonia in the gain condition, and that future anhedonia predicts time discounting in the gain condition; however, only younger and middle-aged adults display future anhedonia in the loss domain.

THE IMPACT OF CHRONIC STRESS ON RUMINATION, ANXIETY, DEPRESSION, AND AGE

S. Freed[1], M. Sliwinski[1], D. Almeida[1], J. Smyth[1], R.B. Lipton[2], M.J. Katz[2], *1. Center for Healthy Aging, The Pennsylvania State University, University Park, Pennsylvania, 2. Albert Einstein College of Medicine, Bronx, New York*

Older adults often report higher levels of well-being. Yet, in contexts with high levels of chronic stress, when older adults are not able to use emotion regulation strategies as effectively, age-related benefits in well-being may disappear. We evaluated this hypothesis in a diverse sample of adults (Mage=47, range 25-65) who completed a wide range of questionnaires that included an assessment of subjective chronic stress and measures of mental health (rumination, anxiety, and depression). We found that chronic stress moderated the relationship of age with rumination (β=.006, $p < .05$), anxiety (β=.008, $p < .01$), as well as depression (β=.005, $p < .09$); results indicated a negative association between age and mental health, but only in those reporting the highest levels of chronic stress. These findings suggest that previously studied age differences in well-being may disappear in contexts with high levels of chronic stress. Implications for socio-emotional aging theories are discussed.

EFFECT OF AROUSAL AND VALENCE ON EMOTION REGULATION CHOICE IN OLDER AND YOUNGER ADULTS

B. Martins[1], H. Tranton[1], A. Aboseif[1], G. Sheppes[2], J. Gross[3], M. Mather[1], *1. University of Southern California, 3715 McClintock Ave, Los Angeles, California, 2. Tel Aviv University, Tel Aviv, Israel, 3. Stanford University, Stanford, California*

Previous research suggests that emotional stimuli that elicit strong responses promote selection of different strategies during emotion regulation than milder stimuli. Regardless of stimulus valence, younger adults prefer to reappraise low intensity stimuli but to distract themselves from high intensity stimuli (Sheppes & Gross, 2011, 2012). Compared with younger adults, older adults favor positive over negative information in their attention and memory (Charles, Mather & Carstensen, 2003; Mather & Knight, 2005). This age-related positivity effect may bias whether older adults choose to approach (reappraise) or avoid (distract away from) stimuli when regulating emotions. However, it remains unknown whether stimulus intensity and valence impact older adult emotion regulation strategy selection. In this study, we explored the effect of arousal and valence on emotion regulation strategy selection across age. Younger and older adult men were shown slideshows of positive and negative images, and asked to select and then utilize either cognitive reappraisal or distraction strategies to decrease their emotional reactions to images that varied in intensity (high intensity, low intensity images). Preliminary results revealed a main effect replicating previous findings, in which high intensity images were more frequently distracted, and low intensity images were more often reappraised across age groups. No significant age by valence interaction was found, supporting that similar to younger adults, conscious older adult strategy choice is largely driven by arousal and not valence. These findings raise the question of whether valence plays a role in automatic emotion regulation decision-making processes.

ENGAGING IN HEALTH-RELATED BEHAVIORS THROUGHOUT THE DAY: ASSOCIATIONS WITH AGE, MOOD, AND STRESS

S. Scott[1], B. Whitehead[2], J. Mogle[3], *1. University of South Florida, Tampa, Florida, 2. University of Michigan-Dearborn, Dearborn, Michigan, 3. Pennsylvania State University, University Park, Pennsylvania*

Many public health campaigns target changes in day-to-day healthy and unhealthy behaviors in order to age well and avoid disease. Most outcomes, however, are multi-determined; few studies have examined the role of daily experiences on engagement in multiple daily health-related behaviors. We examined whether momentary mood and recent disruptive events are related to a range of health behaviors (consuming alcohol, caffeine, nicotine, eating, exercising, using medicine or drugs) in a 10-day ecological momentary assessment study of 189 adults aged 18-81. Palm-top computers prompted participants to complete brief surveys five times daily. Older age was associated with 2-3% higher odds of engaging in exercise and using medication in the last 3 hours. In multilevel models accounting for age, gender, day of week, time of day, and previous behaviors and mood, we found no evidence for mood or events predicting health behaviors in the next three hours. In contrast, recent health behaviors predict mood three hours later. Drinking alcohol and exercise were both associated with significantly higher positive affect and lower negative affect. Eating, however, was only associated with lower levels of negative affect. Use of medicine was related to lower levels of positive affect in older adults. Use of caffeine or nicotine were unrelated to future mood. These results suggest that even when accounting for age and gender differences, in a non-clinical adult sample engaging in health-related behaviors can enhance daily emotional well-being but there is little evidence for stressors or emotions prompting individuals to engage in or avoid health behaviors.

PERCEPTIONS OF THE EVERYDAY EMOTIONAL DISPLAYS OF YOUNGER AND OLDER ADULTS

J.M. Montepare[1], H. Dobish[2], *1. Lasell College, Newton, Massachusetts, 2. Shepherd University, Shepherdstown, West Virginia*

Research has identified general stereotypes of emotional behavior across the life span (e.g., Fabes & Martin, 1991; Montepare & Dobish, 2013). Whereas older adults are expected to experience and express fewer highly charged, negative emotions, they are expected to experience and express more positive, low arousal emotions, as well as negative, low arousal emotions. High arousal, positive emotionality is seen as more characteristic of younger age groups. Using a social-psychological attribution framework, this research examined emotion expectations by exploring how perceivers evaluated the emotional displays of older versus younger adults in “real life” everyday social exchanges. 104 observers (54 women, 17-54 years) were randomly assigned to evaluate the behavior of older and younger adults depicted in vignettes of everyday emotional exchanges reflecting negative or positive emotions varying in high or low intensity. Observers evaluated the extent to which actors were believed to be able to regulate their emotions, were concerned about how others viewed their emotional behavior, were responding to typical, situational cues, and had emotional dispositions. Significant age group differences were found, however, they were not qualified by the valence or intensity of the emotional exchanges. Older adults were evaluated as being able to regulate their emotions more, less concerned about social evaluations, and more likely to be responding to situational cues than younger adults. This work extends our understanding of age-related emotional behavior by showing how the emotional displays of older versus younger adults are likely to be evaluated in everyday social exchanges

A DAILY DIARY ASSESSMENT OF FINANCIAL WORRIES AND BEHAVIORS: EFFECTS OF AGE AND GENDER

J. Mogle, R. Koffer, J. Swenson, M. Krannitz, C. Mineo, D. Almeida, *Center for Healthy Aging, Penn State University, University Park, Pennsylvania*

The great recession has had a prolonged effect on the financial situation of adults across the lifespan. The current study used a daily diary format to capture the daily experiences of this financial situation’s behavioral impact on younger and older adults. Participants completed 8 telephone interviews on consecutive evenings. During each, participants (n = 564; Mage = 43.8) reported how often they had thought about their financial situation that day. At the end of the interview period, participants reported on whether they had done any of the following to manage their financial situation: used public transportation, walked or biked for transportation, put off paying bills, put off buying essentials (e.g., groceries), put off non-essential expenses (e.g., leisure expenses), worked more hours, and borrowed money. They also reported whether they felt they had enough money to make ends meet. There was significant daily variability in thinking about financial issues (ICC=.54); however, there were no significant effects of age or gender (ps>.13). Fifty-three percent of participants reported at least one behavioral adaptation to their financial situation over the past week, with reducing non-essential expenses being the most frequently endorsed change. Women were more likely to make changes (p<.0001) and report not having enough money to make ends meet compared with men (OR=2.16, p=.0004). Younger adults were more likely to report putting off paying bills (OR=1.32, p=.01) and younger men specifically reported more use of public transportation (OR=2.21, p=.01). Implications of these behavioral changes for other daily outcomes (e.g., well-being) will be discussed.

AGE DIFFERENCES IN EMOTION RECOGNITION OF BRIEFLY PRESENTED FACES

L. Emery, K. Morgan, K. Pechanek, C. Williams, *Psychology, Appalachian State University, Boone, North Carolina*

Previous research has found that, when identifying emotional expressions from static faces, older adults show impaired recognition for some emotions (e.g., sadness, fear, anger), but spared or even improved recognition on others (e.g., happiness, surprise, disgust). There are several limitations to previous research, however, including possible ceiling effects in young adults and a lack of ecological validity. In the current research, we used a modified emotion recognition test in which posed emotion expressions were briefly presented in-between neutral expressions, in order to mimic fleeting emotional expressions and increase difficulty. In Experiment 1, 24 young and 24 older adults performed this task. We found a pattern of age impairments in anger, happiness, and sadness recognition; age similarity in fear and surprise recognition; and age improvements in disgust recognition. In Experiment 2, we tested an exploratory hypothesis that age-impairments in vision may partially account for this finding. Fifty young adults were randomly assigned to perform the same test with either typical pictures, or pictures “blurred” to mimic age-related visual declines. Performance was identical to the young adults in Experiment 1, and condition had no effect on performance. Overall, these findings suggest that age differences in emotion recognition (1) are smallest for the most ecologically valid expression (e.g., surprise presented fleetingly), and (2) are not related to age-related visual changes.

SELF-RATED HEALTH MODERATES THE ASSOCIATION OF DAILY REGULARITY AND AFFECT IN OLDER ADULTS

C. Tighe, K.D. Shoji, N. Dautovich, *Psychology, University of Alabama, Tuscaloosa, Alabama*

Introduction: Existing empirical research suggests that greater rhythmicity in daily activities is associated with better affective outcomes. Yet, prior research has generally not considered how certain physical health states, where regularity may be more likely to be imposed rather than chosen, influences this association. The aim of the present study was to ascertain if the association between daily regularity and affect varies by self-assigned physical health ratings. Methods: An archival analysis was conducted on data from the Midlife in the United States follow-up study, MIDUS-II. Participants were 433 community-dwelling adults aged 65 to 84. Intraindividual variability in the duration of time spent on daily activities was derived from data collected via 8 daily phone calls. Physical health and affect were assessed by mail-in questionnaires developed for MIDUS-II. Results: Hierarchical regression analyses indicated a significant regularity by health interaction, signifying the differential association of regularity and both positive, $\beta=.67$, $p=.04$, and negative, $\beta=-.55$, $p=.02$, affect, at varying levels of self-rated health. Follow-up analyses suggest that greater regularity was associated with less positive and more negative affect for individuals who rated their health as being ‘poor’. Conclusions: The present findings complement the existing literature by identifying that the association between daily regularity and affect varies by self-rated physical health. Future studies may examine discrepancies in perceived and actual regularity, as well as assess individual preference for regularity, as such factors may help to explain the relation between regularity and affect for older adults who are experiencing varying states of physical health.

EVENT CENTRALITY AND DAILY WELL-BEING: THE SYNERGISTIC EFFECT OF CHRONIC STRAINS AND DAILY HASSLES

J.R. Piazza[1], G. Orona[1], S.H. Zarit[2], D. Almeida[2], *1. Health Science, California State University, Fullerton, Fullerton, California, 2. Pennsylvania State University, University Park, Pennsylvania*

People react differently to the daily stressors they encounter: Whereas some people appear to take daily stressors in stride, others are much more reactive. One reason for these differences may be the extent to which daily stressors are related to ongoing, chronic strains. The current study tested this hypothesis by examining how people reporting differing levels of chronic interpersonal strains reacted to daily interpersonal stressors. Results revealed that people who reported higher levels of interpersonal strains were more reactive to daily stressors involving interpersonal tensions ($\beta = .05$, $p<.001$). However, these results were qualified by a significant three-way interaction, indicating that among people who reported high levels of chronic interpersonal strain, daily interpersonal tensions were more costly to younger adults’ well-being compared to older adults’ well-being. No age differences emerged for people who reported low levels of chronic interpersonal strain ($\beta = -.003$, $p <.01$).

MEMORY FOR POSITIVE EVENTS AS AN EMOTION REGULATION TOOL: LINKING PROCESSES WITH OUTCOMES IN ADULTS

A.H. Coats[2], S. Scheibe[1], X. Wen[2], J. Striler[2], W.A. Grbcich[2], *1. University of Groningen, Groningen, Netherlands, 2. Westminster College, Fulton, Missouri*

Emotion and aging researchers have recently called for more research linking processes (e.g., remembering positive events) and outcomes (e.g., emotion regulation). The current study aims to examine whether the positivity effect (i.e., older adults’ increased focus on positive material during memory tasks) leads to faster reduction in sadness after a mood induction. Young and older adults received instructions to avoid negativity, focus on positivity, or focus on negativity while watching a sad film clip. A comparison group did not receive instructions and simply watched the film. After a one-hour delay, participants retold the story of the film clip in their own words. Trained raters, blind to condition and age, coded participants’ stories for accuracy in recall. Six young and older adult coders classified each film event as positive, negative, or neutral. Among young adults instructed to avoid negativity, accurately recalling proportionally more positive film events was associated with more reduction in sadness following the mood induction. This relationship did not hold for young adults in the other conditions. Importantly, for older adults in all conditions (except focus on negativity), this positive relationship between memory and sadness reduction exists. Thus, encouraging young adults to avoid negativity may lead them to use memory for positive events as an emotion regulation tool. Furthermore, older adults seem to avoid negativity on their own, without requiring instructions. Older adults’ thought-listing after watching the film are consistent with avoiding negativity. These results have implications for how memory may relate to emotion regulation across adulthood.

AGE-RELATED DIFFERENCES IN UP-REGULATING POSITIVE AND NEGATIVE EMOTIONS: EFFECTIVENESS AND REPORTS OF DIFFICULTY

A.K. Harrington, J. Stanley, *Psychology, The University of Akron, Akron, Ohio*

Older adults typically outperform younger adults when asked to regulate their emotions. However, emotion regulation research has focused on age differences in regulating into a positive mood, ignoring the question of whether older adults are equally effective at regulating into a negative mood. Thirty-seven older adults (60-84 years) and 27 younger adults (19-27 years) were instructed to up-regulate one of three emotions (fear, sadness, or happiness) while watching a film clip intended to elicit an opposite emotional response. Participants indicated their current mood before and after each film clip. Emotion regulation success was computed as a change score for the instructed emotion. Participants also reported the ease of up-regulating their emotions. Participants were least able to up-regulate happiness to a saddening film, and younger adults were marginally more effective at regulating into a happy mood, relative to older adults, $p = 0.064$. Participants reported the greatest ease when up-regulating happiness to a frightening film. Overall, older adults reported more difficulty up-regulating their emotions than younger adults. These effects were qualified by a significant interaction such the relative ease of regulating into a positive mood while watching a frightening film was greater for young adults than older adults. These results suggest that not all emotion regulation abilities increase with age. Future research should investigate whether age differences in regulatory success in the lab translate to similar age differences in everyday life. The findings are discussed in terms of lifespan shifts in motivational goals and functional theories of emotion.

THE RELATIONSHIP BETWEEN AFFECT AND ENVIRONMENTAL CONTEXT IN A HEALTH-IMPAIRED POPULATION

R.C. Intrieri, P. Goodwin, *Psychology, Western Illinois University, Macomb, Illinois*

Participants were 25 community-dwelling older adults that were recruited from cardiac/pulmonary rehabilitation programs to join a study examining affective experience and general well-being. The sample included 8 women (M=69.13, SD=7.34) and 17 men (M=66.74, SD=7.99) with an average age of 67.5 (SD = 7.72). Participants completed a modified version of the Day Reconstruction Method (DRM, (DRM; Kahneman, Krueger, Schkade, Schwarz, & Stone, 2004). The DRM was designed to collect information from participants based upon their recall of the previous day. The individual constructs a short diary consisting of a series of episodes. For each episode, participants provide information about what they were doing (activity), who they were with (social partners or alone), where they were in their environment (at home or in the community), as well as their affective state during each episode. Participants also completed several measures assessing general well-being. The procedure used here was closely modeled on the procedure used in Kahneman et al. (2004). Diary data generated by the DRM, were analyzed using HLM 7.01 with multilevel random coefficient modeling. Coefficients representing mean ratings for both positive affect and negative affect were calculated for each participant. Level-1 Model, Y(Pos or Neg Affect) = P1*(SOCIALIZING) + P2*(ALONE) + P3*(SIGNIFICANT OTHER) + P4*(HOME) + E. For Positive Affect, statistically significant coefficients were obtained for the objective context (coefficients ranging from b = -3.702 to b = 2.158). Results obtained for Negative Affect with statistically significant coefficients for contextual variables (ranging from b = -1.575 to b = 1.371).

AGE DIFFERENCES IN THE EFFECTS OF SOCIAL EVALUATIVE STRESS

L.E. Popham, T.M. Hess, *Psychology, North Carolina State University, Raleigh, North Carolina*

There is growing evidence of age-related improvements in emotion regulation. The present study aimed to examine whether previously identified age differences in emotion regulation hold up in a high arousal, stressful context. This is an important question given that previous studies that have examined age differences have used mild emotional inductions using pictures or video clips. In the current study, older (N=60; 65-80 years old) and younger adults (N=60; 20-35 years old) participated in a social evaluative stress task, which involved an impromptu speech in front of a panel of evaluators. Participants' blood pressure, heart rate, and subjective emotions were assessed at several points during the pre-speech and post-speech period to assess age differences in the stress regulation process. Consistent with expectations, the results revealed that older adults were able to down-regulate negative emotions more quickly than younger adults following the stressful speech (p = .04). Inconsistent with expectations, however, older adults were not more vulnerable to the physiological costs of stress than younger adults.

NEGATIVE SOCIAL INTERACTIONS AND INCIDENT HYPERTENSION AMONG OLDER ADULTS

R. Sneed, S. Cohen, *Psychology, Carnegie Mellon University, Pittsburgh, Pennsylvania*

The purpose of this study was to determine if negative social interactions are prospectively associated with hypertension among older adults. This is a secondary analysis of data from the 2006 and 2010 waves of the Health and Retirement Study, a survey of community-dwelling older adults (age >50). Total average negative social interactions were assessed at baseline by averaging the frequency of negative interactions across four domains (partner, children, other family, friends). Blood pressure was measured at both waves. Individuals were considered hypertensive if they reported use of antihypertensive medications, had measured average resting systolic blood pressure ≥ 140 mmHg, or measured average resting diastolic blood pressure ≥90 mmHg. Analyses excluded those hypertensive at baseline and controlled for demographics, personality, positive social interactions, and baseline health. Twenty-nine percent of participants developed hypertension over the four-year follow-up. Each one-unit increase in the total average negative social interaction score was associated with a 38% increased odds of developing hypertension. Sex moderated the association between total average negative social interactions and hypertension, with effects observed among women but not men. The association of total average negative interactions and hypertension in women was attributable primarily to interactions with friends, but also to negative interactions with family and partners. Age also moderated the association between total average negative social interactions and hypertension, with effects observed among those ages 51-64, but not those ages ≥65. In this sample of older adults, negative social interactions were associated with increased hypertension risk in women and the youngest older adults.

LIFESTYLE COUNSELING AND SATISFACTION WITH PROVIDER COMMUNICATION AMONG MIDLIFE ADULTS

J. Warren-Findlow[1], J. Hutchison[2], E. Platonova[1], W. Saunders[1], *1. Department of Public Health Sciences, The University of North Carolina at Charlotte, Charlotte, North Carolina, 2. The University of North Carolina at Charlotte, Health Services Research PhD Program, Charlotte, North Carolina*

Effective provider communication is associated with improved health outcomes among US adults. Recent changes to health care policy require primary care providers to engage in lifestyle counseling with their patients. Middle-aged individuals would likely benefit from lifestyle counseling as a way to prevent and/or manage chronic disease. We surveyed middle-aged patients (age 45-64; n=266) at three safety net clinics in Charlotte, NC. Data were collected on satisfaction with provider communication and whether clinicians discussed diet and/or exercise counseling. We conducted logistic regression using generalized estimating equations to account for clinic clustering. The multivariate model adjusted for demographic characteristics, health conditions, housing situation, and satisfaction with clinic care. In unadjusted results, patients who reported being counseled about diet had 4 times odds of higher satisfaction with provider communication (OR=4.03, 95% CI=2.09-7.80). Patients who indicated that they were counseled on exercise had 157% higher odds of higher satisfaction with provider communication (OR=2.57, 95% CI=1.93-3.43). In the multivariate model that adjusts for both lifestyles, and other covariates, the association between diet counseling and satisfaction with provider communication was magnified (OR=4.36, 95% CI=2.73-6.96). The relationship between exercise counseling and provider communication satisfaction was attenuated (OR=1.49, 95% CI=1.14-1.96). Depression, Hispanic ethnicity, and homelessness significantly decreased odds of satisfaction with provider communication. In this study lifestyle counseling was associated with higher satisfaction with provider communication. These low-income patients were open to receiving advice about lifestyle changes and perceived them as an appropriate activity for their clinicians. Further research should examine effective components of lifestyle counseling.

RISK AND PROTECTIVE FACTORS FOR DEPRESSIVE SYMPTOMS AMONG AMERICAN INDIAN OLDER ADULTS: ADVERSE CHILDHOOD EXPERIENCES AND SOCIAL SUPPORT

S. Roh, C.E. Burnette, K. Lee, Y. Lee, S.D. Easton, *Social Work, University of South Dakota, Sioux Falls, South Dakota*

Purpose of study: Despite efforts to promote health equity, many American Indian and Alaska Native (AI/AN) populations, including older adults, experience elevated levels of depression. Although adverse childhood experiences (ACE) and social support are well-documented risk and protective factors for depression in the general population, little is known about AI/AN populations, especially older adults. The purpose of this study was to examine factors related to depression among a sample of American Indian older adults in the Midwest. Method: Data were collected using a self-administered survey completed by 233 American Indians over the age of 50. The survey included standardized measures such as the Geriatric Depression Scale-Short Form, Adverse Childhood Experiences Questionnaire, and the Multidimensional Scale of Perceived Social Support. Hierarchical multivariate regression analyses were conducted to evaluate the main hypotheses of the study. Results: Multiple regression analysis indicated that two dimensions of ACE (i.e., childhood neglect, household dysfunction) were positively associated with depressive symptoms (B= .279, p <.05; B= .121, p <.05) social support was negatively associated with depressive symptoms ((B= -.038, p ≤ .001). Perceived health (B = -.242, p ≤ .01) and living alone (B = .368, p ≤ .05) were also significant predictors. Conclusion: ACE may play a significant role in depressive symptoms among AI/

ANs across the life course and into old age. Social support offers a promising mechanism to bolster resilience among AI/AN older adults.

ALTERED HOPES AND FEARS AMONG OLDER ADULT, LONG-TERM, CANCER SURVIVORS

C. Albitz, E.A. Nalepa, G. Deimling, *Sociology, Case Western Reserve University, Cleveland, Ohio*

The psychological impact of cancer is an important concern for older adult survivors. This research examines how individual hopes and fears are altered by cancer and explores how these psychological shifts are related to survivor characteristics such as sex, race, and years since diagnosis. Qualitative data from the first wave of a ten year, six wave longitudinal NCI-funded project (n=321) are presented to give insight into the multiple ways that individual's hopes and fears are altered by a traumatic life event such as cancer. Response rate for the selected questions was roughly 1 in 3 leaving 100 respondents. Responses were coded based on both the respondent's affect and the content of that response. Content was coded into 7 categories: relationships, ability/disability, spirituality, life perspective, health behaviors, re-occurrence, and no effect. Changes in life perspective and relationships were the most commonly discussed of these categories. There was an overwhelmingly positive response to cancer concerning hopes and fears (positive to negative affect ratio of 5:2). This seems paradoxical, however it implies that individuals view surviving cancer as a learning experience. The response rate that cancer had no effect was roughly 50%. Examining respondent sex, race, and years since diagnosis revealed that males reported more thoughts surrounding health behaviors and re-occurrence than women; years since diagnosis was associated changes in fears surrounding re-occurrence; and blacks discussed spiritually more than whites. These findings have important implications in understanding psychological shifts after cancer and how this major life event shapes identity and life perspectives.

MEASURING AGING ATTITUDES AND COMPARING MEASURES OF ATTITUDES TOWARD AGING

G.S. McCall, R.C. Intrieri, *Psychology, Western Illinois University, Macomb, Illinois*

Butler (1975) defined Ageism as the systematic stereotyping and discrimination against people because of their age. Since 1975 there have been numerous scales developed to quantify attitudes toward the old and aging in general. This study specifically examined the relationship among four measure: the Aging Semantic differential, the Fraboni Scale of Ageism (FSA), the Facts on Aging Quiz-Revised, and a relatively new scale developed by North and Fiske (2013) the Intergenerational Tensions Ageism Scale (ITAS). The ITAS has three domains: Succession, Identity, and Consumption. Succession is defined as the "active succession of enviable positions and influence", Identity is defined as "age-appropriate, symbolic identity maintenance", and Consumption is defined as "minimizing passive shared-resource consumption" North & Fiske, 2013). Data were collected from ninety-six undergraduate students recruited through the University's human participant pool. The mean age was 19.85 (n=97, SD=1.6); 51.5% were Caucasian, 27% were African-American, 7% were Hispanic, 6% were Biracial, and 8% were designated as Other or missing. In terms of gender, Sixty-eight percent were women and 32% were men. Results show that the relationship between the ASD-Instrumental scale and ITAS- Succession and the ITAS- Identity subscales were highly significant (r=.39, p=.0001; r=.27, p=.008, respectively). Also noted were significant relationships between FSA-Antilocution subscale and ITAS- Succession and ITAS-Consumption (r= -.204, p=.046; r= -.286, p=.005, respectively). None of the FSA-subscales and the ASD-subscales demonstrated statistically significant relationships.

EXAMINING THE EFFECT OF A SURVIVORSHIP TRANSITION COACHING INTERVENTION ON SELF-EFFICACY AMONG OLDER BREAST CANCER SURVIVORS

C.S. Huang[1,2], C. Azuero[1,2], S. Bae[2], C. Ritchie[3], K. Meneses[2], W. Demark-Wahnefried[2], M.A. Bakitas[2], E. Kvale[2], *1. Psychology, University of Alabama, Tuscaloosa, Alabama, 2. University of Alabama at Birmingham, Birmingham, Alabama, 3. University of California San Francisco, San Francisco, California*

Objectives: The transition from active treatment to cancer survivorship can present physical and psychological burden that persists across time. Because of this complexity, cancer survivorship has been conceptualized within a chronic disease framework. This study examined the effect of a brief survivorship coaching intervention using motivational interviewing and survivorship care planning to enhance self-efficacy among breast cancer patients aged 55 and older transitioning to survivorship. Methods: 46 female non-metastatic breast cancer survivors (mean age M= 65.33, SD = 6.63) were recruited and randomly assigned to either the survivorship coaching intervention (n=21) or usual care control (n=25) group. Self-efficacy was assessed with the Self-Efficacy for Managing Chronic Disease 6-item Scale. A mixed effects model was used to assess the effect of the intervention on self-efficacy at pre-intervention and three-month follow up. Results: A significant interaction was found between time and intervention type, Wilk's Lambda=.86, F(1,28)=4.63, p <.05, Partial Eta Squared=.14. Specifically, survivors in the intervention group demonstrated significantly greater improvement in self-efficacy at three-month follow-up compared to those in the usual care control group. Conclusions: Findings demonstrate that a one-time survivorship planning visit that engages older breast cancer survivors in their healthcare plan has beneficial effects on self-efficacy for managing survivorship care beyond usual care. Future research is needed to better understand the mechanism that leads to higher self-efficacy.

SESSION 1635 (POSTER)

EDUCATION AND AGING

EVALUATING AN EVIDENCE BASED TRAINING PROGRAM FOR IMPROVING ADVANCE CARE PLANNING CONVERSATIONS IN NURSING HOMES

J.G. Hennon[1,2,3], E.A. Mulvaney[1], J.N. Klinger[1,3], R. Schulz[1,3], *1. University of Pittsburgh, Pittsburgh, Pennsylvania, 2. GRECC, VA Pittsburgh Healthcare System, Pittsburgh, Pennsylvania, 3. Geriatric Education Center of Pennsylvania, Pittsburgh, Pennsylvania*

Palliative care and advance care planning can benefit residents of long-term care facilities, including those whose conditions are not imminently life-limiting and for whom hospice is inappropriate. Using evidence based practices for palliative care and communication at end-of-life, this project developed and implemented an educational program to improve skills of direct care staff in six nursing facilities in a midsize Midwestern city to promote a practice change of completing advance care planning conversations with residents, documenting these conversations, and routinely utilizing advance care planning forms and orders. Using a train-the-trainer model, project staff did initial trainings in each facility utilizing multiple educational strategies; then, staff development personnel completed training of all staff over a 6 month period and integrated the training for new hires. Evaluation of staff behavior change was done through chart reviews of 20 randomly selected charts per facility carried out at baseline (prior to training implementation) and 6 and 12 months after training was implemented. Chart review recorded information about medical orders, presence of advance care planning forms, documentation of advance care conversations, and inclusion of goals in the care plan. Advance care planning conversations and documentation of them increased steadily and significantly at 6 and 12 months. This project suggests that training of nursing home staff can alter the frequency with which advance care planning conversations take place and are documented. More needs to be done to translate these larger goals into daily care.

ASSESSMENT OF AGING-RELATED LEARNING OBJECTIVES AMONG PSYCHOLOGY MAJORS

A. June, C. Andreoletti, *Central Connecticut State University, New Britain, Connecticut*

Program evaluation is an important component of ensuring quality instruction and curricular development in higher education. This is especially crucial for gerontology in higher education as we prepare students to meet the increasing demands of the aging population. The present study examined how well the Department of Psychological Science at Central Connecticut State University (CCSU) is assessing and meeting gerontology-related learning objectives. A total of 188 undergraduate psychology majors completed a multiple-choice capstone psychology assessment required for graduation during the years of 2012 and 2013. However, 43 participants were excluded from further analysis because their lifespan development course was taken at another university. The remaining 145 students (M age = 23 years, 76% female, 79% White) all completed a lifespan development course at CCSU and 20% also had an advanced psychology of aging course. Students responded to five questions assessing learning objectives related to gerontological theories, research design, and domains of study. Sixty-three percent responded correctly to a question about Kubler-Ross's end-of-life theory, 76% responded correctly to a question about personality theory based on life transitions, 81% correctly identified a cross-sectional research design, and 75% recognized behavior genetics as a domain for studying the relative contributions of nature and nurture to aging. By contrast, only 39% were able to identify the generativity stage of Erikson's psychosocial development theory when provided with an age range. This is a first step toward developing more comprehensive age-related learning objectives and assessments and demonstrates clear areas of strength and needed improvement in our curriculum.

GERONTOLOGY PRACTITIONER CERTIFICATE: NEEDS ASSESSMENT AND PROGRAM DEVELOPMENT

K. Hash, J. Englehardt, E.M. Fullmer, *West Virginia University, Morgantown, West Virginia*

This poster presents a survey assessing the geriatric training needs of professionals in aging and the resulting continuing education based gerontology practitioner's certificate program. A total of 391 individuals participated in the online survey. The majority of respondents were trained as social workers (46%), followed by nurses and speech pathologists (each 16%). In terms of formal geriatric training, 43% identified CE offerings as the source of this training. Thirty-three percent indicated that they had no formal training in geriatrics. The majority (77%) expressed some interest in enrolling in a certificate program within the next two years. Increased knowledge and competence, personal satisfaction and growth, and meeting CE licensure requirements were the major reasons given for enrollment. Cognitive changes, dementia and end of life issues were each selected by almost half of the respondents as areas in which they needed the most training. Legal issues, health care and social policies and programs were also of interest. Online training was indicated as a preferred training method. Using survey findings, a 100-hour program was developed to extend the understanding of the aging process and issues faced by older adults and strengthen the skills of persons who work with older adults. This needs assessment can benefit other programs that wish to assess the geriatric training needs of professionals and develop an appropriate educational program to respond to these needs. As the number of older adults continues to rise, providing such training will go a long way in ensuring an adequate and competent workforce.

PROMOTING GERIATRICS TEACHING THROUGH A CHIEF RESIDENT IMMERSION TRAINING (CRIT) PROGRAM

H. Auerbach[1,2], B. Brett[3], R. Chippendale[1,2], M.E. Young[1,2], L.B. Caruso[1,2], A. Sorensen-Alawad[1], S. Levine[1,2], *1. Boston University School of Medicine, Department of Medicine, Section of Geriatrics, Boston, Massachusetts, 2. Boston Medical Center, Boston, Massachusetts, 3. Brett Consulting Group, Somerville, Massachusetts*

Background: Non-geriatricians must acquire skills and knowledge to ensure coordinated care for older adults with multi-morbidity. Exposure to geriatrics principles in residency curricula is variable. The Chief Resident Immersion Training (CRIT) Program in the Care of Older Adults is designed to increase Chief Resident (CR) capacity to provide such education. We explored whether prior exposure to and attitudes towards teaching geriatrics are related to geriatrics topics taught six months post-CRIT (PC). Methods: CRs completed baseline (BL) and 6-month PC surveys. Both surveys assessed topics taught in the past 6-months and attitudes towards teaching geriatrics. Independent variables: total hours of geriatrics training received 2 years pre-CRIT; total number of geriatrics topics taught at BL; confidence in, responsibility for, and enjoyment of teaching geriatrics. Dependent variable: total geriatrics topics taught at 6-months. Regression (list-wise) analyses were conducted with matched BL and PC surveys. Results: 452 CRs from 17 institutions attended CRIT from 2008-2012. 78.7% completed follow-up surveys. Controlling for geriatrics topics taught pre-CRIT, total hours of geriatrics training received during residency and enjoyment of teaching geriatrics at follow-up were significant predictors of total topics taught at six months (both $p<.001$). Enjoyment of teaching geriatrics pre-CRIT, responsibility for, or confidence in, teaching geriatrics post-CRIT were not predictors. Conclusions: CRIT exposes CRs to geriatrics principles they can disseminate to promote better care of older adults. 6-month post-CRIT variation in the number of geriatrics topics taught by CRs suggests more research is needed to assess how geriatrics can be further integrated into residency education.

LEARNING THROUGH LOSS: INCORPORATING NARRATIVES ABOUT LOSS IN DEATH EDUCATION

C. Bolkan[1], E. Srinivasen[2], A.R. Dewar[3], S. Schubel[1], *1. Washington State University, Vancouver, Vancouver, Washington, 2. University of Wisconsin LaCrosse, LaCrosse, WI, Wisconsin, 3. University of Central Florida, Orlando, Florida*

Students may have a greater willingness to discuss issues of death and loss through written assignments, however, there is little guidance for instructors regarding how to manage these sensitive assignments, nor how students benefit from them. We implemented and evaluated a "lossography" assignment in undergraduate thanatology courses within a gerontology program. In this assignment, students (N = 64, mean age = 30) wrote about their losses and anonymously shared the narratives with their classmates. We describe the implementation of this assignment as an educational tool, qualitatively analyzed the loss narratives for salient themes, and assessed the usefulness of the assignment for educators in a wide variety of disciplines/settings. Additionally, students completed a quantitative survey reflecting on their course learning. Although many themes of loss emerged, the most frequently reported significant loss was death of a grandparent. Additionally, most significant losses occurred in childhood/adolescence. Four major learning themes emerged: (1) grief and coping with a variety of losses, (2) universality of death, grief, and loss, (3) appreciation of life and loved ones, personal growth, and connectedness, and (4) helping families/children with loss and grief. Students also reported gaining self-awareness and knowledge to apply to future careers, feeling prepared to cope with future personal losses, and compassion for others. Of all aspects of course delivery, the lossography was evaluated highly (4.7/5) and 44% identified it as the most beneficial to their learning. Furthermore, 97% recommended this assignment for future students. The implications of the assignment for death education are also discussed.

A FACULTY DEVELOPMENT TRAINING PROGRAM TO IMPROVE THE PARTNERSHIP FOR HEALTH IN AGING COMPETENCIES

C.L. Coogle, L. Hackett, M.G. Owens, J.H. Mathews, P.W. Slattum, E. Wheeler, L. Waters, E.F. Ansello, *Virginia Center on Aging, Virginia Commonwealth University, Richmond, Virginia*

The conceptual framework for the Virginia Geriatric Education Center's 160-hour interprofessional faculty development program in geriatrics is based on the core multidisciplinary competencies in the care of older adults established by the Partnership for Health in Aging (PHA) Workgroup on Multidisciplinary Competencies in Geriatrics. The 23 relevant competencies were incorporated into an evaluation instrument designed to measure changes in self-efficacy among faculty scholars as a result of their participation in the VGEC's curriculum development and evaluation training program. The first program cohort of 12 faculty scholars indicated their levels of confidence with respect to each PHA competency before and after training using a rating system (from 0-100) derived according to Bandura's guide for constructing self-efficacy scales, and higher ratings were indicative of higher levels of self-efficacy. All participants completed the self-report measures before and after training. Results indicated that prior to training, self-efficacy related to the competencies was significantly lower (M= 61.09; SD= 16.27) than the overall mean rating following training (M= 83.16; SD= 7.01). The mean difference in perceived PHA competency levels before and after training was 22.07, t(11) = 3.65, $p < .01$. This presentation will provide additional results of changes within and across the six primary domains: health promotion and safety, evaluation and assessment, care planning and coordination across the spectrum, interdisciplinary and team care, caregiver support, and healthcare systems and benefits. Analyses indicative of curriculum improvements will be related to competency mapping with the 103 program objectives that comprised the program's didactic content.

EVALUATING A PAIN REPORTING AND MANAGEMENT PLAN FOR CONFUSED AND NON-VERBAL LONG TERM CARE RESIDENTS

B.M. Usher[2,4], C.J. Dunwoody[2], E.A. Mulvaney[2,5], B. Robison[2,6], K. Lanz[2,4], J.G. Hennon[1,2,3], J.N. Klinger[1,2,6], R. Schulz[1,2,7], *1. University Center for Social and Urban Reasearch, University of Pittsburgh, Pittsburgh, Pennsylvania, 2. Geriatric Education Center of Pennsylvania, Pittsburgh, Pennsylvania, 3. GRECC, VA Pittsburgh Healthcare System, Pittsburgh, Pennsylvania, 4. Supportive and Palliative Care, UPMC Presbyterian, Pittsburgh, Pennsylvania, 5. School of Social Work, University of Pittsburgh, Pittsburgh, Pennsylvania, 6. Aging Institute, University of Pittsburgh, Pittsburgh, Pennsylvania, 7. School of Medicine, University of Pittsburgh, Pittsburgh, Pennsylvania*

Nationally, quality improvement initiatives are being undertaken to address pain management in long term care (LTC). New federal regulations are also in place to improve resident pain management outcomes, however gaps remain and little is known about how to effectively design and implement a program for assessing, managing and communicating about pain for confused and non-verbal long term care residents Previous research indicates that pain is under assessed and under treated and that those who are non-verbal and those who suffer dementia are more susceptible to under-treatment of pain because they can't verbally express their pain management needs. Barriers to effective pain management also include resident, family and staff counterproductive beliefs about pain in addition to education gaps regarding pain management. We developed an evidence based practice initiative to teaching LTC nurses and Registered Care Technicians (RCTs) from 10 LTC facilities in the Midwest region how to identify, assess, treat, and report pain in non-verbal and confused residents. The train-the-trainer model was used to educate staff development champions and support them with their work at each site. Tools introduced for use included: Stop and Watch, PAIN-AD, CALM, the Analgesic Trial and CHAT. Chart reviews were conducted pre and 6 months post the intervention to assess whether changes in documentation of: pain, its aggravating and relieving factors, as well as pharmacological and non-pharmacological treatments for pain were in evidence. Follow-up at 12 months will be conducted to assess retention of learning over time and to guide permanent system change.

IMPROVING GERONTOLOGIC NURSING COMPETENCY: MAPPING LEARNING CONTENT WITHIN AN INTERPROFESSIONAL VIRTUAL CASE

S.C. Johnson, P. Parsons, M. Feldman, L. Sargent, *Virginia Commonwealth University, Richmond, Virginia*

Background Care of elderly adults necessitates specialized knowledge and skill, as well as need for coordination among different healthcare professionals, across multiple settings. To assure effective, high-quality outcomes for elderly adults, healthcare professional students must develop interprofessional skills as well as discipline-specific gerontologic competencies. To achieve desired education outcomes, faculty need to integrate these two facets of competency development into the curriculum. Methods Ninety-two baccalaureate nursing students were assigned to one of 42 interprofessional teams comprised of students from 4 disciplines. Using a virtual case study approach, students planned care for a complex geriatric patient across the continuum, including community, hospital, long-term and end-of-life care. Student teams collaborated when responding to 54 multiple-choice questions covering a range of geriatric content. The virtual case content was mapped to the AACN (2010) curricular guidelines for nursing care of older adults. At the conclusion of the case, outcome data was collected and nursing students' performance was evaluated with consideration to the competency map. Results Opportunities for case and curricular follow-up were noted in these priority geriatric content areas:1)Screening and assessment; 2) Interaction of acute and chronic illnesses; 3) Geriatric syndromes; 4) Variations in management of care across the continuum; and 5) Strategies to promote quality and safety. Conclusion Mapping learning content to discipline-specific competencies is essential when planning and implementing interprofessional learning strategies for health professional students. Faculty will use results of this study to make recommendations for geriatric curricular improvements and to make recommendations for improvements in the case study.

EFFECT OF LARGE SCALE, LOW DOSE INTERACTIVE TRAINING ON STUDENTS' ATTITUDES AND KNOWLEDGE SURROUNDING INTER-PROFESSIONAL COMMUNICATION AND TEAMWORK

R.L. Dillard, C. Clevenger, B.P. Davis, *Center for Health in Aging, Emory University, Atlanta, Georgia*

Clinical educators have come to recognize the importance of inter-professional education (IPE) within health professions training programs. Existing models of IPE require further evaluation to determine effectiveness on improving knowledge and perceptions of inter-professional communication. Our study evaluates the effect of a two-hour, large-scale training on student attitudes toward IPE and knowledge of the Situation, Background, Assessment, and Recommendation (SBAR) communication tool. First year students from Emory University's Nursing, Medicine, Physical Therapy, Anesthesiology Assistant, Physician Assistant, and Medical Imaging programs participated in the training in the fall of 2013 (n=470). Approximately 10% (n=45) completed pre- and post tests measuring knowledge of and attitudes toward communication and IPE. The intervention consisted of pre-reading on SBAR, lecture, panel discussion of interdisciplinary clinicians, and small-group collaboration with inter-professional student peers. The SBAR Knowledge Test (AZ toolkit) and the Interdisciplinary Education Perception Survey (IEPS) (Cameron et al, 2009) measured students' knowledge and attitudes, respectively. Pre-training surveys indicated 45% of respondents having "never heard of" SBAR; rates dropped to 4% indicating "never heard of" following the training. Average knowledge test scores improved from 65% (pre-training) to 75% post-training. Respondents indicated minimal changes on IPES: average scores increased from 5.06 to 5.13 (Likert 6-point scale) with many students declining in their perception. WHY DO GERONTOLOGICAL EDUCATORS NEED TO KNOW ABOUT "BINGO ARMS"?

T. Gendron, J. Lydecker, *Virginia Commonwealth University, Richmond, Virginia*

Purpose: Little is known about the relationship between anxiety about aging and body image. This study examines whether body image avoidance and objectified body consciousness are predictive of overall aging anxiety, fear of older people, psychological concerns about aging and aging appearance. Methods: This cross-sectional study examined aging anxiety, aging related concerns, objectified body consciousness, and body image avoidance in 501 undergraduate students attending a large public university. Results: Aspects of objectified body consciousness (viewing the body as an outside observer and body shame) and body image (avoidance of situations that provoke concern about physical appearance) predict overall anxiety about aging, fear of older people, psychological concerns as well as physical aging appearance concerns. Implications: This study suggests the utility and necessity of including anxiety about aging and aging appearance as core gerontological educational content, in addition to raising awareness of the societal ideal perpetuating youth and thinness.

IMPACT OF STAFF EDUCATION ON THE USE OF BEHAVIORAL ACTIVATION AS AN INTERVENTION IN THE MANAGEMENT OF DEPRESSIVE SYMPTOMS IN LTC RESIDENTS

G.A. Hudgins, T.A. Egan, D.P. Doyle, *Montana Geriatric Education Center, University of Montana, Missoula, Montana*

Working with three long-term care (LTC) facilities in Missoula, Montana, the MTGEC conducted a two phase project to improve the identification, prevention and management of depression in LTC residents. In the second phase, baseline data were collected from 122 residents' charts after which education on the use of behavioral activation was provided for LTC staff. Behavioral activation (BA) in the treatment of late life depression involves identifying, planning and implementing meaningful activities for residents to decrease their depression. Pre- and post-testing of the 56 participating staff (nurses, nursing assistants, pharmacists, social workers, physical therapists, administrators) showed significant ($p<0.0001$) gains in knowledge about the BA intervention. Participants rated the training session as excellent (59%) or good (34%) in terms of increasing their knowledge of BA in the treatment of depression. Four months after the initial data collection, a repeat data collection and analysis on 108 residents showed significant increases in the documentation of depressive symptoms compared to the initial data collection. Charting of depressive symptoms increased from a total of 357 symptoms noted (pre-training) in 122 residents to 417 symptoms noted (post-training) in 108 residents ($p<0.0001$). The average number of notes charted on depression increased from 2.9 per patient in a 2 month period (pre-training) to 3.9 per patient (post-training)($p<.0.0001$). In addition, the number of BA interventions increased from 65 pre-training to 125 post-training. Identification of desirable activities increased from 8 to 108, plans for resident involvement increased from 6 to 101, and actual involvement increased from 55 to 110 instances.

THE ROLE OF EDUCATION ON COGNITIVE DECLINE PRIOR TO DEATH: A SYSTEMATIC REVIEW

D. Cadar, G. Muniz-Terrera, *MRC Unit for Lifelong Health and Ageing, University College London, London, United Kingdom*

A key aim of aging research is the identification of factors that may slow cognitive decline in elderly. Education is a well-studied risk factor that has been reported to be associated with cognitive ageing. Its association with terminal decline (cognitive change prior to death) remains however unclear. Several studies have investigated this association, but the difference in methodology and statistical techniques used have contributed to a controversy in findings. The current work aimed to synthesise evidence about the effect of education on terminal decline in global and specific cognitive abilities. Biomedical and social science databases (PubMed, PsycoINFO, EMBASE, and Scopus) were searched from January 1990 to September 2013. A systematic review of 479 articles has investigated and compared trajectories of cognitive decline in longitudinal studies with repeated measures of cognitive functioning in relation to terminal decline. The studies were not matched on age at death, but were controlled for education. Results revealed mixed evidence of education. The rate and onset of terminal decline varied across cognitive domains. A preliminary hypothesis suggests that motor and cognitive functions both undergo a period of accelerated decline in the last few years of life. Exacerbate age- and mortality related cognitive declines among the oldest old were particularly seen in test of memory. Education affected terminal decline differently across the domains but this modification was not consistent with the predictions of cognitive reserve theory. The results of this review consolidate the existing pool of knowledge related to the variability in cognitive decline prior to death.

EDUCATION, NUMERACY, AND RISK FOR ELDER FINANCIAL EXPLOITATION

S.N. Williams, *Psychology, Scripps College, Claremont, California*

Elder financial exploitation(FE) is a crime that takes many forms, including transfer of real property,estate changes, unauthorized ATM charges, overcharging for services, forged checks, and "gifts". Basic research into the understanding of FE has been lacking until recently, in part because of difficulties in accurately defining and measuring FE (Conrad et al, 2010). The ongoing study examines neuropsychological correlates and the impact of education on financial exploitation in a sample of 159 community dwelling older adults who were administered a test battery as well as the Older Adult FinancialExploitation Measure, a 79-item self report measure (OAFEM; Conrad et al.,2010). Preliminary analyses revealed that there was no correlation between education and FE (p=ns), but higher levels of education is correlated with higher numeracy ($p=.001$) and numeracy is correlated with FE ($p<.05$). In other words, older adults who performed worse on the numeracy measure reported higher frequency of fraudulent events. So, although education and numeracy are correlated, linear regression analyses showed that education doesn't predict FE ($p>.63$), but numeracy does ($p<.05$). Moreover, numeracy remains to be a significant predict above and beyond education illustrating the unique role of numeracy in predicting FE. These results are consistent with work on financial capacity (Marson, 2000) and the growing literature on the importance of numeracy in decision-making (Wood et al., 2010).

OLDER ADULT OFFER READING PROGRAMS FOR YOUNG CHILDREN IN RURAL COMMUNITIES

Z.L. Bail[1], C.M. Mehrotra[2], L.M. Haglin[1], *1. Northland Foundation, Duluth, Minnesota, 2. The College of St. Scholastica, Duluth, Minnesota*

Since 2008, the Northland Foundation has worked with 10 rural communities and three Indian Reservations to develop locally-driven

AGE to age initiatives. These sites range in population from 391 to 12,124 with high poverty rates. Each site developed an action plan and implemented an array of projects that build friendship between age groups and enhance community well-being. A regional network has been created to bring participating sites together for information-sharing and training. In the fall of 2012, the Foundation added a program enhancement aimed at helping young children, age three to grade three in a variety of community-based and school settings, become successful readers by connecting them with caring older adult volunteers. AGE to age Reading Pals was piloted in three rural sites: Proctor, McGregor, and Moose Lake where more than 36 older adult volunteers regularly read with 204 children over the school year. The volunteers helped students at schools during lunchtime, after school, and at the library. They also read to children in early childhood care and education programs. The program was continued for a second year during the 2013-2014. Teachers reported the program helped their students become more confident readers with reading aloud. It also boosted their self-confidence and made them feel special and valued. It also benefited the volunteers. As one volunteer stated, "Being a Reading Pal opens the door for blending the old with the new, investing in what I can give away to the young new ideas and new places to go with a book."

MAKING CONNECTIONS: THE POSSIBLE LEGACY OF AN INTERGENERATIONAL PROGRAM

E.H. Thompson[1], A. Weaver[2], A. Futterman[1], *1. Sociology & Anthropology, College of the Holy Cross, Worcester, Massachusetts, 2. Bridges Together, Inc, Sudbury, Massachusetts*

Among children, forms of ageism range from affective and cognitive distancing to outright avoidance of contact with older people. On the face of the shrinking opportunities for children and older adults to routinely interact with one another – sometimes the result of age-segregated and gated communities, younger families' geographical mobility and greater distance from older relatives – many communities have introduced intergenerational programs within the elementary school curriculum. The current study reports on the "images of aging" held by 944 students attending a regional high school. For more than a decade one community has maintained an intergenerational program that brings 4th grade students together with older adults. The question was, do the students coming from the two towns differ in the images of aging? Separate regression analyses of positive and negative images of aging – controlling for students' frequency and self-reported quality of interaction with older adults, affective and cognitive distancing, ethnicity, age, and gender – reveal a town effect (beta = .057, t = 2.05, p < .05) for positive images of aging. This does not mean that the intergenerational program produced the observed difference, however what is certain is that the high school students from one community with ongoing intergenerational programming hold a more positive image of older adults. Further research is needed to parse out if there is a short- and long-term legacy effect when young students have an opportunity to interact closely with older adults who are not their grandparents or neighbors.

WHO BENEFITS? LONELINESS CHANGE AND STABILTY FOLLOWING A FRIENDSHIP ENRICHMENT PROGRAM FOR OLDER WOMEN

N. Stevens[1], C.M. Martina[1], G.J. Westerhof[2], *1. Psychogerontology, Radboud University Nijmegen, Nijmegen, Netherlands, 2. University of Twente, Enschede, Netherlands*

The negative consequences of loneliness in later life have become increasingly clear during the last decade, as has the value of having friends to reduce loneliness. Despite their beneficial influence, contact with friends often declines as we age.The Friendship Enrichment Program (FEP) was designed to support older women to develop the friendships that they desire. In this study we examined patterns of change in loneliness during the year following the FEP among 108 participants. Using cluster analysis of loneliness scores at two points in time, 7 clusters were identified. We combined these clusters into three groups: a recovered group (26%), a significantly improved group (36%), and a non-improved group (29%). A very small group (9%) was never lonely . Demographic variables (age, education, marital status) were not associated with the patterns of loneliness. However presence of a friend in the outer circle of the convoy initially, and presence of friends in the inner and outer circles, variation, and improvement in friendship later were associated with recovery from loneliness. Non-improvement was associated with a lack of these qualities in friendship development. These results are interpreted in terms of relational competence: a) the ability to develop new relationships and b) the ability to enhance relationships. Why some women do not succeed in reducing loneliness by means of friendship development is a question that requires further exploration.

COGNITIVE FUNCTIONING AND BEHAVIORAL CHANGE: EFFECTIVENESS OF AN INTERVENTION PROGRAM IN MEMORY

T.M. Granado Gil[1], N. Mendoza Ruvalcaba[1], E. Arias Merino[2], F. De Santos Avila[2], *1. Universidad de Guadalajara CUTONALA, Guadalajara, Jalisco, Mexico, 2. Universidad de Guadalajara, CUCS, Guadalajara, Jalisco, Mexico*

Introduction The intervention program "Memory a Big Treasure" was designed to improve cognitive skills through behavioral change and training on working, episodic and subjective memory in older persons. The objective of this study is to assess the effectiveness of this program. Methods This study was developed in the CASOENAC-project, FONCICYT-94670(EU-CONACYT). Participants were n=24 healthy older persons attending a community center (CICA), mean age 68.58(SD7.63) years, 54.2%women, 4.58(SD3.13) years education, divided in two groups (experimental n=12, control n=12, no differences in age, gender, education), the first took part in a 10-sessions program during (2-hours, once/week) the second remained in wait list. The program based on Precaution Adoption Process Model (PAPM) consisted in theorical-practical sessions for training on working, episodic and subjective memory. A pre-post battery included The Rivermead Behavioral Memory test, Backward Digit-Span (WAIS-RM), Subjective Memory Complains Scale, and PAPM-assessment. Pearson's Chi-square, Mann-Whitney U, Wilcoxon, and signs test were performed. Results At baseline the groups were similar p>.05, after the program in the experimental group were found significant improvements on working(p= .015), episodic(p=.002) and subjective memory(p=.011) compared with the control group. Regarding behavioral change groups at baseline were similar in stage of behavior change (Stage2: Unengaged), after the program most of the experimental group progress to the Stage6 (acting) while the control group remained without significant changes. Conclusion Findings show the program promotes improved memory through behavioral change in healthy elders. Training of cognitive functions prevents the development of pathological forms of cognitive change in old age and promotes active aging.

AGING AT HOME: BIOPSYCHOSOCIAL PROFILES AND ADULT DAY PROGRAMS

A. Eades, P. Katz, J. Karuza, A. Berall, B. Edelstein, *Baycrest, Toronto, Ontario, Canada*

Background: In response to rising healthcare costs in an aging population, the provincial government of Ontario has implemented the "Aging at Home Strategy" aimed at avoiding premature long-term care (LTC) placement. Avoidance of LTC placement may impact the functional profile of ADP membership, affecting programming and staffing profiles. Purpose: Profile the biopsychosocial characteristics of existing ADP members and compare their characteristics with an incoming cohort of new ADP members. Methods: Out of 105 individuals attending an ADP, 50 individuals were recruited (35 existing members, 15 new members) over one year. Existing members had been in the program 5 months to 14 years (mean=3 years); new members were recruited within their first month. Findings: New members were on average four years younger than existing members, but were more functionally impaired. Nearly all (93%) required mobility aids for ambulation and were cognitively impaired (90%); a significant majority (85%) experienced symptoms of depression and rated themselves as moderately lonely. Living situation (e.g. living alone) did not appear to be a factor for moderate loneliness among new members; however, more than 70% of existing members in the moderate loneliness category do not live alone. Discussion: Data suggest that the cohort of incoming ADP members are frailer and more functionally impaired. This study raises questions about whether increased prevalence of loneliness and depression is reflective of changes within the population, or if continued participation in an ADP supports improvement of psychosocial measures. This distinction is critical for ADPs' ability to effectively plan and demonstrate outcomes.

IMPACT OF PAST EXPERIENCE ON COLLEGE STUDENTS' ATTITUDES TOWARD OLDER ADULTS

J. Olson, M. Powers, *University of Cental Oklahoma, Edmond, Oklahoma*

Students' attitudes toward older adults can be improved through positive experiences with older adults, however, it is not clear if this improvement is dependent upon past experience. The purpose of this study was to examine the impact of past experience on change in attitudes toward older adults among college students participating in an intergenerational fitness assessment project. Kinesiology students completed a fitness testing experience at a local retirement community (n = 54). Students' attitudes toward older adults were assessed using Polizzi's Refined Aging Semantic Differential Scale (ASD) and the Attitudes Toward the Elderly Scale (ATE) developed by the Student Assisted Independent Living (SAIL) project. Attitudes toward working with older adults (ATW) were assessed using a scale developed by the SAIL project. Attitude assessments were conducted before and after the fitness testing experience. We also asked students if they had past professional experience with older adults. Complete data were obtained for 47 students. Students with past experience had significantly higher ATW scores at baseline than students without experience (p = .001). Repeated measures ANOVA indicated no significant interaction effects for any scale based on past experience; however, there was a trend toward those without experience increasing ATW with no change observed among those with experience. Both groups significantly and similarly improved on the ASD and ATE ($p < .05$). These results indicate that students with past professional experience may have more positive attitudes toward working with older adults, but do not have different attitudes toward older adults in general.

A TOOLKIT FOR ON-CAMPUS AND ONLINE COURSE CURRICULUM MAPPING

L. Huber[1], A. de Siqueira[1], E. Jung[1], J. Siefert[2], *1. Indiana University, Bloomington, Indiana, 2. Northeast Wisconsin Technical College, Green Bay, Wisconsin*

What core skills, competencies, and learning outcomes do gerontology programs seek to instill in students? AGHE's newly defined knowledge, abilities, and skills competencies (AGHE, 2014) provide faculty an opportunity to sharpen the focus of their curricula, measure proficiency, and meet market demands (Educational Advisory Board, 2012). Curriculum mapping aligns courses outcomes, assessments, and learning activities with program-level competencies. For those who teach online, that focus can be easily blurred by opportunities and barriers presented by technology. In this presentation, a series of tools will be presented to facilitate curriculum mapping for building or revising on-campus and online courses to meet program level competencies. From design documents to learning objective matrices to quality review rubrics (Quality Matters, 2014), this toolkit will equip attendees to design and develop on-campus and online programs that prepare students to master competencies and meet market demand in the field of aging. AGHE (2014). http://www.aghe.org/ Educational Advisory Board (2012). http://www.eab.com/ Quality Matters (2014). https://www.qualitymatters.org/

GERIATRIC CARE BOOT CAMP: AN INTERPROFESSIONAL, INTENSIVE EDUCATION PROGRAM

L.B. Solberg, C.S. Carter, T.N. Richardson, L.M. Solberg, *University of Florida, Gainesville, Florida*

Geriatric care is best delivered to patients through careful coordination of interprofessional teams of healthcare professionals, but there is a shortage of such professionals educated to care for older adults. Additionally, the population of older adults is rapidly increasing. In response, the University of Florida (UF) piloted a half-day long geriatric care boot camp to educate healthcare professionals about core concepts in geriatric medicine, including delirium and dementia, medication management, palliative care, and ethics. The boot camp was offered with two aims: 1) determine the level of interest of healthcare professionals across the University in participating in an intensive program dedicated to care of older individuals; and 2) measure whether this event would increase attendees' understanding of and comfort level in caring for older patients. The interprofessional perspective of the speakers and the varied expertise of the attendees differentiated the event from boot camps offered at other institutions. Pre- and post-assessments completed by the 44 boot camp participants (including nurses, pharmacists, and others) showed this type of educational initiative is in demand and an effective learning opportunity. Changes in participants' understanding of the core concepts covered were statistically significant, as was the change in comfort level of participants in caring for older adults. The majority of the attendees reported finding the multidisciplinary perspective of the boot camp beneficial. We will discuss these findings, the boot camp itself, and future plans in more detail to provide helpful guidance to others creating interprofessional geriatric practice curricula for healthcare professionals.

SESSION 1640 (POSTER)

STRESS AND COPING

STRESSING, SOCIALIZING, AND SIPPING: THE ROLE OF DIFFERENTIAL STRESSORS AND SOCIAL INTEGRATION IN RISKY ALCOHOL CONSUMPTION IN MID- TO LATE-LIFE

T. Wilson, L.A. Wray, *Biobehavioral Health, The Pennsylvania State University, University Park, Pennsylvania*

As age increases, tolerance to alcohol decreases. Excessive drinking can worsen current health conditions, increase morbidity, and interact adversely with medications related to many conditions associated with older age (e.g., acetaminophen, sleep). Approximately 40% of adults aged 65 years and older exceed the National Institutes of Alcohol Abuse and Alcoholism's recommended guidelines for alcohol consumption. Further, stress can be detrimental to quality of life and successful management of chronic diseases (e.g., diabetes). Existing studies document links between psychosocial factors (e.g., social support, social integration, stress) to alcohol use and abuse. Using 2010 data on 3,826 adults age 51 and older from the nationally representative Health and Retirement Study, the current study examines whether psychosocial factors (e.g., social integration and stressors) are associated with risky alcohol consumption, controlling on known covariates of alcohol consumption. Preliminary results suggest several known social status factors (e.g., younger age, being female) and not having chronic stressors (e.g., ongoing financial strain or health problems) were associated with the reduced likelihood of being a risky drinker. Getting together with friends was found to be related to an increase likelihood of being a risky drinker.

Preliminary results imply that known social status factors (e.g., age, gender) in addition to type of social network contact and chronic stress is related to risky drinking in middle-aged and older adults.

CHANGES AND STABILITY OF STRESS-RELATED GROWTH OVER 5-YEAR: FINDINGS FROM DAVIS LONGITUDINAL STUDY

X. Bi[1,2], C.M. Aldwin[3], *1. Center for Innovation to Implementation, VA Palo Alto Health Care System, Menlo Park, California, 2. Department of Psychiatry and Behavioral Sciences, Stanford University School of Medicine, Stanford, California, 3. Human Development and Family Sciences, School of Social & Behavioral Health, College of Public Health & Human Sciences, Oregon State University, Corvallis, Oregon*

Few studies have examined change and stability of stress-related growth (SRG) over time. The purpose of this study is to identify the number of classes based on SRG responses, and to examine how individuals make transitions across SRG classes over 5 years. Data were collected among 509 college alumni in both 1996 (T1) and 2001 (T2), Mage at T1 was 44.24, SD = 7.38. Latent class analyses (LCA) were used to identify number of classes of SRG for T1 and T2, separately. Latent transition analyses (LTA) were used to examine how individuals make transitions across SRG classes from T1 to T2. Two classes were found at both time points: high SRG (T1 61%%, T2 66%) and low SRG (T1 39%, T2 34%). The LTA found four subclasses: stable low SRG (66%), from low to high SRG (34%), stable high SRG (83%), from high to low SRG (17%). More women and older individuals were in the stable high SRG subclass than in the stable low SRG subclass. Those in the low to high SRG subclass were older than those in the stable low SRG subclass. Women were less likely to transit from the high SRG class to the low SRG class. SRG showed high stability over 5 years, especially in the high SRG class. Women and older individuals were more likely to have stable high SRG over time. Further, older individuals were more likely to transit from low SRG to high SRG over time. This suggests that SRG increases with age.

CHILDHOOD FAMILY ENVIRONMENT AFFECTS PATTERNS OF HASSLES AND UPLIFTS IN ADULTHOOD: THE VA NORMATIVE AGING STUDY

Y. Jeong[1], C.M. Aldwin[2], H. Igarashi[2], A. Spiro[3,4], *1. Chonbuk National University, Jeonju, Republic of Korea, 2. Oregon State University, Corvallis, Oregon, 3. Boston University, Boston, Massachusetts, 4. VA Boston Healthcare System, Boston, Massachusetts*

Childhood family experiences are important for well-being in later life. Those from cohesive families are more likely to enjoy good psychological health in adulthood, while those from highly conflicted families have poorer well-being. Childhood family experiences can also influence cognitive processes, with conflicted families resulting in more negative stress appraisals and poorer social skills. We investigated the effect of childhood family experiences on the longitudinal patterns of hassles and uplifts in older men (n=713) from the Normative Aging Study (Mage = 64.3; SD = 6.8). They completed the Family Environment Scale on their family of origin and current families in 1990. We related scores on family of origin to their patterns of hassles and uplift over 15 years, controlling for conflict and cohesiveness in their current family. Results showed that conflict scores in childhood were associated with pattern of hassles, with men who had the lowest level of hassles having lower conflict scores, compared to those with patterns indicating higher levels of hassles. In contrast, cohesion scores were associated with patterns of uplifts, with those having more uplifts on average reporting higher cohesion scores for family of origin. These findings suggest that negative family environments are related to more hassles in later life, whereas positive family experiences lead to more uplifts in later life.

INTRAINDIVIDUAL VARIABILITY IN DAILY ANTICIPATORY COPING: AGE AND EDUCATION DIFFERENCES

S.D. Neupert, J. Ramsey, A. Davis, *NC State University, Raleigh, North Carolina*

Daily stressors, especially arguments, are associated with worse mood, increases in physical health symptoms, increases in memory failures, and poorer performance on cognitive tasks in older adults. However, flexibility in coping strategies is linked with better outcomes for older adults. The current study implemented an 8-day daily diary to examine intraindividual variability as an index of flexibility in daily anticipatory coping (e.g., coping that takes place before a stressor occurs) in a sample of 43 older adults (M age = 74.3, SD = 7.5, range = 60-96). Participants completed questionnaires of anticipatory coping with respect to potential arguments that they may experience the following day. Significant intraindividual variability was found for all indices of daily anticipatory coping. Within-person standard deviation scores were calculated for each measure of anticipatory coping. We were interested in potential age and resource (i.e., education) differences in coping flexibility (i.e., intraindividual variability). Results from multiple regression analyses indicated that older adults ($\beta = -1.21$, $p = .02$) and those with more education ($\beta = -3.6$, $p = .023$) were less flexible in problem analysis for upcoming arguments. Additionally, there was an Age X Education interaction ($\beta = 3.71$, $p = .02$); education was associated with less flexibility in problem analysis for young-old adults, while education was associated with more flexibility in problem analysis for old-old adults. These results suggest that there is intraindividual variability in anticipatory coping behaviors for arguments within older adults, but that this flexibility may change with age and access to resources.

NEGATIVE AGING PERCEPTION WAS ASSOCIATED WITH DECREASED LONGEVITY: UNHEALTHY HABIT AS A MEDIATOR

X. Zhang[1], H. Fung[2], F.R. Lang[3], *1. Psychology, Peking University, Beijing, Beijing, China, 2. Chinese University of Hong Kong, Hong Kong, China, 3. University of Erlangen-Nürnberg, Erlangen, Germany*

Levy (2002) has argued that positive self-perceptions of aging could lead to increased longevity. We further examined the association between negative aging perception and longevity in a sample of Chinese older adults. We analyzed a population-based data from Chinese Longitudinal Healthy Longevity Survey (CLHLS), which was initially carried out in 1998 with 9,093 older adults (77 – 122 years old, Mean age = 92.10, SD = 7.74) from 22 out of the 31 provinces in China. And 4 follow-up surveys have been conducted in 2000, 2002, 2005, and 2008. In each wave, 3 items were designed to measure participant's negative self-perception of aging (e.g., feel useless with age), and the internal consistency of the 3 items was acceptable (mean $\alpha = .64$). Daily consumptions of alcohol and cigarettes were recorded as an indicator of unhealthy habits. Other demographic variables such as age, sex, education, marital status, self-reported health and quality of life were also measured and included in analysis as covariates. Cox Proportional Hazards Model was applied, and the results indicated that after controlling for demographic variables, participants with higher level of negative aging perceptions had a lower survival rates compared with those who had a lower level of negative aging perception. Moreover, this association was mediated by participant's unhealthy habits, such that individuals with higher level of negative perception had more unhealthy habits (e.g., drinking more alcohol or smoking more cigarettes), which could in turn impair their health and reduce their longevity.

CONTEXTUAL AND INDIVIDUAL CHARACTERISTICS PREDICTING INDIVIDUAL HEALTH OUTCOMES FOR OLDER ADULT LOUISIANA RESIDENTS

R. Ferreira[2], A.C. Faul[1], J.G. D'Ambrosio[1], *1. Kent School of Social Work, Univ Louisville, Louisville, Kentucky, 2. Tulane University, New Orleans, Louisiana*

Disaster mitigation research studies the impact of individual and contextual indicators on the ability of older adults 50+ and communities to adjust and cope with disaster disturbances. This research is relevant in a state like Louisiana who has been affected by disasters for centuries. Andersen's Behavioral Model of Health Utilization) is the conceptual model that drove this study, modified with the disaster resilience of place model as well as the hazards-of-place model of vulnerability. The study uses a multilevel, repeated cross-sectional design with a three-level, nested structure. It used secondary data gathered from the Behavioral Risk Factor Surveillance System for seven cohorts from 2004-2010. Parish-level data came from 12 additional sources. A representative Louisiana sample of 15,685 adults 50+ was used to test the model. Because the outcome variable (self-rated health) was ordinal, a ordered multinomial response model was tested. 20% of the sample reported fair to poor health in 2004, increasing to 25% by 2010. The results indicated inequitable disaster mitigation, with contextual social resilience, individual social vulnerability, individual economic resilience and contextual economic resilience indicators explaining the most variance in the self-rated health of older residents. Disaster risk indicators did play a role in explaining health outcomes, but not as strong as anticipated. By educating gerontologists on the importance of building resilience within communities and within older adults, and raising the awareness of the problem of inequitable disaster mitigation, we can foster better health outcomes for older adults living in disaster prone areas.

MINDFULNESS BUFFERS THE EFFECTS OF STRESS ON HEALTH-RELATED QUALITY OF LIFE IN OLDER ADULTS

E. Whyne, C. de Frias, *School of Behavioral and Brain Sciences, The University of Texas at Dallas, Richardson, Texas*

The current study examined whether the link between stress and health-related quality of life was buffered by protective factors, namely trait mindfulness, in a sample of middle-aged and older adults. In this cross-sectional study, 134 healthy, community-dwelling adults (ages 50–85 years) were recruited from Dallas, Texas. The participants were screened for depressive symptoms and severity (using the Patient Health Questionnaire [PHQ-9]). All participants completed measures of self-reported health status (i.e., SF-36v2: mental and physical health composites), life stress (using the Elders Life Stress Inventory [ELSI]), and trait mindfulness (i.e., Mindful Attention Awareness Scale). Hierarchical regressions (covarying for age, gender, and education) showed that life stress was inversely related to physical and mental health. Mindfulness was positively related to mental health. The negative effect of life stress on mental health was weakened for those individuals with higher levels of trait mindfulness. The results suggest that mindfulness is a powerful, adaptive strategy that may protect middle-aged and older adults from the well-known harmful effects of stress on mental health.

SLEEP DURATION AND DAILY CORTISOL FOR CAREGIVERS ON HIGH AND LOW STRESS DAYS

A.N. Leggett[1], L.C. Klein[2], S.H. Zarit[2], *1. Psychiatry, The University of Michigan, Ann Arbor, Michigan, 2. The Pennsylvania State University, University Park, Pennsylvania*

Sleep complaints are common among caregivers and are associated with detriments in mental and physical health. Examining the relation of sleep with cortisol, a biomarker of the stress process, may further link sleep with subsequent health changes in caregivers. The current study examines whether sleep duration is directly associated with the cortisol awakening response (CAR), or if it is moderated by Adult Day Services (ADS) use, an intervention known to lower daily stressor exposure and improve blunted CAR, which is a pattern found among people under chronic stress. We examine caregivers (N=150) of individuals with dementia (IWD) on low stress days when IWDs attended ADS and high stress days when IWDs did not attend ADS. Data were gathered over 8 consecutive days. Caregivers were primarily female (87.3%) with a mean age of 61.43. We ran a multi-level model to explore the association of today's ADS use, last night's sleep duration, and their interaction with today's CAR. Using the Johnson & Neyman technique to probe the significant interaction between ADS use and sleep duration, we found that when an individual sleeps at or longer than their average and uses ADS, they have a higher CAR. When an individual sleeps at or longer than their average but does not use ADS, they have a smaller or blunted CAR. Findings indicate that ADS use moderates the association between sleep duration and CAR such that longer than average sleep is associated with blunted, dysregulated cortisol patterns on non-ADS days.

STRESS AND EVERYDAY MEMORY PROBLEMS: THE BUFFERING ROLE OF SELECTION, OPTIMIZATION AND COMPENSATION

S.A. Robinson, E. Hahn, M. Lachman, *Brandeis University, Waltham, Massachusetts*

There is an established negative relationship between stress and cognition. However, less work has examined the relationship between naturally occurring stress and everyday memory problems. The use of a self-regulatory strategy, such as selection, optimization, and compensation (SOC), may help to buffer these negative effects of stress. The present study extends previous work relating daily stressors and everyday memory problems by examining whether this relationship varies across levels of SOC strategy use. Participants (n = 122, 23 – 94 years of age) completed a baseline interview and a daily diary study for seven consecutive days. Each day, participants self-reported daily stressors, SOC strategy use and everyday memory problems. Multilevel analyses examined a within-person relationship between daily stressors and everyday memory problems, and the moderating effect of SOC strategy use. Results revealed that on days on which participants reported more daily stressors compared to their own average, they also reported more memory problems (Est. = 1.21, SE = 0.25, $p < .0001$). Additionally, SOC strategy use moderated this effect (Est. = -0.21, SE = 0.05, $p = .0001$). When participants experienced a day with high stress, those that had high SOC strategy use reported fewer memory problems than those that had low SOC strategy use. When participants experienced a low stress day, there was no difference in memory problems between those that used high or low SOC strategies. These findings help to further understand the relationship between stress and everyday memory problems, with possible implications for developing intervention programs using SOC strategies.

THE ROLE OF CONSCIENTIOUSNESS IN EMOTIONAL REACTIVITY TO DAILY STRESSORS

K.A. Leger[1], S.T. Charles[1], D. Almeida[2], *1. Psychology and Social Behavior, UC Irvine, Irvine, California, 2. Pennsylvania State University, University Park, Pennsylvania*

Conscientiousness, a personality trait characterized by self-control, deliberation, and competence, has strong associations with lifelong health and well-being. High levels of conscientiousness predict reduced disease development, fewer cognitive problems, and greater longevity. Researchers have suggested a number of processes that may explain these links, including lifestyles related to reduced stressor exposure and reactivity. Heightened emotional reactivity to daily stressors has been associated with poorer health and the development of chronic health conditions. People with high levels of conscientiousness may be less reactive to stressful life events. The current study examined the moderating effects of conscientiousness on negative emotional reactivity to daily stressors and how this relationship varies with age. Participants (N=1842) completed a series of daily interviews in Wave 2 of the National Study of Daily Experiences (NSDE II), a subset of the Midlife in the United States (MIDUS II) Survey. Multilevel models indicated that lower levels of conscientiousness were associated with increased emotional reactivity to daily stressors (b=.035, p<.001). Additionally, lower levels of conscientiousness were associated with greater exposure to stressors. This effect was similar across age groups. Results indicate that emotional reactivity to daily stressors is one pathway through which conscientiousness influences health.

THE INTERACTIVE ROLE BETWEEN STRESS, COPING, AND DISPOSITION

J. Blaxton, C. Bergeman, *University of Notre Dame, South Bend, Indiana*

Various contextual factors influence the relationship between stress and depressive affect, such as the type of stressor encountered, the coping strategies used to buffer the impact of the stressor, and the disposition of the individual involved. Specifically, according to Fredrickson's undoing hypothesis, positive emotions uniquely benefit the individual, promoting the use of coping strategies and buffering the impact of stressors on emotional well-being. This hypothesis posits that individuals with high positive affect also utilize better coping strategies when dealing with stress. The current study assesses the unique relationships between two types of stressors (ambient stressors and role strains), two coping strategies (emotion-focused coping and instrumental-focused coping) and the role of positive affect on depression. Standardized data from the Notre Dame Study of Health &Well-being was used to explore these relationships. The sample includes 566 subjects with an age range from 40-91 (M=63.4, SD=9.9). Analyses indicated significant direct effects of age and significant two-way interactions between coping and stress for all the models. In addition, the model consisting of role strains, emotion-focused coping, and positive affect also resulted in a two-way interaction between emotion-focused coping and positive affect. There were significant three-way interactions between coping, stress, and positive affect for all four models. The general trend was similar across all models with positive affect buffering the effects of stress on depression for both high and low strains, and high coping only showing substantial buffering of the effects of stress on depression in the group with low positive affect.

THE ROLES OF AGE AND COGNITIVE FUNCTION IN MODERATING THE RELATIONSHIP BETWEEN JOB DEMAND AND EMOTIONAL DISTRESS

J. Hyun[1], D. Almeida[1], J. Smyth[1], M.J. Katz[2], R.B. Lipton[2], M. Sliwinski[1], *1. The Pennsylvania State University, University Park, Pennsylvania, 2. Albert Einstein College of Medicine, Bronx, New York*

Prolonged states of negative affect (NA) have been linked to a poor physical and mental health outcomes. Because people are working into older ages, it is important to understand the factors that moderate the effects of occupational stress on NA. We examined how intelligence (measured by the Shipley vocabulary and Ravens progressive matrices tests) and age influences the relationship between self-reports of job demand and NA in a diverse midlife sample of adults (N=132, M[SD] age=45.06[10.53]). Regression analysis indicated high levels of job demand were associated with more NA and that this effect was amplified in those with lower scores on the Shipley ($\beta = -2.00$, $p < .05$) and Ravens ($\beta = -3.53$, $p < .01$). The relationship between job demand and NA was equivalent across age. Implications of these findings for the effects of occupational burnout and job stress among an aging workforce are discussed.

ASSESSING THE INFLUENCE OF CHRONIC STRESS AND SPOUSAL SUPPORT ON GLYCEMIC CONTROL IN DIABETIC ADULTS: DO GENDER AND RACE/ETHNICITY MATTER?

A. Thierry, L.A. Wray, *Biobehavioral Health, The Pennsylvania State University, University Park, Pennsylvania*

BACKGROUND: Better management of HbA1c levels in adults with diabetes can prevent negative sequelae associated with poor glycemic control. Chronic stress may hinder, and social support may help, diabetics' ability to maintain healthy HbA1c levels. This study assesses the association between chronic stress, spousal support, and HbA1c in married/partnered US adults with diabetes. METHODS: We analyzed data for 3,533 US married/partnered adults >50 year who responded to the 2006 Health and Retirement Study core interview and participated in both Psychosocial and Lifestyle Questionnaire and HbA1c biomarker collection. Three indices were created: chronic stressors persisting for ≥ 12 months, positive spousal support, and negative spousal support. HbA1c served as the measure of diabetes management. Differences by gender, race, and Hispanic ethnicity were assessed. RESULTS: Chronic stress is positively associated with HbA1c (F=8.30, p=0.004), more so in women than in men (F=5.18, p=0.023; F=4.21, p=0.040). This relationship is significant in Whites (F=6.80, p=0.0091), but not Blacks (F=0.0, p=0.9654) or Hispanics (F=2.59, p=0.1076), even though these groups have higher average HbA1c and chronic stress levels than Whites. There is a significant decline in HbA1c for Whites and men with high spousal support (F=4.52, p=0.0336; F=5.28, p=0.0216). Negative spousal support was significantly related to increased HbA1c (F=9.39, p=0.0022), but to a greater degree in Hispanics compared to non-Hispanics. CONCLUSION: Perceived high quality of spousal support may help to mitigate the detrimental effects of chronic stress on HbA1c. Further examination of differences of the impact on HbA1c, particularly for women and minorities, are needed.

SOCIAL SUPPORT AND PSYCHOLOGICAL DISTRESS AMONG OLDER ADULT CANCER SURVIVORS

S. Vang, A.C. Mui, *Columbia University, New York, New York*

The purpose of this study is to explore the role of social support as a protective factor for psychological distress among older adult cancer survivors, a rapidly growing population. The secondary data for this research is from the Health Information National Trends Study (HINTS), a biennial, cross-sectional survey conducted with a nationally-representative sample of adults age 18 and older. Data used for this study were collected from HINTS interviews conducted in 2012, and included all participants who were age 65 and older with a reported history of cancer (n=261). Demographic data show that 50.2% were males and 49.8% were females. The average age of respondents was 75. Non-Hispanic Whites made up 84% of the sample. Approximately 54% were married. The average annual income was between $35,000-50,000. Bivariate findings indicate that older cancer survivors who reported greater years of education, higher incomes, and non- minority status were at lower risk for psychological distress. Multiple regression results suggest that protective factors against psychological distress among older adult cancer survivors include having emotional support, better health status, and being Non-Hispanic White, after controlling for other demographic differences. Findings indicate that social support, particularly emotional support, is an important coping resource for older cancer survivors when they have had to deal with cancer treatment or mortality issues. Further research is needed to understand why older adult cancer survivors from racial/ethnic minority groups are at greater risk for psychological distress.

DOES STRESS IMPACT THE RELATIONSHIP BETWEEN RISK FACTORS AND VASCULAR FUNCTION?

L.K. Hill[1,2,3], B. Jamerson[3,5], A. Aiken-Morgan[3], C.L. Edwards[2,3], K.E. Whitfield[4,3], *1. Center for the Study of Aging and Human Development, Duke University Medical Center, Durham, North Carolina, 2. Department of Psychiatry, Duke University Medical Center, Durham, North Carolina, 3. Duke University, Social Science Research Institute- Center for Biobehavioral Health Disparities Research, Durham, North Carolina, 4. Department of Psychology & Neuroscience, Duke University, Durham, North Carolina, 5. Durham Veterans Administration Medical Center, Durham, North Carolina*

African Americans experience exceptionally high rates of hypertension and diabetes, which are risk factors for poor vascular functioning and mortality. Possessing at least one e4 allele of the apolipoprotien E (APOE) gene is also associated with greater cardiovascular disease risk, and evidence suggests that APOE4 and diabetes are synergistically associated with cerebrovascular changes. Psychosocial stress is an additional cardiovascular risk factor; however, the extent to which stress may further contribute to complex pathophysiological vascular changes remains largely unexplored in African Americans. In the present study, we investigated the interactive associations of stress, hypertension and diabetes co-morbidity, and APOE4 status with pulse pressure, a measure of vascular functioning, in a composite sample (N = 664) of middle-aged and older African American adults from the Carolina African American Twin Study of Aging (CAATSA | n=285) and the Baltimore Study of Black Aging (BSBA | n = 379). Univariate models adjusted for age, sex, and education showed significant main effects for co-morbidity and APOE4 status (p's < .05). Specifically, pulse pressure was higher among individuals with at least one APOE4 allele and either hypertension, diabetes, or both. There was a significant interaction between co-morbidity and stress such that individuals with co-morbid disease and higher stress levels exhibited significantly higher pulse pressure compared to non-diabetic, hypertensive participants (p < .05). For individuals with at least one APOE4 allele and those without, pulse pressure was highest among individuals with co-morbid disease and higher stress. These results support the view that stress is an additive factor in vascular disease risk.

AGING INMATES USE THE ARTS TO COPE WITH STRESS

K.T. Vu[4], K.A. Skarupski[1,2,3], *1. Center on Aging and Health, Johns Hopkins University, Baltimore, Maryland, 2. Dept.of Medicine, Division of Geriatric Medicine & Gerontology, Johns Hopkins School of Medicine, Baltimore, Maryland, 3. Office of Faculty Development, Johns Hopkins School of Medicine, Baltimore, Maryland, 4. University of Minnesota, Minneapolis, Minnesota*

Purpose: Among the coping strategies used in response to stress, the arts constitute a creative coping mechanism. We can learn about resilience from people who face chronic stress and prisoners certainly live in a stressful environment. Design & Methods: The participants were male inmates in a maximum security prison in the midwest U.S. who participated in the Stress & Health in Prison (SHiP) Study. A 314-item questionnaire was distributed to 1,200 inmates residing in the general population and 192 returned their questionnaires (16% RR). One open-ended question asked participants to describe how they cope with stress and how they manage their health. Results: The mean age of the inmates was 41.8 [SD=11.1], 62% were African American, 45% had at least a high school education, 62% were married, average time served was 14.7 years [SD=8.1], average sentence length was 67.7 years (SD = 108.31), and 35.4% had life sentences. Among the open-ended responses, art-specific replies accounted for 13% (16/125) and included references to music, artwork, drawing, poetry, and writing. For example, one participant stated, "I write R&B and rap music (to cope with stress)!" Another noted, "[I] write about what bothers me and how to prevent it." Implications: The arts are used to alleviate the stressful effects of prison life, to self-regulate emotional, spiritual, and physical well-being, and to tell personal incarceration stories. Future analyses will link the use of arts to discrete health outcomes which may have implications for older community-dwelling adults living in isolation or in other institutional settings.

DISTRESS, COPING, AND END-OF-LIFE PLANNING IN ADVANCED CANCER PATIENTS WHO WANT TO KNOW PROGNOSIS

K. Trevino[1], H.G. Prigerson[2], *1. Rowan University, Glassboro, New Jersey, 2. Weill Cornell Medical College, New York, New York*

Background. This study examined differences in distress, quality of life, coping, and end-of-life care planning in advanced cancer patients who reported wanting to know versus not wanting to know their life-expectancy. Methods. Patients (n=645; Mean age=59.6 years) with advanced cancer were asked "If your doctor knew how long you had left to live, would you want him or her to tell you?" (0=No, 1=Yes). Participants were interviewed to obtain information on their socio-demographic characteristics, suicidal ideation, quality of life, and coping, and indicated whether they had discussed end-of-life care with their doctor. Regression analyses examined relationships between wanting to know life-expectancy (predictor variable) and outcome measures, controlling for confounding socio-demographic factors. Results. 72.1% of patients wanted to know life-expectancy. Patients who were white and married were more likely to want to know. Patients who wanted to know had worse existential and physical quality of life, were more likely to report suicidal ideation, and reported higher levels of coping by planning and lower levels of positive religious coping. They were also more likely to discuss end-of-life care with their doctor than patients who did not want to know. Discussion. Patients' desire to know their life expectancy may reflect an underlying suspicion that death is near and/or be driven by psychological distress, indicating the importance of proactive measures to prevent painful death. Patients who want to know their life expectancy may be more actively involved in care planning which may reduce distress and result in enhanced preparation for death.

ASSESSING THE EFFECT OF DAILY STRESSOR REACTIVITY ON FINANCIAL WELL-BEING ACROSS ADULTHOOD

R. Koffer, S. Lee, J. Mogle, D. Almeida, *Human Development and Family Studies, The Pennsylvania State University, State College, Pennsylvania*

Emotional reactivity to stressors affects both proximal and long-term health and well-being outcomes. Current economic times also beg greater examination of the drivers of financial well-being. As such, the present analyses examined the effect of an individual's stressor reactivity (within-person negative affect change in response to a stressor experience) on his/her financial net worth 10 years later. Two waves (1995-96 and 2004-05) in the national Midlife in the United States study provided N=526 participants (Mage=54.94, SDage=11.90) who responded to both a paper survey, including demographic, health, well-being, and lifestyle behavioral questions, as well as daily diary telephone interviews recording stressor experiences for 8 consecutive nights. Participants were categorized into two, self-identified groups: positive or non-positive net worth, and separately categorized into octiles based on their self-reported net worth dollar amount. After controlling for income, age, gender, ethnicity, household characteristics, and stressor reactivity at wave 2, we found that greater wave 1 stressor reactivity predicted greater odds of having non-positive net worth as compared to positive net worth (OR=3.0, p<0.01). Further, a one standard deviation increase in stressor reactivity predicted a lower net worth category 10 years later (e.g. from the average net worth category: $59,000-$110,000, to the next category lower: $18,000-$50,000) (p<0.05). These results did not depend on age. Results will be contextualized by comparing stressor reactivity effects to age effects on net worth, and examining potential drivers of the effect of stressor reactivity on net worth. Implications for financial well-being in older age will also be discussed.

ASSOCIATION OF SELF-REPORTED ANXIETY AND DEPRESSION WITH COGNITIVE TESTING AND NEUROIMAGING MEASURES IN INDIVIDUALS WITH TYPE 2 DIABETES FROM THE DIABETES HEART STUDY

L. Raffield[1,2,3], G.A. Brenes[4], B.I. Freedman[5], C.E. Hugenschmidt[6], F. Hsu[7], J.A. Maldjian[8], J.D. Williamson[6], D.W. Bowden[2,3,9], *1. Molecular Genetics and Genomics Program, Wake Forest School of Medicine, Winston-Salem, North Carolina, 2. Center for Human Genomics, Wake Forest School of Medicine, Winston-Salem, North Carolina, 3. Center for Diabetes Research, Wake Forest School of Medicine, Winston-Salem, North Carolina, 4. Department of Psychiatry and Behavioral Medicine, Wake Forest School of Medicine, Winston-Salem, North Carolina, 5. Department of Internal Medicine - Nephrology, Wake Forest School of Medicine, Winston-Salem, North Carolina, 6. Department of Gerontology and Geriatrics, Wake Forest School of Medicine, Winston-Salem, North Carolina, 7. Department of Biostatistical Sciences, Wake Forest School of Medicine, Winston-Salem, North Carolina, 8. Department of Radiology, Wake Forest School of Medicine, Winston-Salem, North Carolina, 9. Department of Biochemistry, Wake Forest School of Medicine, Winston-Salem, North Carolina*

Increased anxiety and depression, accelerated cognitive decline, and increased risk of dementia are observed in individuals with type 2 diabetes (T2D). Anxiety and depression may contribute to lower performance on cognitive tests and to the changes in neuroimaging measures often observed in individuals with T2D. We examined these relationships in the family-based Diabetes Heart Study. 739 European American individuals with T2D from 529 families completed cognitive testing, brain magnetic resonance imaging, the Brief Symptom Inventory-anxiety, and the Center for Epidemiologic Studies Depression Scale 10 item measure. We hypothesized that self-reported anxiety and depression would be associated with cognitive performance, including the Digit Symbol Substitution Task, the Modified Mini-Mental State Examination, the Stroop Task, the Rey Auditory-Verbal Learning Task, and the Controlled Oral Word Association Task for Phonemic and Semantic Fluency, and neuroimaging measures, including assessments of brain volume, white matter lesion volume, diffusion imaging scalars, and cerebral blood flow. Association was examined using marginal models with generalized estimating equations in SAS 9.3. Analyses were adjusted for age, sex, and use of psychotropic medications. Self-reported anxiety and depression were associated with lower performance on all cognitive testing measures assessed ($p \leq 0.002$). Anxiety and depression were also associated with increased white matter lesion volume ($p \leq 0.004$), decreased gray matter cerebral blood flow ($p=0.001$), and increased white matter mean diffusivity ($p \leq 0.007$). Effects were strongest for individuals reporting both anxiety and depression symptoms. Anxiety and depression were important predictors of cognitive testing and neuroimaging measures in an aging (66.0 ± 9.9 years) cohort affected by T2D.

SOCIAL SUPPORT, PSYCHOLOGICAL RESOURCES, MENTAL HEALTH, AND INFLAMMATION: POTENTIAL PATHWAYS?

S. Kim, P.A. Thomas, *Sociology, Purdue University, West Lafayette, Indiana*

Social support serves important social, psychological, and behavioral functions in later life. Accordingly, a body of literature examines the impact of social support on health (e.g., Cohen, 1985), with much attention being drawn to self-reported mental and physical health. Much less is known about how social support influences objective, clinically measureable health outcomes. We address this gap in the literature by focusing on chronic inflammation as a modifiable risk factor for disease. There is compelling evidence that a circulating level of inflammatory protein, measured by C-reactive protein (CRP), is an objective indicator of physical health and mortality because it signals early physiological dysregulation preceding disease. However, research yields inconsistent findings on how social support 'gets under the skin' and affects CRP, signifying the need to investigate potential pathways linking them together. Therefore, the current study examines how social support affects inflammation indirectly through self-esteem and mental health. To answer the research questions, this study uses two-wave data from the National Social Life, Health, and Aging Project (NSHAP), a nationally representative sample of older adults in the United States. Findings from structural equation models suggest that net of controls, social support affects self-rated mental health both directly and indirectly through self-esteem. At the same time, mental health serves as an intermediate pathway linking social support and inflammation. These findings not only suggest a significant role of social support on multiple aspects of health but also specify complex psychological and physiological processes linking them together.

FINANCIAL STRAIN AND SLEEP QUALITY BEFORE AND AFTER THE GREAT RECESSION: ROLE OF SOCIAL SUPPORT?

L.R. Wilkinson, *Purdue University, West Lafayette, Indiana*

Objective: This study examines financial strain and sleep quality among older adults before and after the Great Recession. Guided by cumulative inequality theory, this study poses three main questions. First, does initial financial strain lower sleep quality? Second, do increases in financial strain over time lower sleep quality? If so, does social support play a role? Methods: This research draws on 5,415 respondents from the Health and Retirement Study (2006-2010) to examine whether the economic downturn affected changes in sleep quality over a four-year period. The Health and Retirement Study contains measures of financial strain and sleep quality before and after the economic downturn, thereby creating an "experiment in nature." Residual change models estimate the effect of financial strain in 2006 and change in financial strain between 2006 and 2010 on four measures of sleep quality. Results: Results reveal that greater financial strain in 2006 and increases between 2006 and 2010 both contribute to poorer sleep quality, even after adjusting for household income and wealth. This finding was observed for trouble falling asleep and feeling rested in the morning, but not for sleep disturbances during the night. Additionally, positive social support lowered the probability of poor sleep quality, whereas negative social support increased the probability of poor sleep quality. Discussion: This study builds on the literature on financial strain using a novel study design. The findings reveal the impact of financial strain on sleep quality following the Great Recession, and highlight the importance of social support in understanding this relationship.

WHY CONNECT DOCTORS OF MEDICINE AND JURISPRUDENCE TO EFFORTS TO PREVENT ELDER FINANCIAL ABUSE?

R. Roush[1], D. Marson[2], L.A. Stiegel[3], D.M. Blandin[4], *1. Baylor College of Medicine, Houston, Texas, 2. University of Alabama, Birmingham, Alabama, 3. American Bar Association, Waqshington, D.C., District of Columbia, 4. Investor Protection Trust, Washington, D.C., District of Columbia*

Neurodegenerative changes in neuronal cells and brain networks lead to changes in executive functioning and financial capacity. Declining financial capacity, in turn, adversely affects elders, their families, and society as a whole. MetLife (2011) found elder investment fraud and financial exploitation (EIFFE) cost society \$2.9 billion in 2010. Widera (2011) posited that when financial losses force elders to choose between paying routine living expenses and out-of-pocket health care costs, their frail conditions can spiral down quickly. Plassman (2008) revealed that 35% of persons over age 71 had mild cognitive impairment (MCI) or full dementia. Triebel and Marson (2009) showed that declining checkbook skills in persons with MCI are associated with impending conversion to Alzheimer's disease. Denburg (2007) concluded that damage to the prefrontal cortex of the brain can make elders less risk averse. Older adults' increased vulnerability to EIFFE necessitates involving physicians and lawyers in detection and prevention efforts. Following overviews of clinical factors and EIFFE, presenters will reveal (1) four-year results of the Investor Protection Trust (IPT)/ Baylor College of Medicine partnership to educate clinicians (N=6500) about EIFFE in 28 states, the District of Columbia and Puerto Rico; and (2) early results of a similar new IPT/American Bar Association partnership to educate lawyers. Presenters also will discuss what these initiatives teach us about how to connect physicians and lawyers to efforts to detect and prevent EIFFE, and how these critical connections help to prevent vulnerable elders from the adverse outcomes described in the Widera paper.

ELDER MISTREATMENT AWARENESS AMONG SENIOR CENTER AND FAITH-BASED ELDER MINISTRY PERSONNEL: A PILOT STUDY

A.E. Sokan, *Texas State University, San Marcos, Texas*

Elder mistreatment (EM) is a gross infringement on the human rights and dignity of its victims. It affects the quality of life of those affected, their families and society. Unfortunately, although about 90% of EM occurs among community dwelling older adults, much of this abuse and mistreatment is hidden, and goes undetected because of a lack of knowledge and awareness about EM - definition, risk factors, signs and appropriate responses. Studies have shown that appropriate knowledge and awareness increases confidence in identifying, and responding to EM among personnel who work with older adults. As the population ages, more seniors are served by social and recreational service providers (SRSPs), such as those who work at senior centers and faith-based elder ministries, providing a rich opportunity to interact with service personnel. These personnel are well placed to be watchful eyes for actual or suspected EM. This pilot study identifies gaps in senior center and faith-based elder ministries personnel's knowledge and awareness about EM, along with the barriers to identifying and responding to EM among their clientele. Preliminary findings indicate a need for sensitivity awareness and the benefits of training interventions designed to address knowledge gaps where they exist.

SELF-NEGLECT: RESEARCH RESULTS AND POLICY ISSUES

M.S. Day, G. McCarthy, *School of Nursing & Midwifery, UCC, University College Cork, Ireland, Ireland*

Background: Self-neglect has been described as the inability or unwillingness to provide for one-self the goods and services needed to live safely and independently. It is a complex multidimensional phenomenon and accounts for 18-20% of referrals to Senior Case Workers in Ireland. Aim: To investigate health and social care professional's perspectives and knowledge of self-neglect and ascertain sources of knowledge. Methodology: Ethical approval granted by Local Research Ethics Committee. A descriptive quantitative cross sectional design was used. A multi item researcher developed self-neglect questionnaire was posted to a national convenience sample of 549 community health and social care professionals in Ireland and 341 (60%) responded. Analysis: Data analysed using SPSS20 and descriptive statistics (mean ± S.D., frequency, average) and multiple linear regression. Findings: The most common professional grouping was community nurses (n=305) and social workers (n=34). One third (n=112: 33.8%) had been in contact with 3 to 5 self-neglect cases in previous 12 months. The main source of knowledge related to practice and personal experience. Community nurses were less likely than social workers to use literature and books as a source of knowledge. Knowledge was significantly associated with higher level of education, gender and number of self-neglect cases. Some professionals had deficits in relation to legal and policy aspects of self-neglect. Conclusions The majority of health and social care professionals had no educational preparation on self-neglect. The findings emphasize the need to develop training programmes on self-neglect and promote more use of literature and books.

PREVALENCE OF ELDER SELF-NEGLECT IN A CHICAGO CHINESE POPULATION: THE ROLE OF COGNITIVE, PHYSICAL AND MENTAL HEALTH

R. Chen[1], M. Zhang[1], E. Chang[1], C. Li[1], K. Lam[1], M.A. Simon[2], X. Dong[1], *1. Rush Institute for Healthy Aging, Chicago, Illinois, 2. Northwestern University, Chicago, Illinois*

Backgrounds: Elder Self-neglect is an increasingly prominent public health issue that occurs in all socio-demographic groups. However, very little is known about the prevalence and factors associated with elder self-neglect among minority older adults. This study examined the cognitive, physical and psychological characteristics associated with elder self-neglect in an U.S. Chinese older population. Methods: Data were from a population-based epidemiological study in the greater Chicago area. In total, 3,159 Chinese older adults aged 60 years and above were interviewed in person from 2011-2013. Participant's personal and home environment was rated on hoarding, personal hygiene, house in need of repair, unsanitary conditions, and inadequate utility. Results: The prevalence of elder self-neglect of all severities was higher among older adults who were with lower cognitive function, lower physical function, and those with more depressive symptoms. Lower physical function (ADL moderate/severe self-neglect OR 1.09, 95% CI1.05-1.13; IADL mild self-neglect: OR 1.04, 95% CI1.03-1.06; IADL moderate/severe self-neglect: OR 1.06, 95% CI1.04-1.07) and cognitive function (mild self-neglect: OR 1.05, 95% CI1.03-1.07; moderate/severe self-neglect: OR 1.07, 95% CI1.04-1.09), and more depressive symptoms (mild self-neglect: OR 1.05,95% CI1.02-1.07; moderate/severe self-neglect: OR 1.08, 95% CI1.06-1.11) were significantly associated with increased risk for elder self-neglect of all severities. Conclusion: Oder adults with lower levels of cognitive, physical, and psychological health were more likely to report elder self-neglect and its phenotypes. Health care professionals should improve screening for self-neglect among older patients who report cognitive impairment, physical disability and depressive symptoms.

SESSION 1645 (POSTER)

SUCCESSFUL AGING II

HUMAN CAPITAL, STATUS INCONSISTENCY AND RETIRED ELDERS' LIKELIHOOD OF VOLUNTEERING

N. Danigelis, B. McIntosh, *Sociology, University of Vermont, Burlington, Vermont*

Education (human capital) and income (just plain capital) have long been recognized as significant predictors of increased likelihood of volunteering among American elders (Morrow-Howell, 2010). Relatively unexplored is the differential impact that socioeconomic "status inconsistency" (Lenski, 1954) might have on volunteering, which raises an important question: Do low education / high income and high education / low income elders volunteer to the degree that additive models would predict? Additionally, do predictors of volunteering differ across status inconsistent and status consistent groups? To answer these questions, we employ data on 13,036 individuals 65+ and out of the labor force from the 2011 Volunteering Supplement to the Current Population Survey (CPS). Contrary to expectations, results showed that high education / low income elders were more likely to volunteer than either of the other two groups, especially low education / high income elders. Furthermore, logistic regression and difference of slopes analyses showed that education and income operated differently across the three subsamples, highlighting especially the importance of a high school degree among low education / high income elders and the significance of income increases for the status consistent subsample but not for either status inconsistent subsample. Other predictors also operated differently across status groups, lending support for the idea that status inconsistency is a viable concept in examining volunteering. The findings are discussed in terms of the significance of human capital in relation to role expectations, especially as education relates to marginalized individuals (Homans, 1962, Moen, 1992; Greenfield & Marks, 2004).

CONDITIONAL INDEPENDENCE: A GROUNDED THEORY TO ENABLE PRODUCTIVE AGING

M.B. Cole[1], K.C. Macdonald[2], *1. Quinnipiac University, Hamden, Connecticut, 2. Sacred Heart University, Fairfield, Connecticut*

Today's retirees already understand some of the basics of successful aging, attending to physical and mental fitness, and continuing an active lifestyle. Productive aging represents the next step, choosing roles and occupations that keep them engaged with others and with their communities. However, as they continue to age, emerging health challenges could compromise their ability to live and function independently. The basis for this grounded theory, authors conducted a qualitative productive aging study (PAS) over the past 3 years. They interviewed forty successful agers, defined by their current engagement in 3 of 6 productive occupations: self-manager, home manager, caregiver, volunteer, paid worker, and lifelong learner. The findings resulted in three main themes: 1) self-manager role, 2) social connections, and 3) self-fulfilling activities. Considering these themes, three interactive strategies serve to preserve occupational and social roles through occupational therapy interventions: 1. Because self-management guides the choices for self-care, social, and occupational engagement, supporting intentional abilities that enable this role are paramount. 2. Situational adaptation facilitates maximum functioning by addressing issues such as home safety, transportation, accessibility of public spaces, social expectations and support. Adaptive equipment and strategies, compensate for compromised abilities, so that the client can continue to participate in life. 3. Structured performance is deliberate, conscious planning and preparation in anticipation of activity participation. The theory of conditional independence helps older adults to define under what conditions, and with which supports, they are able to continue to engage in meaningful productive occupations that preserve their autonomy, social identity, and independence.

HELPING OTHERS AND CARDIOVASCULAR DISEASE RISK FACTORS: DOES VOLUNTEERING GET "UNDER THE SKIN" LATER IN LIFE?

J.A. Burr, S. Han, J.L. Tavares, *Gerontology, Univ Mass Boston, Boston, Massachusetts*

Research has shown that engaging in productive activities is positively related to better mental and physical health and negatively related to mortality risk. Volunteering is among the more consistent indicators of productive aging associated with well-being in later life. Uncovering the pathways through which volunteering is related to the proximate determinants of health is gaining ground, but the results from previous studies are equivocal. This study examined the relationships among volunteering and four risk factors for cardiovascular disease (CVD): obesity (waist circumference), blood pressure (hypertension), cholesterol (low HDL), and glucose (HbA1c), using the 2006 Health and Retirement Study. Logistic regression results showed that volunteer status was consistently related to the four indicators of CVD risk in the predicted negative direction for middle-aged persons (age 51-64 years). Middle-aged volunteers were less likely than non-volunteers to be obese, to be hypertensive, have low levels of HDL cholesterol, and have high levels of glucose. Middle-aged volunteers were also less likely to show evidence of a modified version of the metabolic syndrome. For middle-aged persons, volunteering more than 100 hours annually was related to a lower likelihood of CVD risk compared to persons who did not volunteer. With few exceptions, volunteering was not a protective factor for persons 65 years and older. Further research is required to determine at what point in the life course volunteering ceases to be a benefit for the volunteer. These results supported the idea that helping others is beneficial for both the community and for the older volunteer.

FINDINGS FROM THE MASSACHUSETTS HEALTHY AGING DATA REPORT

E. Dugan[1], F.W. Porell[1], N.M. Silverstein[1], C. Lee[1], J.S. Chae[1], K.M. Turk[1], B. Gaines[1], R. Palombo[2], *1. Gerontology Dept, University of Massachusetts Boston, Boston, Massachusetts, 2. Tufts Health Plan Foundation, Watertown, Massachusetts*

The aging of the population has piqued interest in optimal aging. Policymakers, service providers, philanthropists, researchers, and lay people in Massachusetts have formed a Healthy Aging Collaborative to work together to better understand and promote healthy aging in Massachusetts (see mahealthyagingcollaborative.org). Approximately 14% of the state is age 65 or older (N=891,303) and by 2030 this is expected to exceed 21%. We developed community profiles reporting nearly 100 indicators of healthy aging for the 351 cities and towns in the state and 16 Boston neighborhoods. Never before has data been reported at such a local community level. Analyses were conducted using data from CMS, BRFSS, US Census and other sources using small area estimation techniques to determine age/sex adjusted community rates. We then compared community and state rates, as well as state rates to national rates. State rates for MA adults 65 or older ever being diagnosed with chronic disease indicators were: diabetes (32%), hypertension (78%), stroke (13%), Alzheimer's disease or related dementias (14%), depression (29%), and 4+ chronic conditions (59%). Disparities among communities were pronounced; several communities face immense challenges to healthy aging scoring worse than state averages on 24 or more indicators. Compared to national rates, Massachusetts ranked better on arthritis and COPD, but worse on diabetes, hypertension, and Alzheimer's. This poster describes both the methodology and findings of the report and includes examples of how communities have used these data for developing new partnerships, identifying priorities and promoting positive change.

THE MEANS AND ENDS OF SUCCESSFUL AGING: THE MANITOBA FOLLOW-UP STUDY

A.U. Swift, R.B. Tate, *Manitoba Follow-up Study, University of Manitoba, Winnipeg, Manitoba, Canada*

Along with trying to define successful aging, researchers continue to struggle with whether it should be considered a predictor (i.e., a means), an outcome (an end), or both. Since 1996, the men of the Manitoba Follow-up Study (MFUS) cohort have been repeatedly surveyed for their lay definitions of successful aging. Our recently-published coding manual outlines 86 themes that emerged from the narrative data. In an earlier top-down attempt to narrow the gap between lay definitions and theories of successful aging, we found that the 86 themes mapped almost completely onto a number of prominent theoretical paradigms in the field. Among the theoretical paradigms considered were Baltes and Baltes' (1990) SOC model; Rowe and Kahn's (1997) successful aging definition, and Bowling's (2007) framework. In our present bottom-up approach, we conceptually mapped the components of these three prominent theories onto the 86 themes (from the MFUS men's successful aging definitions) and found the degree of overlap to be less complete, highlighting the disjoint between lay vs. researcher-defined successful aging. Bowling's theoretical framework showed 77% overlap with the successful aging themes, whereas the SOC model and Rowe and Kahn overlapped by 20% and 13%, respectively. In all cases, the psychological adaptation components of the theories showed the greatest degree of overlap with the themes from the narrative definitions. Close inspection of the themes not subsumed in the overlap suggested that they may represent the means used by individuals to age successfully, whereas the mapped themes could represent the ends of successful aging.

ACTIVE AGING: OUTCOMES FROM VITAL AGING® PROGRAM IN MEXICO

N. Mendoza Ruvalcaba[1,2], R. Fernandez-Ballesteros[2], *1. Universidad de Guadalajara, CUTONALA, Guadalajara, Jalisco, Mexico, 2. Universidad Autónoma de Madrid, Madrid, Madrid, Spain*

Introduction Vital Aging® is a program designed to promote individual active aging in older persons 60 years and over, currently in 3 versions (presential-course, multimedia, and e-learning) has been successfully applied in Spain. The objective of this study is to assess the effectiveness of this program in Mexico (presential and multimedia versions). Methods Intervention study. Participants were n=71 divided in four groups (1-Experimental: presential n=19, 2-Experimental: presential/multimedia n=15, 3-Experimental: presential n=17, 4-Control n=20), mean age 64.5 years, women. The program consisted in 19 theorical-practical sessions (2-hours/twice-week). A pre-post battery assessed activities, opinions on aging, physical-activity, nutrition, life satisfaction, health (objective/subjective), memory (subjective/objective), social participation, self-efficacy, and socio-demographics. Descriptive and ANOVA comparisons were performed. Results After the program, all experimental groups improved their opinions (p's<.01) and self-efficacy on aging (p's<.001) compared to control. Presential groups showed improvements on subjective memory (p's<.05), and satisfaction with social relationships (p's<.05) compared to control. While multimedia group reported better life satisfaction (p=.027) and increases in activities (p=.005). 1-Experimental group showed better subjective health (p=.012) and less memory problems (p>.000). Control group remained without changes. Conclusion Findings show that Vital Aging® Program promotes personal improvements toward active aging in Mexican older persons. Maintaining health and quality of life across the lifespan will do much towards building fulfilled lives, a harmonious and a intergenerational community.

THE EFFECTS OF RESILIENCE FACTORS ON SUCCESSFUL AGING: FINDINGS FROM THE GEORGIA CENTENARIAN STUDY

Y. Baek[1], P. Martin[1], I.C. Siegler[2], L. Poon[3], *1. Iowa State University, Ames, Iowa, 2. Duke University, Durham, North Carolina, 3. University of Georgia, Athens, Georgia*

Purpose: The purpose of this analysis was to examine the effects of resilience factors (Big-5 personality traits) on the components of successful aging (cognition, volunteering, activities of daily living, and subjective health) by using the data of the Georgia Centenarian Study. The data collection used in this study consisted of 72 octogenarians and 234 centenarians. Methods: Exploratory factor analysis was conducted to reduce the number of resilience (personality) factors. The chi-square difference test using MPlus was used to test two competing factor models. And, in order to test the effects of two resilience factors, blocked regression analysis was conducted. Results: Two factors were extracted, which were named as inter-personality and intra-personality resilience. Inter-personality resilience consisted of Extraversion and Openness whereas intra-personality resilience included Neuroticism, Agreeableness, and Conscientiousness. The chi-square difference test indicated that a two-factor model was found to fit better than a one-factor model. After controlling demographic variables, intra-personality resilience was associated with higher level of cognition ($\beta = .15$, $p < .05$), higher possibility of doing a volunteer work ($\beta = .16$, $p < .05$), and higher level of activities of daily living ($\beta = .16$, $p < .05$). Inter-personality resilience was also a significant predictor for successful aging. It was positively associated with cognition ($\beta = .17$, $p < .05$) and volunteering ($\beta = .18$, $p < .05$). Conclusion: Resilience is an important source that helps older adults adapt successfully with the aging process. Two resilience factors including personality traits were associated with successful aging.

SUCCESSFUL AGING TRAJECTORIES IN LATER LIFE

T.D. Cosco[1], G. Muniz[3], B.C. Stephan[2], C. Brayne[1], *1. Public Health & Primary Care, University of Cambridge, Cambridge, United Kingdom, 2. Newcastle University, Newcastle-upon-Tyne, United Kingdom, 3. MRC Unit for LIfelong Health and Wellness, London, United Kingdom*

Background: Successful aging is premised on the acknowledgement of the heterogeneity of aging trajectories. To date there has been little investigation into these longitudinal trajectories using latent class analysis. Methods: A previously validated, a priori model of successful aging, including both biomedical and psychosocial components, was mapped into a longitudinal population-based cohort study: the Cognitive Function and Ageing Study (CFAS). Using latent class analysis the trajectories of successful aging were mapped longitudinally. Results: Several different successful aging trajectories were identified. Each of these trajectories was associated with a unique demographic profile. Discussion: The heterogeneity of successful aging trajectories highlights the many and varied ways in which individuals can age. Identifying the specific trajectories and their associated characteristics highlights the unique ways in which individuals can age and provides the opportunity for policy and practice interventions.

DOES SPIRITUALITY COMPENSATE FOR LOW MASTERY IN CONGESTIVE HEART FAILURE?

M. Nguyen[1], C.M. Aldwin[1], J. Proulx[1], C. Park[2], *1. Oregon State University, Corvallis, Oregon, 2. University of Connecticut, Storrs, Connecticut*

Congestive heart failure (CHF) is a chronic condition which is associated with poor quality of life, including diminished mastery in older adults, leading to higher rates of depression. Coping strategies for loss of perceived control include a search for meaning in life and reestablishment of control or mastery. In this study, we examined the interaction of spirituality and mastery on physical and mental health using data from the Religion/Spirituality and Congestive Heart Failure Study (Park, 2006). The participants in this study consisted of 189 CHF patients (121 men, 68 women) whose mean age was 68.65 (SD = 10.14). Mastery was measured by the Hope Scale (Snyder et al., 1991), and spirituality by the Daily Spiritual Experiences Scale of the Brief Multidimensional Measures of Religiousness/Spirituality (BMMR/S; Fetzer, 1999). Mental and physical health outcomes were measured by 12-item Short-Form Health Survey (SF-12; Ware, Kosinski, Keller, 1996). We used mean scores of all scales and reverse coded these items when necessary in order to create scales in which higher scores indicated higher mastery, spirituality, and mental and physical health. Hierarchical multiple regression equations supported previous studies showing that high mastery predicted mental health, $\beta = 55.05$, $p < .05$, but the direct effect of spirituality was not significant. However, spirituality moderated the relationship between mastery and mental health, $\beta = -5.82$, $p < .05$. Spirituality did not moderate relationship between mastery and physical health. Thus, spirituality was a buffer and improved mental health in CHF patients with low mastery, but not physical health.

HOW IS ENGAGING IN PRODUCTIVE ACTIVITIES ASSOCIATED WITH DEPRESSION AMONG OLDER ADULTS WITH CANCER?

P. Xu, E. Dugan, B. Kim, S. Thapa, *Gerontology, UMASS BOSTON, Boston, Massachusetts*

Older adult's participation in productive activities generally has a positive relationship with well-being. Past research on this topic tends to be limited to studies of very healthy older adults. Yet, the benefits may be even more important for less healthy adults. We explored this in older adults with cancer and examined the association between depression and productive activities. A better understanding of this issue is critical to extend the remaining life for those patients and improve quality in the end phase of life. The purpose of this study is to explore the association between four productive activities (employed, formal volunteering, grandparenting, and helping friends) with depression in older adults with cancer. Drawing on data from the 2010 Health and Retirement Study (HRS), this study examines 2,148 respondents who aged 50 years and above and are diagnosed with any kind of cancer (except normal skin cancer). Depression is measured by the short scale of CES-D form (8 items) and is dichotomized into yes (4-8 scores) and no (0-3 scores). The higher score, the more likely the individual is depressed. Logistic regression analyses showed that older cancer patients who had paid employment experienced less depressive symptoms. Similarly, formal volunteering was associated with less depression. Helping friends and grandparenting were not significantly related to depression. These findings suggest that even though being sick, engaging in certain productive activities is important in relieving depression.

EFFECTS OF ACTIVITIES ON MEMORY BELIEFS: A QUANTITATIVE CROSS-SECTIONAL DESIGN WITH A LIFESPAN SAMPLE

S.A. Hicks[1], D.S. Jopp[1], C. Hertzog[2], *1. Fordham University, Bronx, New York, 2. Georgia Institute of Technology, Atlanta, Georgia*

Do our hobbies influence our aging? Research shows that both memory beliefs and some leisure activity engagement each relate to memory ability. The question arises then whether activity engagement influences these beliefs. The goal of the current study was to examine relationships between leisure activities and beliefs about perceived memory change and control for adults across the lifespan. The present study used data on personal memory beliefs, as assessed by the Personal Beliefs about Memory Instrument (Lineweaver & Hertzog, 1998), and leisure activity engagement measured with the Extended Victoria Longitudinal Study Activity Questionnaire (Jopp & Hertzog, 2010). The sample included 261 adults aged 18-85. Regression analyses were conducted to determine which activities predicted memory beliefs among young (18-30 years), middle-aged (31-59 years), and older (61-85 years) adults. For younger adults, results revealed that more engagement in technology-related activities predicted worse perceived future memory change. Technology use also predicted perceived memory change for middle-aged adults, but in relation to retrospective memory. Specifically, engagement in more technology-related activities predicted worse perceived change from the past. For older adults, more public social activity engagement predicted better perceived future memory change, and engagement in all activities predicted future control beliefs. Regression analyses with interaction effects confirmed the findings. In sum, findings reveal differential relationships between leisure activities and personal memory beliefs at different ages, and extend prior research by showing that leisure activities are related to memory beliefs. Thus, findings provide a deeper understanding of the relationships among memory beliefs and leisure activities.

PREDICTORS OF ADULT EDUCATION PROGRAM SATISFACTION AMONG LAS VEGAS COMMUNITY-DWELLING OLDER ADULTS

T. Yamashita, E. Lopez, J. Reid-Keene, *University of Nevada, Las Vegas, Las Vegas, Nevada*

Life-long learning has received growing attention as the American population ages. Both formal (e.g., organized) and informal (e.g., self-learning) education is beneficial for physical health, emotional well-being and social networks in later life. One key determinant of successful learning among older adults is the continuation of learning activities. In general, participants who are satisfied with their educational programs/learning activities are more likely than others to continue their participation over the long term. However, little is known about what factors predict satisfaction with educational programs among older adults in urban communities. Data were collected from 1,075 middle-aged to older adults (age 50 and older) who participated in organized adult education programs provided by the Osher Lifelong Learning Institute (OLLI) in Las Vegas. A total of 318 respondents completed an online survey. Partial proportional odds ordinal logistic regression was used to model program satisfaction as a function of demographic, socioeconomic, OLLI program-related and health/well-being variables. Results showed that being older (OR = 1.08, $p < 0.05$), more years participating in OLLI (OR = 3.90, $p < 0.01$), greater well-being (OR = 1.03, $p < 0.001$) and an active social life (OR = 2.6, $p < 0.05$) were associated with higher satisfaction with the OLLI programs. In contrast, white participants (OR = 0.36, $p < 0.05$) and those who were employed (OR = 0.18, $p < 0.05$) had lower satisfaction. The findings were evaluated with regard to the existing relevant literature, participants' characteristics, and a content analysis of the qualitative comments from respondents.

ATTITUDES TOWARDS CENTENARIANS, LIFE-EXTENSION AND THE WISH TO REACH 100 YEARS OLD

O. Ribeiro[1,2,3], A.F. Canedo Garrido[2,1], M. Cerqueira[2,1], L. Teixeira[1], *1. ICBAS - Institute of Biomedical Sciences Abel Salazar, UNIFAI, Porto, Portugal, 2. University of Aveiro, Aveiro, Portugal, 3. ISSSP, Porto, Portugal*

Presently there are numerous debates surrounding the topic of human life extension and issues from diverse scientific backgrounds, mainly from bioethical debates, have been extensively brought to discussion; yet, public beliefs and attitudes regarding life extension have not been particularly studied nor their potential associations with attitudes towards living an extremely long life. This study aims to analyze the relationship between pro- and anti-longevity attitudes; attitudes towards very old people and the willingness to live until the age of 100 years in a sample of older adults. Selected items from the Life-Extension Questionnaire (LEQ), the Aging Semantic Differential (ASD) using centenarians as an attitudinal target and a question about the willingness to live until the age of 100 were administered to a sample of 141 individuals aged 60+ years old. Socio-demographic information (age, gender, marital status, children and grandchildren's existence, educational level), perceived health status and perceived quality of life were also obtained. Overall findings suggest that there are no overwhelmingly pro- and anti- attitudes toward life extension in the considered sample, but that there is a prolongevist trend. Marital status (being married/living together), higher educational level, positive perceived health status and willingness to live to age 100 were found to be significantly related with this trend. Further studies are needed on the public opinion regarding human life extension and on the contextual variables and psychological constructs that may affect a more positive or negative attitude towards extreme longevity. Further analyses of the LEQ instrument are also needed.

NO TIME LIKE THE PRESENT TO PLAN FOR THE FUTURE

J.L. Koposko, D.P. McDaniel, D.B. Pearce, K.S. Austin, K.M. Jones, D.A. Hershey, *Psychology, Oklahoma State University, Stillwater, Oklahoma*

Future time perspective (FTP) is the extent to which one enjoys thinking about the future. Previous literature demonstrates that high FTP levels predict effective planning outcomes, but few investigations have examined the relationship between FTP and behavioral outcomes in multiple domains of life. In addition, there are many measures to assess FTP, but the relationships among measures are not well understood. The present investigation had two goals. The first was to examine FTP in five different domains requiring planning for late life: social, work, leisure, finances, and health. The second was to compare how different FTP scales captured relationships between time perspective and behavioral outcomes. Sixty-four individuals between the ages of 24 and 65 completed self-report FTP scales and behavioral outcome scales in five domains. The FTP scales were the Zimbardo Time Perspective Inventory, the Consideration of Future Consequences Scale, and five other FTP scales specific to each domain. The behavioral outcome scales tapped adaptive life planning behaviors in each of the domains. Bivariate regressions were carried out in which FTP was regressed onto each of the behavioral outcome measures. Of the five domains, health consistently showed the strongest relationships. Overall, there were more significant relationships when domain-specific measures of time perspective were used than when either of the two general measures were used. Results suggest that FTP is more important in some domains of life than others (i.e., health) and that domain-specific measures of FTP may be more sensitive to the relationships among FTP, planning, and late-life outcomes.

PERCEPTIONS OF PAIN AND PAIN MANAGEMENT AND THEIR IMPACT ON WILLINGNESS TO USE PAIN MEDICINE

S. Hong, J.G. Cagle, *School of Social Work, University of Maryland, Baltimore, Maryland*

Despite the growth of the economic impact of pain and pain management, there remains a lack of knowledge about disparities, especially, evidence regarding individual attitudes and beliefs about accepting pain treatments. This study provides preliminary information on the prevalence of public concerns about pain management and reports the mediating influence of the perceptions. A cross-sectional survey of community-dwelling adults 18+ in US was conducted . Using a random selection method,123 respondents were telephone-interviewed in 2012. Based on the modified Protection Motivation Theory, hierarchical logistic regression was conducted to examine factors influencing willingness to use pain medicine. Perceptions on pain and pain management were applied for multiple mediation analyses. Thirteen items about beliefs of pain and pain management were grouped into 5 factors: threat/coping appraisal, attitude/subjective norm/perceived control. Threat appraisal was most common, and subjective norm was least common. Regarding the hierarchical regression, threat appraisal, income, and military service experience were significantly associated with the intention to use pain medicine. Through the mediation analyses with the bootstrapping method, four mediation relationships were found; 1) race and income on subjective norm through education, 2) gender on threat appraisal through medical work experience, 3) medical work experience on the intention to use pain medicine through threat appraisal. Threat of pain might be an important predictor of using pain medicine and a mediator to bridge past experience to behavior of pain management. Education programs targeting minorities, men, and low income families might reduce the gap of pain management disparities.

THE TYPES OF EXPERIENCES REMEMBERED CAN AFFECT PERCEPTIONS OF AGING

C.F. Brito, K.L. Nagy, A.H. Potochnik, J. Jimenez, R.C. Peterson, J.P. Brassea, *Psychology, Eastern Illinois University, Charleston, Illinois*

Personalized contact with an out-group, and imagining inter-group interactions, leads to reduced prejudice towards, and more positive perceptions of, the out-group. The purpose of this study was to examine whether aging and death anxiety, as well as perceived familiarity and comfort with the elderly, can be affected by having young adults remember an experience with an older adult. Participants (N=178) were randomly assigned to one of three conditions, and asked to think about either a positive, negative, or non-valence experience they had had with an elderly person. Participants were then administered the Aging Anxiety Scale (AAS) and Templer's Death Anxiety Scale (DAS); they also indicated their familiarity and comfort with the elderly on continuous line scales. ANOVA was used to examine differences among the memory conditions, and partial correlations to examine the relationships among the measures; in all analyses, we controlled for social desirability. Both AAS (p=.70) and DAS (p=.15) scores were not significantly different among memory conditions. For the positive memory group, (1) familiarity was reported to be significantly (p=.013) higher; (2) the relationship between the AAS and DAS (r=.34) was less; (3) and, familiarity was more predictive of aging anxiety (r= –.47). For all three memory conditions, as participants' comfort level with the elderly decreased, their aging anxiety increased. We conclude that evoking positive memories in young adults can lead to increased perceptions of familiarity with the elderly; and, the more familiar and comfortable with the elderly young adults report being, the less aging anxiety they report.

EXPANDING MIDDLE-AGE? TRANSFORMING AGE CATEGORIES IN PEOPLE'S SELF-IDENTIFICATIONS

I. Pietila[1], H. Ojala[2], T. Calasanti[3], N. King[3], *1. School of Health Sciences, University of Tampere, Tampere, Finland, 2. University of Tampere - School of Social Sciences and Humanities, Tampere, Finland, 3. Virginia Tech, Blacksburg, Virginia*

Literature on age relations and ageism suggests that old age is a marginalized status and therefore when people identify themselves in terms of age, they are reluctant to call themselves "old" irrespective of their chronological age. This presentation uses data collected from 32 personal interviews and 4 focus groups with working aged (aged 50-55) and retired (aged 65-70) Finnish engineers to explore 1) how these men self-identify in terms of age categories; and 2) whether the change in occupational status influences the extent to which men all themselves middle-aged. Our findings suggest that, rather than adopting new terms used by scholars or the general public (such as "third-agers" or "senior citizens"), these men are expanding the time of life to which middle age might refer, and indeed, may be creating new categories of middle age rather than challenging or changing terms relating to old age. Further, neither labor force transitions nor one's chronological age and distance from what otherwise might be considered middle age led them to see themselves as anything other than middle aged. Retired respondents eagerly called themselves "middle-aged", and some respondents also drastically downplayed their chronological age. And among the working aged interviewees some respondents even hesitated to call themselves "middle-aged", instead describing themselves as "early middle-aged". What middle age means in these contexts bears greater research.

SESSION 1650 (POSTER)

FAMILY AND INTERGENERATIONAL RELATIONSHIPS

A PRELIMINARY ANALYSIS OF INTERGENERATIONAL RESOURCE TRANSFERS ACROSS MULTIPLE GENERATIONS AND TIME

A.E. Barnett, *University of Wisconsin-Stout, Menomonie, Wisconsin*

Guided by life course perspective, contingency theory, exchange model, and intergenerational solidarity theory, this study sought to examine whether earlier intergenerational resource transfers (IRT) were related to later IRT between American middle-age adults and their adult children and parents. Two waves of Midlife in the United States (MIDUS) panel data were analyzed for 5,519 middle-aged adults using structural equation modeling. Intergenerational resource transfers were measured using reports of giving and receiving unpaid assistance, emotional support, and finances at Time 1 and Time 2. Results indicated an acceptable fit for the measurement ($\chi 2$ (224) = 2077.56, $p < .001$, CFI = .04, RMSEA = .96.) and structural model ($\chi 2$ (276) = 43,931.70, $p < .001$, CFI = .04, RMSEA = .96). Respondents who received from their children in T1 were more likely to give to their children in T2. Respondents who gave to their children and parents in T1 were more likely to receive from their children in T2. Respondents who gave to their parents in T1 were more likely to give to their parents in T2. Finally, respondents who gave to their parents in T1 and did not receive from their parents or children in T1 were more likely to receive from their parents in T2. This longitudinal perspective on IRT begins to provide a more unified and complete picture of how resources are given and received across multiple generations of American families.

THE ROLE OF GRANDPARENTS IN THE EARLY IDENTIFICATION AND DIAGNOSIS OF AUTISM SPECTRUM DISORDERS

J. Hillman[1], A.R. Marvin[2], S. Levin[2], J.K. Law[2], C. Anderson[3], *1. Applied Psychology, Penn State Berks, Reading, Pennsylvania, 2. Kennedy Krieger Institute, Baltimore, Maryland, 3. Towson University, Towson, Maryland*

Autism spectrum disorder (ASD) now affects 1 in 88 children in the U.S. (CDC, 2012). Little is known about the first person experience of grandparents of these children or what role they may play in early identification of the disorder. The Kennedy Krieger Institute's Interactive Autism Network, therefore, launched an online survey to examine grandparents' experiences. 1,881 grandparents with at least one grandchild with ASD (83% grandmothers; 95% Caucasian; 60% lived in suburbs; 37% completed college) completed an anonymous 30 minute survey, representing the first national study of such grandparents. Results revealed that 76% of the grandparents played an active role in the diagnosis of their grandchild's ASD, and that 28% "independently identified" the initial symptoms of ASD. Multinomial regression analysis revealed that the odds of participation in early detection increased significantly for grandparents who were grandmothers, middle-aged, currently employed, or who lived within 25 miles of their grandchild. Pearson correlation showed that having a grandparent identify concerns sooner about their grandchild's development was associated with receiving an earlier formal diagnosis, $r=.42$, $p<.001$. Grandparents also reported that health care professionals such as pediatricians (20%), and teachers and daycare providers (10%) expressed denial regarding their grandchild's ASD. The majority of grandparents engaged in advocacy including fundraisers and walks (48%), educational programs (32%), and political advocacy (30%). Thus, grandparents of children with ASD appear to represent a significant resource within the extended family, despite often being ignored or excluded by treatment professionals. Recommendations to incorporate grandparents into the diagnostic process are offered.

PTSD AND MARITAL QUALITY AS PREDICTORS OF REPORTED PAIN IN BABY-BOOMERS

K. Stott, J. Yorgason, *School of Family Life, Brigham Young University, Provo, Utah*

Data from a sample of 3401 individuals who completed the 2010 follow-up survey of the Life and Family Legacies Study were examined to assess the levels of marital quality, post-traumatic stress disorder, and reported pain for the respondents. Associations between martial quality, post-traumatic stress disorder (PTSD), and reported pain levels were examined among this sample of Baby-Boomers. Regression models indicated that after controlling for various demographic and social influences, marital quality was not significantly related to reported pain levels. PTSD, however, was found to be strongly predictive of increased reported pain levels. Contrary to previous research and theory, further regression analyses indicated that the interaction of higher marital quality and higher PTSD was also predictive of higher reported pain levels. Possible explanations are discussed, within the framework of family stress theory, for these counter-intuitive findings as well as possible ramifications for practitioners. Also, recommendations are offered for future research direction and focus.

RELATIONSHIP QUALITY IN MOTHER-DAUGHTER CAREGIVING DYADS: A REVIEW

D.N. Solomon, *SON, OHSU, portland, Oregon*

Background: Seventy percent of adult-child caregivers for aging parents in the US are women; 85 percent of those they care for are mothers. Much is known regarding the instrumental and physical aspects of caregiving, yet considerably less is known of the emotional quality of the lifelong mother-daughter relationship, particularly in the context of cognitively intact mothers. Purpose/Aim: To synthesize empirical literature pertaining to relationship quality between cognitively intact aging mothers and caregiving daughters. Search Strategy: A systematic appraisal of peer-reviewed, English language research on relationship quality in aging mothers over 60 and their adult caregiving daughters was conducted, 1990-present. MEDLINE, CINAHL, PsycINFO, and Google Scholar were accessed combining MeSH terms including "chronic disease" with "mothers," "children," and "caregivers." Nineteen articles met criteria. Findings: Research supports a mother-daughter caregiving relationship characterized by complexity and multi-dimensionality, including conflict and its management. Via caregiving, mothers and daughters are often able to transform their relationship to a deeper, more mature level. Several researchers were surprised to discover improvement in daughters' mental health and emotional commitment to caregiving relationships as mothers' health deteriorated. Research and Clinical Implications: How mothers and daughters personally perceive multi-dimensional aspects of their relationship is still largely undiscovered, as is how the relationship may further change towards the mother's end of life. These factors require additional exploration if we are to offer mothers and daughters the care they may require at this complex, poignant time.

THE INFLUENCE OF CLOSENESS WITH MOTHERS & MOTHERS-IN-LAW ON MARRIED AND COHABITING PARTNERS' RELATIONSHIP SATISFACTION

J.E. Stokes, *Sociology, Boston College, Chestnut Hill, Massachusetts*

Relationships with parents and in-laws influence adults' lives and their other relationships, including marriage. Close and supportive intergenerational relationships can improve marital quality, while distant or conflictual relationships can have adverse effects. Yet marriage can be a greedy institution, weakening intergenerational ties. Cohabitation is analogous to marriage, yet lacks its legal status and may be less binding. The present study examined whether closeness with one's own mother and one's partner's mother influenced relationship satisfaction for married and cohabiting partners. Reports of relationship satisfaction were collected from both members of 421 married and 209 cohabiting couples from the Married and Cohabiting Couples Study (2010). A series of multilevel models (MLMs) were conducted separately for married and cohabiting couples. Results support the greedy marriage thesis, as cohabitors reported significantly greater closeness with both mothers and partners' mothers than did married participants. Moreover, closeness with both one's own mother and one's partner's mother were significantly related with greater relationship satisfaction for cohabitors, but not for married persons. However, mother and mother-in-law closeness significantly moderated one another for married persons. Further analysis revealed that discrepancies between closeness with one's mother and one's mother-in-law—regardless of whom one was closer to—exerted a negative effect on satisfaction for married persons, but not for cohabitors. That is, married persons are most satisfied when they are equally close with mothers and mothers-in-law; satisfaction suffers when they report being closer to one or the other. Implications for the literature on marriage, cohabitation, and intergenerational relationships are discussed.

PROCESS EVALUATION OF TRAINING TO ENHANCE EVIDENCE-BASED PRACTICE USE IN ELDER AND CHILD PROGRAMS

R.H. Weaver, A. Mendes, K.A. Arsenault, S.E. Jarrott, *Human Development, Virginia Tech, Blacksburg, Virginia*

We utilized a community-based participatory research approach to enhance and sustain the use of evidence-based intergenerational best practices (BPs) at four elder and three child care programs. Contact theory informs us that certain conditions, including authority support (e.g., providing staff with resources to build needed skills), facilitate positive intergroup contact (Pettigrew, 1998). Programs supported by tradition and authority are more sustainable as staff gain knowledge, time, and other resources to implement best practices and optimize intergroup contact. Our presentation explores staff comprehension of different training formats of BPs. Our 5-year program began with daylong workshops to share evidence-based practices with staff. Retrospective pre/post-evaluations indicated staff confidence that they could implement these practices. Observational data indicated otherwise as levels of BP indicators were low and intergenerational interaction did not increase. We developed multi-media training modules (Year 2) that increased access and flexibility to train new hires and support different learning styles. Twenty-nine staff, including seven program directors, completed the multi-media training and associated reflections. Thematic analysis of reflections (Year 3) indicated that staff conceptually understood most BPs, demonstrating they know *what* to do, but do not consistently know *how* to implement the BPs in the context of each unique programs. For example, the BPs of age and role appropriateness of programming, incorporating participant interests, and facilitating interaction are more challenging to implement, as staff focus on product-focused activities. The challenges of implementation reveal the need for collaborative efforts to determine and provide appropriate administrative support in years 4-5.

DOES DISTANCE MATTER? POTENTIAL BARRIERS TO GRANDPARENTING FROM THE SUN-BELT

K. Barnes[1], E. Kahana[1], J. Lee[1], B. Kahana[2], *1. Case Western Reserve University, Cleveland, Ohio, 2. Cleveland State University, Cleveland, Ohio*

Grandparents who maintain close family ties have been extensively studied. Yet, little is known about grandparents' relationship with their distant grandchildren, particularly when grandparents relocate to age segregated retirement communities in the sun-belt. In many of these adult communities, young children are not welcome. Our study investigated the relationship between distant grandparents and their grandchildren in comparison to their residentially stable counterparts. Utilizing data from a longitudinal study of successful aging, we compared emotional ties as well as the importance of being grandparents between residentially stable elderly grandparents living in a Midwestern city (N= 221; Mage= 77.36, SD= 7.337) and older adults who migrated to an adult retirement community in Florida (N= 90; Mage= 82.59, SD= 6.973). Our findings revealed that the geographic distance significantly affects the relationships between grandparents and their grandchildren. For instance, the distant grandparents reported significantly lower levels of emotional closeness to their grandchildren than their residentially stable counterparts (t= -7.372, p< .05). Grandparents living in retirement communities also viewed being a grandparent as less important to them (t= -4.948; p<.05) and spent significantly less time with their grandchildren than the residentially stable grandparents (t= 8.297, p<.05). Both selection factors in older adults choosing to relocate to the sun-belt and residential distance can serve as barriers to maintenance of close intergenerational family ties.

CONNECTING GENERATIONS: EVIDENCE FROM COMMUNITY ENGAGED INTERGENERATIONAL LEARNING

L. Holley[1], R.S. Hanks[2], L.K. Donorfio[3], *1. Department of Gerontology, University of Nebraska at Omaha, Omaha, Nebraska, 2. University of South Alabama, Mobile, Alabama, 3. University of Connecticut, Storrs, Connecticut*

Disconnection of generations by the information revolution, culturally embedded ageism and age grading of society exacerbates elder isolation and undermines self-efficacy. (AGE, 2009; Silverstein and Bengston, 1997; Markides and Krause, 1985). To address these concerns and advance knowledge of intergenerational studies/programming, the AGHE Committee on Intergenerational Learning and Research (ILR) has evolved as a support network for educators and students in Gerontology. Professors Sally Newman, Paul Roodin and Roma Hanks initially convened the group as a task force of the AGHE Academic Program Development Committee. Reports given at the most recent ILR meeting, co-chaired by Laura Donorfio and Roma Han50 during the AGHE 2014 conference revealed that colleagues from academic institutions across the US and in the Netherlands and China have developed a surprising range of innovations in intergenerational learning and research. This presentation disseminates evidence of educators' disconnected but widespread use of Community Engaged Intergenerational Learning and Research to address barriers to generational solidarity and the consequent isolation of elders from their communities. Innovations range from design of a multi-year, multi-state NIH funded study and novel service learning projects in the US to development of honors programs for multi-generational cross-disciplinary experiential learning within the study of aging in the Netherlands. Project structures, stakeholders, and objectives are described. Evidence for efficacy is examined and critiqued to identify strategies for assessment and replication of the innovations, and plans to connect this network of innovation, especially through the AGHE Intergenerational Learning Web Page are discussed.

DIFFERENCES IN HOUSEHOLD STRUCTURES AMONG ASIAN AMERICANS

P. Xu, M.E. Szinovacz, *Gerontology, UMASS BOSTON, Boston, Massachusetts*

Traditional norms encourage extended households (especially upward extension) among Asian Americans. However, few studies have examined household structures among Asian Americans. A better understanding of this issue is important to assess familial obligations and potential support needs among Asian Americans. Drawing on data from the American Community Survey (ACS) 2009-2011 3-year sample, this paper examines differences in household types (especially upward and downward extension) among selected groups of Asian Americans, namely Chinese, Japanese, Filipino, Korean, South Asian, and Vietnamese. We restrict the analyses to households with heads aged 35 and over as younger respondents are unlikely to have grandchildren (downward extension; N=93,970). Four household types are defined by the relationship to household head: upward (households including the head's or his/her spouse's parents), downward (households including the head's grandchildren), and among households including grandchildren, whether or not the grandchild's parent also lives in the household. Our analyses, using logistic regressions with Chinese as reference group) confirm differences among Asian subgroups even after controlling for demographic, economic, and acculturation characteristics. Generally, nuclear households prevail among all groups. Inclusion of parents predominates among Vietnamese and Filipinos, whereas inclusion of grandchildren is most common among Vietnamese, Japanese, Filipino, and South Asians. Among households with grandchildren, skipped generation household are more prevalent among Filipinos and South Asians. These findings suggest that Vietnamese and Filipinos may require supports with both parent and grandchild care, whereas Japanese and South Asians may need supports primarily with grandchild care.

INTERDEPENDENT LIVES OF MIDDLE AGED COUPLES: IMPLICATIONS OF EXCHANGES OF SUPPORT WITH ADULT OFFSPRING

J. Lee[1], S.H. Zarit[2], M.J. Rovine[2], K. Birditt[3], K. Fingerman[4], *1. Case Western Reserve University, Cleveland, Ohio, 2. Penn State University, State College, Pennsylvania, 3. University of Michigan, Ann Arbor, Michigan, 4. University of Texas, Austin, Texas*

Parents and children maintain active relationships throughout their adult lives, and these interactions may affect the older couple's marriage. In particular, family events such as exchanges of support with other family members influence the lives of middle-aged couples' marriage. Indeed, prior research has found strong interdependence in flows of support between middle aged mothers and their children. However, relatively less is known about the association between exchanges of support with adult children and husband's well-being. Using a sample of 197 couples from the Family Exchange Study, we conducted a dyadic analysis (e.g., Actor Partner Interdependence Model) to examine how exchanges of support between middle aged parents and their adult children is associated with their feelings of stress/reward and ambivalence. Findings indicate that more support provision from each spouse has positive associations with his or her own feelings of stress in helping offspring (β=.34, .25, for husbands and wives each, p<.05 for both). We also found a significant partner effect, in that wives' support for adult offspring has positive association with husband's stress (β=.26, p<.05), indicating that higher wives' support increased husband's stress in helping offspring, but not vice versa. Furthermore, each spouse's support provision has also positive association with their own feelings of ambivalence towards adult children (β=.23, .31, for husbands and wives each, p<.01, p<.01). These results show the importance of gender roles, that is, wives' support for adult children may affect more husbands' well-being and relationship with children than did husbands' provision of support for children.

SUPPORTING SCIENCE EDUCATIONAL OUTCOMES OF GRANDPARENTS-HEADED FAMILIES

Y. Lee, *Social Work, Binghamton University, Binghamton, New York*

Purpose: Based on a needs assessment with grandparents raising grandchildren, a three-week science camp to grandparent-headed families was provided to foster quality of life within the family system and support the grandchildren's success in Science, Engineering, Technology, and Math (STEM) areas. Individual interviews and focus groups with the grandparents and graduate students from Physics and Social Work evaluated the impact of interdisciplinary collaboration in working with the intergenerational families and explored factors related to the effectiveness of the interdisciplinary education in the graduate students' respective pre-service professional preparation. Methods: Graduate students from Physics and Social Work and grandparents raising grandchildren participated in focus groups and interviews to evaluate the impact of interdisciplinary collaboration in working with the intergenerational families and explored factors related to the effectiveness of the interdisciplinary education. Two focus groups and four individual interviews were conducted after the three-week service. Data analysis was conducted in three steps: (1) open coding, (2) axial coding, and (3) selective coding (Strauss, 1987). Results: Four major themes relating to the effectiveness of the interprofessional education and implications for practice emerged: (1) benefits of collaborative experiential learning environment, (2) importance of recognition of complementary roles in working with intergenerational families with multifaceted needs, (3) challenges to interdisciplinary communication, and (4) benefits of intergenerational and interdisciplinary communication on topics of science and mental health. Implications: The interdisciplinary collaboration between Physics and Social Work not only benefited the intergenerational families but also strengthened the quality of pre-service professional preparation the graduate students received.

ADULT GRANDCHILD FAMILY CAREGIVING FOR GRANDPARENTS: THE ROLE OF INTERGENERATIONAL SOLIDARITY

M.N. Jackson, *University of Minnesota, St. Paul, Minnesota*

An ever-expanding population of older adults requires further involvement of family members in care activities. Adult grandchildren are among those who provide care for older relatives, but little is known about their involvement in grandparent caregiving. Through the lens of Intergenerational Solidarity Theory, a theory typically used to understand relationship patterns in older adults, this study seeks to understand the factors that foster adult grandchildren's involvement in care for grandparents. Drawing on data from Wave 7 of the Longitudinal Study of Generations (Bengtson, 2009), this study examines the following research question "If and how do affectual, associational, consensual, and conflict types of solidarity explain variations in the likelihood of grandchildren performing functional solidarity tasks for grandparents (when controlling for structural solidarity)?" Results from a logistic regression show that levels of affection (affectual solidarity) and amount of contact (associational solidarity) with grandparents were the most influential factors in determining grandchildren's involvement in care, above and beyond factors of structural solidarity. This study provides a foundation for understanding the factors that may foster grandchildren's caregiving. Future research should expand on these findings to explore how these levels of solidarity shape the caregiver experience for grandchildren and the implications it may have for their emotional and psychological well-being.

INTRAFAMILY STRAIN, FAMILY LIFE STRESS, AND FAMILY FUNCTIONING IN GRANDMOTHER CAREGIVERS

P. Thongterm, C. Musil, C. Warner, J.A. Zauszniewski, *Nursing, Case Western Reserve University, CLEVELAND, Ohio*

Prior research indicates that perceptions of poor family functioning by grandmothers are related to factors within individual family members and the family unit. Grandmothers raising grandchildren perceive more difficulties in overall family functioning than non-custodial grandmothers. McCubbin & McCubbin's Resiliency Model of Family Stress, Adjustment and Adaptation was used as a framework to examine whether (1) intrafamily strain and family life stress affected grandmothers' perceptions of their family functioning and (2) social support and resourcefulness moderated the effects of intrafamily strain and family life stress on the grandmothers' perception of family functioning. We examined these questions in a secondary analysis of cross-sectional data from wave two of a longitudinal study of 346 mid-western grandmothers (159 grandmothers raising grandchildren without parents in the home and 187 grandmothers who did not live with grandchildren) using hierarchical multiple regression, controlling for demographics and grandmothers' health. In the total sample, grandmothers who reported more intrafamily strain and mental health concerns, less instrumental and subjective support, and lower resourcefulness perceived more problems in family functioning. For grandmothers raising grandchildren, more intrafamily strain and mental health concerns and lower resourcefulness led to worse perceptions of family functioning. There were no significant moderating effects. For non-custodial grandmothers, more intrafamily strain, less support, lower resourcefulness, and White race contributed to more problems in family functioning. Significant moderating effects of resourcefulness and support (instrumental and subjective) were found; more support in the face of high strain reduces problems in family functioning. Implications of resourcefulness training and support are discussed.

MOVING IN, MOVING OUT, AND STAYING WITH MOM: CONTINUITY AND CHANGE IN ADULT CHILDREN'S CORESIDENCE WITH OLDER MOTHERS

K.L. Johnson[1], J. Suitor[1], M. Gilligan[2], K. Pillemer[3], *1. Sociology, Purdue University, Lafayette, Indiana, 2. Iowa State University, Ames, Iowa, 3. Cornell University, Ithaca, New York*

Interest in parent-adult child coresidence has waxed and waned across the last three decades, generally following the course of changes in economic well-being in the U.S. Given the economic factors fueling interest in this topic, it is not surprising that the focus of research in this area has been on the role of social structural factors in these processes— in particular adult children's acquisition and loss of normative adult statuses such as employment and marriage. We suggest that this focus on structural characteristics has led scholars to ignore the role of interpersonal factors, which we propose play as important a role in parent-adult child coresidence as children's social structural characteristics. To address this question, we examine structural and interactional characteristics of middle-aged adult children and the mother-child dyad using a within family approach. Our research is guided by classical theories of interpersonal relations and exchange processes and homophily theory using a life course framework. We used data collected as part of the first and second wave of the Within-Family Differences Study (WFDS). The final analytic sample for this paper includes 132 mothers' reports on 538 children in families in which at least one child who coresided at one or both waves. Findings indicate that both structural and socioemotional characteristics of the mother-adult child dyads, including history of support, parent-child conflict at T1, children's marital status, and children's deviant behaviors in adulthood played important roles in change and continuity in coresidence.

PATIENT AND FAMILY MEMBER PROGNOSTIC UNDERSTANDING IN OLDER ADULTS WITH ADVANCED CANCER

S. Hickman[1], R.A. Butler[1], M.T. Weaver[1], P. Helft[2], B. Habermann[3], *1. Indiana University School of Nursing, Indianapolis, Indiana, 2. Indiana University School of Medicine, Indianapolis, Indiana, 3. University of Delaware, Newark, Delaware*

Background Family members are an integral part of the cancer care experience and play an important role in treatment decision-making. Family involvement is particularly important for older patients, who tend to rely more heavily on family members to make decisions as prognosis worsens and functional status declines. Methods Dyads consisting of a patient aged 65 and older with metastatic lung, pancreatic, or esophageal cancer and a family member were invited to participate. Participants filled out questionnaires regarding recall of discussions with the physician, estimates of prognosis, and perception of treatment goals. Results The sample consists of 34 dyads (n = 34 patients and n = 34 family members). Patients and family members largely agreed in their recall of conversations with the treating oncologist, with more reporting discussions about reasons to continue (88%) than discontinue (21%) chemotherapy (SIG). A majority (82.5%) agreed on the current goal of treatment: 19% agreed the goal was to cure the cancer and 58% agreed the goal was to palliate or control the cancer. A majority of dyads (51.7%) share a belief that the likelihood of survival of 12 months or longer was greater than 90%. Conclusions Patients and family members largely share in their recall of conversations and understanding of treatment goals, yet maintain an optimistic perception of prognosis.

MEMORY AND EXECUTIVE FUNCTION IN THE LONG LIFE FAMILY STUDY

S.L. Andersen[1], P. Sebastiani[2], J. Sun[2], T.M. Neary[1], J.D. Gass[1], L. Feldman[1], T.T. Perls[1], *1. Medicine/Geriatrics, Boston University School of Medicine, Boston, Massachusetts, 2. Boston University School of Public Health, Boston, Massachusetts*

Long-lived participants of the Long Life Family Study (LLFS) have a reduced prevalence of cognitive impairment and perform better than referent groups on brief tests of cognitive function. Here, we performed more in-depth neuropsychological testing focusing on tests of episodic memory and executive function. A 2.5 hour battery of neuropsychological tests was administered to a subset (n=69) of LLFS proband participants and age-matched referents (n=56), mean age=91 years. Also tested were 100 offspring cohort participants and 84 referents (mean age 63 and 68.1 respectively). Tests included word list learning, complex figure drawing, verbal fluency, clock drawing, logical memory, digit spans, and a sorting test. Cognitive reserve proxies were collected. Generalized estimating equations adjusted for age, sex, intellectual ability, and familial relatedness were used to compare the LLFS proband and offspring generations to respective cohorts. LLFS proband generation participants had significantly more education and greater participation in mid- and late-life cognitive activities than the referents but no differences on cognitive tests. The offspring generation showed borderline significant differences on the clock drawing test and forward digit spans and significantly less late-life cognitive activities (p=.01). Conclusion: Older people without familial longevity may be more reliant on better education and higher indices of cognitive reserve in order to achieve similar cognitive performance of LLFS proband generation participants. Offspring generation participants showed a tendency toward better executive function and attention indicating that better cognitive function is associated with familial longevity. Larger sample sizes and continued follow-up to determine cognitive changes over time are warranted.

ASSOCIATING ADVERSE CHILDHOOD EXPERIENCES WITH MID-LIFE DEPRESSIVE SYMPTOMS AND QUALITY OF LIFE AMONG INCARCERATED MALES: EXPLORING MULTIPLE MEDIATION

K.A. Skarupski[1,2,3], J.M. Parisi[5], E. Tanner[4,2,1], *1. Center on Aging and Health, Johns Hopkins University, Baltimore, Maryland, 2. Dept.of Medicine, Division of Geriatric Medicine & Gerontology, Johns Hopkins School of Medicine, Baltimore, Maryland, 3. Office of Faculty Development, Johns Hopkins School of Medicine, Baltimore, Maryland, 4. Johns Hopkins University School of Nursing, Baltimore, Maryland, 5. Johns Hopkins Bloomberg School of Public Health, Baltimore, Maryland*

Purpose: We explored the association of experiencing family death and abuse during childhood with mid-life depressive symptoms and quality of life among prisoners. Using a stress and coping framework, we examined social support and coping strategies - spirituality, physical activity, poor diet, and meaning in life – as potential mediators. Design & Methods: Participants were male inmates residing in the general population of a maximum security prison who completed a 314-item questionnaire (192/1200 respondents [16% response rate]). Adverse childhood experiences were measured via 15 questions related to experiencing death (e.g., family member was murdered, parent died) and 6 questions related to experiencing abuse during childhood. Depressive symptoms were measured using the 10-item CES-D and quality of life was measured using the 26-item World Health Organization Quality of Life –Brief Scale. Results: In both unadjusted and adjusted multiple mediation models, associations between death and abuse and depressive symptoms were not explained by social support and coping. However, both the death (point estimate = -.5052; CI.95 = -1.0364, -.0429) and abuse (point estimate = -.7792; CI.95 = -1.6369, -.0381) associations with quality of life were partially explained by the total of the indirect effects, primarily via the specific indirect effect of social support. Discussion & Implications: We found cross-sectional evidence that social support partially mitigates the deleterious effects of death and abuse experienced at childhood on overall quality of life in middle-age, among prisoners. Interventions to enhance social support in institutionalized settings may have beneficial effects at both the person- and environment-levels.

ROLE CONFLICT AND SOCIAL SERVICE USE IN BABY BOOMER CAREGIVERS

H. Kim[1], A. Steinhoff[1], J. Cheon[2], *1. School of Nursing, University of Kansas, Kasnas City, Kansas, 2. University of Maryland School of Nursing, Baltimore, Maryland*

Baby boomers (BBs) are unique in their experience of intergenerational burden and conflicts during caregiving. However, there is limited information available on the generational differences among pre-BBs, BBs, and post-BBs regarding caregiving role and social service use. This study describes the socio-demographic and caregiving-related differences of BBs compared to their pre-BB and post-BB caregiver groups. This secondary data analysis was completed using the survey data conducted by the National Alliance for Caregiving in 2009. Chi-square statistics, ANOVA, and ANCOVA were performed based on Pearlin's stress process model (N = 1,588). BBs represented the largest proportion (44.1%) of US caregivers followed by post-BBs (39.5%) and pre-BBs (15.4%). The majority of BB caregivers were likely to be women, care-recipients' children or grandchildren, employed while caregiving, and current caregivers ($p < 0.05$). Compared to other caregiver cohorts, BB caregivers were more likely to share caregiver responsibility with secondary caregivers and functioned as mediators between care-recipients and healthcare providers ($p < 0.01$). After controlling for age, BB caregivers experienced higher levels of role conflict between job and caregiving, spent fewer hours for caregiving, and provided more informal medical care. By increasing caregivers' age, BB caregivers used more respite care and transportation services ($p < 0.05$), but not financial help. In conclusion, the study found BB caregivers' unique characteristics and challenges of their caregiving roles and services use. These findings will assist multidisciplinary healthcare teams to identify what types of resources may best be designed to resolve role conflict and the caregiving burden of BBs.

SESSION (POSTER)

CHRONIC DISEASE MANAGEMENT

IDENTIFYING EFFECTIVE METHODS FOR NURSING ASSESSMENT AND TEACHING ABOUT MEDICATION SIDE EFFECTS IN A HOME CARE SETTING

D.R. Mager, *School of Nursing, Fairfield Universtiy, Fairfield CT, Connecticut*

Purpose: To identify HC patients' self-perceived needs regarding knowledge of medication side effects and methods to improve nursing interventions regarding medication side effect teaching during HC visits. Methods: A researcher created survey was examined by four HC experts and then administered to a focus group of five older adults to establish content validity. After minor revisions it was mailed to all patients over age 65, without a dementia diagnosis at one VNA (n=241) in the Northeastern USA. Participants returned signed consent and surveys via a pre-addressed, stamped envelope and received a \$5.00 gift card incentive for completion. Qualitative data was analyzed and categorized by theme to determine this population's preferences on medication side effect teaching. Results: Data is currently being analyzed. Preliminary results suggest that older adults in this setting have unmet needs regarding medication side effect education and they harbor fears about adverse drug effects, yet some wish to be informed of potential side effects while others do not. Implications: It is critical to teach patients about medication side effects to decrease potential adverse drug events (ADEs) from occurring. This kind of research is warranted so that HC nurses can better meet the needs and expectations of the over 8 million people (Joint Commission, 2011) who receive HC services annually. It is hoped that by addressing medication side effects in a way that patients desire and expect, it may be possible that a more proactive approach to teaching this material can be instituted.

SELF-EFFICACY AND DISABILITY IN PARKINSON'S DISEASE

D.S. Abraham, A.L. Gruber-Baldini, M.J. Armstrong, E. Barr, L. Shulman, *University of Maryland School of Medicine, Baltimore, Maryland*

Background: Self-efficacy for managing chronic disease is defined as an individual's confidence in his/her ability to successfully perform specific tasks or behaviors related to one's health in a variety of situations. High self-efficacy has been associated with improved outcomes in chronic health conditions but has rarely been examined in Parkinson's disease (PD). This study examined whether greater self-efficacy for managing chronic disease was associated with less self-reported disability. Methods: Cross-sectional data were collected from 391 PD patients seen at the University of Maryland PD and Movement Disorders Center. Measures: Lorig Self-Efficacy for Managing Chronic Disease (6-items, range 6-18, high scores favorable); Older Americans Resources and Services Disability subscale (14-items, range 14-70, low scores favorable). Additional variables were captured from chart review, self-reported questionnaires, and neurologist examination. Linear regression models examined whether self-efficacy was associated with disability, controlling for confounders. Results: Mean self-efficacy score was 13.7 (SD=2.93) and mean disability score was 21.1 (SD=9.6). After adjustment for disease severity (Unified Parkinson's Disease Rating Scale motor subscale, Hoehn & Yahr stage), duration of disease, cognitive impairment (Mini Mental State Examination score), and psychological symptoms (Brief Symptom Inventory 18 score), greater self-efficacy was associated with less disability ($b=-0.45$, $p<0.01$, full model $R^2=0.661$). Conclusions: Greater self-efficacy was associated with less disability in PD cross-sectionally. Future analysis should examine whether self-efficacy is associated with long-term disability in PD patients. Understanding the association between self-efficacy and disability can aid in patient management as self-efficacy can be targeted through interventions.

DEVELOPMENT OF THE PROMIS® SELF-EFFICACY FOR MANAGING CHRONIC CONDITIONS ITEM POOL

A.L. Gruber-Baldini[1], C. Velozo[2], S. Romero[3], L. Shulman[1], *1. Epidemiology & Public Health, University of Maryland School of Medicine, Baltimore, Maryland, 2. Medical Univerity of South Carolina, Charleston, South Carolina, 3. University of Florida, Gainesville, Florida*

Background: Self-efficacy for Managing Chronic Conditions is defined as an individual's confidence in his/her ability to successfully perform specific tasks or behaviors related to one's health in a variety of situations. As part of the NIH-funded Patient Reported Outcomes Measurement Information System (PROMIS®), we developed a self-efficacy tool designed to be used across chronic conditions utilizing patient and expert input. Methods: Item pool was developed through 5-step process: 1-systematic literature review; 2-subdomains of interest adjudicated through online Delphi review with 23 international experts through 3 rounds; 3-12 focus groups with 78 neurological disease patients elucidated subdomains and item content; 4-binning and winnowing of items by 6 investigators to create unique items; 5-cognitive interviews with 30 patients to finalize item content. Results: Literature identified 64 self-efficacy instruments with total 1033 items. Final subdomains included Self-Efficacy for Managing: 1-Daily Activities (Delphi rating=9.4, 0=completely disagree/10=completely agree; 36 items retained), 2-Medications and Treatments (Delphi=8.0; 27 items), 3-Symptoms (Delphi rating 8.6; 28 items), 4-Emotions (Delphi=7.4; 28 items), 5-Social Interactions (Delphi=6.7; 24 items). Social Interactions was more endorsed in focus groups than higher Delphi-rated (dropped) subdomains of Take Preventive Measures (Delphi=8.4) and Communicate with Clinician (Delphi=7.7). Focus groups and cognitive interview patients (n=108) were 62% male, mean age=55 (range 23–80), 33% minorities. Primary diagnosis: Parkinson's disease (27%), epilepsy (23%), multiple sclerosis (19%), neuropathy (17%), stroke (14%). Discussion: PROMIS® Self-efficacy for Managing Chronic Conditions item pool has been developed encompassing 5 subdomains and 143 items, which are undergoing calibration testing in over 1,000 patients.

CHRONIC PAIN FROM AGE 70 TO 90

J. Stessman[1,2], Y. Rottenberg[1,2], J.M. Jacobs[1,2], *1. Geriatrics and Rehabilitation, Hadassah Hebrew-University Medical Center, Jerusalem, Israel, 2. The Jerusalem Institute of Aging Research, Jerusalem, Israel*

Background: The natural history of chronic pain among older people is poorly documented. We present longitudinal data from age 70 to 90 concerning chronic musckoloskeletal or joint pain, abdominal pain and chronic headache. Methods: Data was collected by the Jerusalem Longitudinal Study, which prospectively follows a representative sample, born 1920-1921. Subjects underwent comprehensive assessment and examination at home in 1990, 1998, 2005, and 2012 at ages 70 (n=605), 78 (n=1023), 85 (n=1222), and 92 (n=674). Mortality data were collected. Results: At ages 70, 78, 85, and 92, chronic musculoskeletal pain was present among 41.5%, 59.2%, 39.6%, and 15.5% of subjects respectively; chronic joint pain was present among 42.9%, 60.6%, and 45.4%, and 26..0% respectively. In contrast abdominal pain was less common, and among the oldest old was very infrequent: 14.7%, 13%, 1.5%, and 1.5%, with a similar pattern for chronic headache: 16.9%, 18.8%, 1.9%, and 0.5%. Consistent gender differences existed throughout follow-up, with pain being significantly more common (X1.5-2) among women. Headache at age 78 was associated with lower survival from age 78-85 among both males and females; otherwise Kaplan-Meier survival curves adjusted for gender showed no significant differences in longevity according to either abdominal pain or headache. In contrast, there was a tendency for improved survival associated with chronic MSS and joint pain. Conclusion: In contrast to musculoskeletal and joint pain which remains common at all ages, visceral pain is very infrequent among the oldest old, and generally unrelated to survival.

MANAGING MULTIPLE CHRONIC CONDITIONS: PERCEPTIONS OF OLDER ADULTS, CAREGIVERS AND PROVIDERS

J. Ploeg[1], K. Fraser[2], N. Matthew-Maich[3], M. Markle-Reid[1], S. Kaasalainen[1], C. McAiney[1], S. Dufour[1], R. Upshur[4], *1. School of Nursing, McMaster University, Hamilton, Ontario, Canada, 2. University of Alberta, Edmonton, Alberta, Canada, 3. Mohawk College, Hamilton, Ontario, Canada, 4. University of Toronto, Toronto, Ontario, Canada*

Purpose: The purpose of this study was to understand how older adults, family caregivers and healthcare providers manage multiple chronic conditions (MCC). Methods: A qualitative interpretive description approach was used. Qualitative interviews were conducted in Ontario, Canada with 21 older adults who had three or more chronic conditions, 24 family caregivers and 22 healthcare providers. Data were analyzed using repeated immersion in the data, coding using NVivo, and identification of themes. Findings were repeatedly reviewed, discussed and revised by the research team. Results: Older adults had an average of seven chronic conditions while family caregivers provided care to individuals with an average of eight chronic conditions. Six main themes were identified: (1) system navigation is complex with many barriers to the use of services, (2) patients and family are seldom involved in setting goals for their care, (3) family caregivers are the main care providers, however they do not feel supported in their caregiving roles; (4) care is fragmented and uncoordinated across multiple chronic conditions, (5) there is minimal emphasis on prevention and health promotion, and (6) social aspects of patients' and caregivers' wellbeing were not addressed because the approach was predominantly biomedical and disease-focused. Conclusion: Improved health and social system navigation is critical to fully address the complexities of managing MCC. Older adults and family members must be included as key members of the interdisciplinary team and should be actively involved in setting their health goals spanning healthcare care and social care domains.

NON-PHARMACOLOGICAL INTERVENTIONS FOR ELDERLY PATIENTS WITH PARKINSON'S DISEASE: A META-ANALYS

J. Lee, M. Choi, Y. Yoo, *College of Nursing, Yonsei University, Seoul, Republic of Korea*

Purpose: With population aging, non-pharmacological interventions are emerged as important long-term management to improve health-related quality of life (HRQOL) of patients with chronic disease. The purpose of this study was to examine the effectiveness of non-pharmacological interventions for improving the HRQOL of patients with Parkinson's disease (PD). Method: Studies which were published in peer-reviewed journals from January 2000 to June 2013 were searched through PubMed and Cumulative Index for Nursing Allied Health Literature (CINAHL). We used combinations of the keywords such as PD, intervention, and therapy. A meta-analysis was performed to summarize effectiveness of non-pharmacological intervention studies. Results: A total of 13 studies were included in this study. Negative effect sizes indicated that interventions had positive impacts on HRQOL. The overall effect size for the studies (n = 13) was -0.46 with a 95% CI from -0.83 to -0.08 (Z = 2.39, p = .02). Additionally, the effect sizes were calculated for the following subgroups with regard to types of interventions: exercise programs (n = 6), education interventions (n = 2), cognitive-behavioral therapies (n = 2), and self-management programs (n = 3). The effect size of exercise programs was -0.47 with a 95% CI of -0.89 to -0.06 (Z = 2.22, p = .03). Other types of interventions did not have significant effectiveness. Conclusion: The findings of this study demonstrated that non-pharmacological interventions, especially exercise programs were effective in improving HRQOL in PD. We suggest that non-pharmacological interventions focusing on physical function should be developed and applied to patients with PD for their HRQOL.

AMERICAN INDIAN/ALASKAN NATIVE AND CHRONIC DISEASES: A REVIEW OF THE LITERATURE

S. Llanque[1], R. Goins[2], M. Caserta[1], L.M. Savage[3], C.E. Dingley[1], C.R. Landry[4], K.G. Cloyes[1], *1. University of Utah, Salt Lake City, Utah, 2. Western Carolina University, Cullowhee, North Carolina, 3. Linfield College, Portland, Oregon, 4. Native American Youth and Family Center, Portland, Oregon*

The American Indian and Alaska Native (AI/AN) population in the United States is aging. The leading causes of death for AI/ANs aged 55 and older include cancer, heart disease, diabetes, and sequelae from these diseases. The goals of this systematic review are to synthesize the current state of the science involving studies related to chronic disease and older AI/ANs and identify gaps in knowledge to guide future research in this area. Empirical studies targeting older AI/ANs with chronic disease were sought using PubMed, CINHAL, and Google Scholar through Boolean and keyword searches. MeSH terms included the keywords, "American Indian," "AI/AN," "Elders," "Older Adult," and/or "Chronic Disease." Peer-reviewed studies published between 2000 and 2014 were included. Dissertations, non-peer reviewed government reports, book chapters, and secondary sources were excluded from this review. A total of seven studies targeting AI/AN elders with chronic disease were identified and analyzed for this review. Four studies used cross-sectional designs to evaluate chronic disease, lower body functioning, and disability. Two other studies used a community-based participatory research approach to implement interventions focusing on diabetes education and elder abuse. One ethnographic investigation focused on Zuni elders with chronic disease. Findings indicate that there are few studies on chronic disease among older AI/ANs. Future research needs to give more attention to an extensive, in depth research involving AI/AN elders. Partnering with AI/AN communities by involving key stakeholders in the research process can move research in this area in a positive direction, build community capacity, and develop culturally-tailored programs.

AGE COHORT COMPARISON OF PSYCHOLOGICAL AND PHYSICAL HEALTH IN ADULTS WITH PULMONARY HYPERTENSION

T.T. Von Visger[2,1], M. Happ[2,1], K. Kuntz[1], G. Phillips[1], N. Sood[1], *1. The Ohio State University Wexner Medical Center, Columbus, Ohio, 2. Nursing, The Ohio State University Wexner Medical Center, Columbus, Ohio*

To compare physical and psychological health status between three age cohorts (older, middle, and younger) of adults with Pulmonary

Hypertension (PH). A convenience sample of Pulmonary Clinic patients with a confirmed PH diagnosis (n=115). Cross-sectional survey design. We abstracted patients' demographic and physiologic data, including 6-minute walk test, from medical record and administered the following questionnaires: Patient Health Questionnaire, Perceived Stress Scale (PSS-10), and Cambridge Pulmonary Hypertension Outcome Review (CAMPHOR). Comparative statistics were conducted on target variables across three age groups. There were no differences by age group in etiology of PH, severity of disease, CAMPHOR-total, or the psychological distress variables. Older adults' physical performance (6-minute walk test, $p < 0.001$) and their perception of activity performance (CAMPHOR-activity, $p < 0.002$) were significantly lower than the younger age groups. Older adults with PH had lower levels of perceived stress than their younger cohorts (12.0, 17.3, and 17.0, $p < 0.04$). Twenty-nine percent of patients reported experiencing at least one type of psychological disorder. Eight (8) patients - ranging in age from 46 to 77 (median = 64) endorsed "thoughts that you would be better off dead or of hurting yourself in some way" at least several days in the past two weeks. Older adults with PH experience psychological distress at rates similar to the younger PH patients. Older adults perceived lower stress level despite poorer physical performance and perceptions of physical function. This study highlights the importance of routine psychological assessment and treatment referral for older adult patients with PH.

IMPACT OF DIABETES SHARED MEDICAL APPOINTMENTS ON VA CLINICAL VISITS: A LATENT GROWTH CURVE MODEL

C.J. Burant[1,2], S. Kirsh[2], M. Harris[3], P.A. Higgins[1,2], *1. Case Western Reserve University, Cleveland, Ohio, 2. Cleveland Louis Stokes VAMC, Cleveland, Ohio, 3. Cleveland Clinic, Cleveland, Ohio*

Data were collected from VA medical records of 988 patients with diabetes, age 50 and older at a large Midwest VAMC hospital. There were 371 cases who attended SMAs and 617 cases who attended UC only. The mean age of the patients was 70.1 years (S.D.= 9.4), 19.6% were black and 71.6% were white, with a mean A1c of 7.88 (s.d.= 1.55). The mean A1c value for individuals who attended SMAs was 8.55 (sd=1.72) and 7.49 (sd=1.28) for those who only had UC (p.<.001). A nested latent growth curve model comparing number of clinical visits between SMA and UC visits. The nested model fit the data well (Chi Square=34.20; df =6; p <.001; TLI=.97; CFI=.97; RMSEA=.07). When constraining the mean intercepts and slopes of each group to be equal, significant differences were found in health care utilization over a 3 year period for clinical visits [SMA (mean intercept = 10.15) vs. UC (mean intercept = 6.13); SMA (mean slope = -.50) vs. UC (mean slope = .04)]. Individuals who attend SMAs vs. UC visits have higher initial numbers of clinical visits that decline over 3 years. Future studies need to focus on how the amount of health service utilization impacts these patients.

NUTRITION STATUS, FATIGUE, QUALITY OF SLEEP, AND DEPRESSION OF OLDER PATIENTS IN HEMODIALYSIS WITH CHRONIC RENAL FAILURE

J. Kim, S. Kang, *College of Nursing, Chonnam National University, Gwangju, Republic of Korea*

Objectives: This study was to explore status of nutrition status, fatigue, quality of sleep, and depression, and their relationships with one another as well as influencing factors on depression of the older patients in hemodialysis. Methods: The participants were 126 older patients in hemodialysis 2 to 3 times a week regularly with chronic renal failure in hemodialysis center of hospital, older than 55 years old. Data were collected from April 6 to July 4, 2013 using MIS((Malnutrition-Inflammation Score), Fatigue Scale, PSQI(Pittsburgh Sleep Quality Index), and Beck Depression Inventory(BDI). Data were analyzed using the SPSS/WIN 20.0 program. Results: In common, Exercise and level of appetite showed statistically significant differences in nutrition status, fatigue, quality of sleep, and depression by general and health related characteristics. Depression had statistically significant positive correlation with nutrition status(r=.40, p<.001), fatigue(r=.59, p <.001), and quality of sleep(r=.47, p <.001) of the hemodialysis older patients. Fatigue, quality of sleep, education level, and appetite were included in the factors affecting depression of older patients in hemodialysis with chronic renal failure. These variables explained 42.9% of depression in older patients in hemodialysis. Conclusion: The results of this study suggest necessity of careful assessment on exercise, appetite, nutrition status, fatigue, quality of sleep, and depression of the older patients in hemodialysis.

THE IMPACT OF COMORBIDITIES IN PSYCHOLOGICAL STATUS FOLLOWING HIP FRACTURE OF OLDER PERSONS IN TAIWAN

Y. Huang[1], C. Liou[1], S. Tang[2], Y.L. Shyu[3], *1. Nursing, Chang-Gung University of Science and Technology, Tauyuan, Taiwan, 2. Biomedical Engineering Dept., Ming Chuan, Taoyuan, Taiwan, 3. Nursing Dept., Chang-Gung University, Taoyuan, Taiwan*

Objectives. More than 80% elderly in Taiwan suffered chronic diseases, and the high prevalence of hip fracture in Taiwan usually impacts their health. Previous researches had demonstrated that the cognitive impairment and depression increased after hip fracture, but very few studies on the impact of comorbidities on psychological status for elderly following hip fracture. Therefore, the purpose of this study was to examine the influences of comorbidities on post-operative cognitive impairment and depression for hip-fractured elderly in Taiwan. Data and Methods The secondary data of 461 elders with hip fracture from two clinical trials (162,299 respectively) in Taiwan was analyzed by generalized estimating equation approach. Elder's membership among the two studies, their assigned groups and pre-fracture ADL performance were controlled in the analysis to reduce the bias. Outcomes were measured for one year after discharge by the Taiwan mini-mental state examination (as cognitive status) and Taiwan geriatric depression score (GDS, as depression). Results There were 105(22.8%) elderly with no comorbidity, 136(29.5%) with one, 220(47.7%) with more than 2 comorbidities. After controlling the covariates, there was no significant difference between the elderly who without and with one comorbidity. However, elderly who with more than 2 comorbidities associated with more cognitive impairment (B=-0.815, p=0.000) and higher GDS score (B=0.906, p=0.000) than those who with ≤ 1 comorbidity in admission and lasted to one year after discharge. Conclusions More comorbidities negatively influenced the cognitive status and depression of the hip-fractured elderly. The results could provide a reference for further development of related interventions.

THE LONGITUDINAL RELATIONSHIP BETWEEN DEPRESSIVE SYMPTOMS AND CHRONIC DISEASE FOR OLDER ADULTS: A POPULATION BASED STUDY

C. Chen[1], H. Chiu[2], Y. Su[3], *1. University of Kang Ning, Tainan City, Taiwan, 2. Kaohsiung Medical University, Kaohsiung, Taiwan, 3. Meiho University, Ping-Tung, Taiwan*

Background. Although depressive symptoms in older adults are common, their relationship with chronic disease and the influence of chronic disease on the development of depressive symptoms over time is not well understood. This longitudinal study investigates the change trajectories of both depressive symptoms and chronic disease, as well as their associations over time. Methods. Participants included 442 community-dwelling older adults living in Taiwan, aged 65 years or older, who completed six waves of survey interviews. Depression was scored with the Short Psychiatric Evaluation Schedule (SPES) and chronic diseases measure during each consecutive data collection wave. The autoregressive latent trajectory (ALT) model and parallel latent growth curve modeling (LGCM) were adopted for analysis of the data. Results. The ALT model highlights that previous depressive symptoms (and diseases) significantly contributed to the advancement of more severe depressive symptoms (and diseases). This model also indicates that chronic disease significantly contributed to the onset of depressive symptoms and vice versa. The parallel LGCM highlights that the disease intercept had significant effects on the depressive symptoms intercept, as did the depressive symptoms on disease. Furthermore, the disease slope had significant effects on the slope of the depressive symptoms. Conclusions. These findings demonstrate that disease is a stronger predictor of depressive symptoms, than depressive symptoms are of chronic disease. In addition, the prior existence of a health condition will lead to further deterioration of health conditions and that they often coexist.

OLDER ADULTS WITH OSTEOARTHRITIS DO NOT HAVE AN INCREASED RISK OF COGNITIVE IMPAIRMENT

B. Gujar[1], M. Hochberg[1], A.L. Gruber-Baldini[1], W. Hawkes[1], M. Baumgarten[1], M. Nevitt[2], K. Yaffe[2], T.B. Harris[3], *1. University of Maryland, Baltimore, Maryland, 2. University of California San Francisco, San Francisco, California, 3. National Institue on Aging, Bethesda, Maryland*

Background: Recent studies suggest an association between osteoarthritis (OA) and dementia. The objective of this analysis was to determine if older adults with OA have a higher risk of cognitive impairment (CI). Methods: We used data from the Health Aging and Body Composition (HABC) study, a multicenter prospective cohort study of community dwelling adults, ages 70-79, to determine if participants with OA at baseline (self-reported OA or OA defined by HABC prevalent disease algorithm) have an increased risk of developing CI. CI was defined as a Modified Mini-Mental State examination (3MS) score<70. Baseline and year 3, 5, 8, and 10 scores were analyzed. Results: There were 2577 participants with 3MS scores of >=70 at baseline (n=1277 with OA, n=1300 without OA). The OA group had more women (54% vs 44%, p<0.001), higher baseline CES-Depression scores (4.9 SD5.4 vs 4.2, SD4.9, p=0.003) and hypertension (46% vs 40%, p=0.028). There was no significant difference in development of CI after 9 years amongst those with OA (n=165, 12.9%) versus without OA (n=197, 15.1%). $\chi 2$ (1, n= 2577) =2.66, p >0.10. On logistic regression analysis there was no association between OA and incident CI (odds ratio= 0.8: 95% confidence interval 0.6-1.0). There was no significant association between baseline OA and the development of CI at the 3, 5, 8 and 10 year time points. No differences were found upon sensitivity analysis using racially adjusted cut-points for 3MS scores. Conclusions: These results do not support the hypothesis that there is an association between OA and CI

PERSISTENT RESPIRATORY SYMPTOMS AMONG MIDDLE-AGED AND OLDER ADULTS WITH COPD WORSEN HEALTH STATUS

C.H. Martinez, C.R. Richardson, M.K. Han, C. Cigolle, *Division of Pulmonary and Critical Care Medicine, University of Michigan Health System, Ann Arbor, Michigan*

Clinical series have found worse outcomes for COPD accompanied by persistent respiratory symptoms (wheezing/cough/sputum production). However, the effect of symptoms on health status (HS) at the population level, particularly in the context of multimorbidity, is not clear. We investigated (1) COPD prevalence with and without persistent symptoms among American adults ≥51 years and older and (2) association of symptoms with baseline and 2-year change in HS. We analyzed participants age ≥51 years (n=16,785) in wave-2008 of the Health and Retirement Study, a nationally-representative longitudinal health interview survey. COPD and symptoms were self-reported. Respondents reported baseline (2008) HS (excellent to poor) and 2-year (2010) HS compared to previous interview (better/same/worse). Covariates included 7 chronic diseases (hypertension/heart/cancer/diabetes/stroke/musculoskeletal/psychiatric); 5 geriatric conditions (cognitive impairment/falls/incontinence/vision/hearing impairment); dependency in activities of daily living, and sociodemographic characteristics. We used logistic regression to examine the association between COPD, persistent symptoms, and baseline/change in HS. COPD was reported by 10.9% of respondents (n=1,839, representing 7.6 million nationally), 49% of whom had persistent wheezing/cough/sputum production (3.7 million). In fully adjusted models, persistent symptoms were associated with higher odds of fair/poor baseline HS (odds ratio [OR] 2.6, confidence interval [CI] 2.0-3.4) and with 2-year worsening HS (OR 1.6, CI 1.2-2.0). The impact of symptoms on HS was greater than that due to individual comorbid diseases and comparable to having ≥3 comorbidities. Persistent respiratory symptoms are an important factor impacting HS in COPD. These symptoms should be a target for therapy and identification of patients at high risk for worsening HS.

THE LONGITUDINAL RELATIONSHIP BETWEEN CHRONIC DISEASE, DISABILITY AND DEPRESSION FOR OLDER ADULTS

H. Chiu[1], C. Chen[2], L. Mau[3], *1. Graduate Institute of Healthcare Administration, Kaohsiung Medical University, Kaohsiung, Taiwan, 2. University of Kang Ning, Tainan, Taiwan, 3. Chronic Disease Research Group, Minneapolis, Minnesota*

Background: Although health decline in older adults are common, the relationship between chronic disease, disability and depression and the influence of each other over time is not well understood. This study explores change trajectories among three health domains when the effects of contextual and other structural factors are simultaneously considered. Methods: Participants included 442 community-dwelling older adults living in Taiwan, aged 65 years or older, who completed six waves of survey interviews. The study investigated changes of status in three health domains at six time points during 1994-2004. Health status was assessed using 27 items of chronic diseases, 12 items of Physical and Instrumental Activities of Daily Living, and 15-items from the Short Psychiatric Evaluation Schedule. The autoregressive latent trajectory model and parallel latent growth curve modeling were adopted for analysis of the data. Results: This study confirmed that continuous health decline is a major public health problem among the elderly population. The results also show strong change trajectories among the three health domains, with initial poor health status (i.e. existence and level of chronic disease and disability) predictive of further problems across health domains. Discussion: A focus on causal pathways linking chronic disease to change in depression and disability is strongly indicated. In addition, interaction between chronic disease and disability may be a concurrent or a precursor of depression. This provides important information to support the development of future clinical and public health interventions that may help to slow the process of health decline, especially in an ageing population.

OCCUPATIONAL EXPOSURES IN MIDLIFE AS DETERMINANTS OF MORTALITY: A 28-YEAR PROSPECTIVE FOLLOW-UP OF PUBLIC SECTOR EMPLOYEES

M. von Bonsdorff[1], M.E. von Bonsdorff[1], J. Seitsamo[2], J. Ilmarinen[2,3], C. Nygård[4], T. Rantanen[1], *1. Gerontology Research Center and Health Sciences, University of Jyväskylä, University of Jyväskylä, Finland, 2. Finnish Institute of Occupational Health, Helsinki, Finland, 3. University of Eastern Finland, Kuopio, Finland, 4. University of Tampere, Tampere, Finland*

Objectives The aim of this study was to investigate how physical and chemical exposures in the work environment were associated with mortality among middle-aged public sector employees. Methods Data come from the Finnish Longitudinal Study on Municipal Employees, a cohort of public sector employees aged 44-58 with follow-up since 1981. 5464 participants had answered nine questions asking to which extent physical or chemical exposures in the work environment such as e.g. cold, hot or temperature changes, noise and acids, alkali or oils decreased their job satisfaction. Mortality was followed up from January 1981 to July 2009 from the Finnish Population Register. Cox regression models were estimated separately for men and women working in white-collar and blue-collar professions. Results Of the 5464 participants, 670 (22.7%) women and 1093 (43.5%) men died during the follow-up. White-collar men with a higher number of work-related physical or chemical exposures had an increased risk of mortality which was not explained by adjustment for life-style factors (smoking, alcohol consumption and physical activity) or chronic diseases (cardiovascular disease, metabolic disorders and cancer), HR 1.03, 95% CI 1.01-1.06 per one unit increase in work-related exposures. Blue-collar women with a higher number of work-related exposures had an increased risk of mortality compared to those with fewer exposures, but adjustment for life-style factors and chronic diseases attenuated the association, hazard ratio (HR) 1.02, 95% confidence interval (CI) 0.99-1.04. Conclusion Work-related physical and chemical exposures have long-term effects on health, but they may vary according to gender and occupational status.

ENVIRONMENTAL POLLUTION AND THE HEALTH EFFECTS ON THE ELDERLY

M. Ndukwe[1], L.R. Phillips[2], E. Ume[1], S. Evans-Manly[1], J. Mentes[2], A.A. Kehinde[1], W. Chou[1], C.M. Basilio[1], *1. Charles R. Drew University of Medicine and Science/UCLA, Los Angeles, California, 2. University of California, Los Angeles, California*

Due to improvement in technology and industry, environmental air pollution is consistently increasing. Many low-income urban-dwelling elders live in private homes or nursing homes that are located close to industrial areas or freeways where there is a high concentration of these pollutants. The effects of air pollution on childhood asthma are well studied. Theoretically, among older adults (65+ years) who are experiencing physical changes due to normal and pathological aging, exposure to pollutants is also associated with more respiratory and cardiopulmonary morbidity and more hospitalizations for respiratory illnesses. The purpose of this systematic review of the research literature was to explore the degree to which environmental and geronotological research has focused on the relationship between air pollution and health care utilization among older individuals living in urban areas. Due to dearth of literature, a major gap noted relates to the effect of environmental air pollution in older adults living in long term care facilities. Electronic databases from Google scholar, Cochrane Library, and PubMed were used. In addition to summarizing findings of the review, future research is needed to explore this impact of environmental pollution on older adults, which will help inform policy makers and urban planners about environmental health risks of elders living in long term care facilities.

SESSION 1660 (POSTER)

PHYSICAL ACTIVITY

EVALUATION OF A SIT-TO-STAND TASK IN YOUNG AND OLDER ADULTS

S. Paulson[1], M. Gray[2], *1. Dept. of Exercise Science, Shippensburg University, Shippensburg, Pennsylvania, 2. University of Arkansas, Fayetteville, Arkansas*

Ability to rise from a chair is an important task for older adults and is associated with functional independence. Although, performing the sit-to-stand task (STST) itself is important, the phases of the task: preparatory, rising, and stabilization are imperative to study. Evaluation of these STST phases will identify areas older adults find more challenging in order to correct issues and decrease fall risk. Purpose: This investigation examined relative power and time spent in the phases of a STST between younger and older adults. Methods: Twenty (12 females, 8 males) community-dwelling older (71.6 ± 5.6 yrs) and 20 (15 females, 5 males) younger adults (22.3 ± 1.9 yrs) completed 10 STST. Subjects were instructed to place their feet on a force plate and rise from a chair as quickly as possible. Muscular power was measured using the Tendo Weightlifting Analyzer. Kinetic data were used to analyze the time spent in each phases. Results: The one-way ANVOA yielded statistically significant differences between groups for both relative power ($p < .01$) and total time to stand ($p < .01$). Further, the older subjects spent significantly ($p < .01$) more time in all phases of the STST as compared to their younger counterparts (31% PP; 31% RP; 56% SP). Conclusion: Findings of the study suggest community-dwelling older adults generate less relative power and require significantly more time to rise from a chair. Further, older adults need more time to stabilize following a STST suggesting increased fall risk after rising from a seated position.

MEASUREMENT OF SPEED AS A PREDICTOR OF AUTONOMY LEVELS IN ELDERLY PEOPLE

J.F. Ramirez, A. Sánchez Jiménez, H.H. León, *Physical Culture, Sport and Recreation, St. Thomas University, Bogota, Colombia*

Purpose: The Purpose Of The Study Was To Examine The Use Of Maximal Running Distance Performed As A Predictor Of Autonomy Levels. In This Particular Case, The Relationship Among Power (Wingate Test), Velocity Displacement Over Distances Of 15, 30 And 45 Meters And Morphological Variables (Fat Free Mass/ Fat Mass/Areas/ Perimeters) Were Estimated In Older Senior Athletes To Analyze Their Autonomy Levels. Methods: Twenty Elderly Men (54, 7 ± 3,7 Years) From Athletics Groups (Bogotá- Colombia) Were Evaluated Three Times On Each Test Day And On Three Different Test Days. Test-Retest Reliability Was Highest In All Tests. Results: Velocity Displacement Over Distances Of 30 And 45 Meters Correlated Negatively With Average Power (r=-0,61, p= 0,024/ r= -0,66, p= 0,001 Respectively), Body Weight And IMC Correlated Positively With Maximum Peak Power (r= 0,80 p= 0,001; r= 0,77 p= 0,004 Respectively) And Thigh Perimeter Corrected By The Thigh Skinfold Thickness Correlated Positively With Average Power (r= 0,55 p= 0,03). Conclusion: Velocity Displacement Over 30 And 45 Meters Can Be Used To Evaluate The Levels And Functional Autonomy In Elderly Individuals.

CORRELATES OF PHYSICAL ACTIVITY IN ADULTS

B.N. Sprague[1], M. Sliwinski[1], D. Almeida[1], J. Smyth[2], M.J. Katz[3], R.B. Lipton[3], *1. Human Development and Family Studies, The Pennsylvania State University, University Park, Pennsylvania, 2. The Pennsylvania State University, University Park, Pennsylvania, 3. Albert Einstein College of Medicine, Bron, New York*

Research suggests that factors like neighborhood safety, age, and education may be important determinants of physical activity, although these results are not consistent across studies. The goal of the current study is to examine correlates of physical activity in a diverse sample of adults. Two-hundred forty-one participants from the Effects of Stress on Cognitive Aging, Physiology, and Emotion (ESCAPE) project completed data on physical activity engagement, measured by the RAPA (Rapid Assessment of Physical Activity) and various items thought to be correlates of physical activity. Using cross-sectional data, physical activity correlated with neighborhood violence ($r = -.17$) and marginally with social cohesion ($r = -.12$). Physical activity was not correlated with neighborhood aesthetic quality or neighborhood safety. Because the participants all live in the same neighborhood, this suggests that perceptions of the neighborhood may be related to physical activity engagement. Implications for future research will be discussed.

TRANSLATION OF DANCE-BASED RESEARCH INTO PRACTICE

J. Krampe[1], G. Earhart[2], *1. Saint Louis University School of Nursing, St. Louis, Missouri, 2. Washington University School of Medicine, St. Louis, Missouri*

Dance-based movement programs have been shown to improve physical function in community-dwelling older adults, including improving balance and mobility. Besides the health benefits, these group programs provide social support and are cost effective. Dance-based movement programs promote enjoyment while also engendering interest in continued participation for both healthy and impaired older adults. We report on the experiences from two research projects to inform translation to practice. The first was a study of individuals with Parkinson's disease using Argentine tango which was implemented in 2009. In the second study, the Healthy-Steps dance program was tested in older adults with and without lower extremity pain in a senior housing site and implemented in practice in 2013. The experiences of implementing and sustaining these dance programs are discussed using the Texas Christian University Change Model, Stages of Transfer that includes 1) Exposure, 2) Adoption, 3) Implementation, and 4) Practice. The Adoption of dance-based programs by both the older adults and practice partners is a critical and challenging stage; successful strategies for Adoption include building start-up dance instructor funding into the research budget and using a wait-list control research design. This change model for moving dance-based research to practice can be applied to other facility-and community-based movement programs. This model also has implications for improved mobility and maintenance of independence for older adults, while adding to the emerging research on dance-based therapy for this population.

THE EFFECTS OF INTERVENTIONS TO INCREASE PHYSICAL ACTIVITY ON HEALTH OUTCOMES AMONG OLDER ADULTS

J.D. Chase, V.S. Conn, L.J. Phillips, T. Ruppar, *University of Missouri-Columbia, Fort Walton Beach, Florida*

PURPOSE: Interventions designed to motivate community-dwelling older adults to increase physical activity (PA) behavior are modestly effective. The purpose of this meta-analysis is to determine these intervention effects, if any, on anthropometric, quality of life (QOL), depression, and pain outcomes in this population. METHOD: Exhaustive search strategies identified published or unpublished, two-group PA intervention studies among community-dwelling adults age 65 and older reporting PA plus anthropometric, QOL, depression, or pain outcome data. Primary study outcomes were duplicate coded to ensure accuracy. Standardized mean difference effect sizes (ES) were analyzed using a random-effects model. Q and I2 statistics were used to explore heterogeneity of effects. RESULTS: Outcomes were synthesized from 6 anthropometric, 19 QOL, 10 depression, and 12 pain primary studies. The ES for anthropometric outcomes was 0.08 ($p=0.18$). For QOL outcomes, the ES was 0.07 ($p=0.19$). The ES for depression was 0.02 ($p=0.70$). The ES for pain was 0.02 ($p=0.80$). ESs were not significantly heterogeneous. CONCLUSION: Interventions designed to improve PA behavior among community-dwelling older adults do not appear to impact anthropometric, QOL, depression or pain outcomes. Furthermore, the lack of significant heterogeneity across studies suggests that studies were relatively similar. Additional primary research is needed. Future PA intervention research should identify interventions more effective in increasing PA to determine their effect on important health outcomes among older adults.

PHYSICAL ACTIVITY AND SEXUAL FUNCTION IN AGING WOMEN

P.U. Cabral[1], S. Lages[1], A. Canário[2], V. Silva[3], F. Madeira[1], D. Costa[1], A. Gonçalves[2], *1. State University of Piaui - UESPI, Teresina, Piauí, Brazil, 2. Federal University of Rio Grande do Norte - UFRN, Natal, Rio Grande do Norte, Brazil, 3. State University of Rio de Janeiro - UERJ, Rio de Janeiro, Rio de Janeiro, Brazil*

Introduction: The aging process and the menopause arrival tend, both, negatively influence a series of health related factors in women, including their quality of life and sexual function. Objective: To investigate the relationship between physical activity level and sexual function in ageing women. Methods: A cross-sectional study with a sample of 370 women (40-65 years old), treated at public health care facilities in a Brazilian city. A questionnaire was used containing enquiries on socio-demographic, clinical and behavioral characteristics: the International Physical Activity Questionnaire (IPAQ), short form, and the Female Sexual Function Index (FSFI). Results: The average age of the women studied was 49.8 years (± 8.1), 67% of whom exhibited sexual dysfunction (FSFI ≤ 26.55). Sedentary women had a higher prevalence (78.9%) of sexual dysfunction when compared to active (57.6%) and moderately active (66.7%) females ($p = 0.002$). Physically active women obtained higher score in all FSFI domains (desire, arousal, lubrication, orgasm, satisfaction and pain) and total FSFI score (20.9), indicating better sexual function than their moderately active (18.8) and sedentary (15.6) counterparts ($p <0.05$). Conclusion: As it was demonstrated, the physical activity factor proved to have a positive influence on sexual function of the surveyed aging women.

INFLUENCE OF PHYSICAL ACTIVITY ON HEALTH AND QUALITY OF LIFE IN AGEING WOMEN

P.U. Cabral[1], H. Barreto[1], T. Alves[1], S. Lages[1], A. Canário[2], A. Gonçalves[2], V. Silva[3], *1. State University of Piaui - UESPI, Teresina - Piaui, Brazil, 2. Federal University of Rio Grande do Norte - UFRN, Natal, Rio Grande do Norte, Brazil, 3. State University of Rio de Janeiro - UERJ, Rio de Janeiro, Rio de Janeiro, Brazil*

Objective: To evaluate physical activity influence on health and quality of life of women in the menopausal period. Methods: A cross-sectional study surveying 60 women aged 45-65 years, being 30 physically active in a supervised physical exercise program and 30 diagnosed as sedentary. Methods: We applied a questionnaire related to the sociodemographic and clinical characteristics of the surveyed women. To assess the factors health and quality of life the used instrument was the Women Health Questionnaire (WHQ). Results: Physically active women, as compared to the sedentary ones, had higher scores in all domains of the menopausal symptoms addressed by the Women Health Questionnaire. In another words, this result indicating that the active group was less stricken by the menopausal symptoms. Significant differences ($p<0.05$) were observed for depression, somatic symptoms, anxiety, sleep problems and memory/concentration being all better for the active women group. Among all the reported symptoms, back and body members pain (8.3%), hot flushes (3.3%), impatience (3,3%) and headache (3.3%) were the ones that most annoy both groups. However, approximately 75% of the women in each group reported as having no difficulties as to deal with such symptoms. Conclusion: As the results show, regular physical activity appears to be a positive way to the menopausal symptoms reduction, fact that may be thought as capable of improving health and quality of life of women during this period of life.

ASSOCIATION BETWEEN PHYSICAL ACTIVITY AND SLEEP ONSET LATENCY AMONG COMMUNITY-DWELLING OLDER PEOPLE IN JAPAN: A CROSS-SECTIONAL STUDY

J. Cai[1], T. Chen[1], A. Supartini[1], T. Honda[1], M. Nagano[2], E. Matsuo[3], S. Kumagai[1,4], *1. Graduate School of Human-Environment Studies, Kyushu University, Fukuoka, Japan, 2. Kyoto Bunkyo University, Kyoto, Japan, 3. Tokyo Metropolitan Institute of Gerontology, Tokyo, Japan, 4. Faculty of Arts and Science, Kyushu University, Fukuoka, Japan*

Purpose Sleep onset latency (SOL) is an important indicator of sleep quality. Previous studies have reported shorter SOL was related to amount of light intensity physical activity. However, there are few studies using objectively measured physical activity in this area, especially for older adults. The aim of this study was to investigate the relationship between objective physical activity and SOL among Japanese elderly people. Methods Participants of this study were individuals (n=721) who were 65 years or older. Participants were categorized into two groups based on their SOL (shorter SOL, <30min; longer SOL, >30min) by using Pittsburgh Sleep Quality Index. Physical activity (PA) was measured by a tri-axial accelerometer (HJA-350IT, Omron Healthcare, Japan). Two PA indices were defined as: volume of light PA (LPA) (1.6 to 2.9METs, METs*hour/day) and that of moderate-to-vigorous PA (MVPA) (≥3.0METs, METs*hour/day). Results Overall, 31.9% of participants (n=230) were categorized as longer SOL. Higher LPA was significantly associated with decreased risk of long SOL with adjusted odds ratio 0.91 (95% confidence interval, CI, 0.862-0.966), while there was no significant association between MVPA and SOL with adjusted OR 0.98 (95%CI, 0.909-1.065), after controlling for a number of demographic, lifestyle and health factors. Conclusions This study showed objectively measured LPA was associated with longer SOL, while MVPA was not associated with longer SOL. Consistent with previous studies, results of this study provide evidence to support the relationship of LPA and SOL by using objective PA data. To establish the cause and effect relationship, future prospective studies are needed.

PHYSICAL ACTIVITY IN COMBINATION WITH SLEEP DURATION AND THE RISK OF LONG-TERM CARE IN OLDER ADULTS

N. Kitano[1,2], T. Jindo[1], T. Abe[1], A. Sato[1], T. Tsuji[1,2,3], K. Tsunoda[4], T. Okura[1], *1. Faculty of Health and Sport Sciences, University of Tsukuba, Ibaraki, Japan, 2. Research Fellow of the Japan Society for the Promotion of Science, Tokyo, Japan, 3. Gerontology Research Center, University of Jyväskylä, Jyväskylä, Finland, 4. Meiji Yasuda Life Foundation of Health and Welfare, Physical Fitness Research Institute, Tokyo, Japan*

It is well-known that physical activity (PA) has benefit to maintain functional independence, also recent studies have revealed that sleep plays an important role in overall health. This study investigated how the combination of PA and sleep duration is associated with the risk of long-term care in older adults. A total of 4,422 community-dwelling older Japanese individuals (age≥65 years) participated in present survey (average age 72.7±6.2 years; 53.3%men). We used the International Physical Activity Questionnaire short version to assess PA, and sleep duration was evaluated by Pittsburgh Sleep Quality Index. A basic checklist of long-term care prevention was used to screen the high risk senior. Participants were categorized into 4 groups by status of PA and sleep duration: 1) sufficiently active [meeting the World Health Organization (WHO) recommendation] and adequate sleep (≥6 hours), 2) sufficiently active and short sleep (<6 h), 3) inactive (not meeting WHO recommendation) and adequate sleep and 4) inactive and short sleep. A logistic regression analysis adjusted for age and hypnotic use was conducted. In both men (OR=0.293, 95%CI=0.196-0.437) and women (OR=0.392, 95%CI=0.233-0.660), sufficiently active with adequate sleep had low risk of long-term care compared to inactive with short sleep. Either of sufficient activity (men: OR=0.392, 95%CI=0.233-0.660; women: OR=0.433, 95%CI=0.270-0.694) or adequate sleep (men: OR=0.432, 95%CI=0.289-0.646; women: OR=0.526, 95%CI=0.372-0.744) were also associated with lower risk for long-term care. For obtaining general well-being, our findings suggest that it is important for older adults not only to be physically active, but also to sleep well.

PHYSICAL ACTIVITY AND ENERGY EXPENDITURE OF A GROUP OF ELDERLY IN ABEOKUTA, NIGERIA.

I. Olayiwola, *Nutrition and Dietetics, Federal University of Agriculture Abeokua, Abeokuta, Nigeria*

Physical activity is necessary to promote health and increase longevity for elderly people. Thus, the study assessed the physical activity and energy expenditure of the urban elderly. This study was conducted on 220 elderly in the Abeokuta Southwest Nigeria. Three wards were purposively selected from 15 wards of Local Government because of its standard infrastructural facilities compared to other areas within the Local Government. By mean of a structured questionnaire, there was information on Demographics characteristics, types of activities and time allocated for each activity. The duration of various activity was calculated by energy cost and summed up using NutriSurvey2007 database software. Nutritional status was determined by means of anthropometric measurements Both descriptive and inferential statistics were used to illustrate and determine the relationship between variables. The result indicated that 36.4% of the respondents engaged in routine activities that consumed little energy. Majority of the time was spent sitting down. The energy expenditure ranged from 612 to 1296 kcal/day. BMI classification demonstrated that more than half were overweight (55.91%) 21.36% were Obese 1, and about 1% Obese 2. There was a significance relationship between Energy Expenditure and anthropometric measurements ($p<0.05$). This result disclosed that, energy expended affects the Body Mass Index. Regular exercise for elderly at-least 30minutes road walk a day is encouraged.

DEVELOPMENT OF PREDICTION MODELS FOR SIT-TO-STAND LOWER-BODY POWER AND VELOCITY IN OLDER ADULTS

J.M. Glenn, A. Binns, J. Vincenzo, M. Gray, *University of Arkansas, Fayetteville, Arkansas*

Maintaining sit-to-stand speed and lower-body power is an issue in older adults, but difficult to evaluate without specific, expensive equipment. Purpose: The purpose of this investigation was to develop prediction models for lower-body power/velocity in older adults using validated functional fitness field measures. Methods: Sixteen males (78.2±7.1 years) and 41 females (78.1±6.3 years) from a senior living community, volunteered for this study. Functional fitness measures included isometric handgrip (HG) and 30-second chair stand (CS). Lower body power/velocity was evaluated using the TENDO Weightlifting-Analyzer (TENDO). From a seated position, participants performed a sit-to-stand five times with 60-seconds rest between trials. The TENDO was attached to the hip at a 90-degree angle with the floor. Average power (AP) and velocity (AV) were calculated as mean power generated throughout the sit-to-stand. Peak power (PP) and velocity (PV) were the highest power generated at any point throughout the movement. Regression analysis determined the ability of HG and CS to predict lower-body power and velocity assessed via TENDO. Results: Significant ($\alpha<.05$) regression equations were calculated for AP (R2=.66), PP (R2=.69), AV (R2=.63), and PV (R2=.63) using HG and CS as predictors. When evaluating AP and PP, the HG accounted for the greatest percentage of variance (46% and 52%, respectively); however, when predicting AV and PV, the CS accounted for the greatest percent of variance (52% and 47% respectively). Conclusions: Using validated field measures of functional fitness to predict lower body power in older adults is beneficial for technicians as it minimizes need for expensive equipment.

EFFECTIVENESS OF PHYSICAL ACTIVITY INTERVENTIONS WITH HEALTHY OLDER WOMEN: A SYSTEMATIC REVIEW PROTOCOL OF RANDOMIZED CONTROLLED TRIALS

L.E. Young[1], D.J. Sheets[1], P. Skar[1], K. Schick Markaroff[2,1], C. Gordon[1], *1. University of Victoria, Victoria, British Columbia, Canada, 2. University of Alberta, Alberta, Alberta, Canada*

Strong scientific evidence shows that physically active people have higher levels of health-related fitness, a lower risk profile for developing a number of disabling medical conditions, and lower rates of various chronic diseases than people who are inactive. Yet, older women's participation in physical activity is suboptimal. The objectives of this systematic review were to appraise randomized controlled studies of laboratory-, home- and community-based physical activity interventions with the specific goal of improving the physical health of older women living independently in the community. The Joanna Briggs

Institute (JBI) systematic review method was used to assess studies including one of the following outcome measures: 1) cardiorespiratory (e.g. pulse, heart rate, blood pressure, aerobic capacity); 2) body composition (e.g. BMI, waist circumference, hip/waist ratio, % body fat); 3) flexibility (e.g. stretching, balance); and 4) muscular strength and endurance (e.g. grip strength, walking speed). The review included only randomized controlled trials published between 2000 and 2013 where the majority of women were 50 years of age or older and healthy. Papers were assessed by two independent reviewers for methodological validity using standardized critical appraisal instruments from the Joanna Briggs Institute Meta Analysis of Statistics Assessment and Review Instrument (JBI-MAStARI). Data were extracted from papers using the standardized JBI data extraction tool. Twenty six studies met the inclusion criteria with 14 studies adequately rigorous for data extraction. Specific details about the interventions, populations, study methods and outcomes of significance are discussed with particular attention to recommendations for healthcare policy and practice.

IMPACT OF “STANDING UP FROM A LONG SITTING POSITION ON THE FLOOR” ON MEDICAL EXPENDITURES IN OLDER JAPANESE POPULATION

H. Yoshida[1], S. Ueki[1], J. Takato[2], G. Inuzuka[1], N. Arayama[1], H. Haga[3], *1. Tohoku Bunka Gakuen University, Sendai, Japan, 2. Okayama Prefectural University, Okayama, Japan, 3. J.F.Oberlin University, Tokyo, Japan*

This study was conducted to examine the impact of “standing up from a long sitting position on the floor” on medical expenditures in older Japanese population. The subjects were those aged ≥65 years who participated in the baseline health-check (2006), bought the national health insurance and used medical services at least one time in 2006 and 2008 in Tome, Miyagi, Japan. Out of them, 1,033 individuals underwent “the tests of length of time standing up from a long sitting position on the floor”. We followed-up these individuals for 2 years. We determined whether baseline (2006) “standing up from a long sitting position on the floor” affected medical expenditures in 2008 independently from the impact of key confounders (gender, baseline age, self-rated health and medical expenditures), using log-linear models. Increase of one second of baseline “length of time standing up from a long sitting position on the floor” increased medical expenditures per month per capita 3.0% in 2008 significantly (P=.020). Also using log-linear models adjusted for baseline age, self-rated health and medical expenditures, only in women (n=603), increase of one second of baseline “length of time standing up from a long sitting position on the floor” increased medical expenditures per month per capita 3.7% in 2008 significantly (P=.009). Decline of physical strength in Japanese elderly, especially in women, could be an independent risk-factor of condition (locomotive syndrome) and had a strong impact on future medical expenditures.

PAIN BEHAVIORS DURING FUNCTIONAL TASKS AND EXPERIMENTAL PAIN INDUCTION IN OLDER ADULTS WITH KNEE PAIN

T.L. Glover[1], V.I. Edmondson[1], B.R. Goodin[2], J.K. Schmidt[2], M.S. Herbert[2], A. Horgas[1], L.A. Bradley[2], R.B. Fillingim[1], *1. Adult and Elderly Nursing, University of Florida, College of Nursing, Gainesville, Florida, 2. University of Alabama at Birmingham, Birmingham, Alabama*

Assessment of overt pain behaviors can complement self-report pain measures. Several studies report ethnic/racial differences in clinical and experimental pain ratings, but ethnic/racial differences in overt pain behaviors have not been examined. We coded overt pain behaviors from videotapes of 29 older African American (AA) and 29 White (W) adults with symptomatic knee osteoarthritis completing functional tasks (chair, walking) and experimental pain procedures (heat/cold). Three participants did not have complete video data and were excluded from analysis, leaving a sample size of 55 participants. The average age was 58.2 years, 60% female. The pain behavior coding methodology developed by Keefe (1987) was utilized to code the following pain behaviors: bracing, grimacing, guarding, joint flexion, rubbing, withdrawal, and non-verbal/verbal pain. Two experimenters underwent two phases of training and calibration. After training, inter-rater reliability was acceptable (K = 0.68-1.00) for pain behaviors assessed across clinical and experimental pain tasks. The experimenters independently coded 55 participant videos. When experimenters’ coded pain behavior differed by more than one unit, consensus was reached by viewing the videos together. Experimenter ratings of pain behaviors correlated strongly with participant pain rating following the chair task (r = .69-.73, p = 0.01), moderately for the walking task (r =.45, p = 0.01), but poorly for the experimental pain tasks (r = .13-.19, ns). The distribution of pain behavior scores did not differ between AA and W according to the Mann-Whitney U statistic. Thus, assessed pain behaviors were similar across race groups in both clinical and experimental pain tasks.

MICROSTRUCTURAL INTEGRITY IS RELATED TO FASTER GAIT IN THE PRESENCE OF WHITE MATTER HYPERINTENSITIES

B.L. Rosario[1], A.L. Rosso[1], H.J. Aizenstein[1], A.B. Newman[1], S. Studenski[2], C. Rosano[1], *1. University of Pittsburgh, Pittsburgh, Pennsylvania, 2. National Institute of Health, Bethesda, Maryland*

White matter hyperintensities (WMH) are associated with slowing gait in older adults, but some individuals maintain a faster gait with WMH. We characterize microstructure of normal appearing white matter (NAWM) and grey matter atrophy (GMA) in relation to slow gait in those with high WMH. Diffusion tensor imaging data were acquired in 2006-08 on a 3T scanner concurrent with GMA, WMH, and cognitive and physical performance measures in 279 participants of the Healthy Brain Project (78-90 yrs, 58% women, 41% black). Tract Based Spatial Statistics and Voxel Based Morphometry was used to test the association between fractional anisotropy (FA) and GMA with gait speed (above the median=0.91 m/s) in those with high WMH burden (above the median), before and after adjustment for muscle strength. Significant clusters were identified using a threshold-free cluster enhancement ($p<0.05$ FWE corrected). Among those with high WMH, higher FA was related to faster gait speed in interhemispheric tracts and in tracts related to sensory-motor function and information processing. Adjustment for muscle strength attenuated but did not substantially change results. Lower GMA of the temporal gyrus and cerebellum was associated with faster gait speed among those with high WMH. Results were not robust to adjustment for muscle strength. Greater integrity of white matter throughout the brain may provide compensation to WMH for gait speed in older adults. Future studies to examine the factors to promote NAWM integrity in older adults and its impact on mobility are warranted.

SESSION 1665 (POSTER)

DISABILITY, FALLS & MOBILITY

FALLERS IN COMMUNITY CAN BE IDENTIFIED BY TIMED UP AND GO TEST: DATA FROM THE INCHIANTI -FARSEEING

N. Zaffarana[1], M. Colpo[1], M. Baccini[2], L. Chiari[3], S. Mellone[3], C. Tacconi[3], S. Bandinelli[1], *1. Laboratory of Clinical Epidemiology, InCHIANTI Study Group, Azienda Sanitaria di Firenze, Firenze, Italy, 2. Unit of Functional Rehabilitation and Motion Analysis Laboratory, Azienda Sanitaria di Firenze, Firenze, Italy, 3. Department of Electrical, Electronic and Information Engineering, University of Bologna, Bologna, Italy*

Purpose and methods: Still uncertain the best way to assess risk of falling in relatively healthy and not disabled subjects. There is some evidence that the Timed up and go test (TUGt) cannot well discriminate between fallers and non-fallers in healthy older subjects. We explored the hypothesis that the discriminative value of TUGt in the identification of fallers could be improved by the information collected through inertial sensors (IS) built-in a Samsung Galaxy SII/III placed in a belt-pocket on the back. An automatic algorithm developed ad-hoc (uTUG) identified total and partial times needed to perform the test and other biomechanical features computed by the IS signals (gyroscope and accelerometer). Data from 84 participants (51F; 78.6±6.9ys, MMSE 26.9±2.6) able to maintain tandem (T) or semi-tandem (ST) stance for 10 sec without ADL disability, were considered. Analysis was conducted by multiple linear regression models. Results: 18.9% of those who maintained T experienced at least a fall in the last 12 months versus 37.5% of those who maintained ST (p=0.05). Independent of age and gender, uTUG total and partial times were not associated to fall history (p>0.10). Unlike timing, the way in which subjects approached the final sitting position, quantified by a morphological analysis (through the jerk function) of the IS signals, was instead highly associated to fall history (p=0.04 for the lateral acceleration, p=0.03 for the torsional angular velocity). Conclusion: uTUG application could be helpful in the discrimination of fallers versus non-fallers in a community setting providing detailed biomechanical information.

RELATIONSHIPS BETWEEN STRENGTH AND STEP EXECUTION TIME: ROLE OF ACE INSERTION/DELETION GENOTYPES

A. Goldberg, S.A. Talley, *Physical Therapy Department, University of Michigan-Flint, Flint, Michigan*

Introduction: Executing a rapid step is a response strategy used by older adults to avoid falling. Many factors are implicated in the ability to execute a rapid step, including balance, fear of falling and lower extremity strength. Polymorphisms in the angiotensin-converting enzyme (ACE) gene are associated with strength of the lower extremity in older adults. The purpose of this study was to examine the association between strength and step execution time (SET) in older adults with the ACE deletion (DD+), and without the ACE deletion (DD-) genotype. Methods: Twelve adults (mean age 74.5 years) performed trials of rapid stepping in a university research laboratory. SET was assessed using a reaction timer and foot pads. Hip flexor, knee extensor, ankle dorsiflexor and grip strength were assessed using hand-held dynamometry. After isolating DNA from mouthwash samples, allelic discrimination of the ACE genotypes was accomplished using a 5' nuclease assay. Spearman's correlations evaluated relationships between strength and SET within the DD+ and DD- groups. Statistical significance was set at p<0.05. Results: Strength was associated with SET in the DD+ group (hip flexors r=-0.90, p=0.02; knee extensors r=-0.77, p=0.07; ankle dorsiflexors r=-0.83, p=0.04; grip r=-0.90, p=0.02). Associations between strength and SET were weak in the DD- group (r values -0.09 to -0.37; p>0.05) Discussion/conclusions: Strength appears to be associated with stepping performance in older adults with the DD genotype, but not in those without the DD genotype. Studies are warranted to determine predictors other than strength of stepping performance in DD- individuals.

MUSCLE COMPONENTS IN RELATION TO INCIDENT MOBILITY DISABILITY AND GAIT SPEED DECLINE; THE AGES-REYKJAVIK STUDY

I. Reinders[1,2], R.A. Murphy[1], A. Koster[3], I.A. Brouwer[2], M. Visser[2], G. Eiriksdottir[4], V. Gudnason[4,5], T. Harris[1], *1. National Institutes of Health, National Institute on Aging, Bethesda, Maryland, 2. VU University, Amsterdam, Netherlands, 3. Maastricht University, Maastricht, Netherlands, 4. Icelandic Heart Association Research Institute, Kopavogur, Iceland, 5. Faculty of Medicine, University of Iceland, Reykjavik, Iceland*

Background: Aging is associated with lower muscle strength and changes in muscle composition. We examined associations of muscle components with incident mobility disability and gait speed decline. Methods: Data were from 2725 participants (43% men) aged 74.8±4.7 years from the AGES-Reykjavik Study. At baseline, maximal isometric thigh strength was assessed by a dynamometer chair, and mid-thigh muscle area and fat infiltration were assessed by computed tomography imaging. Mobility disability and usual gait speed were assessed at baseline and after 5.2±0.3 years. Incident mobility disability was defined as having much difficulty or unable to walk 500 meter or climb-up 10 steps. A decrease of ≥ 0.1 m/s in gait speed was considered clinically relevant. Results: After adjustment for demographics, BMI, lifestyle indicators and comorbidities, greater strength and area were protective for mobility disability risk and gait speed decline. After adjustment for other muscle components, greater strength was independently associated with lower mobility disability risk in women; OR; 0.76 (95% CI 0.60; 0.96), and lower decline in gait speed risk among both men; 0.68 (0.57; 0.80), and women; 0.71 (0.62; 0.81). Larger muscle area was independently associated with lower mobility disability risk in women; 0.68 (0.52; 0.89), and lower decline in gait speed risk in men; 0.74 (0.61; 0.91). Conclusion: Greater muscle strength and area, but not muscle fat infiltration, were independently associated with 15-30 percent decreased risk of mobility disability and gait speed decline. Interventions aimed at maintaining muscle strength and area in old age might delay functional decline.

DEPRESSIVE SYMPTOMS AND FUNCTIONAL DECLINE IN AN ELDERLY SAMPLE OF URBAN CENTER IN NORTHEASTERN BRAZIL

R.O. Guerra, C.S. Gomes, A.N. Freire, M.A. Moreira, A.C. Maciel, *Departamento de Fisioterapia, Federal University of Rio Grande do Norte, Natal RN, Rio Grande do Norte, Brazil*

BACKGROUND: The decline of mobility can be considered as an important parameter to measure the initial states of the process of disability in the elderly.Population studies in developed countries have revealed the importance of the impact of depressive symptomatology on physical performance in older people. In Brazil, where over the last decades have seen an accelerated process of population aging, still there are few population studies on depressive symptoms and functional status in the elderly. The regional cultural diversity, as well as the contrast of socioeconomic conditions observed in the demographic picture, does assume that the Brazilian population aging has important variations with regard to aspects of mental and physical health of this contingent. OBJECTIVE:To examine the association between depressive symptoms and functional status in elderly people living in an urban center in northeastern Brazil. METHODS: In this cross-sectional, observational, analytic study, 313 community-dwelling elderly (age≥65 years) individuals of both sexes who resided in Natal, Rio Grande do Norte, were evaluated. The Brazilian version of the Center for Epidemiologic Studies Depression Scale was used to screen for depressive symptoms. Physical performance was assessed using the Short Physical Performance Battery. A multivariate linear regression model adjusted for clinical and socioeconomic variables was used to analyze the association between depressive symptoms and functional performance. RESULTS: Our findings showed that the presence of depressive symptoms influenced functional performance, even when analyses controlled for variables such as age, sex, poor perceived health, cognitive status, and body mass index (BMI). CONCLUSION: The results of this study reinforce the association between depressive symptoms and functional performance in an elderly population in an urban center in northeastern Brazil. These findings provide useful information for the identification of potential targets for research and therapeutic interventions aimed at preventing a decline in mobility in elderly individuals.

SARCOPENIA INFLUENCES FALL-RELATED INJURIES IN COMMUNITY-DWELLING OLDER ADULTS

S. Kim, N. Woo, *kyungpook national university, Daegu, Republic of Korea*

This study aimed to determine the relationship between sarcopenia and fall-related injuries in community-dwelling older adults in Korea. The study population comprised 2,848 subjects aged 65 years or older who participated in the Korea National Health and Nutrition Examination Surveys during 2010–2011. Sarcopenia was considered to be present if the subject's appendicular skeletal muscle mass divided by his or her weight was less than 29.9% in men, or less than 25.1% in women. The incidence of fall-related injuries during the past year among all the respondents was 4.3%, and the prevalence of sarcopenia was 32.2%. After controlling for sociodemographic variables and morbidity due to chronic diseases, the incidence of fall-related injuries remained significantly elevated among older adults with sarcopenia (odds ratio = 1.61, 95% confidence internal = 1.01–2.54). Sarcopenia should be considered when investigating means of preventing of fall-related injuries in community-dwelling older adults. To prevent falls among these persons, it is vital to implement intervention programs that increase muscle mass.

DIFFERENCES IN SELF-REPORTED PHYSICAL ACTIVITY AMONG COMMUNITY-DWELLING FALLERS AND NON-FALLERS

J. Vincenzo, S.M. Gray, J.M. Glenn, M. Gray, *Human Performance Lab, University of Arkansas, Fayetteville, Arkansas*

Falling and fear of falling increase with age and decrease quality of life. It is well-documented that exercise decreases fall risk. However, conflicting evidence exists among fallers and non-fallers with regard to physical activity (PA) and the relationship to balance and balance confidence. Purpose: The present investigation compared differences and relationships of PA, balance, and balance confidence among community-dwelling fallers and non-fallers. Methods: Fifty-nine older adults (n = 32 fallers; n = 27 non-fallers) participated in the study (74.98 ± 6.98 years). Fallers answered "yes" to "have you fallen within the past 12 months?". PA was measured by the Physical Activity Scale of the Elderly (PASE). The Activities Specific Balance Confidence Scale (ABC) assessed balance confidence. Functional balance was measured by the Berg Balance Scale (BBS). Results: MANOVA indicated significant differences between groups ($p < .0001$). Fallers had significantly lower BBS (fallers = 49.41±7.23, non-fallers = 53.75 ± 3.03;p = .003) and ABC (fallers = 77.10 ± 13.52, non-fallers = 91.38 ± 8.63; $p < .0001$), but were not different on PASE scores (fallers = 123.02 ± 53.16; non-fallers = 140.86 ± 70.84; p = .286). PASE demonstrated a significant, small relationship with ABC (r = .36, p = .005) and BBS (r = .37, p = .003), but not fall history (p = .31). Conclusion: PA is related to balance and balance confidence, but not fall history. There is no difference in PA between groups despite balance and balance confidence being lower among fallers when compared to non-fallers.

GAIT SPEED AND EXECUTIVE FUNCTION, AND CEREBRAL GLUCOSE METABOLISM IN OLDER ADULTS

R. Sakurai, Y. Fujiwara, M. Yasunaga, Y. Murayama, N. Sakuma, K. Kobayashi, S. Shinkai, K. Ishii, *Tokyo Metropolitan Institute of Gerontology, Itabashiku, Tokyo, Japan*

Slower gait speed is related to lower executive function in older adults. However, little is known about the neural basis underlying this association. This study investigated the relationship between regional cerebral metabolic rates of glucose (rCMRglc), and gait and executive function in physically and mentally high-functioning community-dwelling older adults. Ninety-eight older adults (mean age [SD], 74.0 [5.1] years) who were independent in performing instrumental activities of daily living and had no mobility limitation underwent positron emission tomography using 18F-fluorodeoxyglucose (FDG-PET) to assess brain activity at rest. We measured rCMRglc in 16 regions of interest. Within 6 months after the FDG-PET, maximum gait speed, MMSE, TMT-A and TMT-B were measured. Associations between rCMRglc, gait speed and executive function were examined using multiple linear regression analyses adjusted for demographics (age, sex and educational attainment), and height, body weight, blood pressure and past illnesses. Slower maximum gait speed was associated with lower TMT-B score. However, only lower TMT-B score was associated with lower rCMRglc in the posterior cingulate, parietal and primary sensorimotor cortices. There was no significant association between maximum gait speed and rCMRglc, except marginally significant association between gait speed and rCMRglc in the posterior cingulate. Executive function was more vulnerable to reduced metabolic activity in certain regions of the brain. Such metabolic change in the brain may be a neural basis linking executive function and gait speed in highly functioning older adults.

PILOTING A SELF-ADMINISTERED BALANCE PROGRAM FOR LOW VISION OLDER ADULTS: CLINICAL FIELD-TEST FINDINGS

J. Crittenden[1], L.W. Kaye[1], M.R. Gugliucci[2], S.A. Harvey[1], A. Cowles[2], D.C. Wihry[1], R. Mlotek[3], *1. University of Maine Center on Aging, Bangor, Maine, 2. University of New England, Biddeford, Maine, 3. The Iris Network, Portand, Maine*

The risk of falling and experiencing serious injury in a fall increases with age and nearly doubles for older adults with vision impairment. However, impaired balance is a modifiable falls risk factor. An evidenced-based individualized balance improvement program for older adults has been adapted and tested specifically with those with visual impairment (corrected vision of 20/70 or less) as part of an NIH-funded clinical trial. Instructions and exercise descriptors of this self-administered, in-home program were modified for older adults with visual impairment then field-tested. Training materials were adapted to Braille, large font print, and audio for subjects. Think-Aloud protocols were used to determine the understandability of training materials, subject ability to perform exercises from the descriptors, and clarity of verbal instructions for validated assessments. Community-dwelling older adults (M=77 years; range: 56-95 years) with low vision were recruited through a vision services agency to participate in field-testing. The majority was female, and white. Half was widowed and half used an assistive ambulatory device. The mean Timed Get Up and Go (TUG) was 16.35 seconds with 50% of individuals meeting the minimum clinical trial mobility criteria of TUG ≥12 seconds. Findings underscore the importance of: a high-touch recruitment process, self-selection from a variety of material formats, strong program orientation, instructional language that provides clear reference points in the absence of visual aids, and recognizing fear of falling as a potential implementation barrier. Findings have been applied to this clinical trial and can be applied to other research with vulnerable, sensory-impaired older adults.

EFFECTS OF ENVIRONMENTAL CONSTRAINTS ON ELDERLY GAIT DYNAMICS

E.G. James, *Health and Human Performance, University of Texas at Brownsville, Brownsville, Texas*

Elderly gait has been found to be characterized by altered stride time dynamics during treadmill walking (Hausdorff et al., 1997). Prior theoretical work has shown that environmental constraints can alter the organization of motor behavior (Newell, 1986). The present study examined the effects of different levels of environmental constraints on gait in the elderly during treadmill walking. Seven elderly (age 65 – 70 years) and 8 young (age 18-25 years) adults walked at their preferred speed for 10 minutes on a treadmill with lengths of 1 and 1.5 m. The SD and long-range correlations (using Detrended Fluctuation Analysis) in stride time were examined to determine possible age and treadmill length effects and interactions. There were no significant differences in the SD of stride time. Consistent with prior research (Hausdorff et al., 1997) the elderly had significantly lower stride time Detrended Fluctuation Analysis α-exponents when walking on a 1.5 m long treadmill ($p = 0.009$). However, when walking on a treadmill of 1 m length the elderly stride time α-exponents increased to a level that was not significantly different than those of the young adults ($p = 0.398$). These results indicated that constraining the treadmill length reversed the age-associated change in stride time dynamics. Future research is needed to determine possible retention of this alteration in gait dynamics during long-term gait training.

EFFECTS OF DUAL TASK ON GAIT, STATIC AND DYNAMIC BALANCE AND MANUAL CONTROL IN ELDERLY PEOPLE
